PHARPAR, or ) one of the rivers of Dan PHARPHAR, Scus, or rather an arm of Barrady or Chryforrhoas, which waters Date cus and the country about it. (2 Kings v. 1)
The river of Damascus has its fountain is mountains of Lebanus. At its approach to city it is divided into three arms, one of passes through Damascus. The other two was the gardens round about, and then reuniting they lose themselves at 4 or 5 leagues from the

ty, towards the N. See Maundrell's Travels his and DAMASCUS.

PHARRKIRCHEN. See PHARKIRCHEN.

(1.) PHARSALIA, an epic poem, composed by Lucan on the civil war between Pompey and Czin, and particularly on the victory of the latter ner the former, (see No 2.) It is a poem univer-My acknowledged to have great beauties and rat defects; but we are the less capable of essating its merit as a whole, that either time deprived us of the last books, or its author left it incomplete.

PHARSALIA, or PHARSALIM, HARSALOS, or PHARSALUS, PHARSALUS, Called FARSA, to which place Pompey fled from the plains of Pharfa-It is watered by the Enipeus, which falls in the Apidanus, and both into the Peneus. Be-Pharfalus and Enipeus, Pompey drew up at the fatal battle of Pharfalia. At the meacement of this battle the whole plain was from Pharfalia to the Enipeus, with two dreffed and armed after the fame manner, string the same enfigns. At first both kept ounful filence; but at length the trumpets old, and Cæfar's army advanced to begin the when Caius Crastinus, a centurion, at the of 120 men, threw himfelf upon the enemy's be with incredible fury, and made a great to of them, in consequence of a promise made to Cæfar. But while he was still forward, forcing his way through the one of Pompey's men ran him in at the with fuch violence, that the point of his some out at the hind part of his neck. foldiers then took courage, and flood cary's onfet. While the foot were thus magaged in the centre, Pompey's horse in wing marched up, and having widened mks, with a defign to furround Czfar's right charged his cavalry, and forced them to Hereupon Cæsar ordered his horse a little, and give way to the fix cohorts, he had posted in the rear as a body of re-These, upon a fignal, coming up, chargseemy's horse with determined resolution, and at the faces of the enemy. This new of fighting had the defired effect. For patricians, whom Czfar cails the pretancers, not willing to have their faces med with fears, turned their backs, and fled stmost confusion, leaving the foot at the the enemy. Cæfar's men did not purbut charging the foot, now naked and miled, furrounded them, and cut most of Pompey was fo transported with It feeing the flower of his forces thus cut in that he left his army, and retired flowly tent, without fpeaking a word, and contithere, like one distracted, till his whole ardefeated. Cæsar no sooner saw himself of the field than he marched to attack bey in his entrenchments; upon which, Pompatting on fuch a garment as might best fabis fight, stole out at the decuman gate, took the road to Largesa, which city had

hitherto shown great attachment to him, bot where he was murdered, tho' fome fay this happened at Peinsium. (See Pompey). In the mean time Cæfar began the attack on the enemy's camp, which was vigoroully defended by the cohorts Pompey had left to guard it; but they were at length forced to yield. Cæsar was not a little furprised, when, after having forced the entrenchments, he found the enemy had made preparations before-hand for a festival after the victory, which they thought certain. In Pompey's tent Cæsar found the box in which he kept his letters: but, with a magnanimity worthy of himself, he burnt them ail, without reading one; faying, that he had rather be ignorant of crimes, than obliged to punish them. The next day, when the dead were numbered, it appeared that Cæfar had scarce lost 200 men; among whom were about 30 centurions, whom Czefar caufed to be buried with great folemnity. He paid particular honours to the body of Crastinus, and ordered his ashes to be deposited in a tomb, which he erected to his memory. On Pompey's fide, the number of the dead amounted to 15,000 according to fome, and to 25,000 according to others. Czefar took 24,000 prisoners, 8 eagles, and 180 enligns.

(2.) PHARSALUS, or PHARSALIA, an extensive plain of Thessaly, between the above town and the Enipeus, in which the decifive battle above

mentioned was fought.

PHARUS, in botany, a genus of the hexandria order, belowing to the monœcia class of plants; and in the natural method ranking under the fourth order, Gramina. The male calyx is a bivalved uniflorous glume; the co olla, a bivalved glume; the female calyx the same with the male; the corolla an uniflorous, long, and wrapping There is but one feed. glume.

PHARUSII, or Phaurusii, an ancient nation of Africa, beyond Mauritania. Mela, i. c. 4.

PHA

(1.) PHASEOLUS, the Kidney-Bean; a gehus of the decandria order, belonging to the diadelphia class of plants; and, in the natural method, ranking, under the 32d order, Papilionaceae. Linnaus enumerates 15 species. Of these, one comprehends many varieties. Those principally cultivated for the table are, 1. The common white, or Dutch kidney-bean. 2. The smaller kidney-bean, called the Batterfea kidney bean. And, 3. The upright fort, called the tree kidney-1. The first fort was some time ago propagated in England, and is still in Holland; it grows very tall, and requires long stakes and poles to climb on, and its beans are confiderably broad: this makes them lefs fateable in the markets, people fupposing them to be old because they are broad; and they are hence grown into disuse, though a much more valuable kind for eating than any other. 2. The Battersea bean is what is more univerfally cultivated: it never grows very tall, nor rambles far, and the air can eatily pals between the rows, because of its moderate growth; this makes it bear plentifully, and ripen well for the table. It is the best tasted bean, except the iast. 3. The tree kidney-bean, is also a plentiful bearer, and never rambles, but grows up in form of a shrub; but its beans are broader than the Battersea kind, and are not so well tasted. They are all propagated from feeds, which are to be put into the ground in the end of March or beginning of April for an early crop a but they should have a warm fituation and a dry foil; and be planted in a dry season. The manner of planting them is, to draw lines with a bough over the bed, at 31 feet distance, into which the feeds are to be dropped about two inches afunder; and the earth is to be drawn over them with the head of a rake, to cover them about an inch deep. In a week after fowing, the plants will appear, and the earth should be drawn up about their stalks as they rife up; for a few days after this they will require no further care, except to be kept clear from weeds, and, when the beans appear, to have them gathered twice a-week; for if the beans are suffered to hang on too long, they not only become of no value, but they weaken the plant. The first crop of kidney-beans will continue a month in good order; and, to supply the table afterwards, there should be fresh sowings in March, April, May, and June; the last of which will continue till the frosts come to destroy them. Some raise their early crops on hot-beds; and this is to be done exactly in the same manner as the raising the early cucumbers.

(2.) Phaseolus, a new species of phaseolus, apparently a very useful one, has been discovered by. M. Moraney, "an inhabitant of Morne Rouge, dependant on the Cape;" we suppose Cape François of the island of St Domingo. It requires no peculiar management: its roots are in scasson when the pods blacken, and its shores run in every direction, scarching for nourishment through the clefts of rocks, and receiving the impression of the strata without injury. If the principal root is left, the plant shoots again and shourishes as before; but it is not yet ascertained whether it puts forth any new roots. The seeds are not alimentary, when dressed, as if nature designed them only for

propagating other plants. Every use which farinaceous plant can supply, this new phased has successfully answered.

PHASIANA, in ancient geography, a coun of Afia, feated on the banks of the Phasiana. The Phasiana. The people of Phasiana.

were originally from Egypt.

PHASIANUS, in ornithology, a genus of his belonging to the order of galling. The che are covered with a fmooth naked skin. Ghi in his Roman History, tells us, that the phasianus is derived from the river Phasis, banks of which are the native habitation of pheasant. See Phasis, N° 3. There are a species and Varieties. See Pheasant.

1. PHASIANUS ARGUS is yellowish, black spots, a red face, and a blue crest on back of the head. It is found in Chinese Ta "The argus," (fays Latham,) though it be tive in china, is very commonly found in the of Sumatra, where it is called co-ow. It is extremely difficult to be kept alive for any derable time after catching it in the woods; for more than a month. It feems to have a pathy to the light, being quite inanimate is open day; but when kept in a dark place, is pears perfectly at ease, and sometimes main note or call, from which it takes its names which is rather p aintive, and not harsh like of a peacock. The sless hard common pheasant."

2. Phasianus columbres is red, with a head, a wedge-thaped tail, and papillous d It is a native of Africa and Afria.

3. Phasianus Gallus, the common hill cock and hen, with a compressed carus fleshy comb on the top of the head, and ad of caruncles or wattles under the chin. The are naked, and the tail is compressed and a Of all birds, perhaps this species affords the eft number of varieties; there being fearer be found that exactly rejemble each other in age and form. The tail, which makes beautiful figure in most of these birds, is con wanting in others; and in fome even the run The toes, which are usually four in all mals of the poultry kind, yet in one specimount to five. The feathers, which lie to and in fuch beautiful order in most of the are acquainted with, are in a peculiar specifinverted, and stand staring the wrong way. there is a variety that comes from Japan, instead of feathers feems to be covered over hair. It is not well afcertained when the was first made domestic in Europe; but it is raily agreed that he was first brought to Et Aristophanes calls the code from Persia. Perfun bird; and tells us he enjoyed that dom before some of its earliest monarchs. animal was known to early even in the most in parts of Europe, that the cock was one of forbidden foods among the ancient Britons.

deed, the domestic fowl feems to have banished the wild one. Perlia itself seems no longer to know it in its natural form. But the cock is still bund in the illands of Tinian, in many others of the Iulian ocean, and in the woods on the coaft Malabar, in its ancient state of independence. hs wild condition, his plumage is black and yela, and his comb and wattles yellow and purple. Here is another peculiarity also in those of the full woods; their bones, which, when boiled, has are white, in those are as black as ebony. oled to one of his own species; and in every of the world where refinement and polifhed ners have not entirely taken place, cock-fightis a principal divertion. In China, India, the ppine islands, and all over the East, cockbing is the foort and amusement even of kings princes. With us it is declining every day; tisto be hoped it will in time be abolished among the lowest vulgar. See Cock FIGHT-11-4. The cock claps his wings before por crows. His fight is very piercing; and fails to cry in a peculiar manner, when beers any bird of prey in the air. His exmany courage is thought to proceed from me the most falacious of all birds. A fingle affices for ten or a dozen hens; and it is but he is the only animal whose spirits are ated by indulgence. But he foon grows be radical mouture is exhaufted; and in 3 as he becomes utterly unfit for impregna-" Hens also, (says Willughby,) as they greatest part of the year daily lay eggs, unice for so many births, but for the most ter three years become barren." The hen ciutches a brood of chickens above once s though instances have been known in they produced two. The number of eggs the hen will lay in the year are above 200 d he be well fed and supplied with water eny. It matters not much whether the be by the cock or not; fire will continue to hough the eggs of this kind can never by be brought to produce a living ammai. is made without any care, it left to herbole scratched in the ground, among a es, is the only preparation the makes for also of patient expectation. Nature, almausted by its own fecundity, seems to inher of the proper time for hatching, which welf tellifies by a clucking note, and by dif-Tog to lay. The good housewives, who more by their hens eggs than by their often artificially protract this clucking and fometimes entirely remove it. As then begins to cluck, they ftint her in her on; which, if that fails, they plunge her water; this; for the time, effectually ack her hatching; but then it often kills in hird, who takes cold and dies under eration. If left entirely to herfelf, the hen kidom lay above twenty eggs in the same ithout attempting to hatch them. In the he the hen fel-lom lays above fifteen eggs. the hen has hatched her chickens, her afleems to alter her very nature, and correct perfections. No longer voracious or cow-OI. XVII. PART I.

ardly, the abstains from all food that her young can fwallow, and flies boldly at every creature that the chinks is likely to do them mischief. Capons may very eafily be taught to clutch chickens. To effect this they pluck the feathers off his breaft? and rub the bare skin with nettles; they then put the chickens to him, which prefently run under his breaft and belly, and probably rubbing his bare skin gently with their heads, allay the stinging pain which the nettles had just produced: This is repeated for two or three night; till the animal takes an affection to the ehickens that have thus given him relief, and continues to give them the protection they feek for. He from that time brings up a brood of chickens like a hen, clutching them, feeding them, clucking, and performing all the functions of the tenderest parent. A capon once accustomed to this service, will not give of ver; but when one brood is grown up, he may have another nearly hatched put under him; which he will treat with the filme tenderness he did the former. The cock, from his falaciousness, is a thort-lived animal in a domestic state; but how long these birds live, if left to theinselves, is not yet well afcertained. Aldrovandus hipts their age to be ro years; and it is probable that this may be its extent. They are subject to some disorders; and as for poisons, belides nux vomica, which is fatal to most animals except man, they are injured, as Linnæus afferts, by elderberries; of which they are not a little fond. Of this species Mr Latham enumerates no less than 13 varieties, beginning with the wild cock, which is a 3d less in the body than the domestic cock. This variety he imagines to be the original flock from whence all our domestic varieties have sprunga They appear to be natives of the forests of India. There are but few places, however, as he observes, where the different voyagers have not met with cocks and hens, either wild or tame. Those of Pulo Condorc are very much like our own, but confiderably less, being only of the fize of a crow-(Damp. Voj. vol. i. p. 392.) Those of Sumatra and Java are remarkably large, and are called the St Jago breed. The cock is so tall as to peck off a common dining table. When satigued, he sits down on the first joint of the leg. (Hist. Sumatra, p. 98. They are found in New Guinea, but not in great plenty. (Forr. Vor. p. 105.) Forfer obferves, that they are plenty at Easter, Society, and Friendly Illes: at the two last they are of a pro-digious fize. They are not uncommon at the Marquefas, Hebrides, and New Caledonia; but the Low Isles are quite destitute of them. (See 05/. p. 193.) Ducks and poultry are numerous in the Sandwich Iiles. (Cook's Journal, p. 229.) They are not found to breed in the northern parts of Siberia; and in Greenland are only kept as rarities. (Faun. Groen.) See HATCHING, No 1.

4. PHASTANUS GUINEFISTS. The motmot, or Guinea pheafant, is brownith, formewhat red below with a wedge-like tail, and wants fpurs.

5. PHASIANUS NECTHEMERUS is white, with a black creft and belly, and a wedge-shaped tail. It is a native of China.

6. PHASTANUS PICTUS has a yellowish creft, a red breast, and a wedge-shaped tail. It is a native of China.

(1.) \* PHA

(1.) \* PHASIS. n. s. In the plural phases. [ \$\varphi\_{\sigma\_{ij}}\$; \$\phase phase. Fr.] Appearance exhibited by any body; as the changes of the moon.—All the hypotheses yet contrived, were built upon too narrow an infeection of the phases of the universe. Glanville.—

He o'er the seas shall love or fame pursue; And other months another phases view. Greech.

(2.) PHASIS. See PHASES.

(3.) Phasis, in ancient geography, a river which. cis. falls into the Enxine sea about 700 miles from Constantinople. " From the Iberian Caucasus (says Gibbon), the most lofty and craggy mountains of Asia, that river descends with such oblique vehemence, that in a short space it is traversed by 120 bridges. Nor does the stream become placid and navigable till it reaches the town of Sarapana, five days journey from the Cyrus, which flows from the fame hills, but in a contrary direction, to the Caspian lake. The proximity of these rivers has fuggested the practice, or at least the idea, of wasting the precious merchandise of India down the Oxus, over the Caspian, up the Cyrus, and with the current of the Phasis into the Euxine and Mediterranean seas. As it successively collects the streams of the plain of Colchos, the Phasis moves with diminished speed, tho' accumulated weight. At the mouth it is 60 fathoms deep, and half a league broad; but a small woody island is interposed in the midst of the channel: the water, fo foon as it has deposited an earthy or metallic sediment, floats on the furface of the waves, and is no longer susceptible of corruption. In a course of 100 miles, 40 of which are navigable for large veffels, the Phasis divides the celebrated region of Colchos or Mingrelia, which, on three fides, is fortified by the Iberian and Armenian mountains, and whose maritime coast extends about 200 miles, from the neighbourhood of Trebizond to Dioicurias, and the confines of Circaffia. Both the foil and climate are relaxed by excessive moisture; 28 rivers, besides the Phasis and his dependent streams, convey their waters to the sea; and the hollowness of the ground appears to indicate the fubterraneous channels between the Euxine and the Caspian."

(4.) Phasis, an ancient city of Colchis, fo named

from the above river.

(1.) \* PHASM. n. f. [σασμα.] Appearance; phantom; fancied apparition.—Thence proceed many aerial fictions and phasms. Hammond.

PHASMATA, } in physiology, are certain ap-(2.) PHASMS, } pearances arising from the various tinctures of the clouds by the rays of the heavenly bodies, especially the sun and moon. These are infinitely diversified by the different figures and situations of the clouds, and the appulses of the rays of light; and, together with the occasional flashings and shootings of different meteors, they have, no doubt, occasioned those prodigies of armies fighting in the air, &c. of which we have such frequent accounts in most ancient authors. Hom. Iliad. vii.

(1.) \* PHEASANT. n. s. [failan, Fr. phalms from Phalis, the river of Colchos.] A kind wild cock.—The hardest to draw are tame in as the cock, peacock and pheasant. Peachant.

Preach as I please, I doubt our curious Will chuse a pheasant still before a hen. (II.) PHEASANT, in ornithology. See Planus. Mr Latham enumerates 9 different specific and the common of the common o

of pheasants, and 6 varieties of the common plant; but as he gives them no diffindive time classical names, we referved a description of them to this article, instead of arrangings under Phasianus, the generic name.

1. PHEASANT, COMMON. Mr Latham obs that the common pheasant is now found in of nature in almost the whole of the Old nent. They fometimes (he fays) come into yards near woods, and produce cross breed common hens. He then fays, " M. Saler marks, that the hen pheafant, when done and fitting, will get the plumage of the male after that become so little respected by himbe treated with the same incivility as he show to one of his own fex. Pheafants we ginally brought into Europe from the banks Phasis, a river of Colchis, in Afia Minor from whence they ftill retain their name. to the peacocia, they are the most beauti birds, as well for the vivid colour of their as for their happy mixtures and variety. birds, so beautiful to the eye, are not less when served up to the table. Their flesh fidered as the greatest dainty. A spirit of pendence feems to attend the pheafant even tivity. In the woods, the hen pheasant lay 18 to 20 eggs in a season; but in a domestic the feldom lays above 10. In the fame m when wild, the hatches and leads up her with patience, vigilance, and courage; but kept tame, the never fits well, fo that a hen nerally her fubstitute upon such occasions: for leading her young to their food, the is a ignorant of where it is to be found; and the birds starve, if lest solely to her protection. pheafant, therefore, on every account, feet ter left at large in the woods than reclain pristine captivity. Its fecundity when w fufficient to stock the forest; its beautiful pla adorns it; and its siesh retains a higher ! from its unlimited freedom. At night they upon the highest trees of the wood; and b they come down into the lower brakes and b where their food is chiefly found. They get make a kind of flapping noise when they are the females; and this often apprifes the sport of their retreats. At other times he traces in the snow, and frequently takes them in sp which they alarm the gunner, and being a large mark, and flying very flow, there is little chance of milling them. When these birds are taken roung into keeping, they become as familiar as tickens. For her neft, dry grafs and leaves must laid for her in the pheasantry. The young ti are very difficult to be reared, and they must supplied with ants eggs, which is the food the one leads them to gather when wild in the ods. To make these go the farther, they are chopped up with cruds or other meat: and young ones are to be fed with great exactness, as to the quantity and the time of their sup-This food is fometimes also to be varied; wood lice, earwigs, and other infects, are to rariety. The place where they are reared be kept extremely clean; their water must proceed till the dew is off the ground in the me, and they should always be taken in bewhen they become adult, they very in thift for themselves; but they are partifond of oats and barley. The pheafant, full grown, feems to feed indifferently upon thing that offers. A French writer, afferts they regale even upon carrion.

PHEASANT, COURIER. "The courier pheabut very imperfectly described by Fernanand is faid to be 18 inches long. The genelour of the plumage is white, inclined to fulabout the tail they are black, mixed with pots of white; the tail itself is long, and of colour, reflecting in some lights like the of a peacock: the wings are short. This inhabits the hotter parts of Mexico; flies but is recorded to outrun the swiftest

PHEASANT, HYBRIDAL, a name given by n to a species or variety which is a mixed between the pheafant and cock; one of is in the Leverian Museum.

PHEASANT, PARRAKA. The parraka is ahe fize of a finall fowl, refembling it in the and body. Its length is 23 inches. The of the bill is dark rufous; the eyes are the general colour of the plumage is a brown on the back, and fulvous under the the top of the head is fulvous, and the feaere somewhat long, but not so much as to real crest; the wings are short; the webs mails of 12 feathers, is even at the end, aa foot in length, and is, for the most part, pendent; the legs are of a dark rufous, into black; the claws are like those of a fowl. oculiar (fays Mr Latham) in its internal thruc-™ πspect to the windpipe; which, instead tring directly the breaft, as in most birds, over the fide of the left clavicle, and on the c of the fleshy part of the breast, being coonly by the ikin, then taking a turn upb, pailes over the right clavicle into the breaft, is distributed through the lungs in the usual The fewa e has not this circumvolution of windpipe. The hannequaw, mentioned by wifi, is probably the fame bird. He fays that

But of all birds they are thot most easily; as they it is black, roofts in trees, and may be heard ear-aways make a whirring noise when they rise, by his in the morning, diffinctly, but hoarsely, repeating the word hannequase (easily mistaken for par-raquaw) very loud. These are found in the unfrequented woods of the internal parts of Cayenne, Guiana, and many parts of S. America. At funrife they fet up a very loud cry, which is thought to be the loudest of all birds in the new world; at which time the eyes appear red, as does a small fkin under the breaft, which is not at all feen, except when the bird makes fuch exertions, or is angry. This cry is very like the word parraquaw; and is repeated many times together; and often many cry at once, or answer one another, but most in breeding time, which is twice in the year; at each time laying from four to fix eggs; making the nest in low branches or stumps of trees, and behaving with their chickens in the fame manner They feed on grain, feeds, and herbs; as hens. but feed the young in the nest with worms and finall infects. Thefe, with many other birds, inhabit the woods by day, coming out into the open favannas morning and evening to feed; at which times they are chiefly killed by the natives and near inhabitants. They may be brought up tame; and their flesh is much esteemed.

This bird Linnæus 5. PHEASANT, SUPERB. described from the various representations of it painted on paper hangings, and China ware; and farther confirmed by a figure and description in a Chinese book which came under his inspection.

(III.) PHEASANT'S EYE, in botany. See Adonis. (IV.) PHEASANTS, ISLE OF, OF ISLE DE FAIsans, or the Isle of Conference, an island between France and Spain, formed by the Bidaffon, abounding with *Pheafants*. The BIDASSOA had long been a subject of dispute between France and Spain, each county laying claim to it exclusively; till the 15th century, when it was agreed between Lewis XII. of France, and Ferdinand V. of Spain, that the river should be common to both nations. This island was afterwards the scene, where another treaty, called the Treaty of the Pyrenees, was concluded between France and Spain, in 1699; and it was also the scene of an interview between the monarchs of these kingdoms, on the marriage of Lewis XIV. whence its latter name. It lies about 2 miles from Fontarabia. Lon. 1. 46. W. Lat. 45. 20. N.

PHEBE, a deaconess of the port of Corinth, called Genchrea. St Paul had a particular effeem for her; and Theodoret thinks he lodged at her house, while he continued at Corinth. She brought to Rome the epiftle he wrote to the Romans, wherein the is commended in fo advantageous a manner. See Rom. xvi. 1, 2.

PHE

PHEGOR, or PEOR, a deity worthipped at a very early period by the Midianites and Moabites, and probably by all the other tribes which then inhabited Syria. PHEGOR, or PFOR, is the fame with the Hebrew word pechor, which fignifies aperuit, and probably refers to the prophetic influence always attributed to the folar deity, by which he opened or discovered things to come. Accordingly we find PHEGOR or PEOR generally joined to BAAL, which was the Syrian and Chaldean name of the fun after he became an object of worship; hence BAAL-PHEGOR must have been the fun worshipped by some particular rites, or under fome particular character. What there were, a resolution of Pechar into its component parts may perhaps inform us. As this word, wherever it occurs in Scripture, has some relation to distencing or opening the mouth wide, it is probably compounded of EHAH the mouth or face, and EHAR naked. In those countries we know that the women wore veils; but it would appear, that in celebrating the rites of this drity they were unveiled. It feems even not improbable, that on thefe occasions the fexes danced promiscuously without their clothes; a practice which would naturally give birth to the licentious amours mentioned in the 25th chapter of the book of Numbers. If this be admitted, it will follow that Phegor was the fun prefiding over the mysteries of Venus. See BAAL-PEOR.

PHEIA. See PHEA.

PHELDSCHARETZ, a town of Ruffia, in the province of Caucafus; 20 miles S. of Kizlar.

PHELIN. See PHELLIN.

PHELLANDRIUM, WATER HEMLOCK; a genus of the digynia order, belonging to the pentandria class of plants; and in the natural method, ranking under the 45th order, Umbellatæ. There are two species, one of which, viz.

PHELLANDRIUM AQUATICUM, is a native of This grows in ditches and ponds, but is not very common. The stalk is remarkably thick and dichotomous, and grows in the water. It is a poison to horses, bringing upon them, as Linnæus informs us, a kind of palfy; which, however, he supposes to be owing not so much to the noxious qualities of the plant itself, as to those of an infect which feeds upon it, breeding within the stalks, and which he calls curculio paraplesticus. The Swedes give fwine's dung for the cure. The feeds are fometimes given in intermittent fevers, and the leaves are by some added to discutient cataplasms. In the winter, the roots and stem, diffected by the influence of the weather, afford a very curious skeleton or network. Horses, sheep, and goats, eat the plant; fwine are not fond of it; cows refuse it.

PHELLIA, a river of Laconia. Pauf. iii. 20. (1.) PHELLIN, a river of Russia, which runs from

Lake Vertz; and falls into the Baltic, at Pernov.

dex; and Leyden, No 4.

PHIALIA, a town of Arcadia. Pauf. viii. 3. PHICORES, an ancient nation who inhabited the banks of the Palus Mæotis. Mela, i. 19.

PHIDIAS, the most famous sculptor of antiquity, was an Athenian, and flourished in the 83d Olympiad. This wonderful artist was not only confummate in the use of his tools, but accomplifted in the sciences of history, poetry, sable, geometry, optics, &c. He first taught the Greeks to imitate nature perfectly, and all his works were received with admiration. They were also incredibly numerous; for it was almost peculiar to Phidias, that he united the greatest facility with the greatest perfection. His Nemelis, one of his first pieces, was carved out of a block of marble, found in the Perlian camp, after the battle of Marathon. He made an excellent statue of Minerva for the Plateans; but the statue of this goddess in her magnificent temple at Athens, of which there are still some relies, was an astonishing production. Pericles ordered Phidias to make a statue of the goddess; and Phidias formed a most admirable figure of ivory and gold, 39 feet

high. But what rendered his name immortal, proved at that time his ruin. He had carved upon the shield of the goddes his own portrait and that of Pericles; and this was made a crime. Upon this he withdrew to Elis, and made for the Elians the Olympic Jupiter; a prodigy of art which was ranked among the 7 wonders of the world. It was of ivory and gold; 60 feet high, and every way proportioned. Phidias concluded his labours with this masterpiece; and the Elians, to do honour to his memory, appropriated to his descendants, the office of keeping clean this magnificent image.

RHIDITIA, in Grecian antiquity, feafts celebrated with great frugality at Sparta. They were held in the public places and in the open air. Rich and poor affifted at them equally, and on the fame footing; their defign being to keep up peace, friendship, good understanding, and equality among the citizens great and smail. It is said that those who attended this feast brought each a bushlei of slour, eight measures of wine named chorus,

five mince of cheefe, and as many figs.

(2.) PHILA, an ancient town of Macedonia.

(1.) PHILADELPHIA, in antiquity, were games infittuted at Sardis to celebrate the union of Caracalla and Geta, the fone of Septimius Severus.

(2-5.) PHILADELPHIA, in ancient geography, the name of 4 towns; 1. in Arabia; 2. in Cilicia; 3. in Syria. (Lempr.) 4. in Lydia, now called A-

lab fber. Plin. v. c. 29.

(6.) PHILADELPHIA, an ancient town of Turkey in Alia, in Natolia. It is feated at the foot of mount Tmolus, by the river Cogamus, whence there is an exceeding fine view over an extensive piain. It was founded by Attalus Philadelphus, brother of Eumenes. It was very liable to earthquakes, which, perhaps, arose from its vicinity to the region called Catakekanmene. So severe were those earthquakes, that even the city walls were not fecure; and fo frequent were they, that thefe experienced daily concustions. The inhabitants, therefore, who were not numerous, lived in perpetual apprehension, and their constant employment was in repairs. In fact, so great were their fears, that their chief refidence was in the country, the foil of which was very fertile. Such is Strabo's account of this place. In 1097, it was taken by affault by John Ducas the Greek gene-141. It was without difficulty reduced also in 1106, under the same emperor. The Turks marched tom the East with a defign to plunder it and the raritime towns. The Emperor Manuel, in 1175, retired for protection from the Turks to this 3 ace. In 1300 it felt y lot to Karaman. In 1:06 it was beneged by A maras, and confideraharaffed; but was not taken. In 1391, this prace alone refused to admit Bajazet; but it was at length forced to capitulate for want of provi-

tions. It has been matter of furprise that this

town was not totally abandoned; and yet it has furvived many cities less liable to inconveniences and is still an extensive place, though in appear ance it is poor and mean. Some remnants of it walls are ftill flanding, but with large gaps. Th materials are fmall ftones ftroughly cemented. is thick, lofty, and has round towers. Near it among the mountains, there is a spring of a pu gative quality; and many people refort to it i the hot months. It taftes like ink, is clear, by tinges the earth with the colour of ochre. The famous wall which credulity has believed to made of human bones, stands beyond the and the town. See No 10. Dr Chaidler, vilited ic, fays, "the number of churches is mostly in ruins, decorated with painted in Only fix are in a better condition. The ep pal church is large, and ornamented with gift carving, and holy portraits. The Greeks a bout 300 families, and live in a friendly is course with the Turks. The clergy and lat general are ignorant of Greek, yet the little and offices of the church are read in that guage. The Philadelphians are a civil po One of the Greeks sent us a small earthen full of choice wine. Philaderphia, possessia, ters excellent in dying, and being fituated to of the most capital roads to Smyrua, is muc quented, especially by Armenian merchants Greeks still call this place by its ancient! but the Turks call it Allabijur. The numb inhabitants is about 8000; of whom 2000 posed to be Christians." It is about 40 miles of Smyrna. Lon. 28. 15. E. Lat. 38. 28. N

(7.) PHILADELPHIA, a populous and well tivated county of Pennsylvama; bounded on NE. by the Poquasin and Bucks county; SE. by the Delaware, which separates it from Jersey; W. by Delaware county, and N. Montgomery county. It is 22 miles long, broad; contains 89,600 acres; and is divided to 14 townships; viz. Smithfield, Byberry, land, Lower Dublin, Oxford, Bristol, Gestown, Roxburgh, Northern Liberties, Bloa Philadelphia, Moyamensing, Passyunk, and seeds. It contained, in 1795, besides the Philadelphia, (N° 9.) 11,667 free citizens 114 staves. It sends 5 members to the Gestown of Philadelphia, (N° 9.) 11,667 free citizens 114 staves. It sends 5 members to the Gestown of Philadelphia, Smith Staves of Philadelphia, Smith Staves of Philadelphia, (N° 9.) 11,667 free citizens 114 staves.

Affembly.

(8.) PHILADELPHIA, a township in the a county.

(9.) PHILADELPHIA, the capital of Penni nia, and of the above county. It is one of most beautiful and regular cities in the work ing of an oblong form, situated on the W. of the Delaware, on an extensive plain, by course of the river, 120 miles from its m where it flows in's the Atlantic. It is ho only 60 miles from the sea at Little Egg Har in a WNW. direction; where the river is 2 broad, and deep enough to admit a fixty-ton thip. The tide rifes 6 feet perpendiculated flows at the rate of 4 miles an hour, to the of Trenton, 30 miles higher up in a NE. tion. The length of the city, from E. to 11 1 is, from the Delaware to the Schuyikill, # original plan of Mr Penn, is 10,300 feel, the breadth from N. to S. is 4,837 feet. The

ty was founded by the celebrated William Penn. The original plan of the city was a parallelogram, extending in length from Delaware, two squares beyond Schuylkill. The western limits of the cily were, however, confined by the first charter, granted by William Penn, in 1701, to the E. fide i Schuyikill. This plot, which is two miles bog and one broad, is interfected by a great busher of fireets, croffing each other at right ans. Of these there were originally 9, from the saware to the Schuylkill; thefe were interfectby 23 streets running N. and S. The E. and freets, except High Street, are named after trees, first found by the colony on their arriin the country; viz. Vine Street, Saffafras, berry, Chefnut, Walnut, Spruce, Pine, and Ce-Strets; which last is the S. boundary of the The fireets running N. and S. are named ording to their numerical order, commencing claware. Front Street is the first, then Se-Street, Third Street, &c. to Thirteenth Street; ate this numerical order ceases, and another at Schuylkill in the fame order, First Street, Street, &c. to Eight Street; between which Thirteenth Street is Broad Street, so named being the broadest in the city. The number ones in the original plan was 184; but as feof the squares have since been intersected by freets, the number in 1795 was 304; several Mich are again intersected by lanes. In the th of the streets there is a great diversity; Street being 100 feet wide; Broad Street Mulberry Street 60, and all the other streets original plan 50 feet wide. In the improut of the city the streets are paved with pebmes in the middle, to the breadth of three of the whole wisteness; and on each side, the paths are paved with bricks, and defended th, 10 or 12 feet distant from each other. those streets which have been lately paved the posts have been removed, the footraifed 8 or 10 inches, and defended in front the street, by a range of hewn stone. are several other considerable streets, not original plan: as Water Street, Dock Street, rect, &c. Of these the two first are con-Water Street is 30 feet broad and exto Pine Street parallel with the course of Deliware. Penn Street is compactly built, digant and lofty houses, some of them five shirth. From its convenience near the shipit has become a place of confiderable bufi-The wharves are made with square caseof logs, filled with earth and ftones, and bove two miles in front of the city and Dock Street, which was originally a s and a general nuisance, was not laid out Me; but is now a large and beautiful street, ng in a ferpentine course through 2 squares. fron 90 to 100 feet broad, and has a row of poplar trees on each fide. The ends of all reeds within the city are public property, ing the places where the fire wood is kept, ace a revenue of L. 489 a year. The streets fuminated at night by 662 lamps, which conannually 8,606 gallons of oil. The houses, prieral, are mostly about 3 stories high, built bricks, in a plain neat style. The height of

the ground on which the city stands is about 40 feet above the Delaware, but some parts are lower, particularly Water Street, which is apt to be overflowed and the stores damaged in high sloods, when a strong E. wind blows. The houses for public worship are 28; viz. 5 for Quakers; 6 for Presbyterians and Seceders; 3 for Episcopalians; 3 for Roman Catholics; 2 for German Lutherans; 2 for Methodifts; I for German Calvinifts; I for Swedish Lutherans; 1 for Moravlans; 1 for Baptifts; I for Univerfalifts; I for African Episcopalians; and a Jewish synagogue. Some of these are very elegant. The other public buildings are a flate-house, two city court-houses, a county court-house, a jaii, an university, a public library, the Philosophical Society's hall, a dispensary, an hospital, an alms-house, three incorporated banks, two theatres, an amphitheatre, an ana-tomical theatre and laboratory, 3 market-houfes, a fish-market, a house of correction, and a powder magazine; which often contains upwards of 50,000 quarter casks of gun-powder. State house stands on the S. side of Chesnut Street. between Fifth and Sixth Street, and was erected in 1753. The State house square is an elegant place, ornamented with trees, gravelled walks, &c. and furrounded by a high brick wall on three fides, the house itself inclosing it on the 4th. The Philadelphia Library was incorporated in 1742, and in 1795 contained upwards of 12,000 vols. befides a very valuable mufæum, and a philosophical apparatus. The market-house in High Street extends from Front Street to Fourth Street, and is supported by 300 pillars. "It is perhaps (fays Mr Jos. Scott,) exceeded by none in the world, in abundance, neatness, and variety of provisions exposed in it." (Unit. States Gazetteer.) The university, on the W. side of Fourth Street, was incorporated in 1791, and united with the old college, academy, charity schools, &c. in 1799. The whole number of students is about 510; of whom about 25 are graduated annually. The American Philosophical Society was formed Jan. 2, 1769, and incorporated 15th March, 1780. Three volumes of their Transactions were published in 1771, 1796, and 1793. The College of Phylicians, for promoting medical, anatomical, and chemical knowledge, was formed in 1781, and incorporated in 1789. And so much is literature of every kind cultivated by all ranks of people in this city, that an annual fuir for books was established, and commenced the 1st Tucsday of Sept. 1803. The city is provided with many public charitable institutions, which are well managed. The stock of the public hospital, in 1793, was L. 17,065; besides several valuable lots of ground, buildings, &c. The Philadelphia Dispensary, for medical relief to the poor, was inflituted 12th April, 1786, and has proved very uleful. The Quaker's Alessbouse is another excellent charitable institution. Academies, for instructing young ladies in all the branches of polite education, are numerous, and well conducted. African Schools, for the inftruetion and improvement of the children of the unfortunate race of Ham, have been also established and produced good effects. There are also many humane focieties in this city; one for recovery of

persons apparently drowned; another for allevia- and 356 SW. of Boston. Lon. 75° 8'45" W. I ting the miseries of prisons, which has done much good; and a 3d entitled The Pennsylvania Society for the Abolition of Slavery, which was commenced in 1787, and was enlarged in 1794. There are also Societies for the relief of German emigrants; of Irish emigrants; of widows and families of Presbyterian clergymen; and one for the affifiance of emigrants in general, inftituted in 17943 belides many other similar humane institutions, too tedious to enumerate. The chief manufac-tures carried on in this city and suburbs are as follow: Ten rope-works which manufacture 800 tons of hemp annually; 13 breweries, which confume above 50,000 bushels of barley; 6 sugar houfes; two rum distilleries, and one rectifying ditto; 35 earthen ware manufactories; 3 for cards; fix for chocolate, 4 for mustard, 4 for nails, 1 for steel, I for aquafortis, fal ammoniae and glaubers falts; 1 for oil colours, 11 for brushes, 2 for buttons, 1 for parchment, 1 for Morocco leather; besides various private manufactories of guns, hats, cabinets, and various small wares, in gold, silver, copper, tin-plate, pewter, &c. There are also great numbers of paper mills, in the suburbs, which have encouraged printing fo much, that there were 31 printing-houses in this city in 1795, 4 of which publish each a Daily Gazette, one of which is in the French language; besides two Weekly Newspapers, one of which is in the German language. The catalogues of books for fales contain upwards of 300 fets of Philadelphia editions from 1 vol. 12mo to 18 vols 4to, befides a greater variety of maps and charts than is to be found any where elfe in America. The trade of Pennsylvania is chiefly carried on from this city: (See Pennsylvnaia, § 16:) and there are few commercial towns in the world, where thips from Philadelphia may not be found in their ports. Upwards of 13 failed in 1794 to China and the E. Indies; but the most extensive commerce is carried on with Great Britain and the W. India islands. The number of vessels entered at this port in 1793, was 1414, of which 477 were large thips. The number of houses, in 1794, was above 9.000 and 400 were building. The population, of the city, in 1794, was estimated at 55,000. Philadelphia is governed by a mayor and recorder, 15 aldermen, and 30 common council-men. The mayor is elected annually by the aldermen; the recorder every 7th year, by the mayor and aldermen, from among the citizens. The aidermen are chofen every 2d year, on the 1st Tues, in April; and the common council on the 2d Tuef. in April, every 3d year, by the freemen; who also have the privilege of electing the members of the Assembly. The mayor, recorder, and aldermen are justices of the peace, and of over and terminer. They hold these courts quarterly. There are two annual fairs, helides the Book fair above mentioned, on the 27th May and 27th Oct. A supreme Fcederal Court is held here on the 1st Mon. in Febr. and Aug. A circuit court on the 11th of April, and a diffrict court on the 2d Tues. in Feb. May, Aug. and Nov. In 1793, a malignant fever, called the Yellow Fever, (See MEDICINE, Index.) prevailed here and carried off 4042 of the inhabitauts. Philadelphia is 97 miles SW. of New York,

39° 56′ 54" N.

(10.) PHILADELPHIA STONES, a name wh fome authors have given to what is otherwise led Christian bones, found in the walls of that c It is a vulgar error that these walls are built bones; and the tradition of the country is, when the Turks took the place they fortifie for themselves, and built their walls of the of the Christians whom they had killed there, Smyth, in one of his epiftles, mentions this as an instance of Turkish barbarity. This opinion has gained credit merely from a look porous stone of the sparry kind, found in m aqueduct, which is still in the wall. Sir Pre caut brought home pieces of these stones, even he supposed to have been bones; but proved on examination to be various bodies, ly vegetable, incrufted over and preferred in a of the nature of that which forms incruitation Knäresborough spring, and other places with These bodies are often cemented together in fiderable numbers by this matter, and their shape iost in the congeries, till a diligent and dicious eye traces them regularly.

(1.) PHILADELPHIAN, adj. Of or below

to Philadelphia.

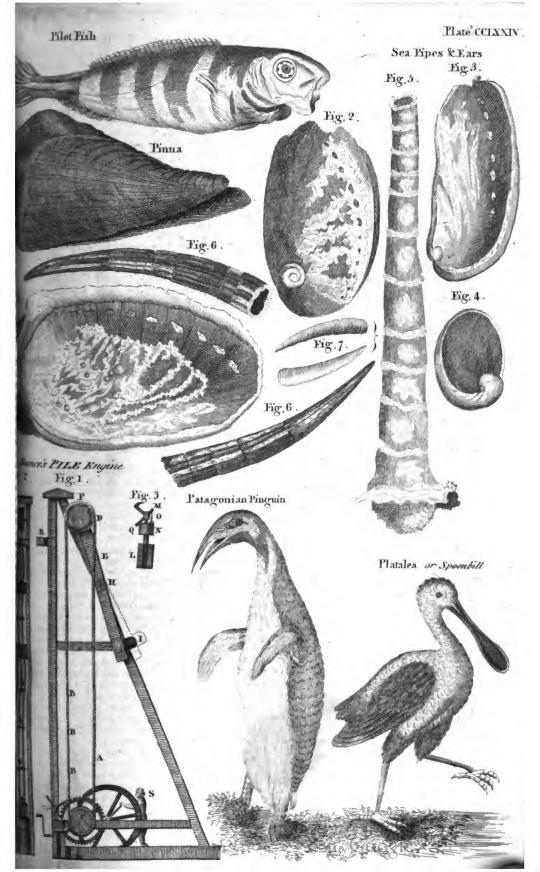

(2.) PHILADELPHIAN SOCIETY, in eccleful hiftory, an obfcure and inconfiderable focid mystics. They were formed about the ende 17th century by an English female fanatic, name was Jane Leadley. This woman, led by her visions, predictions, and doctrine, disciples, among whom were persons of ing. She believed that all diffentions among tians would cease, and the kingdom of the deemer become a scene of charity and sel if Christians, difregarding the forms of do or discipline of their several communions, all join in committing their fouls to the of the internal guide, to be instructed verned and formed, by his divine impulse an gestions. But she went farther: she even tended a divine commission to proclaim the proach of this glorious communion of faint was convinced that the fociety established by felf was the true kingdom of Christ. One leading doctrines was, that of the final reflo of all intelligent beings to perfection and h

PHILADELPHIANS, n. f. the natives of zens of one or other of the cities called Pa DELPHIA.

(I.) PHILADELPHUS, in antiquity, a ut furname of feveral ancient kings; from Greek pia , lover, and wiapo, brother. PTOLEMY and EGYPT, § 12.

(II.) PHILADELPHUS, in botany, the l TREE, OF MOCK-ORANGE; a genus of the gynia order, belonging to the icosandria cla plants; and in the natural method, ranking der the 19th order, Hefperidea.

1. Philadelphus coronarius, subite ga, or mock orange, has been long cultivat the gardens of this country as a flowering in it is not well known in what country it is found native. It rifes 7 or 8 feet high; fe up a great number of Bender Raiks from

goot. These have a grey bark, branch out from their fides, and are garnished with oval spear-shapri leaves. These last have deep indentures on their edges; their upper furface being of a deep pren, but the under furface pale, with the tafte of a fresh cucumber. The flowers are white, and pone out from the fides and at the ends of the ranches in loofe bunches, each it inding on a difind foot-stalk: they have four oval petals, which pred open, with a great number of stamina withforounding the ftyle. This thrub by its flow-nuckes a fine figure in May and June; for they produced in clusters both at the end and from fides of the branches. They are of a fine ite colour, and exceedingly fragrant. The peof which each is composed are large, and mad open like those of the orange; and then ming branches, which stand each on its own parate short footstalk, and being produced in enty all over the shrub, both at once feast the e and the smed. These slowers, however, are mimproper for chimneys, water-glasses, &c. nome; as their feent will be too firong. flowering fyringa, is a variety, feldom riling a yard high. The leaves and branches are proportionally smaller and more numerous, the birk of the shoots of a lighter brown, m the other. It fometimes produces flowers i or 4 rows of petals; whence the name. we much smaller than those of the other: fourth only once in five years, which makes ally worth propagating. The dwarf syringa of lower growth, feldom arising to more two feet in height; and the branches and are smaller and more numerous, and the

PHILADPLPHUS INODORUS, the Carolina fig., with entire leaves, is a native of Carolina, is yet but little known in Europe. It rifes ha shubby stalk of about 16 feet in height, ling out slender branches from the sides opposarmished with smooth leaves sharped like foof the pear tree, and standing on pretty long stalks. The slowers are produced at the ends the branches; and are large, white, spreading a, with a great number of short stamina with the simulation. This is the tallest grower by sar the species, and makes the grandest show when blow; though the flowers have no smell.

1. PHILADELPHUS NANUE, with oval leaves membat indented, and double flowers, feldom 11 above 3 feet; the flowers come out fingly mithe flides of the branches, and have a double while row of petals of the fame fize and form, will as the fame feent with N° 1.3 but it flowers early. The propagation of all the forts try early. The most certain method is by try; for the young twigs being laid in the earth winter, will be good rooted plants by autumn kilowing. a. These plants may be increased by taitings, which being planted in October, in a hady most border, many of them will grow; though it will be proper to let those of the Carolina for remain until spring, and then to plant them in pots, and help them by a little heat in the hed. By this affistance, hardly one outting Vol. XVII. Pár II.

will fail. 3. They may be aifo increased by fickaers; for all the forts throw out suckers, though
the Carplina syringa the least of any. These will
all strike root, and be fit for the nursery ground;
nay, the double-flowering and the dwarf forts are
always increased this way: for these plants having
stood j or 6 years, may be taken up and divided
into several fcores. All the plants, however,
whether raised from layers, cuttings, or suckers,
should be planted in the nursery to get strength;
before they are set out for good. They should
be planted a foot assumer, and the distance in the
rows should be two seet. After this, they will
require no other care than hoing the weeds, until they have stood about two years, which will
be long enough for them to stand there.

(1, 2.) PHILÆ, a town and iffand of Egypt, above the finaller cataract, but placed opposite

Syene, by Pliny; v. c. g.

(3.) PHILE, one of the Sporades illes.

PHILÆNI, two brothers, citizens of Carthage, who facrificed their lives for the good of their country. When the Carthaginians ruled over the greatest part of Africa, the Cyreniaus were aifo a great and wealthy people. The country betwixt them was fandy, and of an uniform appearance. There was neither river nor mountain to diffinguith their limits; which engaged the two nations in terrible and tedious wars. At last they agreed, " that upon a day appointed deputies should set out from their respective homes, and the place where they met one another should be accounted the common boundary of both nations." Accordingly, the Philæni, sent from Carthage, made all The Cyrenidispatch to perform their journey. ans proceeded more flowly. These last, perceiving themselves behind, charged the Carthaginians with fetting out before the time; and made a mighty buftle upon it. The Carthaginians then defired any other terms, on which the Greeks made this proposal to the Carthaginians, " either to be buried alive in the place which they claimed as the boundary to their nation, or that they would advance forward to what place they inclined upon the same condition." The Philiani accepting the offer, made a facrifice of their lives to their country, and were buried alive. The Carthaginians dedicated alters in that place to the memory of the two brothers. These altars, called Aræ Philesorum, ferved as a boundary to the empire of the Carthaginians, which extended from this monument to Hercules's Pillars, which is as bout 2000 miles, or, according to the accurate observations of the moderns, only 1420 geogra-

phical miles. Salluft de Bell. Jug.
(1.) PHILÆUS, the fou of Alax by Lyfide, daughter of Coronus, one of the Lapithæ; and a

lineal ancestor of MILTIADES.

(2.) PHILRUS, the fon of AUGEAS, K. of Elis, whom Hercules placed on the throne, after killing his father.

PHILANTHROPIC, adj. Belonging to phi-

lanthropy; henevolent to all mankind.

PHILANTHROPIST, n. f. A lover of man-kind. Aft.

(1.) \* PHILANTHROPY. n. f. ]pine and supers.] Love of mankind; good nature.—Sueb

z transient temporary good nature is not philan-

throony. Additon.

(2.) PHILANTHROPY is of nearly the same import with Benevolence; and differs from friendthis, as this last affection sublists only between individuals, whilit bilanthrowy comprehends the whole species. Whether man has an inflinctive propensity to love his species, which makes him incapable of happiness but in the midst of society. and impels him to do all the good that he can to others, feeling their felicity an addition to his own, is a question that has been warmly debated among philotophers, ever fince metaphysics was studied as a science. Among the philosophers of the 27th century Hobbes took the unpopular fide of this queltion; infilting that man is naturally a Lelfish animal incapable of any generous principle. Lord Shaftesbury adopted the opposite fide, and has been fince followed by Bp. Butler, Hutcheson, Lord Kames, Dr Beattie, Dr Reid, &c. who inthat the whole duty of man refults from an intuitive principle called the moral fense, from which philanthropy is infeparable. (See MORAL PHILOSOPHY.) On the other hand Mr Locke and his followers, particularly Mr Hartley deny that any one principle of the human mind is intuitive or innate. (See Instinct.) Without prefuming to decide this question, the origin of philanthropy may be thus traced. Brothers and fifters being constantly together, contribute to each others amusement: bence arises that pleasure which they have in each other's company, and the uneafiness which they feel when separated. This generates mutual love in their minds, which is firengthened by the injunctions of their parents. Benevolence, thus generated, foon extends to their daily companions; and takes a wider range as these companions are multiplied, and as children advance towards the state of manhood. New objects then present themselves to the mind. A man foon discovers, that, as he is a member of a community, his happiness as an individual depends in a great measure on the prosperity of the whole. Hence arises p triotism, and that pleasure which we all take in the eminence of our countrymen. But the principle of benevolence stops not here. He whose mind is enlarged by a liberal education, confiders all particular countries as pro-vinces of one great country extended over the whole globe; and all mankind, of course, as not only fhoring the fame nature with himself, but as being in reality his fellow-citizens and brethren. The principles of, religion, if he be actuated by them, must aid these reslections, and make him with the happiness of all who stand in the same relation with himself to the Great Governor of the world. This is philantbropy; and we fee how it may fpring, by the great law of affociation, from defires which, in their original flate, cannot be confidered as other than feifish. It is a calm sentiment, which we believe hardly ever rifes to the - warmth of affection, and certainly not to the heat of passion.

PHHLELPHUS, Francis, professor of eloquence at Padua, was been in 1398. In 1429, he was sent by the republic of Venice to Constantinople, where he married the daughter of the learned Emmanuel Chrysoloras. The cmp. John Paleolo-

ILINUS, a native of Agrigentum, who along with Hannibal, against the Romans. Frote a history of the Punic wars. G. Nep.

PHILIP, the apostle, was a native of Bethin Galilee. His call by our Lord, his connon with Nathanael; his presence at the mibus feeding of 3000; with his estimate of the ke; his introduction of the Greeks to our ur, and his request to see the Father, are ded in the gospels, chiefly by St John. It is pled that he and Nathanael were present at urriage at Cana. The upper Alia fell to this h's lot, where he took great pains in plantgospel, and by his preaching and miracles many converts. In the latter part of his le came to Hierapolis in Phrygia, a city del to idolatry, and particularly to the worof a screent of a prodigious bigness. St Phihis prayers procured the death of this monand convinced its worshippers of the absurof paying divine honours to fuch adious crea-But the magistrates, enraged at Philip's imprisoned him, and ordered him to he rely scourged, and then put to death, which by was by crucifixion; others, by hanging up against a pillar. St Philip is generally troved among the married apostles; and it is be had three daughters, two of whom preed their virginity, and died at Hierapolis; the ded at Ephelus. The pretended gospel unhaname was forged by the Gnostics, to countheir bad principles and worse practices. Christian church observes his festival, with of St James, on the first day of May. Euseb.

(1) PRILLY, the ad of the feven deacons, was seen by the apostles after our Saviour's returned on. (Acts vi. 5.) This deacon, they say, was of a fire in Palestine. It is certain that his daught lived in this city. (Acts x xi. 8, 9.) His preaches and miracles performed at Samaria; his consensor and baptum of the people; his interview with and conversion of the Ethiopian ennuch;

with his subsequent baptum of him; and his preaching the gospel at Azotus and various other cities, are recorded by St Luke in the Acts of the Apostles. The modern Greeks say, that he week to Trailes in Asia, where he founded a church, of which he was the apostle and bishop; and where he rested in peace, after performing many miracles. The Latins, on the contrary, say that he died at Cæsarea, and that three of his daughters were there buried with him. It is thought, that the eunuch converted by St Philip was the surface possible of the Ethiopians; and the Abyssires boast of having received the Christian faith from him.

(3.) PHILIP I. King of Macedonia. See MACEDON, § 3.

(4.) PHILIP H. King of Macedon, was the 4th

fon of Amyntas II. He was fent to Thebes as an hoftage by his father, where he learned the art of war under Epaminondas, and studied the manners and the pursuits of the Greeks. He discovered, from his earlieft years, that quickness of genius and greatness of courage, which afterwards procured him so great a name. On the death of his brother Perdiccas III. he ascended the throne as guardias of his nephew Amyntas III. whom he got deposed, and succeeded about A. A. C. 360. The principal transactions of his life and reign being related under Macedon, § 6-10, it is only necessary here to add a few c aracteristical anecdotes of him. He was the first who caused gold to be coined in his own name. He employed his wealth in procuring spies and partitans in all the great cities of Greece, and thus making conquests without the aid of arms. At the fiege of Methone in Thrace, he received a wound in his right eye by an arrow; which was inscribed with the words; For Philip's right oye." After the archer, w o fhot it, had offered his fervices to Philip, boafting that he could hit the swiftest bird on the wing. Philip ridiculed his art by faying, that " he would

be of use, if they were to make war with starlings;" which made After join the enemy, and take this method of reverge. By assuming the mask of a moderator and peace-maker, he gained confidence; in attempting to protect the Peloponnelians against the incroaching power of Sparta. he rendered his cause popular; and by ridiculing the infults offered to his person as he passed thro Corinth, he displayed his moderation and philofophic virtues. In his attempts to make himfelf master of Eubœa, he was unsuccessful; and Phocion, who despised his gold as well as his meanness, obliged him to evacuate an island whose inhabitants were as infentible to the charms or money, as they were unmoved at the horrors of war, and the bold efforts of a vigilant enemy. From Eubœa he turned his arms against the Scythians; but the advantages he obtained over that indigent nation were inconfiderable, and he again made Greece an object of plunder and rapine. His be-

haviour after the battle of CHERONEA reflects great differed upon him as a man and as a monarch. In the hour of festivity, and during the entertainment he had given to celebrate his victories, Philip fallied from his camp, and with the inhumanity of a brute, insulted the bodies of the slain, and exulted over the calamities of the prifoners. His insolence, however, was checked, Y y 2 when

then Demades, one of the Athenian captives, exclaimed. "Why do you, O king, act the part of a Thersites, when you can represent with so much dignity the elevated character of an Aga-mention?" The reproof was felt; Demades received his liberty; and Philip learned to gain popularity even among his fallen enemies, by re-lieving their wants and eafing their diffresses. At the battle of Chæronea the independence of Greece was extinguished; and Philip formed new enterprizes, and meditated new conquefts, being appointed general of the Greeks against the Persians. But he was stopped in the midst of his warlike preparations, being flabbed by Paufanias as he entered the theatre at the celebration of the nuptials of his daughter Cleopatra. This murder has given rife to many conjectures. Many confider the repudiation of Olympias and the refenement of Alexander, as the causes. The ridiculous ho-hours, which Olympias paid to her husband's murderer, firengthened the fuspicion against the queen; but Alexander declared that he invaded Pertia to revenge his father's death upon the Persian princes, by whose intrigues the assassion had been committed. The character of Philip is that of a fagacious, artful, prudent, and intriguing monarch: he was brave in the field, eloquent and diffimulating at home, and he pottetted the art of changing his conduct according to the caprices of mankind, without ever altering his purpose, or losing fight of his ambitious aims. He pot effed much perfeverance, and in the execution of his plans he was always vigorous. He had that eloquence which is inspired by strong passions. His assassination prevented him from atchieving the greatest of his undertakings; otherwife he might have acquired as many laurels, and conquered as many nations, as his fon Alexander did; and Persia might have been added to the Macedonian empire, perhaps with greater moderation, with more glory, and with more lafting advantages. The private character of Philip raifes indignation. The admirer of his virtues is difgusted to find him difgracing himtelf among the most abandoned prostitutes, as well hs by the most unnatural crimes and lascivious indulgences, which can make even the most profigate to blush. He was murdered in the 47th year of his age, and the 24th of his reign, about 336 years before the Christian era. His reign is interefting, and his administration a matter of infinev. He is the first monarch whose life and actions are described with accuracy and historicalfaithfulness. Philip was the faiher of Alexander the Great and of Cleopatra, by Olympias; he had also by Audaca an Illyrian, Cyna, who marfied Amyntas the fon of Perdiccas, Philip's elder brother; by Nicasipolis a Thessalian, Nicæa, who married Caffander; by Philana a Lariffaan danber, Aridaus, or Phillip III. who reigned some time after Alexander's death; by Cleopatra; the piece of Attalus, Caranus and Europa, who were both murdered by Olympias; and Ptolemy, the first king of Egypt, by Arlinoe, who in the first month of her pregnancy was married to Lagus. Of the many memorable fayings reported by Plufarch of this prince; the following are the most remarkable. Being present at the sale of some expulses, in an indecent pullure, one of them in-

formed him of it; " Set this man at liberty, (hid Philip) I did not know that he was my friend. A poor woman had often importuned him to d her justice, but was told that he had no time to attend to her petition; whereupon the faid will some warmth, " Cease then to be a king." Phili felt the force of this reproof, and immediate gave her fatisfaction.—Another woman came t ask justice of him as he was going out from great entertainment, and was condemned: appeal? exclaimed the." " And to whom do y appeal, faid the king." "To Philip fatting This answer opened the eyes of the monarch, retracted his fentence. If he possessed any tue, it was that of fuffering injuries with pater Having learned that fome Atheman amballa charged him, in full affembly, with atrocious lumnies: " I am under great obligations (fat to those gentlemen, for I shall henceforwards circumspect in my words and actions, that I convict them of falsehood." One saying of lip, however, does him less honour than the bove mentioned; viz. "Let us amuse chi with playthings, and men with oaths." To bominable maxim gave rife to the object "That he was in full length, what Length afterwards was in miniature." It is well he that Philip had a person about him, who out at times, " Philip, remember that the mortal;" but whether we should place that account of his pride or his humility, it is di to détermine.

(5, 6.) PHILIP III. and IV. two fhort in narchs of Macedonia. See MACEDON, § 1

(7.) PHILIP V. king of Macedon, was the of Demetrius. His iniancy, at the death father, was protected by Antigonus, one friends, who afcended the throne, and reight 12 years, with the title of Independant in When Antigonus died, Phitip recovered ther's throne, though only 15 years of a he early distinguished himself by his bolding his ambitious views. He came to the thro the year 220 before our Saviour, and the ing of his reign was rendered glorious by the queits of Aratus; a general who was as co for his love of justice as his skill in war. virtuous a character could hardly fail to be greeable to a prince who indulged himfelf ind species of diffipation and vice: and his cruel him foon displayed his character in its true for to the gratification of every vice, he had meannels to facrifice this faithful and virtuot thenian. Not statisfied with Macedonia, I aspired to become the friend of Annibal, tol with him the fpoils which the diffrelies of the mans seemed to promise. But his expects were frustrated; the Romans discovered his frigues; and though weakened by the valor the Carthaginian, they were foon enabled to him in the field of battle. The conful La entered Macedonia; obtained a victory over hear Apollonia, reduced his fleet to alles compelled him to the for peace. This was permanent; and when the Romans discort that he had affifted their formidable enemy hibal with men and money, they appointed T Flamit

Raminius to punish his perfidy. The Roman conful, in a general engagement, fought near Cysocephale, totally defeated the monarch, who fired his life by flight, and was obliged to demand face by his ambalizdors, which was granted with Micely. In the midft of these public calamities peace of his family was diffurbed; and Peris, the eldest of his fons by a concubine, raised ficions of his brother Demetrius, whose condeplion and humanity had gained popularity athe Macedonians, and who from his refiat Rome, as an hostage, had gained the graces of the senate. Philip listened to the acculations of Perfeus, that Demetrius wished to him of his crown. But no sooner was Dehas facrificed to credulity, than Philip beto convinced of his rathness; and to punish perfuly of Perseus, he attempted to make Anus, another son, his successor. But he was sated by death, in the 42d year of his reign,

PHILIP, a native of Acarnania, physician cander the Great. When that monarch to fuddenly taken ill, after bathing in the 4 Pailip undertook to remove the comwhen the rest of the physicians believed I medical assistance would be inessectual. he was preparing his medicine, Alexander that letter from Parmenio, in which he was to beware of his physician Philip, as he befored against his life. The monarch was ed; and when Philip presented him the mehe gave him Parmenio's letter to perule, um to drink the potion. The serenity and Mare of Philip's countenance, as he read ter, removed every fuspicion from Alexanmall, and he purfued the directions of his run, and in a few days recovered.

Philip, fother-brother of Antiochus Epi-(1 Macc. vi. 14, and 55. 2 Macc. ix. 29.), Phrygian by birth, and very much in Anti-favour. This prince made him governor milem (2 Macc. viii. 8. v. 22.) where he the Jews very cruelly, to force them to their religion. Seeing that Apollonius and Pere defeated by Judas Maccabæus, he fent fuccours to Ptolemy governor of Colowho sent him Gorgias and Nicanor with a ful army. Some time after, Antiochus goyoud the Euphrates, to extort money from tople, Philip went along with him; and Aninding himself near his end (1 Macc. vi. ade him regent of the kingdom, put his into his hands, his royal cloak, and his the he might render them to his fon the lantiochus Eupator. But Lyfias having Metion of the government in the name of Eupator, who was but a child, Philip not to cope with him, durft not return into but he went into Egypt, carrying the bo-Epiphanes along with him, to implore affiftfrom Ptolemy Philometor against Lysias the strof the government of Syria. The year while Lysias was busy in the war carryto against the Jews, Philip got into Syria, and Possession of Antioch: but Lysias returning the country, with great diligence, retook Antioch, and put Philip to death, who was taken in the city.

(10, 11.) PHILIP, M. Julius, a Roman emperor of an obscure tamily in Arabia, from whence he was furnamed the Arabian. From the lowest rank in the army he gradually rose to the highest offices; and when he was made general of the pretorian guards, he affassinated Gordian to make himself emperor. To secure himself on the throne. he left Mesonoramia a prey to the continual invafions of the Persians, and hurried to Rome, where his election was approved by the fenate and people. Philip rendered his cause popular by his liberality and protufion; particularly on occasion of the centenary commemoration of the foundation of the city; which was celebrated with more magnificence than under the preceding reigns. His usurpation, however, was short. Philip was defeated by Decius, who had proclaimed himself emperor in Pannonia; and he was affaffiuated by his own foldiers near Verona, in the 45th year of his age, and the 5th of his reign. His ion, who had shared with him the imperial dignity. was also massacred in the arms of his mother. Young Philip was then in the 12th year of his age, and the Romans lamented in him the loss of rifing talents, of natural humanity and endearingvirtues.

(12.) PHILIP I. king of France, succeeded his father Henry I. in 1060, when only 8 years of age, under the guardianship of Baldwin V. count of Fianders, who discharged his trust with zeal and fidelity. He defeated the Gascons who were inclined to revolt, and died, leaving his pupil is years of age. This young prince made war in Planders against Robert, Baldwin's younger for, who had invaded Fianders, which belonged to the children of his elder brother. Philip marched against him with a numerous army, which was cut to pieces near Mount Cassel; and the conqueror enjoyed his usurpation. Philip, after this, tired of his wife Bertha, and fond of Bertrade, wife of Polques count of Anjou, carried her off from her husband. Having, in 1093, annulled his own marriage, as well as Bertrade's with the count of Anjou, both under pretext of barrenness, Philip and the were married by the Bp. of Beauvais. This union was deciared void by Pope Urban II. a Frenchman by birth, who pronounced the fen-tence in France, to which he had come for an Philip, fearing the pope's anathemas afylum. might excite his subjects to rebel, sent deputies to the pope, who obtained a delay, with permiffion to use the crown. This delay was not of long duration. Philip was excommunicated anew in a council held at Poitiers in 1100; but in 1104, Lambert bishop of Arras, legate of Pope Pascal II. at lail brought him his absolution to Paris, after having made him promise never to see Bertrade more; a promise which he did not keep. It would appear that the pope afterwards approved their marriage; for their fons were declared capable of fucceeding, Philip died at Melun the 29th of July 1108, aged 57. See FRANCE, § 22. (13.) PHILIP II. furnamed Augustus, with other

(13.) PHILIP II. (urnamed Augustus, with other vain titles, (see France, § 24.) son of Lewis VII. and of Alix, his third wife, daughter of Thibault,

count of Champagne, was born the 22d Aug. #165. He came to the crown, after his father's death in 1180, at the age of 15. The king of England seemed willing to take advantage of his rninority, and to seize upon a part of his dominions. But Philip marched against him, and compelled him, fword in hand, to confirm the ancient treaties between the two kingdoms. As foon as the war was ended, he made his people enjoy the bleffings of peace. He gave a check to the oppressions of the great lords, banished the comedians, punished blasphemies, caused the streets and public places at Paris to be paved, and annexed to that capital a part of the adjacent villages. It was inclosed by walls with towers; and the inhabitants of other cities were equally proud to fortify and embellith theirs. The Jews having for a long time practifed the most shameful frauds in France, Philip expeiled them from his kingdom, and declared his subjects quit with them; an action not justifiable. The tranquisity of France was diffurbed by a difference with the count of Flanders, which was terminated in 1184. Sometime after he declared war against Henry 11. of England, and took from him the towns of Isloudun, Tours, Mans and other places. The epidemical madness of the crusades then agitated all Europe; and Philip caught the infection. He embarked in 1290, with Richard I. king of England, for the relief of the Christians in Palestine, who were oppressed by Saladin. These two monarchs fat down before Acre, the ancient Pto-Jemais; as did almost all the Christians of the eaft, while Saladin was engaged in a civil war on the banks of the Eu, hrates. Their forces, joined to those of the Asiatic Christians, were above 300,000 fighting men. Acre furrendered the 13th of July 1191; but the difagreement, which took place between Philip and Richard, did more mifchief than could be compensated by 300,000 hegoes. Philip returned to France, with a languishing diforder, which was attributed to poilon, but which might have been occasioned merely by the scorching heat of a climate so different from that of France. He lost his hair, his beard, and his wails; his very flesh came off. The year after, he obliged Baldwin VIII. count of F anders to leave him the county of Artois. He next turned his arms against Richard king of England, from whomhe took Evreux and Vexin; though he had promiled upon the gospels never to take any advantage of his rival during his absence. Philip, repulled from Rouen with loss, made a truce for 6 months; during which he married Ingelburga, princess of Denmark, whose beauty could only be equalled by her virtue. The divorcing of this lady, whom he quitted to marry Agnes daughter of the duke of Merania, embroiled him with the court of Rome. The pope excommunicated him, but restored him upon his promising to take back his former wife. John succeeded to the crown of England in \$199, to the prejudice of his nephew Arthur, to whom of right it belonged. The nephew, supported by Philip, took arms against the uncle, but was defeated in Poitou, where he was taken prisoner, and afterwards murdered. The murderer, King John, being summoned before

the peers of France, not having appeared, was declared guilty of his nephew's death, and condemned to lofe his life in \$203. His lands, fituated in France, were forfeited to the crown Philip feized upon Normandy, carried his vide rious arms into Maine, Anjou, Touraine, Poitos and united those provinces once more to the crow of France. The English had no other part's France but the province of Guienne. To crow his good fortune, John was embroiled with the court of Rome. This eccle fastical thunder we very favourable for Philip. Innocent II. trans ferred to him, a perpetual right to the kingle of England. To give the greater force to the tence, he en ployed a whole year in building if ships, and in preparing the finest army that ever seen in France. Europe was in expedit of a decifive battle between the two kings, w the pope laughed at both, and artfully took himself what he had bestowed upon Philip. legate perfuaded John to give his crown to court of Rome. Then Philip was express; bid by the pope to make any attempt upon land, now become a fee of the Roman ch or against John who was under her protect Mean while, Philip's great preparations h larmed all Europe; Germany, England, an Netherlands were united against him. For count of Flanders, Philip's vastal, joined the peror. Philip was not disconcerted; his valou confpicuous at the battle of Bouvines, of 27th July 1214, which lasted from noon till Before the engagement, he had made even of his pobles who followed him with reluct zealous in his cause. The enemy had an ar 250,000 fighting men; that of Philip was no fo numerous; but it was composed of the of his nobility. The king run great hazard life; for he was thrown down under the feet, and wounded in the neck. It is faid ; Germans were killed. The counts of Fla and Boulogne were led to Paris in irons. French king made no conquest on the fide of many after this ever memorable action; gained him an additional power over his Philip conqueror of Germany, and possessor most all the English dominions in France, vited to the crown of England by the full King John who were grown weary of his Upon this occasion he acted like an ab litician. He perfuaded the English to alk b Lewis for their king. Lewis made a defeent England, was crowned at London, and municated at Rome in 1216. (See Engla 25, 26.) King John's death extinguished t fentment of the English, who, having de themselves for his son Henry III. torced Le leave England. Philip died at Mantes, the July 1223, aged 59, after a reign of 43 years all the kings of the 3d race, he made the gr accession to the crown lands, and transmitted greatest power to his successors. He reunit his dominions Normandy, Anjou. Maine, raine, Poitou, &c. After having subdued Joh humbled the great lords, and by the overthre foreign and domestic enemies, took away. counterpoile which balanced his authority.

was more than a conqueror; he was a great king and an excellent politician; fond of spiendor on public occasions, but frugal in private life; exact in the administration of justice: skilful in employing alternately flattery and threatenings, revardeand punishments; zeasous in the defence of religion, and the church; but he knew well how to procure from her succours for the state. The exterprizes of Philip were almost always successi; he formed his projects with deliberation, and crited them with difpatch. He began by renng the French happy, and in the end rento them formidable; though he was more ined to punish than to pardon, he was regretted to subjects, as a great monarch, and as the faof his country.

14-16.) PHILIP III, IV, and V. See FRANCE,

16, 27, 28. (17.) PHILIP VI. the first king of France of collateral branch of Vulois, was for to mes count of Valois, brother of Philip IV. sounted the throne in 1328, on the death of win Charles IV. after having held the re-France was much divided in the beginhis reign, by disputes about the succes-Edward III. of England laid claim to it as for of Philip IV. by his mother; but Philip ios took possession of it as first prince of the He marched to the relief of his vaffal the of Flanders, whose subjects, on account of sage, had taken up arms against him. He rd the rebels at Cassel, performed prodigies our, and gained a fignal victory on the 24th 1318. Having made all quiet, he devoted of peace to the internal regulations of midom. The financiers were called to an and fome of them condemned to death; others Peter Remi, general of the finances, ish behind him near 20 millions. He afterenacted various laws respecting freeholds, are more ancient than the name. The 1329 was diftinguished by a solemn homage Philip, by Edward III. of England, for the of Guienne, upon his knees, and with his severed. The interior peace of the kingsifturbed by difputes about the diftincthe church and state. This controversy foundation of all the disputes afterwards led about the authority of the two powers; contributed to confine the ecclefiaftical juon within narrower limits. Soon after Ed-III. declaring war against France, he recoverparts of Guienne, of which Philip was in m. The Fiemish having again revolted from bjoined the standard of Edward; and rethat he would assume the title of king of him consequence of his claim to the crown; agreeably to the letter of their treaty, ony followed the king of France. From this dis dated the union of the flower-de-luce kepards in the arms of England. Philip's were at first attended with some success; were at hirt accounts which the he of the battle of Ecluse, in which the th feet, confishing of 120 large ships, and fired by 40,000 seamen, was beat by that of hand in 1340. This war, which had been alternately discontinued and renewed, began again with fury in 1345. The two armies having come to an engagement the 26th Aug. 1346, near Crecy, in Ponthieu, the English gained a fignal vic-tory. (See CRESSY.) The loss of Calais, and several other places, was the fruit of this defeat. Some time before, Edward had challenged Philip of Valois to a fingle combat; which he refused, not from cowardice, but from the idea that it was improper for a fovereign prince to accept a challenge from a king who was his vaffal. At length, in 1347, a truce for fix months was concluded between France and England, and afterwards prolonged at different times. Philip died 23d Aug. 1350. He had, however, reunited Dauphiny to France. (See DAUPHINY.) Philip likewise added to his domain Rousillon and a part of Cerdagne, by lending fome money to the king of Majorca, who gave him those provinces as a security; provinces which Charles VIII. afterwards restored without any reimbursement. The fictitions and ideal value of the coin was also raised, a great deal of bad money was issued from the The officers of the mint were fworn upon the gospels to keep the secret; but Philip was a fool to think that fo gross a fraud would not be discovered.

(18.) PHILLE I. king of Spain, was the fon of the emperor Maximilian I. In 1490, he married Jane or Joan Q. of Spain, in whole right he obtained that crown. He died in 1506, aged 28; and was succeeded by his son Charles V. See Spain.

(19.) PHILIP II. fon of Charles V. and Isabella. of Portugal, was born at Valladolid on the 21st arft of May 1527, and became king of Naples and Sicily by his father's abdication in 1554. He afcended the throne of Spain on the 17th Jan. 1556, Charles had made a truce with the French, but his fon broke it; and having formed an alliance with England, poured into Picardy an army of 40,000 men. The French were cut to pieces at the battle of St Quintin, on the 20th Aug. 1557. That town was taken by affault, and the day on which the breach was mounted, Philip appeared armed cap-a-pee to animate the foldiers. It was the first and last time that he ever wore this military drefs. His terror was so great during the action that he made two vows; one, that he should " never again be prefent in a battle; and the other, to build a magnificent monastery to St Lawrence, to whom he attributed the success of his arms. which he executed at Escurial, about 7 leagues from Madrid. The taking of Chatelet, Ham, and Noyon, were the only advantages derived from a battle which might have proved the ruin of France. The Duke of Guise repaired the difgrace of his country by the taking of Calais and Thionville. While he was animating the French, Philip gained a battle against Marshall de Thermes near Gravelines. His army was commanded by Count Egmont, whom he afterwards caused to be behead-He made no better use of the victory of Gravelines than he had done of that of St Quintin: but he reaped advantage from the peace of Chateau Cambrelis, the master-piece of his politics. By that treaty, concluded the 13th April, 1559, he gained possession of Thionville, Marienbourg, Montmedi, Heldin, and the county of Charon is-

This war, so terrible, and attended with so much cruelty, was terminated, like many others, by a marriage. The monster took for his third wife Blizabeth, daughter of Henry II, who had been promised to bis own fon, Prince Charles! and the young prince and princess were deeply in love with each other. After these glorious atchievements, Philip returned in triumph to Spain, without having drawn a fword. His first care, upon his arrival at Valladolid, was to demand of the grand inquisitor an AUTO DA FE'. This was immediately granted to him; 40 wretches were strangled and burnt, and one of them was burnt alive. Don Carlos de Seza, one of these unfortunate victims ventured to draw near to the king, and faid. to him, "How, Sir, can you fuffer so many wretches to be committed to the flames? Can you be witness of such barbarity without weeping?" To this Philip coolly replied, " If my own fon were suspected of herefy, I would myself give him up to the severity of the inquisition. If an executioner were wanting, I would supply his place myself." On other occasions he conducted himfelf agreeably to this intolerant spirit. This horrid cruelty, and abuse of his power, had the effect to weaken that power. The Flemish, no longer able to bear so hard a yoke, revolted. The revoable to bear so hard a yoke, revolted. lution began with the large provinces of the continent; but the maritime provinces only obtained their liberty. In 1579 they formed themselves into a republic, under the title of the UNITED Pro-VINCES. Philip fent the duke of Alba to reduce them; but the cruelty of that general only ferved to exasperate the insurgents. Never did either party fight with more courage, or more fury. Haerlem having furrendered at discretion, the conquerors caused all the magistrates, all the pastors, and above 1500 citizens, to be hanged. The duke of . Alba, being at length recalled, the grand commander of the Requesties was sent in his place, and after his death Don John of Austria; but neither of those generals could restore tranquillity in the Low Countries. To this son of Charles V. succreded a grandion no less illustrious, namely, Alexander Farnese duke of Parma, the greatest man of his time; but he could neither prevent the independence of the United Provinces, nor the progress of that republic. Philip, always at his ease in Spain, instead of coming to reduce the rebels in Flanders, proferibed the Prince of Orange, and fet 25,000 crowns upon his head. William, fuperior to Philip, disdained to make use of that kind of vengeance, and trusted to his sword for his prefervation. In the mean time the king of Spain fucceeded to the crown of Portugal, to which he had a right by his mother Isabella. This kingdom was subjected to him by the duke of Alba, in three weeks, in 1580. Antony, prior of Crato, being proclaimed king by the populace of Lifbon, had the resolution to come to an engagement; but he was vanquished, purfued, and obliged to fly for his life. A cowardly affaffin, Balthazar Gerard, by a piftol-shot killed the Prince of Orange, and thereby delivered Philip from his most implacable and dangerous enemy. Philip was charged with this crime, without reason; though when the news was communicated to him, he was imprudent enough to exclaim, " If this blow had been

given two years ago, the Catholic religion and would have gained a great deal by it." This mu der did not restore to Philip the Seven United Pr That republic, already powerful by & affifted England against him. Philip having res ved to diftress Elizabeth, fitted out, in 1583, fleet of 150 ships, which were partly capture partly burnt, and partly ship-wrecked; and which very few returned. See Armada. T enterprise cost Spain 40 millions of ducats, 200 men and 100 ships. While Philip attacked B land, he was encouraging in France the H League; the object of which was to overture throne and divide the flate. The leaguers con red upon him the title of Protedor of their all ation; which he eagerly accepted, from a pe fion that their exertions would foon conduct or one of his family, to the throne of Fra But Henry IV. embraced the Catholic religi and made his rival lose France in a quarter of hour. Philip, at length, exhausted by the baucheries of his youth, and the toils of gor ment, drew near his last hour. A flow feve most painful gout, and a complication of diforders, could not difengage him from bu nor draw from him the least complaint. exhaufted by a complication of diffemper being eaten up of lice, he expired the rist 1598, aged 72, after a reign of 43 years months. No character was ever drawn by rent historians in more opposite colours the of Philip. From the facts recorded in history cannot doubt that he possessed, in an emin gree, penetration, vigilance, and a capaci government. He entered into every branch ministration; watched over the conduct of nifters with unwearied attention; and in his both of them and of his generals discovered fiderable fagacity. He never appeared to be elated or depretted. His temper was the m perious, and his looks and demeanor were ty and severe; yet among his Spanish subj was of easy access; listened patiently to the plaints; and where his bigotry did not in was willing to redrefs their grievances. IF possible to suppose that he was infincere zeal for religion. But as his religion was most corrupt kind, it served only to income natural depravity of his disposition; and pa ed, him to commit the most odious and mo crimes. Of the triumph of honour and hun over the dictates of superstition, there occur a fingle instance in the whole reign of Philip violated his most sacred obligations as often ligion afforded him a pretence, and exercit many years the most unrelenting crucky reluctance or remorfe. His ambition, which exorbitant; his refentment, which was impla his arbitrary temper, which would fubmit controul, concurred with his bigotted zeal Catholic religion, and carried the fanguing rit, which that religion was calculated to to a greater height in Philip, than it ever a in any other prince of that or of any other Though of a small fize, he had an agreeat fon. His countenance was grave, his air tra and one could not discover from his looks joy in prosperity or chagrin in advertity. The

Н

sminft Holland, France, and England, cost Philip the millions of ducats; but America furnished him with more than the half of that fum. His retenues, after the junction of Portugal, are said to breamounted to 15 millions of ducats, of which k only laid out 100,000 for the support of his mn household. Philip was very jealous of outand respect; he was unwilling that any should ak to him but upon their knees. Few princes me been more dreaded, more abhorred, or have d more blood to flow, than Philip II. of had fuccessively, if not all at once, tomaintain against Turkey, France, England, and, and almost all the Protestants of the emwithout a fingle ally. Notwithstanding so millions employed against the enemies of r, Philip found in his occupomy and his reas wherewith to build 30 citadels, 64 fortified 15, 9 sca ports, 25 arsenals, and as many pawithout including the escurial. His debts med to 140 millions of ducats, of which, afping paid feven millions of interest, the greattwis due to the Genoese. He had sold or la capital flock of 100 millions of ducats He affected to be more than commonly is be eat often at the refectory with the ; he never entered their churches without all the relies; he caused kneed his bread the water of a fountain which was thought es a miraculous virtue, and he boasted of bring danced. One great event of his doamer of this prince's death is not certainly His body, which lies in the monument curial, is there separated from his head. particulars of his crime are as little known; we know of the matter is, that in 1568 her, having discovered, or pretending to covered, that he had some correspondence Hollanders his enemies, arrefted him himhis own room. He wrote at the fame time Pius V, an account of his fon' imprisonand in his letter to this pontiff, the 20th of 3, 1563, he fays, "that from his earliest. firength of a wicked nature has fliffed in is every paternal infruction." Philip II. be printed at Anvers, between 2569 and 8 vols folio, the fine Polyglot Bible, bears his name; and he subjected the islands als called the Philippines. He married orie, rif, Mary daughter of John III. king urd; rif, Mary daughter of Henry VIII. of England; adly, Elizabeth of France, for Henry II.; 4thly, Anne daughter of mori Maximilian II. Don Carlos was the first wife. PRILIP III. K. of Spain, fon of Philip II. queen, Anne of Austria, succeeded his 1598. He was an amiable prince but had men to qualify him to correct the errors of ersgovernment. He entrusted all his affairs management of the D. of Lerma; during administration a peace was made with Engatruce with the Dutch. He was guilty

truce with the analysis in expel-

the Moors from Grenada, and the adjacent

been; in consequence of which a large tract

of country was depopulated and has remained a defert ever fince. See Spain. Philip died in 1621:

(21.) FHILIP IV. K. of Spain, was born in 16055 and succeeded his father Philip III. in 1621. The war was renewed against the Dutch, who proved very fuccetsful. Philip next entered into a war with France in which he was equally unfortunate. See Spain. He died in 1665, aged 601

(22.) PHILIF V. D. of Anjou, the 2d fon of Lewis, Dauphin of France, succeeded to the crown of Spain, by the last will of Charles II. in 1700. The house of Austria, being thus excluded from the fuccession, entered into a war with Spain, and was fupported by England. Lewis XIV. defended the right of his grantifen, and after a long ftruggle; Philip wa confirmed K. of Spain by the treaty of Utrecht, in 1713. In 1734, Philip invaded Na-ples, and wrefted that kingdom from the Imperialifts, in favour of his fon Pr. Charles. He died in 1746, and was fucceeded by his fon, Ferdinand VI.

PHILIPEAU, an illand of N. America; in the NW. part of Lake Superior; 24 miles in circum-

terence.

PHILIPOVA, a town of Russa, in trkutsk, on

the Angara; 48 miles WSW, of hundk.

PHILIPPEAU, or PHILIPPEAUX, John Frederick, count of MAUREPAS, a French statesman, born in 1701, and in 1715, at the age of only 14; appointed Secretary at court. In 1728, he became fuperintendant of the marine; and in 1738 minifter of state, but in 1743, he was banished to Bourges, by the intrigues of a lady at court. In 1774, he was recalled to the ministry by Lewis XVI, who placed great confidence in him. was a man of profound learning, and great liberality; but has been blamed by the friends of the unfortunate house of Bourbon, for the advice he gave the king, to affift the American republicans to throw off their dependance on Great Britain; He did not live to fee the confequences, as he died in 1781.

PHILIPPEVILLE, a town of France; in the . dep. of the Ardennes, anciently called Corbigny; till Mary of Austria forlished it, in 1577, and named it Poiltpeville, in honour of Philip II. of Spain. Its fortifications were renewed by Lewis XIV. It is 12 miles NW, of Givet, and 36 N. of Charleville.

PHILIPPI, in ancient geography, a town of Macedonia, in the territory of the Edones, on the confines of Tirace, fituated on the fide of a fleep eminence; anciently called Datum and Drenides, (Applin) though Strato feems to difft, guish them. This town was samous on several accounts; not only as taking its name from the celebrated Philip' II. of Macedon, who confidered it as a fit place for carrying on the war against the Thracians; but also on account of two battles fought in its neighbourhood between Augustus and the republican party. In the first of these battles, Brutus and Cassius had the command of the republican army \$ while Octavianus, afterwards Augustus, and Mark Antony, had the command of their adversaries. The army of Brutus and Cafflus confided of 19 legions and 20,000 horse; the in perial forces of an equal number of legions, but more complete, and 13,000 horse; so that the numbers on both sides

were pretty equal. The troops of Brutus were very richly dreffed, most of them having their armour adorned with gold and filver; for Brutus, though very frugal in other respects, was thus extravagant with respect to his men, thinking that the riches that they had about them would make them exert themselves the more, to prevent these. from falling into the enemy's hands. Both the republican generals appear to have been interior in skill to Mark Autony; for as to Octavianus, he is allowed never to have conquered but by the va-Iour of others. A little before the first engagement. Octavianus, who had been indifposed, was carried out of the camp, at the perfualion of Artorius his phyfician, who had dreamed that he faw a vifion directing him to be removed. Brutus's men, who opposed the wing commanded by Octavianus, charged without orders, which caused great confution. However, they were fuccessful; for part of them, taking a compass about, sell upon the enemy's rear: after which they took and plundered the camp, making a great flaughter of fach as were in it, and among the reft putting 2000 Lace-demonians to the fword who were newly come to the affittance of Octavianus. The emperor himfelf was fought for, but in vain, having been conveved away for the reason above-mentioned; and as the foldiers pierced the litter in which he was ufually carried, it was thence reported that he had been killed. This threw that whole part of the army into fuch conficrnation, that when Brutus attacked them in front, they were most completely routed; three whole legions being cut in pieces, and a prodigious flaughter made among the fugitives. But by the imprudence of the general in purfuing too far, the wing of the republican army conmanded by Cathus was left paked and feparated from the reft of the army; on which they were attacked at once in front and in flank, and thus they were defeated and their camp taken, while Brutus imagined that he had gained a complete victory. Callius himfelf retired to an eminence at a finall diftance from Philippi; whence he fent one of his greatest intimates to procure intelligence concerning the fate of Brutus. That general was on his way, and aircady in view, when the meffenger fet out. He foon met his friends; but they furrounding him to inquire the news, Carlius, who beheld what pailed, imagined that he was taken prisoner by the enemy, retired to his tent, and in despair caused one of his freedmen cut off his head. Thus far at least is certain, that he went into the ten with that freedman, and that his head was found separated from his body when Brutus entered. However, the freedman was never afterwards feen. The 2d engagement was pretty fimilar to the first. Brutus again oppoid Octavianus, and met with the fame-fuccefs; but in the mean time Antony, to whom he ought undoubtedly to have opposed himself, having to do only with the licutenants of Cashius, gained a complete victory over them. What was worft, the fugitives, inflead of leaving the field of battle altogether, fied for protection to Brutus's army; where, crowding in among the ranks, they carried despair and confufion wherever they went, so that a total defeat enflied, and the republican army was almost entirely cut in pieces. After the battle, Brutus put

an end to his own life. See Robe. The city Philippi is likewife remarkable on account of a epittle written by St Paul to the church in the place. It was a Roman colony, (Luke, Pin Coin, Infeription.) It is also remarkable for beather birth-place of Adrastus, the Peripatetic phis solution of the birth-place of Adrastus, the Peripatetic phis solution, and disciple of Aristotle.—The town is in being, and is an archbishop's see; but gradecayed and badly peopled. However, there an old amphitheatre, and several other monune of its ancient grandeur. Lon. 44, 55, S. L. La., o. N.

(1.) \* PHILIPPICK. n. f. [from the invection of Demostheries against Philip of Macedon.] invective declamation.

(2.) PHILIPPICS, n. f. [FIXITERIN LOTAS] its rature, a name which is given to the oration DemoRhenes against Philip II. king of Mace The Philippics are reckoned the mafter-pixel that great orator: Longinus quotes many in ces of the fublime from them; and points of thousand latent beauties. Indeed that pat in which Demosthenes excelled, the frequent terrogations and apostrophes wherewith heat ed the indolence of the Athenians, could be where better employed. Whatever delicacy be in the oration against Leptines, the Phil have the advantage over it, were it only i count of the fubical, which gives Demoth fair a field to display his chief talent, well with Longinus, that of moving and after Dionyfius Halicarnaticus ranks the oration Halonese among the Philippies, and places 8th in order: but though his authority be yet that force and majefty wherein Cicero racteriles the Philippies of Demofthenes, let exclude the oration on the Halonese out number; and authorife the almost universal nion of the learned, who reject it as ipurior banius, Photius, and others, but above alit guidness of the style, and the lowness of preffiors, which reign throughout the wad ther it on Hegelippus.

(3.) PHILIPPICS are likewise applied to crations of Cicero against Mark Antony. In himself gave them this title in his epistes tus; and posterity have found it so just, has been continued to our times. Juvens a colls the 2d the divine Philippic, and a constitute divina Philippia fanax. That or entitling his last and most valued orations also Philippics of Demosthenes shows the high nion he had of them. Cicero's Philippia him his life; Mark Antony having been so tated with them, that when he arrived at munvirate, he procured Cicero's murder, a his head, and stuck it up in the very place with orator had delivered the Philippics.

PHILIPPINA, a town of Mexico, in Guala, on a bay of the N. Pacific Ocean.

PHILIPPINE, a town of the imperial F republic, in the dep. of the Scheidt, and cide prov. of Austrian Flanders, scatted on an at the Scheidt, and strongly fortified. The I feized it in 1633, and augmented its fortifical In 1747, it was taken by the French, under C Lowendal; but restored by the treaty of A Chapelle. On the 23d Oct. 1794, it was taken

15 miles N. of Ghent, and 20 ENE. of Bru-

Pritippine Islands, or certain islands of (1) PHILIPPINES, Asia, which lie cweed 114 and 126 degrees of east longitude, is between 6° and 20° of N. lat. about 300 miles for the control of the control o mber, of which there are 400 very confidera-L. They form a principal divition of that imunit Indian Archipelago, which confifts of fo any thousand islands, some of which are the reft, and many of them the richest, in the ther of these islands, and were discovered in ticar 1921 by the famous navigator Ferdinand galan, a Portuguese gentleman, who had servas native country both in the wars of Africa don the East Indies; particularly under Aburique, the famous Portuguese general, who retel Goa and Maiacea to the obedience of that wa. Mageilan having had a co-fiderable firare the actions, and finding himfelf neglected by government of Portugal, and even deried, as led, the finail advance of a ducat a month pay, left the court of Portugal in difgust, offered his fervices to Charles V. then empe-Germany, and king of Spain, whom he couted of the probability of difcovering a way to Spice Islands, in the East Indies, by the west; read the command of five finall flips begiven him, he fet fail from Seville, on the roth liguf 1519, and standing over to the coast of An area, proceeded fouthward to 52°, the le fortunately hit upon a strait, fince ealithe STRAIT OF MAGELLAN, which carried into the Pacific Ocean or South Sca, (See GELLAN, No 2.) and then fleering northward, alled the equator: after which, he stretched ly to the west, across that vast ocean, till he ed at Guain, one of the Ladrones, on the of Much 1521; and foon after fulled to the ward, and discovered the Philippines, which ton St Lazarus's day; and, in honour of fault, he called them the Archipelago of St Frus. He took possession of them in the name he king of Spain, but was killed in a skirmish the natives of one of them. His people, ever, arrived afterwards at the Moinceas, or Is Islands, where they left a colony, and reled to Spain by the way of the Cape of Good : bring the first persons that ever sailed the globe. But there was no attempt made the Spaniands to fubdue or plant the Philip-Islands until 1564, in the reign of Philip II. of Charles V. when Lewis de Velasco, viceof Mexico, fent Michael Lopez Delagaspes her with a feet, and a force furlicient to make goett of thefe iflands, which he named the pra i, in honour of Philip II. then king of Fig. and they remained under the dominion of goun till taken by Sir William Draper. Proppines are fearce inferior to any other 42 de of Alia in all the natural productions of that appy cumate; and they are by far the best fluited for an extensive and advantageous combook. By their polition, they form the centre

he French republicans, under Gen. Michaud. It of intercourse with China, Japan, and the Spice Islands; and whish they are under the dominion of Spain, they connect the Afiatic and American commerce, and become a general magazine for the rich manufactures of the one, and for the treafures of the other. Befides, they are well fitunted for a supply of European goods, both from the fide of Acapulco and by the way of the Cape of Good Hope. In lact, they formerly enjoyed a traffic in some degree proportioned to the peculiar felicity of their fituation; but the Spanish dominion is too vaft and unconrected to be improved to the best advantage. The trade of the Philippines is thought to have declined; its great branch is now reduced to two ships, which annually pass between these islands and Acapulco in America, and to a fingle port of Mamia in the ill ind of Luconia. Instead of taking Spanish manufactures, they trade with the Chinefe for spices, filks, flockings, Indian fluffs, caircoes, chintz, and many other articles; and with the Japanefe for cabinets, and all forts of lacquered ware; for all which they pay in gold or filver. All these commodities, together with what the islands produce, and great quantities of wrought plate by the Chinese artifans, are collected at Manila, and transported annually in two ships to Acapulco in Mexico. Each of these ships is esteemed worth 600,000l. fterling; and in the war which began in 1739, and which was not diffinguished by fuch a feries of wonderful fucceties as that which ended in 1763, the taking of one of the galleons which carry on the trade between Manita and America, was confidered as one of the most brilhant advantages which we gained. This trade is not laid open to all the inhabitants of Manila, but is confined by very particular regulations, fomewhat analogous to those by which the trade of the reguler thins from Cadiz to the West Indies is rettrained. The flips employed are all king's thips, commissioned and paid by him; and the tonage is divided into a certain number of bales, ali of the same size. Most of the religious are concerned in this trade, and fell to the merchants at a great price what room in the flip they are not to occupy. This trade is by a royal edict limited to a certain value, but it always exceeds it, each flip being generally worth 3,000,000 of dol-The returns made from America are in filver, cochineal, fweetmeats, together with fome European military ware for the women, and fome firong Spanish wine. It is obvious, that the greatest part of the treasure remitted does not remain at Manila, but is dispersed over In tia for goods. Many flrong remonstrances against this Indian trade to Mexico have been made to the court of Spain, wherein they urge, that the filk manufactories of Valentia and other parts of Spain, the linens from Cadiz, and their other manufactories, are hurt in their fale in Mexico and Peru, by the Chinese being able to afford them goods of the fame fort cheaper than they are able; that were this trade laid open, the whole treasure of the New World would centre in Spain, or with European merchants. At Cavite in this bay are a fort, a town, and a fine dock-yard, where thefe large galleons are built

and repaired, and where they load and unload, together with all the other large ships that trade to this bay. The posseipal of the Phiappine islands are Luconia or Munila, Tandago or Samul, Mufbate, Mindora, Marin lugera, Luban, Paragoa, Panay. Negro's Island, Ley e. Bohel, Sibn, Boghu, Negros, St John, Xolo, and Mindanao. In most of these, the Spanish power prevails, and all are under the governor of Luconia; but there are some in which that nation has little authority, or eyen influence, such as Mindanao. The inhabitants of these islands consist of Chinese, Ethiopians, Malays, Spaniards, Portuguele, Pintados or Painted People, and Metters, a mixture of all thefe. Their persons and habits resemble those of the feveral nations whence they derive their original; only, it is observable, that the scatures of the blacks of these illands are as agreeable as those of the white people. There is not a foil in the world that produces greater plenty of all the necessaries of life; as appears by the multitude of inhabitants in the woods and mountains, who subjist almost entirely by the fruits of the earth, and the venision they take. Nor can any country appear moie beautiful; for there is a perpetual verdure, and buds, bloffoms, and fruit, are found upon the trees all the year round, as well on the mountains as in the cultivated gardens. quantities of gold are washed down from the hose by the rains, and found mixed with the find of their rivers. There are also mines of other metals, and excellent load-stones found here; and fuch numbers of wild buffaloes, that a good huntiman on horseback, armed with a spear, will kill 10 or 20 in a day. The Spaniards take them for their hides, which they fell to the Chinese; and their carcales ferve the mountaineers for tood. Their woods also abound with deer, wild hogs, and poats. Of the last, there is such plenty in one of these islands, that the Spaniards gave it the name of Cabras. "Horses, and cows have been likewise imported into these islands, from New Spain, China, and Japan, which have multiplied confiderably; but the flicep that were brought over degenerated. The trees produce a great variety of gume; one kind, which is the commonest, by the Spaniards called brea, is used inflead of pitch; of the others some are medicinal, others odoriferous. In those islands are monkeys and babbons of a monstrous bigness, that will defend themselves if attacked by men. When they can find no fruit in the mountains, they go down to the fea to catch crabs and oyfters; and that the oysters may not close and catch their paws, they first put in a stone to prevent their shutting close; they take crabs by putting their tail in the holes where they lie, and when the crab lays hold of it, they draw him out. are also great numbers of civet-cats in some of the islands. The bird, called taron, is a black fea fowl, fomething lefs than a hen, and has a long leck; it lays its eggs in the fand by the fea fide, 40 or 50 in a trench, and then covers them, and they are hatched by the hear of the fun. The hird faligan builds her neft on the fides of rocks, as the fivallows do against a wall; and these are the dencious BIRDS-NESTS fo much effectived. (See BIRDS NESTS, § 4.) The Spaniards have

introduced several of the American fruits, the coa or chocolate nut particularly, which incifes fo that they have no occasion now to imp it from Mexico. Here is also the Fount TREE, from which the natives draw water; a kind of cane, by the Spaniards called val which, if cut, yields fair water enough f draught, of which there are plenty in the m tains, where water is most wanted. Their il being hot and moiff, produce many veno creatures, as the foil does poisonous herbi flowers, which do not kill those who too tafte them, but so infect the air, that many ple die in the time of their bloffoming. T range, lemon, and several other trees, bear a-year. A fprig, when planted, becomes i and bears fruit in a year. The woods are with trees, which yield more fufterance to than is to be found in almost any other p the world. These islands, however, beside inconveniences, are very fubject to earthq which often prove very fatal. See Mani-

(2.) PHILIPPINES, a religious facility of women at Rome, so called from their tak Philip de Neil for their protector. (See No. 2.) The fociety consists of 100 pow who are brought up till they are of age married, or become nuns, under the died foine religious women, who teach them to write, and work, and instruct them in the of Christianity. They weap a white veil,

black cross on their breasts.

(3.) PHILIPPINES, NEW, or PALAOS, TAOS, a clufter of iffaults, in the E. Indian between the Moluccas, the Old Pinleppin 1.) and the Ladrones, and between the dand the tropic of Cancer. They are about all, but are little known to Europeans.

PHILIPPISTS, a feet among the Lutte followers of Philip Melanchon. If the nountry opposed the Usiquifts, who a his time; and the diffrute growing full hater his death, the university of Writtember espouled Melanchou's opinion, were cathe Flactans, who attacked it, Philippifts.

PHILIP, ST. See NERI, No 2.

(1.) PHILIPS, Ambrole, an English porfeender from a very ancient tamily in Lessing. The conders from a very ancient tamily in Lessing. The Life of the Cambridge; where he wrote his pattorais, acquired him at the time so high a reput His next performance was, The Life of Ara Williams, written, according to Mr Chbinake known his political principles, the association, who is the hero of his work, being a opponent to the high church measures.

be quitted the university, and came to London, be became a confrant attendant at Button's cof-Ec-house, where he became intimate with the noft celebrated geniuses of that age, particularly of Sr Richard Steele, who, in the first volume of is Tatler, inserted a poem of Mr Philips's, callbis Winter Piece, dated from Copenhagen, on bich he bestows the highest encomiums; and, deed, so much justice is in these his commendams, that even Mr Pope himfeil, who had a fixmerfion for the author, while he affected to this other works, used always to except He wrote feveral dramatical pieces; The Diffressed Mother, and Humphrey Duke of effer; all of which met with success, and to them is still a standard of entertainment at theatres, being generally repeated feveral nevery season. Mr Philips's circumstances in general, not only easy, but affluent, from may connected, by his political principles, persons of great consequence. He was conwith Dr Hugh Bouiter, afterwards archof Armagh, the R. H. Richard West, Esq. ary Stevens, in writing a feries of papers the Free Thinker, which were all published er by Mr Philips, in 3 vols. 12mo. In the Queen Anne's reign, he was fecretary to Inver club, a fet of noblemen and gentleho had formed an affociation in honour of eccession, and for the support of its interests. alips's station in this club, with the zeal in his writings, recommended him to the of the new government. He was, from the accession of king George I, put into the Minim of the peace, and appointed a comner of the lottery. And, on Dr Boulter's made primate of Ireland, he accompanied relate across St George's channel, where he pefiderable preferments, and was elected a of the House of Commons, for Armagh. sth, having purchased an annuity for life per annum, he came over to England ume in 1748; but died foon after, at his near Vauxhall, in Surry. " Of his perparaeter (fays Dr Johnson) all I have heard he was eminent for bravery, and skill in and that in converfation he was folemn

Patters, Catharine, a very ingenious lady, her of Mr John Fowler, merchant, born at 100 in Jan. 1631, and educated at Hackney. The Light and went with the vifcountefs of Education into Leland, where the translated large tragedy of Pompey into English, which heral times acted there with great applause. This excellent and amiable died of the final pox in London, 22d June much and justly regretted; "having not 178 Languaine) any of her fex her equal in

PHILIPS, Fabian, was author of feveral reising to ancient customs and privileges stand. He was born at Prestbury in Glou-

cestershire, Sept. 28th, 1601. He studied in the Inns of Chancery, and the Middle Temple, where he became learned in the law. In the civil wars, he was a bold affertor of the king's prerogative; and two days before Charles I. was beheaded, he wrote a protestation against the intended murder, and caused it to be printed, and affixed to posts in all public places. He likewife published, in 1649, 4to, a pamphlet entitied, " Veritas Inconcussa; or King Charles I. no Man of Bood, but a Martyr for his People:" which was reprinted in 1660, 8vo. In 1653, when the courts of justice at Westminster, especially the Chancery, were voted down by Oliver's parliament, he published, "Confiderations against the dissolving and taking them away:" for which he received the thanks of William Lenthal, Efq. speaker of parliament. He was for fome time filazer for London, Middlesex, Cambridgeshire, and Huntingdonshire; and spent much money in fearthing records, and writing in favour of the royal prerogative. only reward he received, was the place of one of the commissioners for regulating the law, worth 2001. per annun, which only lasted two years. After the restoration, when the bili for taking away the tenures was depending in parliament, he wrote and published a book to show the necessity of preserving them, entitled, "Tonenda non tollenda; or, the Necessity of preserving Tenures in capite, and by Knight's-service, which were a great part of the falus populi, &c. 1660," 4to. In 1663 he published, "The Antiquity, Legality, Reason, Duty, and Necessity of Preemption and Pourveyance for the King, and afterwards many other pieces upon fimilar subjects. He affisted Dr Bates in his Elenchus He died Nov. 17th, 1690, in his 89th year; and was buried at Twyford in Middlefex. He was a man well acquainted with records and antiquities; but his manner of writing is neither close nor well digested. He published a political pamphlet in 1681, entitled, " Urfa Major et Minor; showing that there is no such Fear, as is factiously pretended, of Popery and arbitrary Power.'

(4.) PHILIPS, John, an eminent English poet, was born in 1676. He was educated at Winchefter and Oxford. The first poem which diftinguished our author, was his Splendid Spilling, published in 1705. His next was Blenkeim. In 1706, he finished another poem upon eyder. He also wrote a Latin ode to Henry St John, Eiq. which is efteenied a mafterpiece. He was contriving greater things; but his health failing, he was obliged to drop every thing but the care of it. This care, however, did not fave him: for, after lingering a long time, he died at Hereford, Feb. 15, 1708, of a confumption and ashma, before he had reached his 33d year. He was interred in the cathedral of that city, and had a monument erected to his memory in Westminster abbey, by Sir Simon Harcourt, afterwards lord chancellor, with an epitaph written by Dr Atterbury. He was one of those sew poets whose muse and manners were equally excellent and amiable; in a very eminent degree.

(5.) PHILIPS, John, another English poet, ne-

phew of the celebrated Milton, who wrote feveral NW. of Stockholm. Lon. 14. 15. E. Lit. 16 things, particularly some memoirs of his uncle;

and part of Virgil Traveflied.

(6.) PHILIPS, John, another English poet, cotemporary with the two preceding, who was the author of two political farces, both printed in 2716; 1. The Earl of Marr married, with the Humours of Jocky the Highlander. 2. The Pretender's Flight; or a Mock Coronation; with the Humours of the facetious Harry St John.

(7.) PHILIPS, Thomas, a learned English Catholic, born at lekford, in Buckinghamshire, in 1708, and educated at Louvain. He was afterwards fent over as a missionary to England, where he published a Letter to a Student in Divinity, and other tracts. But the work, for which he is most celebrated, is his Life of Cardinal Pole, in 2 vols. 8vo. wherein he endeavoured to foften the harm features of popery, and to wash his church from her flains of blood and tyranny. Several English divines published answers to this work, particular-Iv Dr Neve, Dr Gloster Ridly, &c. Philips died at Leige, in 1774.

- (1.) PHILIPSBURG, an imperial town of Germany, in the circle of the Upper Rhine. It is very strong, and looked upon as one of the bulwarks of the empire. It is feated in a morafs, and fortified with 7 bastions, and several advanced works. The town belonged formerly to the bishop of Spire, and all the works of the fortifications to the empire; but as in the division of the indemnities by Bonaparte, in Aug. 1802, that part of the fecularized bulhopric of Spire, which lies on the E. bank of the Rhine was allotted to the elector of Baden, Philipsbury appears to be now the property of that prince. It has been feveral times taken and retaken, particularly by the French in 1734, when the duke of Berwick was killed at the fiege; but it was rendered back the year following, in confequence of the treaty of Vienna. It is feated on the river Rhine, over which there is a bridge, 7 miles fouth of Spire, 22 SE. of Worms, and 40 NE. of Strasburg. Lon. 8. 33. E. Lat. 49. 12.
- (2) PHILIPSBURG, a town of New Jersey, 35 miles W. of Morriftown.
- (3.) PHILLIPSBURG, a town of New York, 25 miles N. of New York.

PHILIP'S ISLAND, ST, an island in the S. Atlantic Octan. Lon. 13. 25. E. Lat. 12. 22. S.

PHILIP's LAND, ST, an island of the Batavian republic, in the dep. of the Meufe, and late prov. of Zealand; with a village of the same name, separated by a narrow channel from the E. end of the ifle of Schowen.

PHILIP's NORTON, a town of Somersetshire, with a market on Thursday; 7 miles S. of Bath, and 104 W. of London. Lon. 2. 16. W. Lat. 52. 16. N.

PHILIPS, ST, a town of Mexico, in Mechoacan,

in a country abounding with cattle.

•PHILIPSTADT, a town of Sweden, in Warmeland, in the midfl of a hilly country, abounding with iron mines, feated between two lakes, upon a fmall river. It was built by Charles IX, and named after his fon Philip. It was burnt in 1694; rebuilt, and again burnt in 1770; but again rebuilt. It is 20 miles NE. of Carifuldt, and 140

30. N.

PHILIPSTHAL, or CREUTZBERG, a town t Germany in Heffe-Homberg, 12 miles SW. ( Muhl-haufen, and 29 W. of Erfurt.

PHILIPSTON, or a borough of In land (1.) PHILIPSTOWN, in King': Count where the affizes are held. It fent two mainle to the ci-devant leith parliament. It is used N. of Kildare, 17 N. of Maryborough, and SW. of Dublin. Lon. 7. 20. W. Lit. 53. 18.

(2.) PHILIPSTOWN, a township of New Ya in Duchel: County, on the E. bank of Hudde River, 28 miles above New York. In 199 contained 2079 inhabitants, of whom 3471 electors, and 25 flaves. It has a filver mine. PHILIPVILLE, a town of France, in the of the North, and ci-devant prov. of In Hainault, on an eminence; 25 miles SE. of H and 125 N. by E. of Paris. Lon. 4. 24. E.

PHILISTÆA, in ancient geography, the try of the Philistines; which lay along Mediterranean, from Joppa to the bounds Egypt, and extending to inland places not far the coaft. It is also called PALISTINA, 734 a name afterwards applied to the whole Holy Land. See PALISTINA.

PHILIST ÆI, or the people of Philida PHILISTIM, led alfo Caphtorim and Him, originally from Egypt, and descendent Ham. (Moses.) They expelled and destroyed Hivites the ancient inhabitants, and occupied country; that is, the region which retained name of Philistim, in which that of Caphtoria fwallowed up.

PHILISTINES, the ancient inhabitant PHILISTINI, Palestine, well known cred history. The people are fometimes cal Scripture CHERETHITES and CAPHTORINS. earlier part of their hiftory is, like that of ther nations, very obscure and uncertainauthors of the Universal History tell us, that were descended from the Cassuhim partly partly from the Caphtorim, both from Mg the fon of Ham, the fon of Noah. Moleste (Deut. xi. 23.) that they drove out the Art Avites even to Azzah or Gazah, where the tled; but when this happened cannot be mined. But our learned authors are clearly pinion, that the Cassuhim and Caphtorin, whom the Philiftines are descended, came nally from Egypt, and called the country w they had conquered by their own name. PALESTINE). Many interpreters, however, t that CAPHTOR was but another name for CA DOCIA, which they imagine to have been the ginal country of the Philiftines. But Father met, in a particular differtation prefixed to first book of Samuel, endeavours to show that were originally of the ific of Crete. The re which led him to think that Caphtor is the id Crete are as follow: The Philiftines were that in Paleftine, as appears in various parts of Se ture; fuch as Gen. x. 14. Dent. ii. 23. Jer. xiv and Amos ix. 7. whence the Septuagint alm translate this name Secangers. Their proper no See Ezekiel, xxv. 16. was Cherchings.

phaniah, ii. 5. and 1. Samuel xxx. 14. kings of Judah had foreign guards called the Chentities and Pelethites, who were of the number of the Polliffines. (2 Sam. xv. 18.) The Septuagut, under the name Cherethites, understood the Cetans; and by Che ith they understood Crete. leades the Scripture fays, that the Philistines and from the ifle of Caphtor. Now we see no and in the Mediterranean, wherein the marks hereby the Scripture describes Caphtor and Chethin agree better than in the isle of Crete. The Craim o. Cherethim is the fame with that of The Cretans are one of the most anand celebrated people, who inhabited the we been produced originally out of their own This island was well peopled in the time of Trojan war. Homer calls it the island with cties. The city of Gaza in Palestine went by with of Minoa (Steph. Byzant. in Gaza), be-Minos king of Crete coming into that counalled this ancient city by his own name. datus acknowledges that the Cretans were o-🌆 all barbarians, and did not come from Homer favs, that a different language when in the iffe of Crete; that there were there, true or ancient Cretans, Pelasgians, The ancient Cretans are the same as the Chethe Pelafgians as the Philistines or Peleof the Scripture: their language was the fame Lat of the Canaanites or Phonicians, that is, rec'hey were defeended, as well as Canaan, 1, by Mizraim. (Gen. x. 6, 13, 14.) rer, arms, religion, and gods of the The arms are, ows and arrows. Digon the god es was the fune as the Dictynna of 5. But Mr Wells does not think thefe the fineing. He is of the fune opinion tta ors or the Universal Listory, who ±2 € ..., the name of an o'd city of Egypt, foregion of the ancient Capttor. But whebey time from Crete, from Cappadocia, or Egg; they had certainly been a confidence in the land of Cannan, when Abraham there, in the year of the world 2083. They 24.3 very powerful people, were governed is and in poffestion of feveral consisterable Several of their kings then in power were el Asimelech. This race, however, was but a. dention; for their monarchy was changmania servey of five lords, who were purtdenotes or each other, though they acted to the common cause. This form of ment was arrive fucceeded by another race the mong whom the prevailing names were and Air rd ch. They were no comprein the number of nations devoted to exand whose territory the Lord had 114:0 the Hebrews; nor were they of the d feed of Canaan. However, Johna gave and to the Hebrews. (John xv. 45-47. But these conquests of Jothia by ben ill maintained, line under the Stowner Saul, and at the beginning of the of David, the Philliftines oprefied the Ifrael-Stamgar, Samfon, Samuel, and Luck, inbal made head against them, but did not reduce

H their power; and they continued independent down to the reign of David, who conquered them. They continued in subjection to the kings of Judah down to the reign of Jehoram, fon of Jehofhaphat; that is, for about 246 years. However, Jehoram made war against them and probably reduced them to his obedicuce again; as they revolted again from Uzziah, who kept them in subjection during his reign. (2 Chr. xxi. 16. and xxvi. 6, 7) During the unfortunate reign of Ahaz, the Philiftines m. de great havoc in the territories of Judah; but his fon Hezekiah fubdued them. (2 Chr. xxviii. 13. and 2 Kings xviii. 8.) Laitly, they regained their full liberty under the later kings of Judah; and we find from the vengance denounced against them by the prophets Itaiah, Amos, Zephaniah, Jeremiah, and Ezekiel, that they brought many hardships and calamities upon the children of Ifrael: for which cruelties God threatened to punish them. Esarhaddon befieged Ashdod, and took it. (Ifa. xx. 1.) And according to Herodotus, Plammeticus king of Egypt took the same city, after a siege of 29 years. There is great probability, that Nebuchadnezzar, when he fubdued the Ammonites, Moabites, Egyptians, and other nations, bordering upon the Jews, reduced aifo the Philiftines. After this, they fell under the dominion of the Perfians; then under that of Alexander the Great, who destroyed Gaza, the only city of Phænicia that durst oppose him. After the perfecution of Antiochus Epiphanes, the Aimonæans fubjected under their obedience feveral cities of the Philiftines; and Tryphon gave to Jonathan Maccabicus the government of the whole coast of the Mediterranean, from Tyre as far as Egypt, which included all the country of the Phillidines.

PHILISTIS, an ancient queen, whose coin is ffill extant, but of whose life, reign, country and government, nothing is recorded, or can now be aftertained. Her coin is also mentioned by Herodotus, which shows that the must have flourished before the time of that ancient historian, but nothing elfe is recorded by him respecting her. Mr Plakerton thinks the reigned in Siehy, and as a confirmation of this conjecture, mentions fome inferiptions of FAZIMITING GIMENTAGE on the Greedist of the theatre at Syracule; but which do not appear to be old r than the times of the Romans. Some authors think the reigned in Mata or Cotfree, but Mr Pinkerton does not think this probable.

PEHLISTUS, an ancient historian, born in Syracuse. He enjoyed the friendthip of Dionyflus; but being afterwards colled, he wrote a History of Sieily, in 12 books, which was much admired. He was nite wards recalled, and fent againft the Symoutine by Lion, fine the younger, but, being defeated, killed mimicil; A. A. C. 356. Plut. Diod.

FillLLIP Istands, two mands in the S. Pacific Ocean, discovered by Capt. Hunter, in 1791, and named after Arthur Phillip, Efq. governor of New S. Wales. They are 5 miles afunder, but alm it joine! by a long narrow fand-bank, which projects above water, and reaches for about two 3/ls of the distance from the E. or targest island to the W. one, which is finaneft. They are covered with fhrubs, but have few tall trees, and the fard is low. They have fome inhabitants. The largest or eastmost island lies in Lon. 143. 3. E. Lat. 8. 6. N.

PHILLIS. See PHYLLIS.

PHILLYREA, MOCK PRIVET; a genus of the monogynia order, belonging to the diandria c.als of plants; and in the natural method, ranking under the 44th order, Sepiarie. Each flower contains two males and one female. Some fay there are 7 species, all shruby plants, and natives of France or Italy. Others reckon only 3 species, wiz.

1. PHILLYREA ANGUSTIFOLIA, the narrow-leaved phillyrea, or mock privet, a deciduous shrub, native of Spain and Itaiy. This is of iow growth seldom rising higher than 8 or 10 feet. The branches are few and slender, but they are beautifully spotted with grey spots. The leaves stand opposite by pairs. They are long and narrow, spear-shaped, and undivided, of a deep green colour, and of a thick consistence. The edges are entire, and they stand on short sootslake. The slowers make no show. They are whitish, and grow in clusters from the wings of the branches, in March; and are succeeded by small round black berries. The varieties of this species are, the rosemary phillyrea, lawender phillyrea, STRIPED PHILLYREA, &c.

2. PHILLYREA LATIFOLIA, the broad leaved phillyrea, or mock privet, a tall evergreen flirub, a native of the fouth of Europe. It will grow to about 12 feet high. The branches are strong and upright. The bark is of a grey colour, spotted with white, which has a pretty effect; and the leaves grow opposite by pairs. They are of a heart-shaped oval figure, of a thick confistence, Their edges are and a strong dark green colour. fharply ferrated, and they stand on short strong footstalks. The flowers grow from the wings of the leaves in clusters in March. They are of a kind of greenish-white colour, make no show, and are fucceeded by fmall round black berries. There are 3 varieties; viz. the ilex-leaved phillyrea, the prickly phillyrea, and the olive phillyrea with flightly serrated edges.

3. PHILLYREA MEDIA, the oval-leaved phillyrea, or mock-privet, or the media leaved philly ca, a tail evergreen shrub, native of the S. of Europe. It has also 3 varieties, viz. 1. the common fmoothleaved phillyrea. This plant grows to 12 or 14 feet high, and the branches are very numerous. The older branches are covered with a dark brown bark, but the bark on the young shoots is of a fine green colour. They are oval, fpear-shaped, and grow opposite, by pairs, on strong short footfalks. The flowers are produced in clusters from the wings of the young branches. They are small, and of a greenith-white colour; they appear in March, and are fucceeded by berries, which are first green, then red, and black in autumn when tipe. 2. The privet leaved phillyrea grows to 10 or 12 feet high, and the branches are covered with a brown bark. The leaves a little refemble the privet; they are of a fine green colour, and grow by pairs on the branches. They are of a lanceolate figure, and their edges are entire, or n-arly fo: for fome figns of ferratures fometimes appear. The flowers grow in clusters in March.

They are whitish, and are succeeded by small black berries. 3. The olive leaved phillyrea is the most beautiful of all the forts. It will grow to a bout 10 or 12 feet high; and the branches, which are not numerous, spread abroad in a free eat manner, which give the tree a fine air. They at long and flender, covered with a light brown baff and on these the leaves stand opposite by paint proper intervals on fhort footflalks. They rele ble those of the olive-tree, and are of a delig fui green. Their furface is exceeding fmon their edges are entire, and the membrane thickith confidence. The flowers are small white, and like the other forts make no They are succeeded by single roundish by All these species may be either propagate feeds or layers. 1. By feeds. These ripen tumn, and should be sown foon after. There must be made fine; and if it is not naturally dy, if some drift sand be added, it will be much the better. The feeds for the montpai main until the fecond fpring before they come and if they are not fown foon after they are fome will come up even the third fpring They must be sown about an inch deep; ring the following fummer should be kept from weeds. After they are come up, the care must be observed, and also watering weather; and if the beds are hooped, and the shaded in the hottest season, so much the But at the approach of winter they mult be ed, and the beds covered with mate in the est frosts, otherwise there will be danger of the whole crop; for these trees, though the very hardy when grown tolerably large, a ther tender whilft feedlings. They fhould to in the feed beds with this management for fummers; and then waiting for the first and rains in Sept. or Oct. (and having prepared of ground), they should at that juncture be ed out, on which they will immediately The diffance from each other need more than a foot, if they are not defigned main long in the nurfery. If there is a prob of their not being wanted for fome years should be allowed near double that distance every winter the ground in the rows from well dug, to break their roots, and cause to put out fresh fibres, otherwise they will b danger of being loft when brought into the bery quarters. 2. By lagers they will eafly The autumn is the best time for this operate and the young shoots are fit for the purp The best way of layering them is by making at the joint; though they will often grow we a twitt being only made. When the gard chooses the method of twisting a young br for the layers, he must be careful to twist it a a joint so as only to break the bark; for if too much twifted, it will die. But if it be g ly twisted, it will at the twisted parts finke of and by autumn following as well as those larthat had been flit, will have good root; ftrongest of which will be fit for planting wh they are wanted to remain, whilft the weakers worst rooted layers may be planted in the nur ry ground like the feedlings, and treated accor PHI

PHILOLAUS, of Crotona, a celebrated philofopher of antiquity, of the school of Pythagoras, to whom that philosopher's Golden Verses have been afembed. "He was (tays Dr Enfield) a ditciple of Archytas, and flourished in the time of Plato. It was from him that Plato purchased the written records of the Pythagorean fystem. Interfering in affairs of state, he fell a facrifice to political jealoufy. Philolaus treated the doctrine of nature with great fubtlety, but with great obfcurity; referring every thing that exists to matheinatical principles. He taught, that reason, improved by mathematical learning, is alone capable of judging concerning the nature of things; that the whole world confilts of infinite and finite; that number fublish by itself, and is the chain which by its power fultains the eternal frame of things; that the Monad is not the fole principle of all things, but that the Binary is necessary to furnith materials from which all subequent numbers may be produced; that the world is one whole, which has a fiery centre, about which the ten celestial spheres revolve, heaven, the fun, the planets, the earth and the moon; and the fun has a vitreous furface, whence the fire diffused through the world is reflected, rendering the mirror from which it is reflected visible; that all things are preferved in narmony by the law of necessity; and that the world is liable to destruction both by fire and by water. From this funmary of the doctrine of Philolaus it appears probable, that, following Timzeus, whose writings he possessed, he fo far departed from the Pythagorean system as to conceive two independent principles in nature, God and Matter, and that it was from the fame fource that Piato derived his doctrine upon this fubject."

PHILO-

370

Philotogy is compounded of pine, a lover, and and noye, a word, and imports the defice of investigating the properties and relations of award. The lages of Greece were, in the most ancient times, denominated Espai, that is, wise men. Pythagoras renounced this pompous appellation, and assumed the more humble title of pinospai, that is, a lover of wise men. The learned Greeks were afterwards called philosophers; and in process of time, the word philosopher was adopted, to import, "a man deeply versed in languages, etymology, antiquities, &c." Hence the term Philology.

Though philology originally denoted only the fludy of words and language, it gradually acquired a more extensive fignification. It comprehended the fludy of grammar, criticism, etymology, the interpretation of ancient authors, antiquities; and, in a word, every thing relating to ancient manners, laws, religion, government, language,

&c. Most of the branches of philology have been already treated of, under the various heads of Com-PARISON, & III; CRITICISM; DESCRIPTION, E-TYMOLOGY, FIGURE, § VI; GRAMMAR, under English Language; Language; Metaphor, \$ 2; NARRATION, \$ 3; ORATORY, POETRY, &c. There still remains one part, which has been either flightly touched upon, or totally omitted, under the foregoing topics: we mean, the nature and complexion of the different languages, at least of the civilized world. But to enter upon an inveftigation of the languages of barbarous nations, or even of those of the half civilized nations of India, Persia, Turkey, &c. would answer no object of inquiry, or utility to the great majority, if not the whole, of our readers. But it may be equally useful and entertaining even to the most unlearned to give a general historical view of the origin and progress of Language from the earliest period of time. doing this, we shall chiefly follow the ingenious Dr Dorg of Stirling.

## SECT. I. HISTORY OF LANGUAGE.

"WHAT was the antediluvian language, (fays Dr Doig) or whether it was divided into a variety of dialects as at this day, can only be determined by the rules of analogy; and these will lead us to believe, that whatever might have been the primitive language of mankind, if human nature was then conflituted as it is at present, a great variety of dialects must of necessity have sprung up in the space of near 2000 years. If we a opt the Mosaic account of the antediluvian events, we must admit, that the descendants of Cain for some ages lived separated from those of Seth. Their manner of life, their religious ceremonies, their laws, their form of government, were probably different, and thef circumstances would of course produce a variety in their language. The posterity of Cain were an inventive race. They found out the arts of metallurgy, mulic, upholitery, and therefore probably weaving; and doubtlefs many other articles conducive to the eafe and accommodation of life were the produce of their ingenuity. A people of this character must have paid no small regard to their words and modes of expression. . Wherever music is cultivated, language will naturally be improved and refined. When rewind tions are introduced, a new race of words a phrafes of necessity spring up, corresponding the recent stock of ideas to be intimated. Best among an inventive race of people, new yould be continually fabricated, to supply the sciencies of the primitive language, which perhaps scanty in words, and its phrafol unpolished. The Cainites, then, among to other improvements, cannot well be supply to have neglected the cultivation of large "Many conjectures have been hazarded by ancient and modern authors with reforts

by ancient and modern authors with respect to origin of writing; an art nearly connected that of speaking. According to Pliny, "I fyrian letters had always existed; some in that letters had been invented by the Egypti cury; others aferibed the honour of the into the Syrians." Some think, and particular learned Dr David Doig of Stirling is of that " letters were an antediluvian invention ferved among the Chaldeans, or Affyria were the immediate descendants of Noah habited those very regions in the neighbor of which the ark refled, and where that p afterwards fixed his refidence." probability appears to be, that letters were vented for several centuries after the se fome writings either antediluvian or very ter the flood would have been preferred, books of Moles are beyond controverly writings extant, the opinion of those w that he either was the inventor of appl characters, or that they were invented a before the period in which he lived, is at let ly probable. See ALPHABETICAL CHAM 1-5; and ANTEDILUVIANS, 10. "1 cendants of Seth, (fays Dr Doig.) accer the oriental tradition, were chiefly add agriculture and tending of eattle. a great part of their time to the exercise and devotion. From this circumstances to be distinguished by the title of the According to this description, the Sethie fimple unimproved race of people till the with the race of Cain; after which period once adopted the improvements and the that wicked family.

" All the descendants of Seth, howe not mingled with the Cainites. which Noah was descended had not inco with the race of Cain: it was, according facred historian, lineally descended from 8 had preferred the worship of the true God it is probable, the greatest part of man apostatised and become idolaters. true religion, the progenitors of Noah ferved that simplicity of manners and of of character, which had difting withed then ancestors. Agriculture and rearing cattle their tavourite occupations. Accordingly that the patriarch Noah, immediately, deluge," became a hufbandman, and " pla vineyard." The chofen patriarchs, who do imitated their pious ancestors, were the and employed in rearing and tending cath deed there are strong presumptions that the kans, Affyrians, Syrians, Canaanites, and Arabi-24, in the earliest ages followed the same profes-

SECT. I.

" From this deduction, we imagine it is at least politic, that the ancestors of Noah persisted in k observance of the same timplicity of manners bich had been handed down from Adam to Seth. t from him to Enoch, Methuselah, Lamech, In from this last to Noah. According both to aptere and tradition, innovations were the proat of the Cainites, while the descendants of made red to the primitive patriarchal institu-

" li these premises are allowed to be probable, may justly infer, that the language of Noah dised very little from that of Adam; (See LANrun the language of the former, that of the latwill of course be discovered. Whatever may been the dialect of Noah and his family, that dialect, according to the Mofaic account, here obtained, without any alteration, till a of the building of the tower of Babel.this occasion a dreadful convulsion took k: the language of mankind was confounded, nen were scattered abroad upon the fuce of all wrib.

How far this catastrophe extended, we candetermine. One thing is certain, that the eges of all the nations who fettled near the t of population were but flightly affected by buence. Strabo has observed, that 3000 sufter, the inhabitants of those countries exat a very strong refemblance of cognation, their language, manner of living, and the aments of their bodies," and that "the refemin all those particulars was most remarkamong the inhabitants of Mesopotamia."

kappears, then, that the languages of the Ar-Syrians, Alfyrians, Arabians, and probabthe Canaanim, did not fuffer materially by the fution of tongues. This observation may be oded to many of the dialects spoken by the k, who settled in those countries not far disfrom the region where Moses has fixed the oa feat of mankind after the deluge. The inthen is, that if Noah and his family spoke onginal language of Adam, as they most prois did, the judgment which affected the connon of tongues did not produce any confideraalteration in the language of such of the defkindants of Noah, as settled near the region where patriarch had fixed his residence after he quit-the ark.

\*But supposing the changes of language proby the catastrophe at the building of the as confiderable as has ever been imagined, docs not, after all, appear certain that all manm without exception were engaged in this imous project. If this affertion be well founded, e consequence will be, that there was a chon race who did not engage in that enterprise, there was such a family, society, or body of men, it will follow, that this family, fociety, &c retained the language of its great ancestor with-out change or variation. That such a family did adually exit, is highly probable, for the following reasons:

"1. We think there is reason to believe, hat Ham, upon the heavy curfe denounced upon nim by his father, retired from his brethren, and fixed his refidence elsewhere. Accordingly, we find his descendants scattered far and wide, at a very great distance from the Gordyæan mountains, where the ark is generally supposed to have rested immediately after the flood. Some of them we find in Chaldea, others in Arabia Petix, others in Ethiopia, others in Canaan, and others in Egypt; and, finally, multitudes scattered over all the coast of Africa. Between those countries were planted many colonies of Shemites, in Elain, Affyria, Syria, Arabia, &c. We find, at the same time, the descendants of Shem and Japheth settled, in a great degree, contiguous to each other. This disperfion of the Hamites, irregular as it is, can scarce, we think, have been accidental; it must have been owing to some uncommon cause, and none seems more probable than that affigned above. If, then, the descendants of Ham separated early, and took different routs, as from their posterior situations it appears they did, they could not all be present at the building of the tower.

" It is not probable, that the descendants of Shem were engaged in this undertaking, fince we find that they were not feattered abroad upon the face of all the earth. The children of Shem were Elam, Ashur, Arpharad, Lud, and Aram. Elam fettled near the mouth of the river Tigris, in the country which, by the Gentile writers, was called Elymais. Above him, on the fame river, lay the demelne of Ashur on the western side. In ake manner, upon the fame river, above him was 'ituated Aram, who possessed the country of Aramea; and opposite to him was Arphaxad, or Arbaces or Arbaches, and his country was denominated Arpbachitis. Laid, as some think, settled in Lydia, among the fons of Japhet; but this opinion feems to be without foundation. Here, then, there is dispersion, but such as must have originated from the nature of the thing. The five brothers all fettled contiguous, without being feattered abroad upon the auboke earth. Befides, there was no confusion of language among these tribes: they continued to use one and the same tongue, (or lip as the Hebrew idiom expredies it,) through many fucceeding generations.

" From these circumstances, it appears that the posterity of Shem were not involved in the guilt of the builders of the tower, and of confequence did not undergo their punishment. If, then, the language of the Shemites was not confounded upon the erection of the tower, the prefumption is, that they retained the language of Noah, which in all probability, was that of Adam. Some dialectical differences would in process of time creep in, but the radical fabric of the language would remain unaltered.

"3. The posterity of Shem appear in general to have cultivated the pastoral life. They imitated the style of living adopted by the autediluvian posterity of Setb. No sooner had Noah descended from the ark, than he became I/b ba Adamab, a man of the earth; that is, a hufbandman, and planted a vineyard. We find that fome ages after, Laban the Syrian had flocks and herde; and that the chief wealth of the patriarch Abraham and his children

children confifted in their flocks and herds. his Gentile descendants, the Ishmaelites and Midianites, seem to have followed the same occupation. But people of this profession are feldom given to changes: their wants are few, and of confequence they are under few or no temptations to deviate from the beaten track. This circumstance renders it probable, that the language of Adam and Noah was preserved with little variation among the descendants of Arphaxad down to Abraham.

"We have observed, that Ham probably left the fociety of his brothers, and emigrated elfewhere. There is a tradition still current in the East, and which was adopted by many of the Christian fathers, that Noah, in the 930th year of his life, by divine appointment, did formally divide the whole terraqueous globe among his three fons, obliging them to take an oath that they would stand by the decision. Upon this happened a migration at the birth of Peleg, three centuries after the flood. It is affirmed, that Nimrod the archerebel difregarded this partition, and en-croached upon the territory of Afliur, which occafioned the first war after the flood.

" The Greeks had acquired fome idea of this partition, which they supposed to have been between Jupiter, Neptune, and Piuto. Plato feems to have heard of it: "For (fays he) the gods of old obtained the dominion of the whole earth, according to their different aliotments. This was effected without any contention, for they took possession of their several provinces in a fair and amicable way, by lot." Josephus, in his account of the dispersion of mankind, plainly infinuates a divine destination; and Philo Judeus was of the

tame opinion.

" In confequence of this arrangement, the fons of Shem took possession of the countries above menfioned; the posterity of Japhet had spread themselves towards the N. and W.; but the Hamites lerzed upon the land of Canaan; removed eastward, and at length defeending from the Carduchean or Gordyæan mountains, directed their course westward, and arrived at the plains of Shinar, which had been possessed by the Ashurim ever fince the era of the first migration at the birth of Peleg. The facred historian informs us, that " the whole earth was of one language and of one speech;" that in journeying from the east, they lighted upon the plain of Shinar, and dwelt there. In this passage we find no particular people specified; but as we find Nimrod, one of the descendants of Ham, fettled in that country, we are fure that they were the offspring of that patriarch. It would not, we think, be eafy to aftign a reason, how one branch of the family of Ham came to plant itself in the midfl of the fone of Shem by any Lther means but by volence.

" It is indeed generally supposed, that Nimrod, at the head of a hody of the children of Ham; made war upon Ashur, and drove him out of the country of Shinar; and there laid the foundation of that kingdom, the beginning of which was Babel: that this chief, supported by all the Cushhes, and a great number of apostates from the fatrilly of Shem and Japhet who had joined him, retailed to submit to the divine ordinance by the

mouth of Noah, with respect to the partition of the earth; and that he and his adherents were the people who erected the celebrated tower, in confequence of a refolution which they had formed to keep together, without repairing to the quarters afligned them by the determination of Heaven, This was the crime which brought down the judgment of the Almighty upon them, by which they were feattered abroad upon the face of all the earth. The main body of the children of Shen and Japhet were not engaged in this impious us dertaking; their language, therefore, was not con founded, nor were they themselves scattered broad. Their habitations were contiguous; the of the Shemites towards the centre of April dwellings of Japhet were extended towards N. and NW.; and the languages of both the miles continued for many ages without the variation, except what time, climate, laws, religi new inventions, arts, fciences, and commerce, will produce in every tongue in a fuccession years.

"The general opinion then was, that note the progeny of Ham and their affociates were fent at the building of the tower, and that I only suffered by the judgment consequent that attempt. There are even among the Pa fome allufions to the division of the world

the three fons of Noah.

" Berofus, in his history of the Babylomas, forms us, that XISUTHRUS, at the foot of Me Baris or Luban, where the ark refled, gave children their last instructions, and then wand out of fight. It is now generally believed that Xifuthrus of Berofus was Noah. (See Daniel § 5.) Eppolemus, another Heathen writer, us, " that the city Babel was first founded, afterwards the celebrated tower; both w were hailt by fome of those people who the the deluge. They were the same with those in after times were exhibited under the me giants. The tower was at length ruined by hand of the Almighty, and those giants were tered over the whole earth." This quota plainly intimates, that according to the opin of the author, only the raically mob of the Hi ites, and their apostate associates, were togin this daring enterprize.

"Indeed it can never be supposed that Shell if he was alive at that period, as he certainly w would co-operate in fuch an abfurd and impoundertaking. That devont patriarch, we thin would rather employ his influence and author to divert his defeendants from an attempt with he knew was undertaken in contradiction to express ordinance of Heaven; and it is furely httle probable that Eiam, Afliur, Aipharad, Aram, would join the impious confederacy, opposition to the remonstrances of their fath The building of the tower, according to the m probable chronology, was undertaken at a pen so late, that all mankind could not possibly be

concurred in the chterprise. " Many of the fathers were of opinion, the Norh lettled in Armenia, the country where the refted; and that his descondants did not less that region for five generations, during the ipal of 659 years. By this period the human race mul have been so amazingly multiplied, that the plains of Shinar could not have contained them. (See Astronuvalass, § 11—14.) According to the semantan Pentateuch, and the Septuagint version, Pelegwas born in the 134th year of his father Eher. Even admitting the vulgar opinion, that the tower has begun to be built, and the dispersion consequent upon that event to have taken place at this ta, the human race would have been by much too numerous to have universally concurred in sor design.

"From these circumstances, it appears that the stoke made of mankind was not engaged in building the tower; that the language of all the building the tower; that the language of all the building that the dispersion reached only to a combination of Hamites, and of the most profligate part if the two other families, who had joined their

moked confederacy.

"We have purfued this argument to confider-Helength, because some have inferred, from the frence in languages existing at this day, that t because, from the connection still existing mg languages, fome have been bold enough to Man the fact, though plainly recorded in faal history; and inftly, because we imagine that ne of our readers, who do not pretend to perthe writings of the learned, may be gratified the various opinions respecting the conof tongues, and the dispersion of mankind, meded into one mass, equally brief, we hope, melligible: and this view of these opinions, the foundations on which they respectively we think may suffice to prove, that the lannee of Noah was for forme ages preferved unand among the descendants of both Shem and

"To gratify still farther such of our curious ders as may not have access to more ample invention, we shall in this place exhibit a brief and of the circumstances which attended this his attempt. The people engaged in it have in held up as a profligate race. The Almighty set denominates them "the children of men," It is the very appellation by which the antenian sinners were characterized; the sons of the who deaphers of men, &c. Their design rating this edifice was "to make them a nane, as to trevent their being scattered abroad upon the lart of the whole earth." Gen. xi.

"Whatever resolution the rest of mankind might the, they had determined to maintain themselves that spot. The tower was intended as a per of union, and perhaps as a fortress of de-Such a flupendous fabric, they imagined, bud immortalize their inemory, and transmit immortance then include, a. This defign plainly intimates, that there as only a party concerned in the undertaking, ince, had all mankind been engaged in it, the purpof-would have been foolith and futile. Again, They intended, by making themselves a name, to Prevent their being suattered abroad upon the face of the earth. This was an act of rebellion in dind contradiction to the divine appointment, which constituted their crime, and brought down the judgment of Heaven upon their guilty heads.

The consequence of the consumon of languages was, that the projectors left off to build, and were actually scattered abroad, contrary to their intention. See BABEL.

"Abydenus, in his Affyrian annals, records, that the "tower was carried up to heaven; but that the gods ruined it by florms and whirlwinds, and overthrew it upon the heads of those who were employed in the work, and that the ruins of it were cailed Babylon. Before this there was but one language substituting among men: but now there arose πολυθερφωνη, a manifold speech; and he adds, that a war soon after broke out between Titan and Cronus." The Sybilline oracles give much the same account of this early and important transaction.

" Justin informs us, that the Phonicians who built Tyre were driven from Aflyria by an These Phænicians were the desearthquake. cendants of Mizraim the youngest fon of Ham; and were, we think, confederates in building the tower, and were driven away by the cataftrophe that enfued. Many other allusions to the dispersion of this branch of the family occur in Pagan authors. Upon the whole, it is probabie, that the country of Shinar lay defolate for some time after this revolution; for the dread of the judgment inflicted upon the original inhabitants would deter men from fettling in that inaufpicious region. At last, however, a new colony arrived, and Babel, or Babylon, became the capi-

tal of a flourishing kingdom.

" Nimrod, the mighty hunter, is generally thought to have been deeply concerned in the transactions of this period. According to most authors, ancient and modern, this patriarch was the leader of the confederates who crected the tower, and the chief infligator to that enterprize. The Seventy have pronounced him a giant, as well as a They have translated the Hebrew huntiman. word gebur, which generally lignifies firing, mighte, by the word rigae, giant; an idea which we imagine those translators borrowed from the Greeks. The antediluvian giants are called Nephelim and Rephaim, but never Geburim. Rabbinical writers, who juftly hated the Babylonians, readily adopted this idea; and the fathers of the church, and the Byzantine historians, have univerfally followed them. He has been called Nimrod, Nebrod, Numbroth, Nebroth, and Nebris. a few have made him the first Bacchus, and compounded his name of Bar, a fon, and Cufb, that is, the fon of Cufb. Some have imagined that he was the Orion of the Pagans, whose shade is so nobly described by Homer. But the etymology of this last name implies something honourable, and very unfuitable to the idea of the tyrant Nimrod. It must be observed, however, that we find nothing in Scripture to warrant the supposition of his having been a tyrant; so far from it, that some have deemed him a benefactor to mankind. See NIM-

The beginning of this prince's kingdom was Babel. Eufebius gives us first a catalogue of fix kings of the Childmans, and then another of five kings of Arabian extraction, who reigned in Chadaza after them. This might naturally enough happen, fince it appears that the inhabitants of those

those parts of Arabia which are adjacent to Chaldea were actually Cushites, of the same family

with the Babylonians.

"The Cushites, however, were at last subdued. perhaps partly expelled Chaldea by the Chafidim. who probably claimed that territory as the patrimony of their progenitors. That the Chasidim were neither Gustites, nor Hamites, is obvious from the name. The Hebrews, and indeed all the Orientals, denominated both the people who inhabited the eaftern coast of Arabia Cushim, and also the Ethiopians who sprung from the last mentioned people. Had the later inhabitants of Chaldea been the descendants of Cush, the Jewish writers would have called them Cushim. We find they called the Phoenicians Chanaanim, the Syrians Aramim, the Egyptians Mizraim, the Greeks Jonim, &c. The Chafidim, therefore, or modern inhabitants of Chaldea, were politively descended of one Chefed or Chafed; but who this family-chief was, it is not easy to determine. The only person of that name whom we meet with in early times is the 4th fon of Nahor the brother of Abraham; (Gen. xxii. 22.) and fome have been of opinion that the Chaldeans were the progeny of this Chefed. This appears highly probable, because both Abram and Nahor were natives of Ur of the Cha-The former, we know, in consequence of the divine command, removed to Haran, afterwards Charra; but the latter remained in Ur, where his family multiplied, and, in process of time, became mafters of the country which they called the land of the Chasidim, from Chefed or Chased, the name of their ancestor. This account is the more probable, as we find the other branches of Nahor's family fettled in the fame neighbourhood. See ELIHU and JOB.

"How the Greeks came to denominate these people x m.ldum, Chaldxi, is a question rather difficult to be resolved; but we know that they always affected to distinguish people and places by names derived from their own language. They knew a rugged, erratic nation, on the banks of the river Thermodon, in the territory of Pontus, bordering on Armenia the Less. These, in ancient times, were called Alybes, or Chalybes, because they were much employed in forging and polishing iron. Their neighbours, at length gave them the name of Chald or Caled, which imports, in the Armenian dialect, fierce, hardy, robust. This title the Greeks adopted, and out of it formed the

word xuxduss, Chaldeans.

"The Mosaic history informs us, that Ashur went out of that land, (Shinar) and built Nineveh and several other considerable cities. One of the successors of Ashur was the celebrated Ninus, who sirst broke the peace of the world (Jussian, i. c. s.), made war upon his neighbours, and obliged them by furce of arms to become his subjects, and pay tribute. Some authors make him the immediate successor of Ashur, and the builder of Nineveh. This we think is not probable; Eusebius, as we have observed above, gives a list of six Arabian princes who reigned in Babylon. We therefore imagine, that Ninus was the sifth or sixth in succession after Ashur.

"Ninus, according to Diodorus Siculus, made an alliance with Arizus king of the Arabians, and

conquered the Babylonians. This event put an end to the empire of the Hamites or Cushim in Shinar or Babylonia. The author observes, that the Babylon which figured afterwards did not then exist. This fact is confirmed by the prophet Isaiah (xxiii, 13.); " Behold the land of the Chafidim; this people was not till Ashur founded it for them that dwell in the wilderness. They set up the towers thereof, &c." After Babylonia wa fubdued by the Affyrians under Ninus, the capi tal was either destroyed by that conqueror, or de ferted by the inhabitants. At length it was a built by some one or other of the Assyrian s narchs, who collected the roving Chaudim. obliged them to fettle in the new city. The were subject to the Assyrian empire till the of Sardanapalus, when both the Medes and bylonians rebeiled against that effeminate pro

"The Chasidim were celebrated by all antity for their proficiency in aftronomy, aftromagic, and curious sciences. Ur, or Orchos, a kind of university for those branches of iems Such was their reputation in those studies, over a great part of Asia and Europe, a Chair and an astrologer were synonymous terms. I sciences, according to the tradition of the Cals, had been invented by Seth, whom the Edris; and had been cultivated by his do ants downward to Noah, by whom they transmitted to Shem, who conveyed them to

phaxad and his posterity. " To us it appears probable, that the relig sentiments transmitted from Noah through line of Shem, were kept alive in the fami Arphaxad, and so handed down to the family Serug, Nahor, Terah, Abram, Nahor il. The Jewish rabbis, and all the Haran, &c. fian and Mahomedan writers, made Abra contemporary with Nimrod; who, say they, fecuted him most crueily for adhering to the religion. That these two patriarchs were temporary, is very improbable, fince Nimro the third generation from Noah, and Abram tenth. Abram has been invested by the ran cal writers with every department of learn According to them, he transported from Ch into Chanaan and Egypt, astronomy, astro mathematics, geography, magic, alphabet writing, &c. &c.

"After the Babylonish captivity, when Jews were dispersed over all the east, and be to make profelytes of the gate among the Page wonderful things were reported of Abram respect to his acquirements in human eruditi as well as his supereminence in virtue and pi These legendary tales were believed by the lytes, and by them retailed to their connect and acquaintances. But certainly the holy! either was not deeply verfed in the human k ces, or did not deem them of importance end to be communicated to his posterity; fince Jews are, on all hands, acknowledged to be made little progress in these improvements. think of raising the fame of Abraham, by ca ing him with the philosophers, betrays an d treme defect in judgment. He is entitled to pres of a higher kind; for he excelled in piety, the father of the faithful, the root of the Melhal and the friend of God. Before thefe, all other titles ranish away. We shall only observe, that the Persans, Chaldeans, and Arabians, pretended that their religion was that of Abraham; that honourible mention is made of him in the Koran; and that the name Abraham or Ibrahim was celebrated over all the east. See ABRAHAM.

"In the progress of this disquisition, we have ken that the language of Noah was, in all probability the fame or nearly the fame with that of Adm. Additions and improvements might be moduced, but ftill the radical stamina of the ruge remained unchanged. It has likewise, hope, appeared, that the confusion of lannge at the building of the tower of Babel was onpartial, and affected none but the rebelious erew file race of Ham and the apoliate part of the failles of Shem and Laphet. We have concluded at the main body of the race of Shem were neidispersed nor their language confounded; d that confequently the descendants of that paich continued to ipeak their paternal dialect, the incorrupted language of Noah. To these ments we may add another, that in all prolity the worship of the true God was preferin the line of Arphanad, after the generality the other fects had lapfed into idolatry. Out this family Abraham was taken, in whose line true religion was to be preserved. Whether wham was an idolater when he dwelt in the d of Chaldea, the scripture does not inform us, ogh it feems to be evident that his father was. thing, however, is certain, namely, that Jeth appeared to him, and pronounced a blefupon him, before he left Ur of the Chaldees. at Gen. xii, 2. and Acts vii, 4.) The progeniof his family had been diftinguished by adheto the true religion. About this time, howor, they began to degenerate, and to adopt the bum of their apostate neighbours. It was then Abraham was commanded by Heaven to kere his kindred and his father's house, and to into a land which was to be shown him." Almighty intended that the true religion be preferved in his line, and therefore rebim from a country and kindred, by the ace of whose bad example his religious prin-might be endaugered. His family had only are apostatized; till that period they had pretel both the language and religion of their vetrable ancestors.

"But however much Abraham might differ the other branches of his family in his relilog fentiments, his language was certainly in uwith theirs. The consequence of this unchonable polition is, that the language which carried with him into Canaan was exactly the with that of his family which he relinquishwhen he began his peregrinations. But if this true, it will follow, that the language afterand denominated Hebrew, and that of the Chadim or Chaldeans, were originally one and the Ime. This position, we think, will not be conburerted. There is then an end of the dispute concerning the original language of mankind. We have advanced some presumptive proofs, that the language of Adam was transmitted to Noah, and

that the dialect of the latter was preferred in the line of Arphaxad downwards to the family of Abbraham; and it now appears that the Hebrew and Chaldean were originally fpoken by the fame family, and of course were the same between themselves, and were actually the first language upon earth, according to the Mosaic history. Numberless additions, alterations, improvements, we acknowledge, were introduced in the course of 2000 years; but still the original stamina of the language were unchanged. The Orientals are not a people given to change; and this character, in the earliest ages, was still more prevalent than at present.

"In confirmation of these presumptive arguments, we may add the popular one which is commonly urged upon this occasion, viz. that the names of antediluvian persons and places, mentioned by the sacred historian, are generally of Hebrew original, and fignificant in that language. Some of them, we acknowledge, are not so; but in this case it ought to be remembered, that a very small part of that language now exists, and that probably the radicals from which these words are descended are among the number of those which have long been lost."

# SECT. II. Of the HEBREW LANGUAGE.

"HAVING thus proved (fays Dr Doig,) the priority of the Hebrew to every other language that has been spoken by men, we shall now proceed to confider its nature and genius; from which it will appear fill more evidently to be an original language, neither improved nor debased by foreign idioms. The words of which it is composed are short, and admit of very little flexion. The names of places are descriptive of their nature, fituation, accidental circumstances, &c. We find in it no improvement from the age of Moles to the era of the Babylonish captivity. The age of David and Solomon was the golden period of the Hebrew tongue; and yet, in our opinion, it would puzzle a critic of the nicest acumen to discover much improvement even during that happy era. In fact, the Jews were by no means an inventive people. We hear nothing of their progress in literary pursuits; nor do they seem to have been industrious in borrowing from their neighbours. The laws and statutes communicated by Moses were the principal objects of their fludies. These they were commanded to contemplate day and night; and in them they were to place their chief delight. The confequence of this command was, that little or no regard could be paid to tafte, or any subject of philosophical invertigation. Every unimproved language abounds in figurative expressions borrowed from sensible objects. This is in a pecunar minner the characteristic of the language in question; of which it would be superstuous to produce instances, as the fact must be obvious even to the attentive reader of the English Bible.

"In the course of this argument, we think it ought to be observed, and we deem it of the greatest importance, that if we compare the other languages which have claimed the prize of originality from the Hebrew with that dialect, we shall quickly

quickly be convinced that the latter has a just title to the preference. The writers, who have treated this subject, generally bring into competition the Hebrew, Chaidean, Syrian, and Arabian. Some one or other of these has commonly been thought the original language of mankind. The arguments for the Syrian and Arabian are altogether tutile. The numerous imprevements superinduced upon these languages, evidently prove that they could not have been the original language. In all cognate dialect., etymologish hold it as a maxim, that the least improved is likely to be the most ancient.

"We have observed above, that the language of Abraham and that of the Chefedim or Chaldeans were originally the fame; and we are perfuaded, that if an able critic should take the pains to examine firifly there two languages, and to take from each what may reasonably be supposed to have been improvements or additions fince the age of Abraham, he will find intrinsic evidence of the truth of this position. There appear still in the Chaldean tongue great numbers of words the fime with the Hebrew, perhaps as many as mankind had occasion for in the most early ages; and much greater numbers would probably be found. if both languages had come down to us entire. The conttruction of the two languages is indeed tomewhat different; but this difference arifes chiefly from the fuperior improvement of the Chaldean. While the Hebrew language was in a manner stationary, the Chaldean underwent propreffive improvements; was mellowed by antitheies, rendered fonorous by the disposition of vocal founds, acquired a copiousness by compounds, and a majetty by affixes and prefixes, &c. In process of time, however, the difference became io great, that the Ifraelites did not understand the Chaldean language at the era of the Babylonish This much the prophet intimates, captivity. when he promifes the pious Jews protection " from a fierce people; a people of a deeper speech than they could perceive; of a stammering tongue that they could not understand." Ifaiah xxxiii,

"The priority of the Chaldean tongue is indeed contended for by very learned writers. Cambden calls it the mother of all languages; and most of the fathers were of the same opinion. Amira has made a collection of arguments, not inconsiderable, in favour of it; and Myriceus, after him, did the same. Erpenius, in his oration for the Hebrew tongue, thought the argument for it and the Chaldean so equal, that he did not choose to take

upon him to determine the question. "Many circumstances, however,

"Many circumftances, however, concur to make us affign the priority to the Hebrew, or rather to make us believe that it has inflered fewelf of those changes to which every living tongue is more or less hable. If we thip this ianguage of every thing obviously adventitions, we shall find it extremely simple and primitive. I. Every thing masoretical, supposing the vowels and points effential, was certainly unknown in its original character. 2. All the prefixed and affixed letters were added time after time, to give more compass and precision to the language. 3. The various voices, moods, tenses, numbers, and persons of

verbs, were posterior improvements; for in that tongue nothing at hist appeared but the indeclinable radix. 4. In the same manner, the few adjectives that occur in the language, and the number and regimen of nouns, were not from the beginning. 5. Most of the Hebrew nouns are derived from verbs; indeed many of them are written with the very fame letters. This rule, however, is not general; for often verbs are derived from nouns and even fome from prepositions. 6. All the verb of that language, at least all that originally be longed to it, uniformly confift of three letters, and feem to have been at first pronounced as monfyllables. If we anatomize the Hebrew language in this manner, we shall reduce it to a very gre fimplicity; we shall confine it to a few names things, perfons, and actions; we shall make its words monofyllables, and give it the true racters of an original language. If at the fa time we reflect on the fmall number of rade words in that dialect, we shall be more and mo convinced of its originality.

"It will not be expected, that we should end into a minute discussion of the grammatical prolarities of this ancient language. For the must refer our readers to the numerous and to borate grammars of that tongue, which are on where easily to be found. We shall only make the strictures, which naturally present them.

before we difmiss the subject.

"The generality of writers who have main ed the fuperior antiquity of the Hebrew language have at the fame time contended that all oil languages of Afia, and most of those of Euro have been derived from that tongue as their for and matrix. We, for our part, are of opin that perhaps all the languages in the eaftern a of the globe are coeval with it, and were one ly one and the fame; and that the different which afterwards diftinguished them, fprungs chimate, caprice, inventions, religions, commi conquefts, and other accidental causes, which occur to our intelligent readers. We have vouced to prove, that all mankind were note cerned in the building of the fatal tower, nor fected by the punishment confequent upon attempt: and we now add, that even that pull ment was only temporary; fince we find, the those very Hamites or Cushim, who are allow to have been affected by it, aid certainly and wards recover the former organization of them. and differed not more from the original standa than the defcendants of Japhet and Shem-

"The Jewith rabbis have pretended to ake tain the number of languages generated by a vengeance of Heaven at the building of Bald They ted us that mankind was divided into pations and 70 languages, and that each of the tions had its totelar or guardian angel. This building legend is founded on the number of progeny of Jucob at the time when that patinand his family went down into Egypt.

"Abraham, a Hebrew, lived among the Chadeans, travelled among the Canaanites, followed among the Philiftimes, lived fome time in Egypt and in all appearance converfed with all those strong without any apparent difficulty. This creumfrance plainly proves, that all these nations at

that time spoke nearly the same language. The nations had not yet begun to improve their respedive dialects, nor to deviate in any measure from the monofyllabic tongue of the Hebrews. With respect to the language of Canaan, afterwards the Phænician, its fimilarity to the Hebew is obvious from the names of gods, men, cilies, mountains, rivers, &c. which are the very have in both tongues, as might be shown in numberiefs cafes.

SECT. II.

We shall now give a brief account of the Hektters, and of the Masoretic points, about there have been to much controverly among derus. Much has been written, and numberhypotheles propoled, to invefligate the origin aplabetical writing. To live even an abridged want of all these, would fill many volumes.

ALPHABETICAL CHARACTERS.) In the orid scheme of Hilkoglyphics, the process was bucks somewhat in this manner: A lion might helds tomewhat in this manner.

Leithed, to import fierceness or valour; an denote strength; a flag, to signify swiftness; to intimate timorousness, &c. The next this process would naturally extend to the ding and appropriating of a few arbitrary afters, for representing abstract ideas, and relations, which could not be well afcerd by the methods above mentioned. These may figus might readily acquire a currencompact, as money and medals do over expan of the world.-Upon this plan we me the ancient Chinese formed their lan-

but neither the picture nor the hieroglyphic, be method of denoting ideas by arbitrary chamappropriated by compact, could ever have d at such perfection as to answer all the purof ideal communication. The grand defiam then would be to fabricate characters to that simple founds, and to reduce these chan to fo small a number as to be easily learnpreserved in the memory. In this attempt Mincle have notoriously failed; their letters, her their characters, are so numerous, that Imy, of their most learned and industrious have been able to learn and retain the catalogue. Indeed those people are not aconceive how any combinations of 20 or 30 des should be competent to answer all the poles of written language.

Many different nations have claimed the hoof this invention. The Greeks afcribed it he Phonicians. They borrowed their letters the Phænicians, and of course looked up to a the inventors. Others attributed the into the Egyptians." But this is contrary for the Egyptians used hieroglyphics for 2 ages after the Phoenicians, Hebrews, and that completed their alphabets. And if bid ever invented or uled alphabetical cham, they would immediately have given up

the of hieroglyphics. iom various circumilances Dr Doig makes it ant " that the Syrian alphabet, or the Syrian were the fame with the Hebrew. That Allynan or Chaldaic and Hebrew languages te the fime, (he adds,) has been fully proved YOL XVII. PART II.

already: that their letters were the same in the original structure, can scarce be controverted: These letters, we think, were antediluvian. As this opinion may admit some dispute, we shall take the liberty to fubjoin our reasons.

" 1. It appears that the era of this invention is buried in impenetrable obscurity. Had an invention of such capital importance to mankind been made in the postdiluvian ages, the author would have been commemorated in the historical annals

of the country where he lived.

" 2. The art of writing in alphabetical characters, according to the facred records, was practifed at fo early a period, that there was not a long enough interval between that and the deluge

to give birth to that noble invention.

Moses has recorded the history of the creation, of a few of the capital transactions of the antediluvian world, the birth, the age, the death; of the lineal descendants of Seth. He has preserved the dimensions of the ark, the duration of the univerfal deluge, its effects upon man and all terrestriai animals, the population of the world by the posterity of Noah, the age, &c. of the patriaichs of the line of Shem, from which his own ancestors had forung. To this he has subjoined the petty occurrences which divertified the lives of Abraham, Isaac, and Jacob, and their descendants. Whence did the historian derive his information? We believe few of our readers will be for enthuliaftic as to imagine that the author received it from divine infpiration. Tradition is a fallible guide; and in many cases the accounts are so minutcly precise, as to defy the power of that species of conveyance. The inspired author must certainly have extracted his abridgment from written memoirs, or histories of the transactions of his ancestors regularly transmitted from the most car-ly periods. These annals he probably abridged, as Ezra did afterwards the history of the Kings of Israel. If this was the case, the art of writing in alphabetical letters must have been known and practifed many ages before Mofes. It has indeed been pretended, that the Jewish decalogue inseribed upon two tables of stone, was the very first fp-cimen of alphabetical writing. The arguments adduced in proof of this fact are lame and inconciufive. Had that been the cafe, some notice must have been taken of so palpable a circumstance. Mofes wrote out his history, his laws, and his memoirs; and it appears plainly from the text, that all the learned among his countrymen could read them. Writing was then no novel invention in the age of the Jewish legislator, but current and generally known at that erac

"The patriarch Job lived at an earlier period." (See Job.) "In that book we find many allufions to the art of writing, and some passages which plainly prove its existence. This shows that alphabetical characters were not confined to the chofen feed, fince Job was in all probability a descendant of Iluz, the eldeft fon of Nahor the brother of Abraham. From this circumftance, we think we may fairly conclude, that this art was known and practifed in the family of Terah, the father of A-

braham.

" 3. There was certainly a tradition among the Bbb Jews Jews in the age of Josephus, that writing was an antediluvian invention. That historian pretends, that the descendants of Seth-erected two pillars, the one of Rone and the other of brick, and inscribed upon them their astronomical observations and other improvements.—This legend shows that there did exist such an opinion of the antiquity of

the art of writing.

" 4. There must have been a tradition to the same purpose among the Chaldeans, since the writers who have copied from Berofus, the celebrated Chaidean historian, speaks of asphabetical writing as an art well known among the antediluvians. According to them, OANNES the Chaldean legiflator, gave his disciples " an insight into letters and science. This person also wrote concerning the generation of mankind, of their different pursuits, of civil polity, &c. Immediately before the deluge (fay they) the god Cronus app. ared to Sifuthrus or Xifuthrus, and commanded him to commit to writing, the beginning, improvement, and conclusion of all things down to the present time, and to bury these accounts securely in the temple of the Sun at Seppara." All these traditions may be fabulous in the main; but still they evince that fuch an opinion was current, and that though the tife of letters was not indeed eternal, it was, however, prior to all the records of history; and of course, we think, an antediluvian discovery.

"This original alphabet, whatever it was, and however confiructed, was, we think, preferred in the family of Noah, and from it conveyed down to succeeding generations. If we can then discover the original Hebrew alphabet, we shall be able to investigate the primary species of letters expressive of those articulate sounds, by which man is in a great infrastre distinguished from the brute creation. Whatever might be the nature of that alphabet, we may be convinced that the ancient Jews deemed it facred, and therefore preserved it pure and thimixed this the Babylonish captivity, if, then; any monuments are full extant inferibed with letters prior to that event, we may rest assured that these are the remains of the original al-

phabet.

"There have, from time to time, been dug up at Jerusalem, and other parts of J dea; coins and medals, and medallions, inscribed with letters of a form very different from those square letters in which the Hebrew Scriptures are now written.

"When the Samaritan Pentateuch was discovered, it evidently appeared, that the inscriptions of those medals and coins were drawn in genuine Samaritan characters. The learned Abbe Barthelemi, in his dissertation "on the two medals of Antigonus king of Judea, one of the later Asmonean princes, proves that all the inscriptions on the coins and medals of Jonathan and Simon Maccabeus, and also on his, were invariably in the Samaritan character, down to the 40th year before the Christian era."

"It were easy to prove, from the Mishna and Jerusalem Talmud, that the Scriptures publicly read in the synagogues to the end of the second century were written in the Samaritan character, we mean in the same character with the Pentateuch in question. As the ancient Hebrew, however, ceased to be the vulgar language of the Jews,

after their return from the Babylonish captivity the copies of the Bible, especially those in privathands, were accompanied with a Chaldaic pan phrase; and at length the original Hebrew chracter fell-into-disule, and the Chaldaic was un versally adopted.

" It now appears that the letters inscribed in the ancient coins and medals of the Jews we written in the Samaritan form, and that the Scri tures were written in the very same character we shall theresore leave it to our readers to jud whether (confidering the implacable batred whi sublisted between these two nations) it be lit that the one copied from the other; or at h that the Jews preferred to the beautiful know fed by their anceftors, the rude and inelegant racters of their most detested rivals. If, the inscriptions on the coins and medals were all in the characters of the Samaritan Pentali (and it is abfurd to suppose that the Jewsborn ed them from the Samaritans), the confeque plainly is, that the letters of the inferiptions those of the original Hebrew alphabet, excels that language, which we dare to maintain, the first upon earth.

" It may, perhaps, be thought rather in ous to mention, that the Samaritan co whom the kings of Affyria planted in the Samaria, were natives of countries where C letters were current, and who were proba norant of the Hebrew language and chara-When those colonists embraced the Jewished they procured a copy of the Hebrew Penta written in its native character, which, from flition, they preferved inviolate as they req it; and from it were copied fuccessively the which were current in Syria and Balestine Abp Usher procured his. From the reasons exhibited, we hope it will appear, that if the brew alphabet, as it appears in the Samarita tateuch, was not the primitive one, it was that in which the Holy Scriptures were first

mitted to writing.

"Scaliger has inferred, from a passage in bius, and another in St Jerom, that Ezra, he reformed the Jewish church, transcribe Scriptures from the ancient characters of the brews into the square letters of the Chalc This, he thinks, was done for the use of Jews, who being born during the captivity, is no other alphabet than that of the people as whom they were educated.—This account of matter, though probable in itself, and supply passages from both Talmuds, has been at ed by Buxtorf with great learning and no kiss mony. Scaliger, however, has been followed a crowd of learned men whose opinion is now ty generally espoused by the sacred critics."

Having faid fo much concerning the Hel alphabet, we must now, according to pros (See Herrew, § III, 1.) hazard a few stricture the vowels a d Masoretic points; the first estimated the last an appendage, of that ancient languard the number of the one, and the nature, and ty, and necessity of the other, in order to real language with propriety and with discriminate have been the subject of much and often illing controversy among philological writers. To en

into a minute detail of the arguments on either fide, would require a complete volume: we shall, therefore, briefly exhibit the state of the controverly, and then adduce a few observations, which, in our opinion, ought to determine the question.

"The controverly then is, Whether the Hebrews used any vowels; or whether the points, which are now called by that name, were substiated inflead of them? or if they were, whether by be at old as Moses, or were invented by Ezor by the Masorites? This controversy has mied the wits of the most learned critics of tare last centuries, and is still undetermined. kws maintain, that these vowel points were and to Moles along with the tables of the and consequently hold them as sacred as they ke ktters themselves. Many Christian authors have handled this subject, though they do The their divine original, nor their extravaantiquity, pretend, however, that they are my proper vowels in the language, and reguascertain its true pronunciation. Though ter from the Jews with respect to the orithese points, they yet allow them a pretty antiquity, ascribing them to Ezra and the ers of the great fynagogue.

It length, however, about the middle of the contury, Elias Levita, a learned German Jew n flourished at Rome, discovered the desaid made it appear that these appendages for been in use till after the writing of the about 500 years after Christ. This innomised Elias a multitude of adversaries, both own countrymen and Christians. Among ter appeared the two Buxtorfs, the father fon, who produced fome cabbaliftical of great antiquity, at least in the opinion Jows, in which there was express niention points. The Buxtorfs were answered by and other critics, till Father Morinus tramined all that had been urged on both produced his learned differtation on that ; against which there has been nothing reany confequence, whilft his work has been y admired, and his opinion confirmed by have beaten the same field after him. anding to this learned father, it plainly ap-

neither Origen, nor St Jerome, nor even pilers of the Talmud, knew any thing of has been called the vowel points; and that books were not finished till the 7th century. the Jewish rabbis who wrote during the 8th centuries, were not in the least acquainted efe points. He adds, that the first vestiges trace of them were in the writings of Aber chief of the western, and of rabbi pitali chief of the eastern, school, that is, the middle of the 10th century; so that they be faid to be older than the beginning period. The Buxtorfs and other learned here ascribed the invention of the vowel in question to the rabbis of the school of which flourished about the middle of century. This opinion is by no means be, because it appears plain from history, efore that period all the Jewish seminaries province were destroyed, and their heads

forced into exile. Some of these retired into Babylonia, and settled at Sora, Naherda, and Pombeditha, where they established famous universities. After this era there remained no more any rabbinical schools in Judæa, headed by professors capable of undertaking this difficult operation, nor indeed of sufficient authority to recommend it to general practice, had they been ever so thoroughly qualified for executing it.

" Capellus and father Morin, who contend for the late introduction of the vowel points, acknowledge that there can certainly be no language without vocal founds, which are indeed the foul and effence of speech; but they affirm that the Hebrew alphabet actually contains vowel characters, as well as the Greek and Latin and the alphabets of modern Europe. These are aleph, be, vau, jed. These they call the matres lectionis, or, if you please, the parents of reading. To these some, we think very properly, add ain, oin, or ajin. These, they conclude, perform exactly the same office in Hebrew that their descendants do in Greek. It is indeed agreed upon all hands, that the Greek alphabet is derived from the Phœnician. which is known to be the fame with the Samaritan or Hebrew. Hitherto the analogy is not only plaufible, but the refemblance precise: The Hebrews and Samaritans employed these vowels exactly in the same manner with the Greeks; and so all was eafy and natural.

"But the afferters of the Masoretic system maintain, that the letters mentioned above are not vowels but confonents or aspirations, or any thing you please but vocal letters. This they endeavour to prove from their use among the Arabians, Persians, and other oriental nations: But to us it appears abundantly strange to suppose that the Greeks pronounced beta, gamma, delta, &c. exactly as the Hebrews and the Phoenicians did, and yet at the fame time did not adopt their mode of pronunciation with respect to the five letters under confideration. To this argument we think every objection mußt undoubtedly yield. The Greeks borrowed their letters 'rom the Phænicians; these letters were the Hebrew or Samaritan. The Greeks wrote and pronounced all the other letters of their alphabet, except the five in question, in the same manner with their originals of the east: if they did so, it obviously follows that the Greek and oriental office of these letters was the same."

"We cannot (adds Dr Doig,) take leave of the facred language without giving a brief detail of those excellencies, which give it a claim to the superiority over those tongues which have sometimes contended with it for the prize of antiquity.

"If this language may claim any advantage over its antagonits, it is undoubtedly in confequence of its simplicity, its purity, its energy, its fecundity of its expressions and significations. In all these, notwithstanding its paucity of words, it excels the vast variety of other languages which are its cognate dialects. To these we may add the significancy of the names, both of men and brutes; the nature and properties of the latter of which are more clearly and fully exhibited by their names in this than in any other tongue hitherto known. Besides, its well authenticated antiquity, and the

venerable tone of its writings, impacts any thing left upon record in any other dialect may extent

"A, far a, we made hand it in its profest netthred condition, and are able to pudge of its charactor from those tow books that have come down to our tone, we plainly perceive that its geam is n upos, primitive, and natural, and exactly con-formable to the character of those uncally acid patriarchs who used it themselves, and translessed it to their selected ants in its native purity and fineplicity. Its words are comparatively few, jet goneife and expreffive; derived from a very famil pernber of radicals, without the artificial compofition of modern languages. No tongue, amount or modern, can rival it in the rich tecundity of its verbs, resulting from the variety and fignificancy of its conjugations; which are fo admirably arranged and diverlined, that by changing a letter or two of the primitive, they express the various modes of acting, fuffering, motion, reft, Ac. in fuch a precite and figuificant manner, that ficquently in one word they convey an idea which, in any other language, would require a tedious paraphrafe. These positions might easily be illustrated by numerous evaluples; but to the Hebiew feholar thefe would be superfluous, and to the illiterate class neither interesting nor entertaining.

"To these we may add the monofyllable tone of the language, which, by a few prefixes and aifixes without affecting the radix, varies the figuification almost at pleasure, while the method of affixing the perion to the verb exhibits the gender of the object introduced. In the nouns of this language there is no flexion, except what is necestary to point out the difference of gender and number. Its cases are diffinguished by articles, which are only fingle letters at the beginning of the word: the pronouns are only tragle letters affixed; and the prepontions are of the func character prefixed to words. Its words follow one another in an edy and ustural arrangement, without intricacy or trumpolition, without forpending the attention or involving the fend by intricate and artificial periods. All thefe flriking and peculiar excellencies combined, plainly demonstrate the beauty, the flability, and antiquity of the lan-

gunge under confideration. "We would not, however, infinuate that this tongue continued altogether wishout changes. We admit that many radical words of it were loft in a courfe of ages, and that foreign ones were substituted in their place. The long following of the Ifraelites in Egypt must have introduced a multitude of Egyptian vocables and phrases into the yulgar dialect at leaft, which must have gradually incorporated with the written language, and in process of time have become parts of its effence. Befides, the Scripture informs us, that there came up out of Egypt a mixed multitude; who must har a infected the Hebrew tongue with the dialect of Egypt. As none of the genuine Hebrew radieals cheed three letters, whatever words exceed that number in their radical date may be justly decined of foreign extraction."

#### SECT. III. Of the ARABIC LANGUAGE.

"We now proceed (fays Dr Doig) to give form, around of the Arabian language, which is easily

deaily one of the latter dialects of the lieber, Both were originally the fame; the ion or transfing a weed and collarged; the latter, in appearance, reading its original fungitieity and rule apear pool of by a people of a genus by no mass in ventive. In this inquiry, too, as in the torrer, we shall spire ourselves the trouble of desending to the grammatical minutize of the torque. To those who are inclined to acquire the first chains of that various, copious, and highly improved tongue, we beg to recommend Erp, ni Radiana Lings, Arab. Golii Gram, Arab. the differations of Aaris, translated by the elder Schulters; M. Riebardson's Pertic and Arabic Gram, Sec.

That " the Hebrew and Arabian are filler & lefts, has been feldom controverted: but we said there is authentic historical evidence that w were politively one and the fame, and at apsil when the one as well as the other appeared is infant unadorned for plicity." Our learned and endervours to prove this, from various can flances; particularly from Gen. x. 25-30, when it is recorded, that the 13 fours of Johan or In tan and their "defeendants possessed all the man time coult of Arabia from Mellia (Mocha) tomort Sephar towards the east of that peninfula." illuftrates this faither from Havilab, the small Joktan's 12th fon, being the name of an exist country abounding with gold, mentioned & Me ics, (Gen. ii. 21.) as furrounded by one of 21vers of Paradife; and he might have urged 12. I'm argument from Ophir, the name of Yolaid rith fon, being the name of another country Arabia, alfo abounding with gold. This Your he fays, the Arabians also call Kohtan; and ak whole infers, that as thefe patriarchs folking thing but Hebrew, "the original language of the tribes of the Arabinas who inhabit a value of country along the fouthern there, was rad their father Kobtan, that is, the Hebrew. Last the most learned Arabians of modern time monthly acknowledge this patriarch as the of their language as well as of their nation

"The other diffricts of Arabia were parkly the offspring of Abraham. The Ithmzeitts pofferity of that patriarch by Hagar, pendial into the very centre of the peninfula; incorporate and in process of time became one people will the Kobtanites. Another region was podefield the enisdress of the fame holy man by Cheur his fecond wife. The Moabites, Ammonites !domites, Anialekites, &c. who fettled in the said ous regions of Arabia Petrica, were all branched of Abraham's family, and used the fame linguist with their great progenitor. The Scripture indeed speaks of people who inhabited the courty in mentioned prior to the branches of Abraham's high mily; but these were extirpated by the former The conclusion then i., that all the inhabitants the three divitions of Arabia did, in the care periods, univertally use the Hebrew tongue

"There was, we are fenfible, a region of Arms inhabited by the Cushim, or defeendants of Crail This diffriet was fittented on the confines of Bubblonia. Our traditions have confounded this contry with the modern Ethiopia; and have come quently aderibed the exploits of the Arabian Collina to the Ethiopians. The Arabian kines of Bubblonia.

abylonia were those of Cushim. These were conpiered and expelled Babylonia by the Chafidim.

Their spoke the Chaldean dialect.

"The Arabic tongue, originally pure Hebrew, us in process of time greatly altered. The Arauns were divided into many different tribes; a icumstance which naturally produced many Herent dialects. These, however, were not of No foreign enemy ever conmuch growth. ered those independent hordes. The Persians, and Romans, sametimes attempted to their territories; but the roughness of round, the scarcity of forage, the penury ed them. They were indeed once invaded by Abyssinians or Ethiopians with some show of as; but these invaders were in a short time elled the country. Their language, of confe-ace, was never adulterated with foreign words entic phrases and idioms. Whatever augmenos or improvements it received were derived the genius and industry of the natives, and com adventitious or imported acquisitions. this we may justly infer, that the Arabian was long stationary, and differed in no detable degree from its Hebrew archetype. termed Schultens, in his Commentary on Job, shown, to the conviction of every candid ina, that it is impossible to understand that subcomposition without having recourse to the cidioms. That patriarch was a Chuzite. country was a part of Arabia. His three swere actually Arabians, being the descend-Ishmael and Esau." (See Job, ELIPHAZ, v, &c.) "His country bordered upon that e predatory Chaldeans, who were an Arabian mi. When we confider all these circumwe are strongly inclined to believe that look of Job was written in Arabic, as the lanfood at that period; which could not have her than the age of Moses. The learned generally agreed that this whole book, the 3 chapters excepted, is a poetical composition, with the most brilliant and most magnisiimagery, the boldest, the justest, and most ous tropes and allusions, and a grandeur of ent wholely divine. Whoever reads the compositions of the modern Arabians, on lubjects, will discover a striking similarity d of diction and fentiment.

<sup>8</sup> Of those different dialects which prevailed apurg the various tribes of Arabia, the principal the Hemyaret and the Koreish. As for the endent tribes, they had no temptation to culare any other language than their own.

The Koreith tribe was the noblest and the karned of all the western Arabs; and the or square temple of Mecca, was before the of Mohammed folely under their protection, temple drew annually a great concourse of Frims from every Arabian tribe, and indeed revaled. The language of the Koreish was stual with emulation by the neighbouring tribes. Numbers of the pilgrims were people of the first Rink. Great fairs were held during their refidence at Mecca, and a variety of amusements silled up the intervals of their religious duties. In these en-

tertainments literary compositions bore the most diftinguished rank; every man of genius confidering not his own reputation alone, but that of his nation or tribe, as interested in his success. Poetry and rhetoric were chiefly effeemed and admired. An affembly at Ocadb, had been effablished about the end of the 6th century, where all were admitted to a rivalship of genius. The merits of their respective productions were impartially determined by the affembly; and the most approved of their poems, written on filk, in characters of gold, were with much folemnity suspended in the temple as the highest mark of honour which could be conferred on literary merit. These poems were called the Moallabat, suspended, or Modbabebat, golden. Several of these are preserved in many European libraries.

" From this attention to promote emulation, and refine their language, the dialect of the Koreish became the purest, the richest, and the most polite, of all the Arabian idioms. It was studied with a kind of predilection; and about the beginning of the 7th century it was the general language of Arabia, the other dialects being either incorporated with it or fliding gradually into difuse. By this fingular idiomatic union the Arabic has acquired a prodigious fecundity; whilft the luxuriance of fynonymes, and the equivocal or opposite fenses of the same or similar words, hath furnished their writers with a wonderful power of indulging, in the fullest range, their favourite passion for antithefis and quaint allufion. One inftance of this we have in the word veli; which fignifies a prince, a friend, and also a flave. This same word, with the change of one letter only, becomes vali; which, without equivocation, imports a fovereign. Examples of this kind occur in almost every page of every Arabic dictionary. But all those advantages of this incomparable language are merely modern, and do not reach higher than the beginning of the 6th century.

"The Koran was written in the dialect of the Koreish; a circumstance which communicated additional splendor to that branch of the Arabian tongue. It has been proved, that the language of the original inhabitants of Arabia was genuine Hebrew; but a question arises, whether the Arabians actually preferved their original tongue pure and unfophisticated during a space of 3000 years, which elapfed between the deluge and the birth of Mohammed? or, whether, during that period, it underwent many changes and deviations from the original standard !-The admirers of that language strenuoully maintain the former position; others, who are more moderate in their attachment, are disposed to admit the latter. Chardin observes of the oriental languages in general, that they do not vary and fluctuate with time like the European tongues.

" Prof. John Robertson, and the great Schultens, are clearly of opinion, that the language in queftion, though divided into a great number of ftreams and canals, still flowed pure and limpid in its courfe. But every oriental scholar must confefs, that the ftyle of the Koran is in a manner obfolete, and become almost a dead language. If the Arabian has deviated fo very confiderably from the flandard of the Koran in little more than 1000

Digitized by Google

gears, by a parity of reason we may infer, that enach greater deviations must have affected the

language in the space of 3000 years.

It is univerfally allowed by such as maintain the unsulided purity of the Arabian tongue, that it was originally the same with the Hebrew, or with the ancient Syriac and Chaldaic. Let any one now compare the words, idioms, and phraseology of the Koran with the remains of those three languages and the difference will be palpable. This circumstance, one would think, indicates in the strongest terms a remarkable alteration.

"There are strong reasons to believe that Job was an Arabian, and flourished prior to Moses, perhaps as early as Jacob. (See Jon, § 1.) The flyle, the genius, the figurative tone of the compolition; the amazing subsimity of the sentiments, the allufions, the pathos, the boldness, the variety, the irregularity, and the poetical enthufiasm which pervade the whole poem, ftrongly breathe the Arabian spirit; indeed the very diction is peculiar to that fingle book, and differs widely from that of the Pfalms and every poetical part of the facred canon. If we compare this book with Mohammed's Koran, we shall scarce find any re-Lemblance of words or phraseology.; but a wondesful fimilarity of figures, enthufialm, and elewation of fentiments. ." We then conclude, that the Arabic did actually lose and gain a multitude of vocables between the era of its first establishment among the descendants of Joktan and Ishenael and the birth of the impostor.

"The art of writing was introduced among the Arabs at a very late period: Without the af-Chance of this art, one would think it altogether impossible to preserve any language in its primewal purity and simplicity. It is generally agreed, that the art was known among the Mamyarites at a very early period. These people were sovereigns of Arabia during a course of many ages. Their Character was somewhat perplexed and confused. Monuments bearing inscriptions in these characters are fill to be seen in some places of Arabia. Some were engraved on rocks; and to these we think it probable that Job aliudes, in those passages where he intimates an inclination to have his fufferings recorde in a book, and graven in the rock for ever. We conclude then, that the Hamyarites knew the art of writing from , earliest antiquity, and that the letters they employed were the rude Chaldaic in their unimpro-

wed flate.

"With respect to the highly polished Koreishites, it is agreed on all hands, that they were unacquainted with the use of letters till a sew years before the birth of Mohammed. Ebn Chalican, one of their most celebrated historians, informs us, that Moramer the son of Mosta, a native of Anbaris, in Irak, first invented alphabetical characters, and taught his countrymen to use them, from whom this noble invention was derived to the Koreishites. These letters, though neither beautiful nor convenient, were long used by the Arabs. They were denominated Supbite, from Supba a city of Irak. In this character the original copy of the Koran was written. These were think were the original clumsy characters, which were retained by the vulgar, after the

beautiful fquare Chaldaie letters were intended; and probably used by priests, philosophet and the learned in general. These letters are a ten at this day used by the Arabs for the tities books and public inscriptions.

"ABAULI the son of Mocla, about 300 year after the death of Mohammed, found out a me elegant and more expeditious character. This vention of Abauli was afterward carried to p section by Ebn Bowia, who died in the year the hegira ar3, when Kader was caliph of B dad. This chara ter, with little variation,

tains at this day.

"The vifir above-mentioned, who carried Arabian alphabet to the pinnacie of perfection vented and aimexed the vowel points for the of ease and expedition in writing; from whit may infer, that prior to the 20th century the rabians had no wowel points. His design, bricating these points, was consessed expedition in writing; which furnishes a profession that the Hebrew wowel points were deat. Some late period for the very same purpose

Our room permits us not to follow our a in his learned differtation on the richnels at riety of the Arabic language; on the orator poetry of the Arabian authors; or to co long and learned quotations in praise of the ple and language, from Bp. Pocoche's Latin tion on that subject. " To these" (says De " we might add quotations from Erpenius tion on the same subject, from Golius, Sch Hottinger, Bochart, and Sir William Jones fides a whole cloud or oriental witnesses, extravagant encomiums would rather than edify our readers. These panegynor perhaps be in some measure hyperbolical; general we believe them pretty well founded the same time we are convinced that the A however melodious in the ears of a native, harsh and unharmonious in that of a Europ

and Robertson, &c. have lavished a proful learning, in proving the affinity and diale cognation between the Hebrew and Arabic. learned professors of the university of Le were the first who entered upon the career rabian learning. To them the European to are principally indebted for what knowledge that language they have hitherto been able to tain. The palm of giory, in this branch of ture, is due to Golius, whose works are of profound and elegant; so perspicuous in met that they may always be confusted without fati and read without languor. Erpenius's exce grammar, and dictionary, will enable the fit to explain the history of Tai nur by Ibni Aral If he has once maftered that fubilime work will understand the learned Arabic better most of the Khatabs of Constantinople of Mecca.

" Bochart, Hottinger, Schultens, Pocock

The Arabian language, however, notwithly ing all its boafted perfections, has undoubted the fate of other living languages; it gradually undergone such confiderable alterated that the Arabic spoke and written in the age Mohammed may be now regarded as a dead guage: it is indeed so widely different from a mode.

nodern language of Arabia, that it is taught and malied in the college of Mecca just as the Latin at Rome.

ect. IV. Of the CHALDEAN, PHOFNICIAN, Ethiopian or Abyssinian, and Egyptian Landuages.

"As there is a very first dialectical analogy alog these languages," (continues our learned aulos) we have arranged them all under one section; see what is observed relating to one of them may bettended to them all.

The Chaldeans, or Chafidim, as they are calis Scripture, were the descendants of Chesed son of Nahors, the brother of Abraham. by drove the Cushim or Arabians out of Bama, and possessed themselves of that country very early period. As they were the posteof Nahor, the descendant of Heber, they unted the other branches of that samily. But an ingenious inventive people, they seem the other branches of that family. But an ingenious inventive people, they seem to possible their language with much care desicacy.

The only genuine remains of the ancient thic language are to be found in the Mebrew tures; and those are to be contained in 268 a, of which we have 200 in Daniel, reaching were 4th chap. 2d. to chap. 8th exclusive; at 67, in chap. 4th, 27 verses; chap. 5th, thap. 6th 18; and in chap. 7th, 25; in Jereschap. 10th there is extant only one verse, these fragments, compared with the Hesti plainly appears, that the difference beauthat language and the Chaldaic is scarce esto that between the Doric and Jonic dialects a Greek.

Whatever might have been the form of the ancient Chaldaic letters, it is generally in that the beautiful square characters, in the Hebrew Scriptures began to be written the age of Ezra, were current among them eraprior to the Babylonish captivity. Those it characters were probably the invention of Chaldean academies, which were established hous parts of that extensive and fertile coun-

The Chaldean declentions and conjugations in foliattle from the Hebrew modifications, it would be superfluous to dwell upon them, work effectual way to acquire an idea of the cost Chaldaic, is to decompound the names affelly of that dialect, which occur insmans of Scripture. By this method of proceeds to beautiful furniture and expressive eners be readily comprehended even by the disterate classes of our readers. At the same the Chaldaic and ancient Syriac bore so near simblance to each other, that they have gestly been classed under one head."

The been classed under one head."

The Dr. Doig displays his perfect knowledge the Hebrew and Chaldaic languages by many baces of fynonymes in both, from which we soly quote a few lines:

Almost all the Chaidean proper names which have either in facred or prophane history are reductly of an Hebrew original, or cognate with that language. We shall subjoin a few ex-

amples: Nabonassar is evidently compounded of Nabo and nazur, both Hebrew words, fignifying to prophecy and to keep. Nabopolazar is made up of Nabo Pul, the same with Bel, most bigh, and Azer, girded, ailuding to arms. Belefix is made up of Bel and wer Bspa, sire, Newachadnezzar, Belshazzar, Belsshazzar, Belsshazzar, Nergalssharezer, Rabshakeh, Ezarhaddon, Merodach, Evil Merodach, and numberless others, are so manifestly reducible to Hebrew vocables, when decompounded, that the oriental scholar will readily distinguish them.

"Names of places in the Chaldaic are likewise so nearly Hebrew, that nothing but the dialectical tone separates them. Thus Ur of the Chaldeans is actually nus light, that city being facred to the sun; Sippora is plainly the Hebrew word Zipporah; Carebenish, a city on the Euphrates, is evidently composed of Kir or Kar, a city, and Chemosh, a name of the sun. In short every Chaldean or old Syrian word now extant, without any difficulty, bewray their Hebrew original.

"We now proceed to the confideration of the PHOENICIAN language, which is known to have been that of the ancient Canaanites. That this was one of the original dialects, and consequently a cognate of the Hebrew, is univerfally acknow-Instead therefore of endeavouring to ledged. prove this polition, we may refer our readers to the works of the learned Mr Bochart, where that author has in a manner demonstrated this point, by deriving almost all the names of the Phoenician colonies from the Hebrew, upon the suppofition that the dialect of those people was closely connected with that tongue. St Augustine, de Civitate Dei, has observed, that even in his time many of the vulgar in the neighbourhood of Carthage and Hippo spoke a diatest of the old Punic which nearly refembled the Hebrew. Procopius, de bello Gath. informs us, that there existed in his days in Africa a pillar with this inscription in Hebrew, "We flee from the face of Johna the robber, the fon of Nun." The names of all the ancient cities built by the Carthaginians on the coast of Africa are easily reducible to a Hebrew The Carthaginian names of perions mentioned in the Greek and Latin history, such as Himilco, Hamilcar, Asdrubal, Hamibal, Hanno, Dido, Anna or Hannah, Sophonisba, Gisco, Maherbal, Adherbal, &c. all breathe a Hebrew extraction.

"The Greeks borrowed a great part of their religious worship from this people; of consequence, the names of most of their gods are Phœnician. Almost every one of these is actually Hebrew. The names of persons and places mentioned in the fragments of Sanchoniathon, preserved by Eusebius, are all of Hebrew complexion. The names mentioned in the Hebrew scriptures, of places which belonged to the Canaanites prior to the invasion of the Israelites under Joshua, are as much Hebrew as those which were afterwards substituted in their sead.

"The island of Malta (anciently Melita) was inhabited by a colony of Phoenicians many ages before the Moors took possession of it. Among the sulgar of that island many Punic vocables are

current to this day, all which may be readily traced up to the Hebrew fountain. To these we may add many inferiptions on ftones, coins, medals, &c. which are certainly Phoenician, and as

certainly of Hebrew extraction."

Before proceeding to treat of the ancient language of the Ethiopians, our learned author gives an ingenious differtation, with many quotations from Josephus, Diodorus the Sicilian, Diogenes Laertius, &c. from which he infers, that the Ethiopians were a colony of Cushites; were originally fovereigns of Shinar or Chaldea, and confequently spoke either Chaldaic or a dialect of that tongue; that their colonists must have used the fame language; that the ancient Ethiopians were a people highly polished, and celebrated in the most early ages on account of their virtue and piety; and that the common letters of that people were the facred character of the Egyptians, or t'a: Cupbite: (fee Sea. III.) For further information we refer our inquifitive readers to the very learned Job Ludolf's excellent grammar and dictionary of the Abyssinian or Geeze tongue. We shall here only endeavour to gratify them with a very brief account of the modern Ethiopic Abyssinian tongue: for which we are indebted to the late James Bruce, Efq; that indefatigable and adventurous traveller.

"The most ancient language of Ethiopia, (now called ABYSSINIA) was the Geez, which was fpoken by the ancient Cushite shepherds. This approaches nearest to the old Chaldaic. Upon a revolution in that country, the court resided many years in Amhara, (see ETHIOPIA, § 16;) where the people spoke a different language, or at least a very different dialect of the faine language. During this interval, the Geez, or language of the shepherds, was dropt, and retained only in writing, and as a dead language: the facred Scriptures being in that tongue only faved it from going into difuse. This tonguesis exceedingly harih and unharmonious. It is full of thefe two letters D and T, in which an accent is put that nearly refembles stammering. Considering the small extent of sea that divides this country from Arabia, we need not wonder that it has great affinity with the Arabic. It is not difficult to be acquired by those who understand any other of the oriental languages; and as the roots of many Hebrew words are only to be found here, it feems to be absolutely necessary to all those who with to obtain a critical skill in that language.

"The Ethiopic alphabet confifts of 26 letters. each of which, by a virgula or point annexed, varies its found in such a manner, as that those 26 form as it were 62 distinct letters. At first they had but 25 of thele original letters, the Latin P being wanting; fo that they were obliged to fubstitute another letter in its place. Paulus, for exexample, they call Taulus, Aulus, or Caulus: Petros, they pronounce Ketros. At last they substituted T, and added this to the end of their alphahet; giving it the force of P, though it was really a repetition of a character rather than the invenvention of a new one. Befides thefe, there are 20 others of the nature of dipthongs.

" The Amharic, during the long banishment of the royal family in Shoa, became the language

of the court, and 7 new characters were added to answer the pronunciation of this new language but no book was ever yet written in any other language than Geez. There is an old law in the country, handed down by tradition, that whoen shall attempt to translate the Holy Scripture in Amharic or any other language, his throat the be cut after the manner in which they kill the his family fold to flavery, and their houses rate to the ground.

" The most ancient name of Egypt was M raim, of confequence the inhabitants fell of Mefri. It appears from the facred historian, if it was inhabited by the descendants of Muzi the 2d fon of Ham. Mizraim had feveral fong fettled in that country. The language Mizraim appears to be one of the fifter for of the Hebrew, Phænician, Arabic, Chaldag But the origin of that people, their language ligion, laws, and inflitutions, have been for ed and confounded, both by their own hills and those of other countries, that one is a able to determine what to believe or what! ject." But we are affured by the facred re that Egypt was a populous, rich, and four kingdom, as early as the age of Abraham. the Delta, or Lower Egypt, been a pool of ing water, (as Herodotus, Diodorus, Stra pretend,) at any time after the general de could not have been drained, cleared, culti and stocked with inhabitants, so early as the of Ahraham.

" Diodorus Siculus, however, is politic the Ecyptians were a colony of Ethiopians this he endeavours to prove by the fimilal features, customs, laws, religious ceremonie between the two nations. That there was frant intercourse of good offices between the branches of the Hamites, cannot be quelliq

"We have already hinted our opinion nature of the Egyptian language; but Egypt is generally thought to have been tive land of hieroglyphics, and because m of opinion that hieroglyphical character prior to alphabetical, we shall hazard a fet jectures with respect to that species of writing

"The end of speech in general, is to men to communicate their thoughts and of tions one to another when prefent; the writing is to perform the same office when P are at a distance. Hieroglyphics are said to been invented to supply this defect. The ancient languages were every where full of the and figures borrowed from fenfible o' jects. circumstance would naturally suggest to se the idea of conveying their fentiments to other, when abfent, by delineations of con objects. Thus, if a favage affect a loan friend's horse, he might convey to him the of that animal; and fo of others. This very lowest species of ideal communication has been flyled picture-writing.

 Some favage leader, more fagacious that vulgar herd, would observe that certan se objects were fitted, to represent certain h passions, and even some abstract ideas. this case a born might be the emblem of po a found of bravery, a lion of fury, a fox of cur

a jeront of malies, &c. By and by artificial figns might be contrived to express such ideas as could at readily be denoted by bodily objects. This might be called symbolical writing. Such was the condation of the Chinese characters; and hence hat prodigious number of letters of which the mitten language of that people is composed. Farket they could not proceed, notwithstanding their nation ever did proceed, who had once no oer characters but hieroglyphical. The Mexibad arrived at hieroglyphical writing, but had arrived at hieroglyphical writing, but had arrived at hieroglyphical writing, but he taken one step towards alphabetical. The mass employ hieroglyphical symbols, but ne ver estained a single idea of alphabetical. In a new think that there is not the least analogy seen these two species to conduct from the to the other; we are therefore of opinion, theroglyphical characters were never the vulctumels of ideal conveyance among civilized in

a this point we differ from many learned, and ingenious writers; fome of whom incligated the intermediate stages through the fabricators of characters must have from hieroglyphical to alphabetical writing, ar part, we have endeavoured to prove, that beical writing was an antediluvian inventand we now lay it down, that among all entons which settled near the centre of cition, hieroglyphics were, comparatively, a mathrication.

be Orientals are extravagantly devoted to yand fiction. Plain unadorned truth with us no charms. Hence that extravagant y of fables and romance with which all any is replete, and by which all ancient hiftory wind and corrupted. Every doctrine of receivery precept of morality, was tendered maind in parables and proverbs. It was attended and area of religion, morality, and the cred areana of religion, morality, and the cliences, were not to be communicated aminimated rabble. For this reason every freed was involved in allegorical darkness.

then, we ought to look for the origin hyphical or picture-writing among the cisations of the east. They employed that of writing to conceal the most important of their doctrines. The Egyptian priefts most celebrated for their skill in deviling mblematical reprefentations; but other nalikewife employed them. We learn from ments of Berofus, preferved by Syncellus kunder Polyhistor, that the walls of the of Belus at Babylon were covered all over here emblematical paintings. These chawere called ago, because they were chiefly yed to reprefent facred objects; and yourna, they were originally carred or engraved.

name points to their original use. See He-Lii. Diod. Sic. l. i. Strabo, l. xvii. Plut. his Diris; Clem. Alex. Eufeb. Præp. Evang. 6 in's Hieroglyphica, &c.

The Egyptians afcribed the invention of letto That, Theuth, or Thrath; the Greek and the Roman Mercurius. (See LER-101. XVII. PART 11. MES, MERCURY, and THOTH.) He was probably some eminent inventive genius, who sourished during the first ages of the Egyptian monarchy, and taught the rude savages the art of writing.

"According to Diodorus Siculus, the Egyptians had two kinds of letters; the one facred, the other common: the former the priefts taught their own children, the latter all learned promiceuously. Clemens Alex. mentions three different flyies of writing employed by the Egyptians: 1. Existolographs, or writing letters; 2. the facred character; which the facred feribes employed; 3. the meroglyphic character, one part of which is expressed by the first elements, and called Cyriologic, that is capital, and the other symbolic.

"The most faithful specimen, of the vulgar language of the Egyptians, is, we believe, find preferved in the Coptic, which, however, is so replete with Greetims, that it must be difficult to trace it out. Under the Ptolemies, the Greek was the language of the court, and consequently must have diffused itself-over all the country. Hence, we believe, two thirds of the Coptic are Greek words, diversified by their terminations, declen-

fions, and conjugations only. See Christian Scholtz's Egyptian and Coptic grammar and dictionary, corrected and published by Godfred Woide, Oxford, 1788.

"The Egyptians and Phoenicians must have spoken the same language, one of the sister dialects of the Hebrew, Chaldean, Arabian, Cushite, &c.—This is not a mere conjecture; it may be proved by many examples. It is true, that when Joseph's brethren went down to Egypt, they could not understand the Egyptian idiom which he spoke; nor would he, had he been actually an Egyptian, have understood them without an interpreter. But by this time the Egyptian had deviated confiderably from the original tanguage of mankind. The Erfe, spoken in the Highlanus of Scotland, and the Irish, are known to be both branches of the old Celtic; yet a Scotch Highlander and an Irishman can hardly understand each other. The Hebrew dialect had been in a manner stationary. from the migration of Abraham to that period: whereas the Egyptian, being fpoken by a powerful, civilized, and highly cultivated people, must have received many improvements, in two centu-

"Cadmus was originally an Egyptian; that leader brought a new fet of letters into Greece, These are generally deemed to be Phomician, They were nearly the same with the ancient Pelassic. Danaus, Persons, Leex, &c. were of Egyptian extraction: they too adopted the Cadmean characters, without substituting any of their own. The Jonim, or Iowans, emigrated from Gaza, a colony of Egyptians, and their letters are known to have district very little from those of Cadmus and the Pelassi. The conclusion, therefore, is, that the vulgar Egyptian letters were the same with the Phomician.

"We are fentible that there are found upon F-gyptian monuments characters altogether different from those we have been describing. The Ethiopians, the Chaldeans, the Perfians, the Greeks, the Romans, the Saracens, have, at different times been sovereigns of that unhappy country. Pers

haps other nations, whose memory is now buried in oblivion, may have erected monuments, and covered them with inscriptions composed of words

taken from different languages."

The learned Dr next proceeds " to fliow, that most part of the names of persons and places, &c. which have been conveyed down to us, may, in general, be reduced to a Hebrew, Phrenician, Syrian, or Chaldean original." This he does in a manner which must be highly interesting to those who are acquainted with the oriental languages; but which, to the majority of English readers, would afford neither inflruction nor entertains out, But from this specimen Dr. Doig seems clearly to prove, that the Egyptian language in the more early ages was one of those dialects, into which that of the defeendants of the postdilluvian patriarchs was divided, a few centuries after the deluge." Our learned readers may confult Bochart's Chanaun, Walton's Proleg. Cebelin's Monde Prim. Jamefon's Spiciligia, &c.

## SEET. V. Of the PERSIAN LANGUAGE.

THE PERSIAN language (fays Dr Doig,) is divided into the ancient and modern; the former of which is at this day very imperfectly known, the latter is at prefent one of the most expressive, and at the same time one of the most highly po-

lifhed, in the world.

"When Mohammed was born, and Anu'shi'-RAVA'N, whom he calls the juft king, fat on the throne of Perfia, two languages were generally prevalent in that empire. The one was called Deri, and was the dialect of the court, being only a refined and elegant branch of the Parf; and that of the learned, in which most books were composed, and which had the name of Pablavi, either from the heroes who thake it in former times, or from Pablu, a tract of land which included fome confiderable cities of Lun. Bendes thefe a very ancient and abstrufe tongue was known to the priefts and philotophers, called the language of the ZEND, because a book on religious and moral duties which they held facred, and which bore that name, had been written in it; while the Pazend or comment on that work was composed in Pablavi, as a more popular dialect. The letters of this book were called zend, and the language

in The Zend and the old *Pablavi* are now almost extinct in *Iran*, and very few even of the Guebres can read it; while the *Parfi*, remaining almost pure in *Shabnameh*, has, by the intermixture of Arabic words, and many imperceptible changes, now become a new language exquisitely polished by a feries of fine writers both in profe and veric.

"The very learned Sir William Jones is confident that the Parfi abounds with words from the Shanferit, with no other change than such as may be observed in the numerous dialects of India; that very many Persian imperatives are the roots of Shanserit verbs; and that even the moods and tenses of the Persian verb substantive, which is the model of all the rest, are deducible from the Shanserit by an easy and clear analogy. From this he infers that the Parfi, like the various idiom dialects, is derived from the language of the Bramins. This conclusion, however, is doubted by Dr Doig.

" The Pazend, according to Sir William, was a dialoct of the Chaldaic;" and of this he exhibits various etymological proofs, which we need not quote, but from which " it plainly appears, if, that Pahlavi was the ancient language of Perfaand, 2d, that the ancient Persian was a cognite diarect of the Chaldean, Hebrew, Arabic, Phons cian, &c. M. Anquetal has ar nexed to his traff lation of Zendavesta two vocabularies in Zend and Pahlavi, which he found in a collection of Rad aget or Traditional Pieces in modern Perfian. vocabulary of the Pahlavi confirms this epical concerning the Chaldaic origin of that langua But with refpect to the Zend, it abounded t vast numbers of pure Shanserit words, to degree, that 6 or 7 words in ten belonged w language.

From this it would appear, that they languages of Perfia were Chaldaic and Shaf and that when they had coafed to be venue the Pahlavi and Zend were deduced from the Pahlavi and the Parfi either from the 2 or immediately from the dialect of the Brain but all had a mixture of Fartarian; for the lexicographers affert, that numberlefs we ancient Perfian are taken from the Cimma Colonies emigrated from Pertia into Crim Temigrants from those quarters must have their way into Scandinavia, as numberlefs to

words are filli current in those reg ons.

"With respect to the Zend, it might a dialect of the Sharferit, and was probably cred language. If ZOROASTRES, or ZARITA as the orientals call him, travelled into g and was initiated in the mysteries of the greligion, he might be instructed in the face lect of that people by the priests. When turned into Persia, and became the aposte new religion, he might compose the was his laws in the facred language. This is then became that of the Magi, who cover from the uninitiated, as the priests did in and the Brahmans in Hindostan.

"To corroborate the cognation between Chaldean and Pahlavi languages, we shall a few arguments from the Mosaic history, to other writings of the Old Testament.

"ELAM is always allowed to have been the genitor of the Perlians. This patriarch was fon of Shem the fon of Noah; and his polifettled near the deficendants of Athur, Arph Lud, and Aram, the other fons of Shem-country where they fettled was denominate LYMAIS as late as the beginning of the Children and This name was retained till the Sconquered that country. The Elamites of ans hooke a dialect of the primary language, we have proved to have been the Hebrew.

"When the four eastern monarchs invade five cities of the plain in Canaan, (Gen-Cheddracy, King of Elam, was at the of the confederacy. Amraphel king of Sthat is Babylon or Chaidea, Arioch king of far, and Tidal, king of some scattered nator the neighbourhood, were his allies. This pademonstrates, that Elam, Shinar, and Ellazar contiguous, and were engaged in the same of Wherever this country is mentioned in Scrip

prior to the era of Daniel and Ezra, it is aiways

nader the name of Elam.

"The Saythians, whom the old Perfians called Sata, Saca, and whom the moderns call TURAN, often over-ran Perfia at a very early period. The timlequence was, an infusion of Scythian or Tartions terms, with which that language was early apregnated. This probably occasioned the first keittion from the original standard. The conpults of Alexander, and the dominion of his fucgion, mult, one would unagine, introduce an sudation of Greek words. That event, howin feems to have affected the language in no at degree, at least very few Greekin terms ocir in the modern Perfian.

"The expire of the PARTHIANS produced a my important alteration upon the ancient Per-They were a demi Scythian tribe; at.d, as conquered the Perfians, retained the domion tor leveral contunies, and incorporated with military, their language must have a two a deep dure to the original distinct of the Persians. Wallam Jones has observed, that the letters the inscriptions at 12ahbr, or Perseposis, bear cresemblance to the old Runic leafars of the admavians. Those inscriptions we take to been Parthian. The Perfians, it is true did more recover the empire; and under them the reign of the Deri and Parli tongues: former confifting of the old Perlian and Parin highly polithed; the latter of the fame lango in their uncultivated vernacular drefs. In atuation the Perfian language remained till invation of the Saracens in 636; when these banans overran that fine country; demolished my monument of antiquity, records, temples, hees; mailacred or expelled the ministers of Magian idolatry; and introduced a language, bugh not entirely new, yet widely differing me the old.

In modern Persian we find the ancient Permanies wonderfully difforted from that form Mer which they appear in the Scripture, in ulias, Megasthenes, and the other Greek authors. m this it has been inferred, that not only the orha, but even the Jews, have changed and me-corpholed then, to accommodate them to the Lad of their own language. As to the Greeks, cknow it was their practice, but the Hebrews, he make no doubt, wrote and pronounced the umes of the Perlian monarchs and governors Pany in the fame manner with the native Perline. It is manifest, beyond contradiction, that bey neither altered the Tyrian and Phoenician Pures of persons and places, when they had octo mention them, nor those of the Egyptiwhen they occurred in their writings. The obsorbinian and Chaldaic names, which are menthosed in the Old Testament, vary nothing from the Chaldran original. In Egra, Nehemiah, and Either, we find the Persian names faithfully prekred throughout.

"The fact is this: Our modern admirers of the Perfic have borrowed their names of the ancient kings and heroes of that country, from romances and fabulous legends of modern date and composition. The archives of Persia were de-stroyed by the Saraccus: nothing of importance was written in that country till two centuries after the era of Mohammed. What fucceeded was Upon this fabulous ad fiction and romance. foundation, the learned Mr Richardson has erected a very romantic fabric, which he thinks fufficient to invalidate the credit of the moft aut entic Grecian historians of that empire; tho' the fables, on which he founds, were not written till near 1000 years after the pretended events had happened, and 200, after all the Persian records had been destroyed by the Saracens.

"After the decifive victory obtained over the Perfians at Kadeila, their ancient government was overturned, their religion proferibed, their laws trampled under foot, and their civil transactions disturbed by the forcible introduction of the lunar for the folar kalendar; while their language became almost overwhelmed by an inundation of Arabic words; which from that period, religion, authority, and fashion incorporated with their

idiom.

" From the 7th till the 10th century, the Persian tongue, now impregnated with Arabic words, appears to have been neglected. Bagdad, built by Almanior, became foon after the year 762 the chief refidence of the khalifs, and the general refort of the learned and the ambitious from every quarter of the empire. At length the accession of the Buyah princes to the Perfian throne marked in the 10th century the great epoch of the revival of Perfian learning. About 977 the throne of Perfia was filled by the great Azaduddawla; who first affumed the title of Siltan. He was born in lipahan, and had a strong attachment to his native kingdom. His court was t're standard of talle and the relidence of genius. The native dialect of the Prince became from the general language of composition in almost every branch of polite learning. From the end of the 10th till the 15th century may be confidered as the most flourishing period of Persian literature. The epic poet FIRDAUSI, in his romantic history of the Perfian kings and heroes, difpiays an imagination and finoothness of numbers hardly inferior to Homer. The whole fanciful range of Perhan enchantment he has interwoven in his poems, which abound with the noblest efforts of genius. This bard has flamped a dignity on the fictions of the eaft, equal to that which Homer has given to the mythology of ancient Greece. His language may be confidered as the most refined dialect of the ancient Perfian. Ebu Fekreddin Anju, in the preface to the dictionary called Farhang Jebanguiri, fays, that the Deri and the Arabic idionis were the languages of heaven.

" For near 300 years the literary fire of the Persians seems to have been almost extinguished. In tafte, the orientals are undoubtedly inferior to the best writers of modern Europe; but in invention and fublimity, they are equalled by none. The Persians affect a rhetorical luxuriance, which to a European wears the air of unnecessary redundance. Amongst the oriental historians, philosophers, rhetoricians, and poets, many will be found who would do honour to any age or people; whilft their romances, their tales, and their fables, stand upon a ground which Europeans have not powers to reach. The present language of Per-

Ccc2

ha is partly Arabic and partly Persian, though the latter generally has the afcendant. The former is nervous, impetuous, and malculine; the latter is flowing, foft, and luxuriant. Their letters are the Arabic with little variation: their aiphabet confifts of 32 letters, which, like the Arabic, are read from right to left. The letters are divided into vowels and confonants. The Arabic characters are written in a variety of different hands.

"There is a great refemblance between the Perfian and Euglish languages in the simplicity of their form and construction; having no difference of terminations to mark the gender either in subflantives or adjectives; all inanimate things are neuter; And animals of different fexes have either different names, or are diffinguished by the words, Her male, and made female. Sometimes indied a word is made feminine after the manner of the Arabians, by having andded to it. The Persian fubflantives have but one variation of case, which is formed by adding a fyllable to the nominative in both numbers; and answers often to the dative, but generally to the accufative case, in other langunges. The other cases are expressed for the most part by particles placed before the nomina-The Persians have two numbers, singular and plural; the latter is formed by adding a fyl-lable to the former. The Perfian adjectives admit of no variation in the degrees of comparison. The comparative is formed by adding ter and the fuperlative by adding prin to the politive.

"The Persians have active and neu er verbs, but many of their verbs have both an active and neuter fense, determined only by the construction. Those verbs have properly but one conjugation, and but three changes of tenfe; the imperative, the aorift, and the preterite; all the other tenles being formed by particles or auxiliary verbs. The passive voice is formed by adding the tentes of the substantive verb to the participle of the ac-

" In the ancient language of Persia, there were few or no irregularities; the imper tive, which is often irregular in the modern Persian, was anciently formed from the infinitive, till the Arabs Introduced their harth confounits, which obliged the Perlians to change the old termination of fome verbs, and by degrees the original infinitive grew quite obsolete; yet they till retain the ancient imperative, and the aprills formed from it. This is the only anomalous part of the Perfian language; which nevertherels far furpailes in fin-plicity all other languages ancient or modern. With respect to the more minute and intricate parts of this language, as well as its derivations, compositions, constructions, &c. we must remit our readers to Miniskie's Institutione: Lingua Turcica eun rudimentis parallelis linguárim Arab. et Perf. Sir William Jones's Perfian Grammar; Mr Richardson's Arabian and Persian Dictionary; D. Herbelot's Bibl. Orient. Dr Hyde de Relig. vet. Perl. &c. Numberle is events are preferred in the writings of the orientals, which were never heard of in Europe, and must have for ever lain concealed from the knowledge of its inhabitants, had not the Perlian and Arabic tongines been studied and understood by the native of this quarter of the globe. Many of those events have been transmitted to posterity in poems and legendary takes like the Runic fragments of the north, the romances of Spain, or the Heroic ballads of our own country. The knowledge of these two languages has laid open to Europe all the treasures of order tal learning, and has enriched the minds of Botons with Indian science, as much as the product of these regions has increased their wealth and enervated the conftitution.

As to poetry, the modern Perfians borrowed their poetical measures from the Arabs: they as exceedingly various and complicated; they con fift of 19 different kinds; but the most comme of them are the lambic or Trochaic measure, a metre that chiefly confifts of those compound feet which the ancients called Emirgines, comp of iambi and fpondees alternately. In lyien ry their verses generally confift of 12 or 16 lables: they fometimes, but feldom, confit of Some of their tyric verses contain 13 syllables: the most common Persian verse is made up of and in this measure are written all their gr poems, whether upon heroic or moral subje as the works of Firdausi and Jami, the Bolist Sadi, and the Memari of Geraleddin. The of verfe answers to our common heroic the which was brought to it high a degree of pertion by Pope. The Rudy of the Persian p is fo much the more necessary, as there at books or even letters written in that lang which are not interspersed with fragment poetry. As to their profody, nothing cal more eafy and fimple.

SECT. VI. Of the SHANSCRIT and BENGAU LANGUAGES.

"THE SHANSCRIT (fays our author,) though of the most ancient languages in the world, little known even in Alia, sill about the mid the 10th century. Since that period, by the defatigable industry of the ingenious Sir LIAM JONES and the other worthy member that fociety of which he was founder and dent, that noble and ancient language be length been brought to light; and from it treafures of oriental knowledge will be comm cated both to Europe and Afia; knowledge without the exertions of that establishment, have lain concealed from the refearches of kind to the end of the world.

"The Shanferit language has for many com ries lain concealed in the hands of the bramus Hindostan. It is by them deemed facred, and of consequence confined solery to the offices of ligion. Its name imports the language of perfet It appears to have been once current over of of the oriental world. Traces of its original tent may be discovered in almost every district Those who are acquainted with it have ten found the fimilitude of Shanferit words those of Persian and Arabic, and even of L and Greek; and that not in technical and me phorical terms, but in the ground-work of guage, in monofyliables, the names of rumbe and appellations of tuch things as would be discriminated on the dawn of civilization.

"The ancient coins of many different and d tant kingdoms of Afia are stamped with Shank characte

chiriders, and mostly contain allusions to the old Shaderit mythology. But though numberless thange and revolutions have convulled Hindoftan, that part of it which lies between the Indus and at Gauges fills preferves that language inviolate. The midamental part of the Shanfcrit language idended into three ciaffes: Dbaat, or roots of ubs; Shubd, or original nouns; and Evya, or uticles. The latter are ever indeclinable, but words comprehended in the two former clafmust be prepared by certain additions and inme to ht them for composition. Not a sylhout a letter, can be added or altered but by mm; not the most triffing variation of the t, in the minutest fubdivition of deciention or faration, can be efficited without the applicaholeveral rules. The number of the radical Believery parts is about 700; and to these, a pentitu flock of verbai nouns owes its origin. The Shanferit language is very copious and The first of these qualities arises in a measure from the wast number of compound with which it is almost overstocked. "The int (fays Sir William Jones,) like the Greek. sand German, desights in compounds; but such higher degree, and indeed to fuch exthat I could produce words of more than 20 e; not formed ludicroufly like that by the buffoon in Aristophanes deferibes a feast, th perfect ferioutnets, on the most folemn ions, and in the most elegant works," The of its best authors is wonderfully concise. regularity of its etymology it far exceeds and Abic; and, like them, has a pro-number of derivatives from each primary The grammatical rules also are numerous Moult, though there are not many anomalies. at 7 declentions of nouns, air used in the t, dual, and plural numbers, and all differformed, according as they terminate with a aux, with a long or a fliort vowel; and as me of different genders, not a nominative be formed to any one of these nonns withhe application of at least four rules, which themse with each particular difference of by as above flated: add to this, that evein the language may be used through all decientions, which is a full proof of the difof the idiom;" -and confequently, (we (4) of the imperfection of this very perfect \$170.

Ascanderic alphabet contains 50 letters; and on: bualt of the Framms, that it exceeds all Apahets in this respect: but as of their 34 hats, near half carry combined founds, and their vowels are merely the correspondent ones to as many thort, the advantage feems The more than funciful. The Shanferit omprehends a very great variety of differta, of 8, 11, 12 or 19 fyllables. The Shan-Le age is impregnated with Perlian, Chal-Paneian, Greek, and even Latin idioins. less to prefumption that it was one of table defects which were gradually pro-Profession eradually receded from the centre The had test the Hindoos were a co-If the left endants of the patriarch Shem.

" It appears, however, by almost numberless monuments of antiquity still existing, that at a very early period a different race of men had obtained fettlements in that country. It is generally admitted, that colonies of Egyptians had peopled Numberlefs a confiderable part of Hindottan. traces of their religion occur everywhere in those regions. The learned president himself is positive, that veftiges of those facerdotal wanderers are found in India, China, Japan, Tibet, and many parts of Tartary. Those colonists were zealous in propagating their religious ceremonies wherever they refided, and travelled. There is even at this day a fliking refemblance between the facred rites of the vulgar Hindoos and those of the ancient Egyptians. Sir William Jones hath justly observed, that the letters of Shanserit, stript of all adventitious appendages, are really the square Chal-We learn from Cashodorus, that daic characters the facred letters of the Egyptians were Chaldaic, and it is allowed that those of the bramins were of the same complexion.

"That the Egyptians had at a very early period penetrated into Hindoftan, is univertally admitted. Offris, their celebrated monarch and deity, according to their mythology, conducted an army into that country; taught the natives agriculture, iaws, religion, the culture of the vine, &c. Sefoftris, another Egyptian potentate, likewife over-ran Hindoftan with an army, and taught the natives many ufeul arts and fenences. When the pafter kings conquered Egypt, it is probable that numbers of the priefts, to avoid the fury of the mercilefs invaders, left Egypt and went into India. These were the authors both of the language and religion of the bramins. The Indians

cultivated, improved, and divertified it.

"Though most of the ancient oriental tongues are read from right to left, like the Hebrew, Chaldalo, Arabic, &c. yet such as properly belong to the whole continent of India proceed from left to right, like those of Europe. The great number of letters, the complex mode of combination, and the difficulty of pronunciation, are confiderable impediments to the study of the Bengal language; and the ignorance of the people, and maccuracy of their characters, aggravate these inconveniences.

"The Bengal alphabet, like that of the Shanferit, conflits of 50 ietters, whole form, order, and found, may be learned from Mr Halhed's grammar. The vowels are divided into long and thort, the latter of which are often omitted. Most of the oriental languages are constructed upon the same principle, with respect to the omission of the short vowel.

"In the Bengal language there are three genders. The terminations are aa for the masculine, and ee for the feminine. In Shanscrit, the names of all things inanimate have different genders, founded on vague and incomprehensible distinctions: the same is the case with the Bengal.

"Every Shanferit noun has 7 cases, exclusive of the vocative; and therefore comprehends two more than even those of the Latin. The Bengal has only 5 cases.

"In most languages where the verb has a separate inflection for each person, that inflection is sufSufficient to ascertain the personality; but in Bengal compositions, though the first and second persons occur very frequently, nothing is more rare than the ulage of the pronoun of the third; and names of persons are inserted with a constant and dilgusting repetition, to avoid, the application of the words HE and SHE. The second person is always ranked before the first, and the third before The personal pronouns have 7 cases, the second. which are varied in a very irregular manner.

" The Shanferit, the Arabic, the Greek and Latin verbs, are furnished with a set of inflections and terminations fo comprehensive and so complete, that by their form alone they can express all the different diffinctions both of persons and time. Three separate qualities in them are perfeetly blended and united. Thus by their root they denote a particular act, and by their inflection both point out the time when it takes place and the number of the agents. In Persian, as in English, the verb admits but of two forms, one for the present tense and one for the agrift; and it is observable, that while the past tense is provided for by a pecuniar inflection, the future is generally fupplied by an additional word conveying only the idea of time, without any other influence on the act implied by the principal verb.

" Every Shanferit verb has a form equivalent to the middle voice of the Greek, used through all the tenses with a reflective sense, and the former is even the most extensive of the two in its use and office: for in Greek the reflective can only be adopted intransitively when the action of the verb d feends to no extraneous subject; but in Shanacrit, the verb is both reciprocal and transitive at

the fame time.

" Neither the Shanferit, nor the Bengalese, nor the Hindostanic, have any word precisely answering to the fense of the verb I bave, and consequently the idea is always expressed by a phrase fynonymous with est mibi; and of course there is no auxiliary form in the Bengal verb corresponelent to I have written, but the fense is conveyed by another mode. The verb substantive, in all languages is defective and irregular, and therefore the Shanforit calls it a femi-verb. The prefent tense of this verb, in Greek, Latin, and Persian, appears to be derived from the Shanfcrit. In the Bengalese, this verb has but two distinctions of time, the prefent and the pasts the terminations of the feveral persons of which serve as a model for those of the same tense, in all other verbs respectively.

" Verbs of the Bengal language may be divided into three classes, which are distinguished by their penultimate letter. The simple and most common form has an open confonant immediately preceding the final letter of the infinitive. The fecond is composed of those words whose final letter is preceded by another vowel or open confonant going before it. The third confifts entirely of causals derived from verbs of the first and

iccond conjugations.

"The Greek verbs in mare formed exactly upon the fame principle with the Shanferit conjugations, even in the minutest particulars. Instances of this are produced in many verbs, which from a root form a new verb by adding the fyllable mi, and doubling the first conforant. The mode furnishes another prefumption of the Egy tian origin of the Shanferit. Many Greeks trail led into Egypt; many Egyptian colonies lettle

" To form the past tense, the Shanserit appl a fyliabic augment; the future has for its char teriffic a letter anagolous to that of the fa tenfe in the Greek, and it omits the reducies of the first consonant. The reduplication of first consonant is not constantly applied to present tense of the Shanscrit more than to of the Greek. The natural simplicity and gance of many of the Afiatic languages are iy debased and corrupted by the continual of auxiliary verbs; and this inconvenien evidently affected the Perfian, the Hindon

the Bengai idioms.

"The infinitives of verbs in the Shankel Bengalefe are always used as substantive t In the Shanferit language, as in the Greek, the forms of infinitives and of participles comp five of time; there are also other branches verb that seem to refemble the gerunds pines of the Latin. All the terms which qualify, to diftinguish, or to augment, it flance or afficit, are classed by the Shan m marians under one head; and the word express it literally signifies increase or According to their arrangement, a fimpel confists of three members; the agent, the the fubject: which, in a grammatical fents, duced to two; the noun and the verb. The a particular word to specify fuc \* words \*\* fy the noun which imports quanty, and a to our adjectives or epithets: Such as are to denote relation or connection, are intima

"The adjectives in Bengalese have no tion of gender or number; but in Shanker words preserve the distinction of gender, Greek and Latin. Prepositions are substances cases. The Latin is less polished than the and of confequence bears a much nearer blance to the Shanferit, both in words, infe

and terminations.

"The learned are now convinced that I of numerical figures was first derived from Indeed the antiquity of their application country far exceeds the powers of invelig All the numerals in Shanfcrit have different for the different genders, as in Arabic. The a strong probability that the European meth computation was derived from India, as it is the same with the Shanscrit, though we this Europeans learned it from the Arabians."

SECT. VII. Of the Chinese Languag

" THE Chinese, (says Dr Doig,) according the most authentic accounts, are a people of antiquity. Their fituation was fuch, as, earliest ages of the world, in a great measure cured them from hostile invasion. As China large and fertile country, producing all the faries, conveniencies, and even luxuries of la inhabitants were under no necessity of engage Satisfied with the art foreign commerce. which their own country produced, they app

herselves entirely to agriculture and the arts conexted with it; and their frugality, though their or almost was almost incredible, rendered the reduce of their foll abundantly sufficient. Their postions were their own; and as they borrowed whing from other people, they gradually began despite the rest of mankind, and, like the anher Egyptians, branded them with the epithet lareberians.

Their people had at an early period made amy proficiency in the mechanical arts. Their in the liberal feiences was by no means sportion. In mathematics, geometry, and way, their knowledge was contemptible; methics, their laws and customs prove their to have been truly superficial. They value dives very highly upon their oratorial talents ; yet of all languages spoken by any civilized the their's is the least improved." The learn-th Doig, who traces all other languages from MAdam, is obliged to give up the Chinese. The language of the Chinese (says he) was toefferent from those of all other nations, and my firong fignatures of an original tongue. words are monofyllabic, and compositions chivations are altogether unknown. Their and verbs admit of no flexions; in short, thing relating to their idioms is peculiar, capable of being compared with any other a roken by any civilized people. Most bar-a languages exhibit something that resembles empt towards those discritical modifications ech; whereas the Chinese, after a space of years, have not advanced one step beyond first elements of ideal communication. CHINESE, § 16.) This circumstance is a demonstration, that they did not emigrate that region where the primitive race of manis thought to have fixed its relidence. Some imagined, that they are a Tartarian race, breaking off from the main body of that your and widely extended people, directed much towards the SE. There, falling in dightful and fertile plains, they found themwell accommodated, that they dropped to of changing their habitations. The p of China is, indeed, fo environed with this, deferts, and feas, that it would have Cheult to have emigrated. Secluded from the f mankind, the Chinese were left to the by h of their own inventive powers to fabricate mynage, as well as the other arts, necessary the support and convenience of life.

Their flock of vocables, when they emigrated Tartary, was neither ample nor accommodate answer the purposes of the mutual conveys of idear. With this flender flock, however, skem to have been satisfied. Instead of framsew race of terms by compounding their prince ones; instead of diversifying them by instead, or multiplying them by derivatives, as one in every other language; they ruther chose win their primitive words, and by a variety modifications, introduced upon their orthomy or pronunciation, to accommodate them

Is rariety of fignifications.

"The Chinese language must then have been a furman dialect. The Chinese have not hitherto

found out the art of composition of words. This is the more surprising, that, in the characters which form their written language, they employ many compositions. The character by which they represent misfortune, is composed of one hieroglyphic which represents a honse, and another which denotes free; because the greatest misfortune that can befal a man is to have his house on fire. With respect to the language which they use in speech, though they often employ many words to express one thing, yet they never reachem together into one word, making certain changes upon them that they may incorporate the more conveniently, but always preserve them entire and unaltered.

"The whole number of words in the Chinese language does not exced 1200: the nouns are but 326. It is furprifing, that a people whose manners are polished and refined, should be able to express so many things as must attend such a course of life, by fo finall a number of words, and thefe too monofyllables. The difficulties which attend this fingular mode must be felt almost every inflant. Du Halde fays, that the Chinese have two different dialects: the one vulgar, which is spoken by the vulgar, and varies according to the different provinces; the other is called the Mandarin language, and is current only among the learned. The latter is properly that which was formerly fpoken at court in the province of Kinng nan, and gradually spread among the polite people in the other provinces. It is spoken with more elegance in the provinces adjoining to Kiang-nan than in any other part of the kingdom. By degrees it was introduced into all parts of the empire, and became the univerfal language.

"We are therefore of opinion, that the modern language of the Chinese was deduced from the original Mandarin or court dialect, and that this last was an artificial speech fabricated by that people. The learned have long held it up as the primary dialect, because, fay they, it bears all the fignatures of an original unimproved language. In our opinion, nothing appears more ingeniorfly artificial. It is universally allowed that, in its structure, arrangement, idioms, and phraseology, it resembles no other language. Is not every learned man now convinced, that all the Atiatic langnages yet known difcover unequivocal fymptoms of their cognation and family refemblance? The Ethiopiana, Chaldeans, Arabians, Perfians, Egyptians, Hebrews, Phonicians, the Brahmans, Bengalefe, the Hindoos bordering upon China, all fiseak only different dialects of one language, varying from the original in dialect only, fome in a greater fome in a leffer degree; why should the Chinese alone stand altogether infulated and unallied? Our readers will agree with us, that had the language of the Chincfe been the original language, a refemblance must have still existed between it and its descendants. If it had originated from any other language, it would have retained fome characteristic features of its parent arche-

"The Chinese have an immemorial tradition, that their language was framed by YAO, their first emperor, to whom they attribute the invention of every thing curious, unful, and ornamental. Tra-

ditional

ditional history, when it is ancient, uniform, and univerfal, is generally well founded: we think this tradition may be fairly admitted as a collateral

" The paucity of vocables contained in this fingular language, we think another prefumption of its artificial contexture. The Chinele Onomatheta," (impofers of names,) " would find it an arduous task to devise a great number of new terms, and would therefore reft fatisfied with the finalleft number poffible. In other languages we find the like economy was observed. Rather than fabricate new words, men adapted old words to new, cometimes even to contrary fignifications. They also contrived to join several old ones into one; whence arose a numerous race of compounds. Derivatives too are fabricated for the fame purpole. Inflead of creating new vocables, old ones were compounded, divertified, deflected, ramified, metamorphofed, and tortured into a thousand different shapes.

"There are three different methods to enrich and extend the range of a language. 1st, By fabricating a multitude of words; the plan which has been purfued by the Araba. 2d, By framing a multitude of compounds and derivatives, as in the Greek and the Shanferit. 3d, By varying the fignification of words without enlarging their number; as practifed by the Chinese and their colonists. The Arabians have shewn the most fertile and inventive genius, fince they have enriched their language by actually creating a new and numerous race of words. The fabricators of the Shanferit and the collectors of the Greek have exhibited art, but comparatively ittle fertility of genius."

"The Chinese (if we may believe their panegyrifts,) perform all the offices of the most perfeet language, by a few monofyllabic notes, fimple, inflexible, and invariable, inerely " by a particu'ar modification of the found." Dr Doig celebrates them for this method, as much more ingeniously artificial, than that adopted by all other nations. We cannot help differing from our learned author, and can fee nothing ingenious in the whole Chinese system. The sole object of language is to communicate ideas with eafe and perspicuity. How far the Chinese language is qualified for this purpose, let Dr Doig's own words declare. "Though the number of words, (fays he,) in the Chinefe language does not amount to above 1200, yet without multiplying words, the , fense is varied almost in infinitum, by the variety of the accents, inflections, tones, aspirations, and the other changes of the voice and pronunciation; circumstances, which make those who do not thoroughly understand the language, frequently mistake one word for another." After this concesfion from its panegyrift, we need make no comment on the perspicuity of the Chinese language. The examples, however, given by the learned doctor of its ambiguity, but which he gives as examples of its copionfriefs, are worth quoting:

"The word teow pronounced flowly, drawing out the v and raifing the voice, fignifies a lord or mafter. If it is pronounced with an even tone, lengthening the v, it fignifies a bog. When it is pronounced quick and lightly, it imports a kitchen. If it be pronounced in a firong and make line tone, growing weaker towards the end, it fi nifies a column. By the fame economy, the f lable po, according to the various accents, a the different modes of pronunciation, has elev different fignifications. It fignifies glass, to be to winnow rice, wife or liberal, to prepare, and woman, to break or cleave, inclined, a very litt to water, a flave or captive.

" Again, the same word joined to various there, imports a great many different things; example mou, when alone, fignifies a tree, see but when joined with another word, it has me other fignifications. Mou leoo, imports " w prepared for building;" mou lan, is " bang wooden grates;" mou bia, " a hox;" mou "a cheft of drawers;" mou thang, "a cher;" mou eul, a mushiroom;" mou nu, "a simail orange;" mou fing, "the planet Just mou mien, "cotton," &c. This word mou mien, "cotton," &c. joined to feveral others, and has as many di figurations as it has different combinated Such is the copionfries and perspicuity of the guage of the CHINESE; a people who have fo highly celebrated by the French philosoph the prefent age, and whose pretended cha antiquity have been fet up in opposition chronology of the Scriptures; although in on no better authority, than that of the gendary history, partly destroyed, and but preferved in their abfurd language, through medium of their perplexed unintelligible glyphics. We were the more furprised to Do Do disposed to celebrate the learning artificial language of this people, that he from the whole of the rest of his treatise lology, above quoted, to be a fleady ad for the authenticity and truth of the Scripti the Old Testament. Indeed the Chine guage bears decifive marks of its being for like all the works of art, it falls infinite of nature.

#### SECT VIII. Of the GREEK LANGUAGE

" THE Greeks, (fays Dr Dorg.) according most authentic accounts, were descended of or Jon, the 4th fon of Japhet, the elden the patriarch Noah. The Scriptures of ok all the orientals to this day, call the Gred nim, or Juanam, or Jav. noth. At what P the colonists arrived in these parts cannot be tainly determined; nor is it of great import That they carried along with them into their fettlements the language of Noah and his lat is, we think, a point that cannot be controved We have endeavoured to prove that the He or at least one or other of its fifter dia was the primaval language of mankind. Hebrew, then, or one of its cognate brane was the original dialect of the Jonim or Gre

"Be that as it may, before these people their appearance in profane history, their iang deviates very widely from this original arche By what means, at what period, and in length of time this change was introduced, eafy to be elucidated. That it was progression

certain.

"The colonics, which traversed a large trad

country before they arrived at their deftined fettiments, must have struggled with numberless. difficulties in the course of their peregrinations. The earth, during the periods which immediately beceeded the universal deluge, must have been overed with forests, intersected with swamps, ates, rivers, and numberless other impediments. Is the necessaries, and a few of the conveniences silife, will always engross the first cares of manand, the procuring of these comforts will exideall concern about arts and sciences which unconnected with these pursuits. Hence at distance from the plains of Shinar, neglectthe practice of the polite modes of civilization th their ancestors were acquainted with, and hild before their migration. Certain it is, those nations which continued to reside in neighbourhood of that centre of civilization, prappear in a cultivated state; while the cois who removed to a confiderable diftance into barbarifin, at a period more early than anals of protane history can reach. This apto have been the fituation of the primary stants of Greece. Their own historians exa very unpromiting picture of their earliest mitors. Diodorus Siculus, in defineating the ader of the original men, sketched his draught the first inhabitants of Greece. He reprethem as absolute savages, going out in parties to make war upon the wild beasts of kld, which kept them in continual alarm. chity obliged them to band together for mutual fecurity; they had not fagacity eto diftinguish between the wholesome and mous regetables; nor had they skill enough up and preferve the fruits of autumn for hishiftence during the winter." The schon Pindar, describing the inhabitants of Pelo-du, says, that the nymphs, called Melisse, and upon men to relinquish the abominable te of eating rand flesh torn from living aniand perfuaded them to use fruits for food. adds, that " in Peloponnefus, they honoursymphs, because they first pointed out the living on the fruits of the earth, and put to the barbarous practice of feeding on heft. The same ladies too invented gar-made of the bark of trees." Hecatæus the in, Strabo, Pliny, Herodotus, and other ant authors give fimilar accounts of the favage of ancient Greece. " But what clearly deantes the unpolished character of the an-Greeks is, the extravagant honours lavished upon the inventors of useful and ingeni-Most of these were advanced to divine and became the objects of religious op to succeeding generations. (See MYSTE. and MYTHOLOGY.) To these testimonies favagism of the original Greeks, others alwithout number might be added. were in this situation, a new colony arin those parts, which in a few years consi-y changed the face of affairs. The people composed this colony were called Pelasgi: terning whose origin, country, character, and enteres, much has been written, and many VOL. XVII. PART II.

different opinions exhibited by the learned. The general opinion is that they were natives either of Egypt or Phænicia."

An anonymous author quoted by Dr Doig. has proved by very plaufible arguments, that thefe people could not be descendants of the Egyptians nor Phoenicians. He maintains, that the Pelafgi were a great and numerous tribe; that they overfpread all the coast of Asia Minor from Mount Mycale to Troas; that they were masters at one time of all the Afiatic and Grecian islands; that they over-ran Greece and many of the neighbouring countries; and all this in less than half a century. These facts he proves from Homer, Diodorus Siculus, Paulanias, and other Greek authors of approved authenticity. He shows, that they were a civilized generation; that they were well acquainted with military affairs, legislation, agriculture, navigation, architecture, letters, &c. He infifts that Phomicia could not at any given period have furnished such a numerous body of emigrants. He believes that this event took place before the invalion of Canaan by the Ifraclites; that confequently the Pelafgic migration was not occasioned by that catastrophe. He has shown, that the Egyptians in the earliest ages were averse to foreign expeditions, especially by sea. finds, that the Egyptian and Phoenician colonies, which afterwards lettled in Greece, were enemies to the Pelafgi, and either fubdued or expelled them. He concludes, that these people were the progeny of the Arabian shepherds, who, at a very early period subdued all Egypt. (See EGYPT, § 8.) After possessing that country about two centuries and a half, they were conquered by Amenophis, who drove them out of the country. Upon this the fugitives retired to Palestine, where Manetho the Egyptian historian loses fight of them, and confounds them with the Ifraelites. This writer supposes that those fugitives gradually directed their course for the W. and NW. coasts of Asia Minor, whence they conveyed themselves over to Greece.

Such are the arguments by which this author fupports his hypothesis. It is new, and appears by no means improbable. Our readers may confult Gebelin's Preliminary Discourse to his Greek Distionary, Lord Monboddo's Origin and Progress of Language, vol. i. and Bryant's Ancient

Mythology.

But " nothing is more certain, than that the Pelafgi were the first people who civilized the favages of ancient Greece. Whether we suppose the Pelasgi to have been the offspring of the Phænicians, Egyptians, or Arabian thepherds, it will make little difference as to their language; every man of learning is convinced that those three nations, especially at that early period, spoke a dialect of the Hebrew. The Pelasgi, then, must have spoken a dialect of that language when they arrived in Greece. Perhaps it might have undergone feveral changes, and acquired fome new modifications, during so many years as had passed since they began to be a separate nation, and in the course of so many peregrinations. Some monuments of theirs still extant prove this fact beyond all contradiction. As these people incorporated with the aborigines of Greece, the remains of the original language of mankind, or at least so much of it as had been retained by them, gradually coalesced with that of the new settlers. From this it is obvious, that prior to the arrival of the new colonifts from the Eaft, the language now current among the two united tribes must have been a dialect of the Phænician, Arabian, Hebrew. &c. Herodotus affirms, that the Pelafgi in his time spoke a barbarous language, quite unintelligible to the modern Greeks. The reason of this difference between the language of the Heilenes or Greeks in the age of Herodotus, and that of the remains of the Pelasgi at that period, seems to be this: Prior to his time, the Greek language had undergone many changes and received vaft improvements; whereas that of the remnant of the Pelasgi, who were now reduced to a low state, had remained stationary, and was then in the fame predicament in which it had been a century after their arrival in the country.

" As the Pelasgi were a people highly civilized and well instructed in the various arts then known in the eaftern world, and were skilled in agriculture, architecture, music, &c. the presumption is that they could not be unacquainted with alpha-This most useful art was well betical writing. known in the countries from which they emigrated; and of course it is impossible to imagine, that they did not export this art as well as the others. Diodorus Siculus pretends, that the Pelafgi received alphabetical letters from Cadmus and his Phœnician followers; that those letters were afterwards called Pelasgic, because the Pelasgi were the first people of Greece who adopted them. This must go to the score of national vanity, since very soon after he acknowledges that Linus wrote the exploits of the first Bacchus and several other romantic fables in Pelaigic characters; and that ORPHEus, and Pronapides the master of Homer, used the same kind of letters. Zenobius likewise informs us, that Cadmus flew Linus for teaching characters differing from his. These letters could be none other than the Pelafgic.

" Pausanias, in his Attics, relates, that he himself saw an inscription upon the tomb of Coræbus, who lived at the time when Crotopus, who was contemporary with Deucalion, was king of the Argives. This infeription then was prior to the arrival of Cadmus; and confequently letters were known in Greece before they were introduced by this chief. It likewife appears from Herodotus himself, that the Ionians were in possession of alphabetical characters before the coming of the Phoenicians. " For (fays he) the Ionians having received letters from the Phænicians, changing the figure and found of some of them, ranged them with their own, and in this manner continued to use them afterwards." If, then, the Ionians ranged the Phonician characters with their own, it is obvious that they had alphabetical characters of their own.

"Monuments bearing inferiptions in the fame letters have also been discovered in several parts of Greece and Italy, which place this point beyond the reach of controversy. As the Pelasgi emigrated from Arabia, the presumption is that their letters were Phonician. They are said by Dr Swin-

ton to have been 13 in number, whereas the Phæsician alphabet confifts of 16. The three additional letters were probably invented by the latter people after the Pelasgi had left the eastern quarters. Besides, the Phænician characters had not as yet received names; and accordingly the Romans, who derived their letters from the Arcadian Pelasgi, had no names for theirs. They were course no other than the original letters of the Phænicians in their first uncouth and irregulation: and for this reason they easily gave ways the Cadmean, which were more beautiful, me regular, and better adapted to expedition.

" Hitherto we have feen the Pelafgi and the nim incorporated, living under the same speaking the same language, and using the letters. But another nation, and one too of extent and populoufness, had at an early pe taken pof effion of a confiderable part of the try afterwards diftinguished by the name of Hi or Greece. Th Thracians were a great and m ty nation; inferior to none except the indi-fays Herodotus. These people, at a very early riod, had extended their quarters over all the thern parts of that country. They were, in cient times, a learned and polished nation. R them, in fucceeding ages, the Greeks learned useful and ornamental sciences. Orpheus the fician, the legislator, the poet, the philosof and the divine, is known to have been of Thi extraction. Thamyris and Linus were his ples, and highly respected among the Greeks That thefe per their learning and ingenuity. spoke the same language with the Greeks, is a dantly evident from the connection between and these Thracian bards. The Thracian guage, then, whatever it was, contributed great proportion toward forming that of Greeks. From the remains of the Thracian lect there appears to have been a very fire femblance between it and the Chaldean. fition we could support by the most plausible mological deduction, did our limits admit. pears that the Thracians, Getæ, and Daci or vi, spoke nearly the same language. The Gi fo much celebrated in the annals of the lower pire, were the descendants of the Getz and B and confequently retained the dialect of their ceftors.

"We have now found out three branches of Greek language; that of the Ionim or Aborgo that of the Pelasgic tribe, and that of the Di cians. These three were only different dialects the very fame original tongue. Some centur after the arrival of the Pelafgi, CADMUS, an Eg tian and a fojourner in Phoenicia, arrived in Bo tia with a multitude of followers. This chief his countrymen introduced letters and feveral useful improvements into the country. As the people were natives of Phænicia, their alpha was that of their native country, confifting of That the Phœnician alphabet was new letters. the same with the Samaritan and Hebrew, has be fo often and fo clearly demonstrated by the learn of the two last centuries, that it would be super ous to infift upon it. The Phænicians wrete fr right to left, and the old Grecian characters inve ed exactly refemble the other.

"The names of the Cadmean characters are Syrian, which shows the near resemblance between that language and the Phænician. They stand thus: alpha, bethu, gamla, d.lta, &c. The Syrians and to add a to the Hebrew vocables; hence aeph becomes alpha, beth, betha or beta, &c. In he Cadmean alphabet we find the vowel letters, which is an infallible proof that this was the pracice of the Phænicians in the age of Cadmus; and his furnishes a presumption that the Jews did the fame at the fame period.

" It is evident that the oldest Greek letters, which are written from right to left, differ very little from those of the Pelagi. The four double letters ke, i, z, are faid to have been added by Pala-bedes about 20 years before the war of Troy. amonides is generally supposed to have added the letters  $\zeta$ , H,  $\Psi$ , though it appears by fome ancient ncriptions that some of these letters were used of re the days of Palamedes and Simonides. In k year 1456 seven brazen tables were discovered Engulium, a city of Umbria in the Apennines, which five were written in Pelasgic or Etruscan wasters and two in Latin. The first of these ta-ble thought to have been composed about 168 an after the taking of Troy, or 1206 years be-Christ. By comparing the inscription on these with the old Ionic characters, the curious to been enabled to discover the resemblance.
The old Ionic characters, written from right left continued in general use for several centu-: It was composed of the Cadmean and Pelas-characters, with some variations of form, poa, and found. The Athenians continued to this character till the year of Rome 350. The I lonic was gradually improved into the new, this quickly became the reigning mode. the old Ionic was laid afide the (Bourgeopiers) grophedon came into cuftom, which goes back and forwards as the ox does with the See BOUSTROPHEDON. "The words artail placed close together, and few small letters reuled before the 4th century. If our curious ders would wish to know more of letters and labets, we must remit them to Chishul, Mor-Postellus, the great Montfaucon, Gebeiin, &c. Having now, fufficiently proved the Greek alphabet was derived from the manician, in order to convince our illiterate malers of the certainty of our polition, we shall poex a Cheme of both alphabets, to which we isbjoin some strictures upon such letters of the Greek alphabet as admit any ambiguity in their sture and application.

\* A alpha, had two founds, the one broad like In the English word all; the other stender, as e nd, spend, defend. The Hebrews certainly used in because they had no other letter to express An found; the Arabs call the first letter of their Phaabet elipo; and they as well as the Phoeniciof A and E promiseuously. The Greeks call their 5th letter  $r\psi\omega_{\sigma}$ , that is, E slender, which seems to have been introduced to supply the place of  $\Lambda$ Bender.

" H, cta, was originally the mark of the spiritus for and no doubt answered to the Hebrew n. his fill retained in that capacity in the word He-

wares, and in words with the fairitus afper beginning books, chapters, fection, &c. E originally marked both the found of Ethan and Hra; that is, it was fometimes founded short as at present, and fometimes long, where it is now supplied by As it was found convenient to distinguish these two different quantities of found by different letters, they adopted H, the former spiritus asper, to denote the long found of E, and substituted the p. esent spiritus asper ['] in its place.

" I, iota, is the Hebrew or Phœnician jod or yod. We imagine it originally served the purpose of both iota and ypfilon. It had two different founds; the one broad and full, the other weak and slender. The latter had the sound of the modern with. That this was actually the case, appears in feveral monumental inferiptions: And upon this depends the variation of some cases of the demonstrative pronoun and of the second declen-

fion.

" 0, omicron or small o, in the original Greek, had three different founds. It founded a fhort, as at prefent; and likewife  $\rho$  long, now denoted by  $\Omega$  or large O. It likewife marked the found of the improper diphthong ou, founded like the English diphthong oo. The  $\alpha$  was taken from the Phænician vau or  $\mathcal{F}$ .

" T, ypfilon was adopted to supply a mark for

the fould of I flender.

"z, zeta, is compounded of &. Dion. Halic. however, informs us that this letter should be pronounced 10, according to the Doric plan.

" O, theta, was not known in the old Greek. It is compounded of \* and the spiritus asper, both which were of old written feparately thus TH.

" =, xi, is compounded of ys, xi, xs. These letters, too, were originally written feparately. " $\Phi$ , phi. This letter is compounded of  $\beta$ , or

e, and the spiritus after; thus BH, TH.

" x, chi, like the foregoing, is compounded of

2, or \*, and the fairitus afper as above.

" \*, pf, like fome of the reft, is made up of

Bi, or which, too, were originally written in

feparate characters.

"Every language, we believe, was originally composed of inflexible words. One of the first attempts towards forming the variations, now denominated declenfions and conjugations, would probably be made upon the demonstrative article and the substantive verb. In the Greek tongue, this

was evidently the method.

"The original Greck article was imported from the cast. It was the Hebrew or P cenician a ba. This particle fometimes fignifies one, and fometimes it answers to our demonstrative the; both in its adverbial and demonstrative capacity it imports demonstration. In the earliest stages of the two oriental languages, it was probably written a-part, as ba melech "the king." In process of time it came to be joined with the following word, as Hammelech. From this we think the Greek article was deduced. It is still retained in the Doric dialect in its priftine character. The difference between bo and ba in the eastern language is nothing. Here then we have the articles i masculine and a feminine. Upon these several changes were superinduced, to render them more useful for the purpofes of language." D d d 2

After this our learned author displays his perfect knowledge of the Greek language, by enlarging upon the different parts of speech, upon which he makes a number of judicious observations; but which our room permits us not to quote; nor do we think it would be of great importance, to any reader, but a student of the Greek language, who certainly would not trust his success in such a study to any thing, that he could expect to find under Philology, in a work like ours. We shall therefore content ourselves with quoting only a sew more of the learned Doctor's general remarks, which we think will be interesting to readers of all classes.

"We have already demonstrated (fays he) that the Ionim or Aborigines of Greece were a race of barbarians; that their language or rather jargon was of the fame contexture. The Pelaigi found both the people and their speech in this uncultivated state. These people arrived in Greece about the year before Christ 1760. It was then that the language of Greece began to be cultivated. Before the age of Homer the work feems to have Nothing of confequence was been completed. afterwards added to the original stock. Homer was born an. ante Chr. 1041; confequently the cultivation of the Greek tongue was completed in about 700 years. But if Orpheus, Linus, Tamyris, &c. wrote long before Homer, as they certainly did, that language was arrived nigh the flandard of perfection 200 years before; by which computation the period of its progress towards its stationary point is reduced to 500 years. But as the Pelafgi were a colony of foreigners, we ought to allow them one century to incorporate with the natives, and to communicate their language, laws, manners, and habits, to the aborigines. By this deduction we reduce the term of cultivation to less than four centuries.

"During this period Greece was furioufly agitated by internal wars. That country was divided into a number of independent states, which were perpetually engaged in quarrels. The profession of arms was necessary for the preservation of the state; and the man of prowess was honoured as a demigod. The Greek tongue was then rough and unpolished; because, like the ancient Romans, the bravest men were more disposed to ad than to

Tpeak.

"There has appeared among barbarous or half-civilized people a description of men whose profession it has been to frequent the houses or palaces of the great, to celebrate their achievements, or those of their ancestors, in the sublimest strains of heroic poetry. Accordingly we find, that the Germans had their bards, the Gauls their fads, the Scandinavians their fads or falders, the Irish their ficas, all retained for that very purpose. They lived with their chiestains; attended them to battle; were witnesses of their heroic deeds; animated them with martial strains; and celebrated their prowess if they proved victorious; or, if they sell, raised the fong of woe, and chanted the mounful directs, &c.

"Among the ancient Greeks there was a numerous tribe of men of the fame defeription, who were at once poets and muficians, and whose of-

fice it was to celebrate the praises of the great, and to transmit their exploits to posterity in the most exaggerated encomioms. These poetical vagrants were flyled Anilos or fongsters. Some of these lived in the houses of great men; while others, less skilful or less fortunate, strolled about the country in the manner above described. The more illustrious of those Ander who were retained in the temples of the gods, were the first improvers of the language of the Greeks. Among the Hebrews the first poetical compositions were hymns in honour of Jehovah." (See Exod. 1 Judges v. &c.) "In Greece, when all was on fusion and devastation, the temples of the go were held inviolable. There the Audii improtheir talents, and formed religious anthems those models which their progenitors had cha in the east.

"The language of the Greeks was yet my and unmellowed: their first care was to read more soft and slexible. They enriched it with ables suited to the offices of religion. Home very where mentions a distinction between language of gods and men. The priests concur in promoting this important purpose. From source the strolling Associated with their art; and from the vulgar deduced the ments of a polished style. From these Associations or a polished style. From these Associations or the Greek tongue acquired variety and slexibility, from which it has defined to the tease, beauty, and versatility, by which it

passes most other languages.

" Few colonies have emigrated from any con zed country without a detachment of prich their train. The supreme powers have an been worshipped with music and dancing. Hebrews, Phænicians, and Egyptians, delig in these musical and jocund sestivals. The pri who attended the lones, Dores, Æolians, bans, Athenians, &c. from the east, introd into Greece that exquisite taste, those delicate fical feelings, which diffinguished the Greeks all the neighbouring nations. Hence that m rous race of onomiatopaias, by which the G language is invested with the power of expre almost every passion of the human foul, in h terms as oblige it to feel and actually to affirm to the passion it would excite. (See Onoma POEIA.) Numberless instances of this occur in very page of Homer, Hefiod, Pindar, Sophod Euripides, and even of Aristophanes: to quote flances would be to infult the Greek fludent."

Here, after giving a short history of Gred poetry, Dr Doig enumerates the most eminent those Greek poets, who successively brought that art and the language to persection, particular Orpheus, Linus, Museus, Melampus, Olen,

fied, and Homer,

"The Grecian poets (fays our author,) joyed another advantage which that class of wers have feldom possessed, which arose from different distances into which their language divided. All those dialects were adopted and rently by the prince of poets; a circumsta which enabled him to take advantage of any w from any dialect, that fuited his purpose. Trendered versitication easy, and diffused an agrable variety over his composition. He even commodit

mmodated words from Macedonia, Epirus, and incum, to the purposes of his versification: kndes, the laws of quantity were not then clearrescertained. Succeeding poets did not enjoy hele advantages, and confequently have been more acum feribed both in their diction and numbers. "The Greek language was divided into many forent dialects. Every petty canton had some gentur forms of speech which distinguished it the others. There were, however, 4 diaal variations which prevailed over all the o-These were the Attic, Ionic, Lolic, and Do-Thele four dialectical distinctions originated the different countries in the east, from which mbes respectively emigrated. The Attics and, ift, of the barbarous aborigines; 2d, ladventitious colony of Egyptian Saites: 3d, branch of Ionians from the coast of Palestine. last formed the old lonian dialect, from forung the Attic and modern Ionic. The msemigrated from a different quarter of the coaft; the inhabitants of which were a rem-If the old Canaanites, and confequently difin dialect from the two first. The Dores from an unpolished race of purple-fishers fame coast, and spoke a dialect more rus-many of the rest. These four nations emifrom different regions; a circumstance in our opinion, laid the foundation of the at dialects by which they were afterwards

Ithis short sketch we cannot exhibit an exof the distinguishing features of each dia-Such an analysis would carry us far beyond his. For fatisfaction on this head, we re-Grecian student to Mattaire's Grecie Linuldi; and shall only add a few observations. Athenians being an active, brisk, volatile elighted in contractions. This ftyle was equitely polished. The most celebrated who wrote in that dialect were Plato, des, Xenophon, Demosthenes, and the ators; Æschylus, Euripides, Sophocles, nes, Menander, Diphilus, with the oand tragic poets. That dialect was kient or modern. The ancient Attic was with the Ionic.

lonic was the ancient Attic; but when tion emigrated from Attica and fettled on of Afia Minor, they mingled with the and Pelafgi, and of courfe adopted a of their vocables. They were an indoaurious, and diffolute people; of course The was easy and flowing, but verbose, rekading style in Homer; and after him a four number of writers on every subject wed the same dialect, such as Herodotus the Ated historian; Ctesias the historian of Peronan, who lived under Seleucus Nicator; Krates the celebrated physician; Hellanicus durian, mentioned with honour by Polybi-Anacreon of Teia; Alcæus, Sappho of Lef-Phrrecydes Syrus the philosopher, and many n of the same profession.

The Mulie and Duric were originally cogdaleds. When the Dorians invaded Pelo-

ponnefus and fettled in that peninfula, they incorporated with the Æoiians, and their two dialects blended into one produced the new Doric. The original Dores inhabited a rugged mountainous region about Offa and Pindus, and spoke a rough unpolished language similar to the foil which they inhabited. Andrew Schottus, in his observations on poetry, l. 2. cap. 50. proves from an old M. S. of "Theocritus, that there were two dialects of the Doric tongue, the one ancient and the other modern: that this poet employed Ionic and the modern Doric; that the old Doric dialect was rough and cumbrous; but that Theocritus adopted the new as being more foft and mellow." A prodigious number of poets and philosophers wrote in this dialect, such as Epicharmus the poet; Ibycus the poet of Rhegium; Corinna the poetess of Thebes; Erynna a poetess of Lefbos; Moschus the poet of Syracuse; Sappho the poetels of Mitylene; Pindar the prince of lyric poets; Archimedes the renowned mathematician; and almost all the Pythagorean philosophers. Few historians wrote in that dialect; or if they did, their works have not fallen into our hands. Most of the hymns sung in the temples of the

gods were composed in Doric. " After the Greek tongue was thoroughly polished, conscious of the superior excellency of their own language, the Greeks, in the pride of their hearts, fligmatized every nation which did not use their language with the contemptuous title of barbarians. Such was the delicacy of their pampered ears, that they could not endure the untutored voice of the people whom they called Baccacopara. This extreme delicacy produced 3 very pernicious effects; 1st, it induced them to metamorphofe and mangle foreign names, to reduce their found to the Grecian standard: 2dly, it prevented their learning the languages of the east, the knowledge of which would have opened to them an avenue to the records, annals, antiquities, laws, customs, &c. of the people of those countries, in comparison of whom the Greeks themselves were of yesterday, and knew nothing. By this unlucky bias, not only they, but even we, who derive all the little knowledge of antiquity we possess through the channel of their writings, have fuffered an irreparable injury. their transformation of oriental names, they have in a manner flopped the channel of communication between the hittories of Europe and Afia. appears evident from Herodotus, Xenophon, Ctefias, and all the other Grecian writers who mention the intercourse between the Greeks and Persians. 3diy, It deprived them of all knowledge of the ctymology of their own language. Plato in his Cratylus endeavours to investigate the etymology of only a few Greek words. His deductions are childith, and little fuperior to the random conjectures of a school-Varro, the most learned of all the Romans, has not been more fuccefsful. Both stumbled on the very threshold of that useful science; and a fcholar of very moderate proficiency in our days knows more of the origin of these two noble languages, than the greatest adepts among the natives did in theirs.

"These impersections, however, are counterbalanced. 398

SECT. VIII.

balanced by numberless excellencies: and we are certainly much more indebted to that incomparable people for the information they have transmitted to us through the medium of their writings, than injured by them in not conveying to us and to themselves more authentic and more ample communications of ancient events." But we need not make encomiums on a language which has long been extoiled, perhaps to an extravagant degree, by the labours of men of the most enlarged capacity and the most refined taste. Dr Doig concludes with some learned remarks on the spirits, or assistance, and accents of the Greek language; for which we must refer the Greeian student to his books and his teacher.

" The Greek Rudent who intends to penetrate into the depths of this excellent language, thould alfo endeavour to be thoroughly acquainted with the books after mentioned, I. Ariftotle's Rhetoric and Poetics, his book De Interpretatione, especially with Ammonius's Commentary. Ammonius was a native of Alexandria, and by far the most acute of all the ancient grammarians. 2. Dion. Halic. De Structura Orationis, where, amidst abundance of curious and interefting observations, will be found the true pronunciation of the Greek letters. 3. Demetrius Phalereus D. Elocutione; a short estay indeed, but replete with instruction concerning the proper arrangement of words and members in fentences. 4. Longinus, the prince of critics, whose remains are above commenda-5. Theodorus Gaza, and the other refugees from Conftantinople, who found an hospitable reception from the munificent family of the Medici, and whose learned labours in their native language once more revived learning and good tafte in Europe. These, with some other critics of less celebrity, but equal utility, will unlock all the treasures of Grecian erudition, without however disciosing the source from which they flowed. To thele we might add a few celebrated moderns, such as Mons. Fourmont the Eider. Mons. Gebelin, Abbé Pezron, Salmafius, and especially the learned and industrious Lord Monboddo.

"We shall now give a very brief account of the wast extent of the Greek language even before the Macedonian empire was erected; at which period, indeed, it became in a manner universal, much more than ever the Latin language could accomplish, notwithstanding the vast extent of the

Roman empire.

"GREECE, originally Hellas, was a region of small extent, and yet sent out many numerous colonies into different parts of the world. These colonies carried their native language along with them, and industriously distused it wherever they formed a settlement. The Iones, Æoles, and Dores, possessed themselves of all the W. and NW. coast of the Lesser Asia and the adjacent islands; and thus even the barbarians learned that polished language. The Greek colonies extended themselves along the S. coast of the Euxine sea, as far as Sinope, now Trebizond, and all the way from the W. coast of Asia Minor: though many cities of barbarians lay between, the Greek tongue was understood and generally spoken by people of rank and saftion.

"There were Greek cities on the N. coast of

the Euxine fea to the very eastern point, and perhaps beyond those limits; likewise in the Tauric Chersonesus, or Crim Tartary; and even to the mouth of the Danube, the straits of Casa, & In the neighbourhood of all these colonies, the Greek language was carefully propagated anothe barbarians, who carried on commerce with the Greeks.

"A great part of the fouth of Italy was plan with Greek cities on both coasts; so that them try was denominated Magna Graciae. Here Greek tongue universally prevailed. In Sid was in a manner vernacular. The Ionian sent a colony into Egypt in the reign of Piatichus; and a Greek settlement had been sein Cyrenia many ages before. The Phocian built Massilia, or Marfeilles, as early as the of Cyrus the Great, where some remains Greek language are still to be discovered tells us, that in the camp of the Helvetin were found in Greek letters. Perhaps a guage ever had so extensive a spread, where not propagated by the law of conquest.

not propagated by the law of conquest.

"The Greek tongue, at this day, is or within very narrow limits. It is spoken in itself, except in Epirus, and the western parts of the likewise spoken in the Gand Asiatic islands in Candia or Crete, parts of the Coast of Asia Minor, and in but in all these regions, it is much corrupt

degenerated.

"It is next to a miracle (fays the Dr) is many monuments of Grecian literature are be found among men. Notwithstanding the ing of the famous library of Alexandria, a almost numberless wars, massacres, and attens, which have from time to time in a stefolated those countries where the Gruguage once flourished; we are told that the remain about 3000 books written in that later

"We shall conclude this section with detail of the most distinguished stages and tions, through which this noble tongue a progress, from the age of Homer to the ta Constantinople, A. D. 1453; a period of

than 2000 years.

"Homer gave the Greek poetry its coloronistency, and enriched, as well as harms the language. The Iliad and Ocyssey have of the air of extempore compositions; and is never wanting to fill up a verse; and a expressions are mechanically, annexed to such as were of frequent recurrence. Hence the piousness and waste of words in the old Greet which forms such a contrast to the condense laboured composition of Virgil.

"The Greek profe was of a more difficulture; and it may be distributed into different or degrees of purity. Of the profe author extant, the first and best slyle is that of HITUS, and of PLATO in the florid or mixed of Xenophon in the pure and simple, of dides and Demosthenes in the austere. No perhaps, is so conducive to form a good to composition as the study of all these writers.

"The flyle of Polysius forms a new epe the history of the Greek language: it was idiotic or popular manner of expression, espemong military men, in his time, about the 150th Nympiad. It became the model of succeeding riters, by introducing a simple unstudied expreson, and by emancipating them from the anxious hour of the old Greeks respecting the cadence d choice of words. The style of the New Tesment, being plain and popular, frequently republes that of Polybius, as has been shown by phelius, and by Kirchmaier, de parallelismo. N. in Polybii, 1725.

Refore this historian, the Alexandrian Jews formed a new or Hellenistic style, resulting the expression of oriental ideas and idioms in the words, after that 'anguage had lost as much punity, as it gained in general use, by the control of Alexander. The Hellenistic is the language that partly of Philo and Josephus. Initure in the style of the evangelists and and, is one credential of the authenticity of the of all books, a book which could not have written but by Jewish authors in the first of the first of the season of Grace, book. i. ch. 8—10. Critistic labour in attempting to adjust the are Greek to the standard of Atticism.

he diction of the Greek historians, and geoor of the Augustan age, is formed on that hous; but improved and modernized, like the a of the present age, if compared with that rendon or Bacon. More perspicuous than it was well suited to such compilations as an written by men of letters, such as Di-Diodorus, and Strabo, without much ex-

corrank in public life.
Le coleliaftical ftyle was cultivated in the lam schools of Alexandria, Antioch, and Conque; rank and luxuriant, full of oriental and formed in a great measure on the life tyrefion. Such is, for instance, the Eusebius. After him, the best Christian polished their compositions in the schools are under the later Sophists. Hence the land flowing purity of St Chrysostom, who

good fense than Plato, and perhaps as sol words.

the Greek of the Byzantine empire, there is differtation by Du Cange, de caufis correctatis, perfixed to his Gloffary, together will's Grammar of the modern Greek. It flage of the Greek language is a miferature of Turkish barbarism. And, which is prising, there is no city of Greece where there is more different from the ancient Altens. The reason of that is, because it long inhabited by a mixed multitude of Inations.

conclude, the Greeks have left the most monuments of human wisdom, fortitude, cence, and ingenuity, in their improvement 7 art and science, and in the finest writings very subject necessary, profitable, elegant, raining. The Greeks have furnished the fire examples of every virtue and accomplishalural or acquired, political, moral, or mithey excelled in mathematics and philosomally the forms of government, in architectarigation, commerce, war: as oraters,

poets, and historians, they stand as yet unrivalled, and are like to stand so for ever; nor are they less to be admired for the exercises and amusements they invented, and brought to perfection, in the institution of their public games, their theatres, and sports."

## SECT. IX. Of the LATIN LANGUAGE.

"This language, (fays our author,) like every other spoken by barbarians, was in its beginning rough and uncultivated.-What people the Romans were, is a point in which antiquarians are not agreed. In their own opinion they were forung from the Trojans; Dion. Halicar. derives them from the Greeks; and Piutarch informs us that some imagined they were spring from the Pelasgi. The fact is, they were a mixture of people coliected out of Latium and the adjacent parts, which a variety of accidents had drawn together, to establish themselves on that mountainous region, to fecure their own property, and plunder that of their neighbours. They were composed of Arcadians, Sabines, Latins, Hetruscans, Umbrians, Oscans, Pelasgi, &c.; and their language must have been a mixture of the different dialects of all these discordant tribes.

"The Latin language ought then to be a mingled mass of the Arcadian, that is, the Æolian Greek, the Pelasgic, Hetruscan, and Celtic dialects. These jarring elements, like the people to whom they belonged respectively, gradually incorporated, and produced what was afterwards

called the Latin torque.

"The Arcadans were a Pelasgic tribe, and spoke a dialect of that ancient Greek, early produced by the coalition of this tribe with the savage Aborigines of Greece. This dialect was the ground-work of the Latin. The Eolian Greek, which was strongly tinctured with the Pelassic, was the model upon which the Latin language was formed. From this deduction it appears, that the Latin tongue is much more ancient than the modern Greek; and that the Greek, as it stood before it was thoroughly polished, hore a very near resemblance to that language. Hence we may conclude, that the knowledge of the Latin language is necessary to understand the Greek.

"A very confiderable part of the Latin tongue was derived from the Hetruscan. That people were the masters of the Romans in every thing sacred. From them they learned the ceremonies of religion, the method of arranging public sessions, the art of divination, the interpretation of omens, the method of lustrations, expiations, &c. It would be easy to prove, that the Pelasgi and Hetrusci were the same race of people; and their languages must have differed in dialect only." See Thursyd. lib. iv.

"The Umbrian or Celtic enters deeply into the composition of the Latin tongue. For proof of this, we need only appeal to Pelloutier, Bullet's Memcires de la Langue Celtique, partie I, Abbe Pezron's Origin of Ancient Nations, &c. The Latin abounds with oriental words, especially Hebrew, Chaldaic, and Petsian. These are certainly remains of the Petasgic and Hetruscan tongues, spoken originally by people who emigrated from

regions, where those were parts of the vernacular language. - In this language, too, there are not a few Gothic terms. Pelloutier supposes, the Celtic and Gothic languages were originally the fame. There are, besides, in the Latin a great number of obsolete Greek words. The most effectual method to distinguish the difference between the early and modern Greek, would be to compare the ancient Latin with the latter; there being very little difference between the ancient Greek and Latin in the earliest periods. It is certain that the Roman letters were the same with the ancient Greek.—Formæ literis Latinis quæ veterrimis Græcorum, fays Tacitus; and Piny fays the fame, and for the truth of his affertion appeals to a monu-ment extant in his own times. These old Greek letters were no other than the Felafgic, which we have shown from Diod. Sic. to have been prior to the Cadmean. For the figure of these letters, see Astle, Postellus, Montfaucon, Palægraphia Græca, M. Gebelin, and our Place II. Vol. I.

"That the Latins borrowed the plan of their declenfions from the Greeks, is 'evident from the exact refemblance of the terminations of the cases throughout the three similar declenfions. In nouns of the first declention, the refemblance is too palpable to fland in need of illustration. In the 2d the Greek genitive is or. In Latin the o is thrown out, and the termination becomes i. The Latin dative ends in o, which is the Greek dative, throwing away , fubscriptum, which was but faintly founded in that language. No genuine Greek word ended in  $\mu$  or m. In the termination of flexions, they changed it into. The Latins retained m, which had been imported as a terminating letter, at an era before the Greek language had undergone its last refinement.-Hence the Latin accusative in um, instead of the Greek m. The vocative declention was in this case originally like the nominative. The Latins have no dual number, because the Æolian dialect, from which they copied, had none. The third declentions in both languages are so exactly parallel, that it would be superfluous to compare them.

"The Latins have no articles, which is certainly a defect. The Pelasgic, from which they copied, had not adopted that word in the demonstrative sense. Homer indeed seldom uses it; and the probability is, that the more early Greeks used it less frequently. Thus in Latin, when I say, wideo bominem, it is impossible to find out by the bare words whether the word bominem intimates a man, or the man; whereas in Greek it would be Brith adoption. Hence the first expression is indefinite, and the second definite.

"The substantive verb sum in Latin seems to be partly formed from the Greek and partly not. Some of the persons of the present tense have a near resemblance to the Greek verb su or sum, while others vary widely. The impersest, præterite, and præterpersest, have nothing common with the Greek verb. The stuture ero was of old 1/20, and is indeed genuine Greek. Upon the whole, the Latin substantive verb more nearly resembles the Persian verb besten than that of any other language we are acquainted with.

"The want of aorists or indefinite tenses seems

a palpable defect in the Latin language. There of these among the Greeks enabled the writer to express the specific variations of time, with my accuracy and precision than the Latins, who no ver attempted to specify them by any other tose but the imperfect and plupersect. Indeed but the Greek and Latin languages were much infrior to the English in this respect." See Luguages, Sect. V. and VI.

"The Latins in reducing verbs to their fe conjugations, formed their inflexions in a very regular manner. Many verbs of the first class flect their præterite and supine like those of second: thus domo, instead of giving and and has iti and itum, like monui and monitum. few verbs of the 3d conjugation have ivi and as if they belonged to the 4th; e.g pero, petitum. Then, some verbs have io in thep ivi in the præterite, and itum in the fupine, contrary to the rules of analogy, they in belong to the third; fuch are cupio, cupitin tum, cupere, &c. Some verhs of the ad cu tion have their præterite and supine as if the longed to the third; thus, jubeo, juffi, juffi bere; augeo, auxi, auchum, augere. Some which are actually of the 4th conjugation their præterite and supine as if they were third; thus fentio, fenfi, fenfum, fentire; baufi, bauflum, baurire, &c. Thefe are irregularities.

"Another blemish in the Latin tongue fioned by its wanting a participle of the pri tense in the active voice. This desect is tually felt, and is the cause of an aukwa cumlocution, wherever it happens. Thus, general having croffed the river, drew up my;" Imperator, cum transifit flunce, ad Struxit. Here cum transiffet flumen is a m circumlocution, which is at once avoided Greek i nysper righters for morning, &c. The always prove an incumbrance in the cased intransitive verbs. When active deponen occur, it is easily avoided. Thus, "Ca ving encouraged the foldiers, gave the fig joining battle;" Cafar cobortains milites, committendi fignum dedit.

" Another palpable defect in this language fes from the want of a participle of the profi five. This again must produce an inconven upon many occasions, as will be obvious to Latin student. The two supines are universal lowed to be substantive nouns of the 4th de fion. How these assumed the nature of vo is not easy to determine. When they are p after verbs or nouns, the matter is attended no difficulty; but how they flould acquire tive fignification, and take the case of the with which they are connected, implies a of prerogative. The Latin gerunds form at unnatural anomaly. Every Latin scholar that those words are nothing but the neutr the participles of the future passive. The cators of the Latin tongue, however, ele them from their primary condition, giving upon many occasions an active fignification.

"Another inconveniency arises from the of the present participle of the verb size. Gre conveniency is derived from the use of the

ine in Greek; and indeed it appears furpriin that the Latins neglected to introduce the articiple en into their language. In this they re hogular. Here again a circumlocution bemes necessary in such a case as the following: The lenate being at Rome, passed a decree. mend of faying fenatus ens Rome, legem tulit, we tobliged to fay cum fenatus Romæ effet, &c. If words ens or existens had been adopted, as in & Greek, this odious circumlocution would have paroided. Many other defects of the like kind occur to every person even in the most aped claffical authors.

If we compare the structure of the Greek and languages, we will quickly be convinced their characteristic features are extremely dif-L. The genius of the former feems eafy and ti; whereas that of the latter, notwithstand-me united efforts of poets, orators, and phi-ben, fill bears the marks of violence and re-L. To translate Greek into English is no lain talk; the texture of the two linguages is tenial, that the words and phrases, and e-idiomatic expressions, naturally slide into ther. With the Latin the case is quite o-se; and before elegant English can be proone must deviate considerably from the o-Should we attempt to translate a piece infinito Greek, and at the fame time into the translation of the former would be atwith much less difficulty than that of the supposing the translator equally skilled in

nguages.

is incongruity feems to fpring from the ing cause. Before any man of considerable es either in the capacity of a poet, grain-nor rhetorician, appeared at Rome, the lanhad acquired a strong and inflexible tone, born to be exactly moulded according to rcian flandard. After a language has conleveral centuries without receiving a new k becomes like a full grown tree, incapabeing bent to the purposes of the mechanic. bhanding all these obstructions, it arrived pitch of perfection, as to rival, perhaps hall the other European languages, the only excepted. Had men of the taste, in, and industry of Ennius, Plautus, Te-Cicro, and the other worthies of the Auage, appeared in the early stages of the commonwealth, their language might been thoroughly reduced to the Grecian ar-Pe, and the two dialects might have improother.

chave observed that the Latin tongue was a of all the languages spoken by the vagrant who composed the first elements of that ic. The prevailing dialects were the Pelaf-Herruscan, and the Celtic, which was the ginal tongue of Italy. Hence the primary not the Romans was composed of discormaterials, which never acquired a natural engenial union. This motiley mixture was bely the original dialect of the Romans. The fic or Hetruscan part of it retained a strong are of the oriental style. The Celtic part is to have been prevalent, since we find that of the names of places, especially in the mid-TOL XVIL PART IL

dle and northern parts of Italy, are actually of Celtic original. It is therefore clear that the ftyle of the first Romans was composed of the languages above mentioned. Their most celebrated writers upon etymology were Æinus Gallus, Quintus Cornificius, Nonius Marcelius, and Festus. At the head of these is Terentius Varro, whom Cicero flyles the must learned of all the Romans. From these writers we are to expect no light. Their etymologies are generally childilly and fu-

"Many circumstances concur to make it light ly probable that, in the earnest periods of the language, very few inflexions were introduced. Ift; When the Pelasgi left Greece, the Greek language itself was not fully polished. 2d, The Arca-hans were never thoroughly cultivated. They were a ruftic paftoral people, and little minded the refinements of a civilized state; consequently the language they brought into Italy at that era must have been of a coarse and irregular contexture. From these circumstance, it appears that the earlieft language of the Romans was very little diverfified with inflexious. The effect of this was, hat the modern Romans did not understand the sand guage of their early progenitors. Polybius, speaking of the earliest treaty between the Romans and Carthaginians, says, "The Roman language has undergone fo many changes fince that time to the prefent, that even those, who are most deeply skils led in the science of antiquities, cannot understand the words of that treaty but with the greatest difficulty."

" After the Romans became acquainted with the Æolian Greeks, who feized upon both coafts of Italy towards the S. which they called Magna Gracia, they began to torture their language into that foreign contexture. The most ancient specimen of this kind confifts of the remains of the XII tables. Here every thing is rude and of a clumfy cast; for though by this time considerable progress had been made in refinement, and the language of Rome had begun to appear in a Grecian uniform, still those changes were not natural, Soon after appeared M. Fabius Pictor and Silenna; historians often quoted by Livy, but whose works are long fince irrecoverably loft. The Fafti Capitolini are often mentioned; but they too perished in the burning of the Capitol; during the civil wars between Marius and Sylla. We must therefore leave the Latin tongue during those per riods rude and barbarous, and descend to others more characteristically marked.

" In this period we find Enrius, who wrote a Roman history in hexameter verse in 18 books, which he called Annals; most part of which is now lost. He likewise translated Euhemerus de Origine Deorum; a work often mention d by the Christian fathers in their disputes with the Pagans. and sometimes quoted by Cicero. Then followed Cains Lucilius the famous fatyrift Acciu: Valerius, Alpinus, &c. whose fragments were published by the Stephens, Paris, 1564. All these imitated the writers of Greece, or translated from them. By their exertions the spirit of these authors was transfuled into the Latin tongue, and its ftructure accommodated to the Grecian plan. - " Plautus and Terence, by translating the co-

Digitized by Google

medies

medies of Menander and Diphilus into their own language, taught the Latin Muses to speak Attic Greek. To speak that language was then the ron, as it is now with us to chatter French. Greek tutors were retained in every reputable family; and many Romans of the first rank were equally qualised to speak or write both in Greek and Latin. The original jargon of Latium became obsolete and unintelligible; and Cato himself condescended to learn the Greek language at 80.

"To pretend to enumerate the various inimitable examples of the Augustan or golden age of the Roman tongue, would be a vain task: we finall only quote a few lines from Velleius Paterculus. Having observed, that the Greek authors, who had excelled in literature, had all made their appearance about the same time, he adds, " Nor was this circumstance more conspicuous among the Greeks than among the Romans; for the Roman tragedy is confined to Accius and the period when he flourished. The charming wit of Latin elegance was brought to light by Cecilius, Terentius, and Afranius nearly in the same age. As for our historians (to add Livy also to the age of the former), if we except CATO, they were all confined to a period of 80 years; fo neither has our flock of poets extended to a space much backward or forward. But the energy of the bar, and the finished beauties of profe eloquence, fetting afide the same Cato (by leave of P. Crassus, Scipio, Lzlius, the Gracchi, Fannius, and Ser. Galba,) broke out all at once under Tuliy the prince of his profeffion."

" From this quotation (the Dr argues,) it appears, that the Romans themselves were convineed of the fhort duration of the golden age of their language. According to the most judicious critics, it commenced with the era of Cicero's oratorical productions, and terminated with the reign of Tiberius, or perhaps the middle of his reign. It is generally believed that eloquence, and with it every thing iberal, elevated, and manly, was banished Rome by the despotism of the Cæsars. We imagine that the transition was too instantaneous to have been entirely produced by that unhappy cause. Despotism was firmly established among the Romans about the middle of the reign of Augustus; and yet that period produced such a group of learned men as never adorned any other nation in fo short a space of time. The age of Lewis XIV. was the golden period of the French tongue; and that age produced a race of learned men, in every department, fuperior in number, and equal in genius to the literati who flourished under the noble and envied constitution of Britain during the same age, though the latter is universally allowed to have been the golden period of this country. The British ises, we hope, enjoy fill as much liberty as ever; yet we believe few people will aver, that the writers of the prefent age are equal either in Ryle or in genius, to that noble group, who flourished from the middle of the reign of Charles L to the middle of the reign of George II. and here despotism is quite unconcerned.

"In the east the fame observation is confirmed. The Persians have long grouned under the Mohammedan yoke, and yet every oriental scho-

lar will allow, that in that courtry, and under t most galling tyranny, the most amazing prodi tions of tafte, genius, and industry, that everd nified human nature, have been exhibited. I der the Arabian ealiphs, the fuccessors of Moha med, appeared writers of a most sublime gen though never was despotism more cruelly exerc than under those fanatics. The revival of let at the era of the reformation was chiefly proed and cherished by petty despotical pris We cannot therefore agree, that the despotid the Cæsars banished eloquence and learning s Rome. Longinus indeed has attributed third fortune to that cause, and tells us, " It is it that is formed to nurse the sentiments of gre niules, to push forward the propentity of ca to inspire them with hopes, and the generous bition of being the first in rank." When nus wrote this, he did not reflect that he was a striking infrance of the unsoundress observation.

"As to science, the fact is undoubtedly other side. That Seneca was superior to in philosophy, cannot be reasonably contra The lafter had read, and actually about whole extent of Grecian philosophy: this ed his reading rather than his learning. mer had add eted himfelf to the floic feet; he does not write with the same flow of el as Tully, he thinks more deeply and reals closely. Pliny's Natural History is a w collection, and contains more ufeful ko than ail the writings of the Augustan age ed into one mass. We think the historic of Tacitus, if inferior to Livy in figle and of diction, much superior in arrangement gour of composition. Quintilian, P younger, Suctonius, Petronius Arbiter, venal, deserve high esteem; nor are they to their immediate predecessors. We the is good reason to conclude, that the loss ty among the Romans did not produce !! tion of eloquence, science, elevation of or refinement of tafte. There were other flances which chiefly contributed to prod revolution.

welleius Paterculus affigns some versous reasons for this catastrophe. "Es (fays be) is the nurse of genius; and one way, and another admiration, fires imitation be stationary in perfection is a difficult and by analogy, that which cannot go so goes backward. As at the outset we are sed to overtake those whom we deem being when we despair of being able to overtake those whom we deem being able to overtake those whom we

"This was the case with the Romansheroes of the Augustan age had burn and prize of eloquence, history, poetry, &c. successfors despaired of being able to equalises to surpass them, in any of these walks, were therefore under the necessity of shriking a new path by which they might arrive at nence. Consequently Seneca introduced the

we, as the French call it; that is, a short, sparking, signification, abounding with antitheing, quaintnesses, witticisms, embellished with bers, and meretricious ornaments; whereas, the yearthe Augustan age was natural, simple, folid, lassed, and property adapted to the nature of bubick and the sentiments of the author.

The historian Sallust land the foundation this unnatural style. Notwithstanding all his skenics, he every where exhibits an affectatof antiquity, an antithetical cast, an air of sity, an accuracy, exactness, and regularity. The standard to his an accuracy, exactness, and measure, and exacts or defect. Paterculus imitated offer; and succeeded best in those points this archetype had failed. Tacitus deviation the Augustan exempiars, and imitated i; but affecting brevity, he often falls into sity. The other contemporary writers emicornate style; and their works are held in imation, and bear marks of degeneracy.

hat degeneracy, however, did not foring the despotic government under which these alives, but from that affectation of fingulation which they were led by an eager but defire of fignalizing themselves. But the first of this rage for innovation did not reach interest as it had done their style; for in ant they were so far from falling below as for the writers of the former age, many instances they seem to have surpassifications.

th respect to sentiment and mental exerlatin authors preserved their vigour, till and essemble of the Romans. The contagion besiversal; and a listlessies, or intellectual the usual concomitant of luxury, spread cover the mental faculties, which renem not only averse to, but even incapadustry and perseverance. This lethargic on of mind seems to have commenced totconclusion of the silver age; that is, ated of the reign of Adrian. It was then Roman eagles began to stoop, and the frome, as well in arts as in arms, began

the Roman genius, about that period, bedoctine, fo the ftyle of the filver age was by vitiated with barbarisms. The barbato flocked to Rome from all parts of the the ambaffadors of foreign princes, and princes themselves, with their attenthe prodigious numbers of flaves over ail e frequent commerce between the Roher and the barbarians; all concurred to le Latin tongue. This vitiated character thyle and fentiment became more and Feralent, from the reign of Adrian to the al of the imperial feat to Conftantinople. beceeded the iron age, when the Roman became absolutely barbarous. Towards E of the filver, and during the whole of ten age, there appeared, however, many or no contemptible talents. The most lable was Seneca the stoic, the master of SE SENECA.

"About the fame time lived Persius the fatyrift, the friend and disciple of the floic Corputus: to whose precepts, as he did howour by his virtuous life, so his works, though small, show an early proficiency in the science of morals. Under the mild government of Adrian and the Antonines lived Aulus Geiius, an entertaining writer in the miscellaneous way, well skilled in criticism and antiquity. His works contain several valuable fragments of philosophy, which are indeed the most curious part of them.

"In the same age with Aulus Gellius flourished Apuleius of Madaura in Africa; a Platonic writer, whose matter in general far exceeds his perplexed and affected style, too conformable to the sale rhetoric of the age when he lived.

"With Auius Gellius we may range MACROBIUS; not because a contemporary (for he is supposed to have lived under Honorius and Theodofius), but from his near resemblance in the character of a writer. His works, like those of the other, are miscellaneous; filled with mythology and ancient interature, with some philosophy intermixed.

"Boethius was descended from one of the noblest of the Roman families, and was conful in the beginning of the fixth century. He wrote many philosophical works; but his ethic piece on the Considation of Philosophy deserves great encomiums, both for the matter and the style; in which latter he approaches the purity of a far better age than his own. By command of Theodoric king of the Goths, this great and good man suffered death;" (See Boethius and Italy, § 7-) "with whom the Latin tongue, and the last remains of the Roman dignity, may be said to have sunk in the western world.

"There were besides a number of poets and historians who slourished during this period; such as Silius Italicus, Claudian, Ausonius, &c. (See Ausonius, Claudian, Italicus, &c. and Job. Alberti Fabricii Bibl. Lat.) There slourished, too, a number of ecclesiastical writers, some of whom deserve great commendation. The chief of these is Lactantius, who has been deservedly dignished with the title of the Christian Cicero.

"The Roman authors amount to a very small number in comparison of the Greek. When we consider the extent and duration of the Roman empire, we are justly surprised to find so few writers of character and reputation in so valt a

"Upon the whole, the Latin tongue deserves our attention beyond any other ancient one now extant. The grandeur of the people by whom it was spoken; the lustre of its writers; the empire which it ftill maintains among ourselves; the neceffity we are under of learning it, in order to obtain access to almost all the sciences, nay even to the knowledge of our own laws, of our judicial proceedings, of our charters; ail these circum stances, and many others too numerous to be detailed, render the acquisition of that imperial language in a peculiar manner improving and interefting. Spoken by the conquerors of the ancient nations, it partakes of all their revolutions, and bears continually their impression. Copious and majestic, when, weary of battles, the Romans vi-

ed with the Greeks in science, it became the learned language of Europe, and by its lustre made the jargon of favages disappear. After hav-ing controlled by its eloquence, and humanized by its laws, all those people, it became the lan-guage of religion. In short, the Latin language will be studied and esteemed as long as good sense and fine tafte remain to the world."

## SECT. X. Of the CELTIC LANGUAGE.

"THE descendants of Japhet having peopled the western parts of Asia, at length entered Europe. Some broke into that quarter of the globe by the N. others croffed the Danube wear its mouth. Their posterity gradually ascended towards the source of that river; afterwards they advanced to the banks of the Rhine, which they palled, and thence ipread themselves as far as the Alps and the Pyrenean hills. These people were composed of different families; all, however, spoke the same language; their manners and custoins bore a near resemblance; there was no variety among them but that difference which climate introduces. They were all known, in the more early times, by the general name of Celtoligtha. In process of time, becoming exceedingly numerous, they were divided into feveral nations. Those who inhabited that large country bounded by the ocean, the Mediterranean, the Rhine, the Alps, and the Pyrenees, were denominated Gauls or Celts. These multiplied so prodigiously in a few centuries, that the fertile regions which they then occupied could not afford them the means of subsistence. Some of them passed over into Britain; others croffed the Pyrenees, and formed fettlements in the noithern parts of Spain. Others made their way into Italy, and colonized those parts which lie at the foot of the mountains; whence they extended themselves towards the centre of that rich country.

"By this time the Greeks had landed on the guage, accordingly, remained unmixed, E. coast of Italy, and founded numerous colonies. The two nations vying as it were with each other in populousness, and always planting colonies in the course of their progress, at length rencountered about the middle of the country. central region was then called LATIUM. Here the two nations formed one fociety, called La-TINI, i. e. the Latin people. The languages of the two nations were blended; and hence, according to some, the Latin is a mixture of Greek and

" As the Gauls were a brave and numerous people, they maintained themselves in their priftine possessions, uninvaded, unconquered, till their domestic quarrels exposed them as a prey to those Romans whom they had often defeated. Not being addicted to commerce, they had little opportunity to mingle with foreigners. language, therefore, must have remained ummixed with foreign idioms. 'Such as it was when they fettlied in Gaul, such it must have continued till the Roman conquelts. If therefore there is one primitive language now existing, it must be found in the remains of the Gaelic or Celtic. Some very learned men, upon discovering the coincidence of very great numbers of words in some of the Greek dialects with other words in the

Celtic, have been inclined to establish a strict ass

nity between these languages.

" Many learned men have thown, that all the local names in the north of Italy are adually of Celtic extraction. These names generally point out or describe some circumst new relating to the nature of their fituation; such as exposur eminence, lowness, monthess, dryness, coldies heat. &c. This is a very characteristic feature an original language; and in the Celtic it is prominent, that the Erfe names of places all of Scotland are, even to this day, peculiarly diff guished by this quality.

" To discover the sources from which the tic tongue is derived, we must, i. Confus Greek and Latin authors, who have prefe Iome Gaelic or Celtic terms in their writing We must have recourse to the Weich and Bretagne dialects; in which any new word eafily diftinguithed from the primitive. 3must converse with the country people and fants, who live at a diftance from cities, in countries where it was once the vernacularies We have been credibly informed, that a high gentleman, croffing the Alps for Italy, and ally fell in with an old woman, a native of parts, who spoke a language to near aking native Erfe, that he could understand h little difficulty; and that the, on the other understood most of his words. 4. The nuine remains of the Gaelic tongue are found in the Highlands of Scotland; the The Scottish Highlanders is obvious. unmixed unconquered posterity of the Britons, into whose barren domains the Re never penetrated. Amidst all the revolution shook and convulsed Albion, those mount regions were left to their primitive lords, though hospitable in the extreme, did not ftrangers to refide long among them. The this day, especially in the most remote par unfrequented islands.

" The Norwegians subdued the western of Scotland at a time when the Scottish chy was flil in its minority. They ere kind of principality over them, of which the of Man was the capital: yet we have been formed by the most respectable authority there is not at this day a fingle vocable of Norse or Danith tongue to be found among islanders. This fact affords a demonstrati that superstitious attachment with which were devoted to their vernacular dialeds.

"The WELSH dialect cannot, we thin pure. The Silures were conquered by the mans, to whom they were actually subject three centuries. During this period, a mul of Italian exotics must have been transplant to their language; and indeed many of the discernible at this day. Their long community their English neighbours and conqu hath also adulterated their language. The is now spoken by a race of people whose m ty and ingentity are nearly upon a level. I ancient history being entirely fabulous, we suspect that the Irish are of Celtic extractional that their forefathers emigrated from the W.o. of Britain at a period prior to all historical or traditional annals. Ireland was once the native land of faints. The chief actors on this facred stage were Romanitts. They pretended to improve the language of the natives; and certainly they made it detaits very considerably from the original Cel-

Though the Hibernian tongue differs confitrably from the original Celtic, fome very ingeion cliays have been lately published by the med members of the Antiquarian Society of in which the coincidence of that tongue, some of the oriental dialects, has been supand by very piaulible arguments. In a differa published in 1772, they have exhibited a dion of Punico-Malte'e words compared with d of the same import in Irish, where it must blowed the refemblance is palpable. In the e differtation they have compared the cele-El Punic scene in Plautus, with its translation the lrift; in which the words in the two leges are furprifingly fimilar. Hence it apthat the Celtic is coeval and congenial with of ancient languages of the eaft. and Norwegians formed fettlements in i; and the English have long been soveof that island. These circumstances must affected the vernacular idiom of the natives; mention the necessity of adopting the lanof the conquerors in law, sciences, and re-

The inhabitants of the highlands and islands mland are the descendants of those Britons led from the power of the Romans, and and themselves among the fens, rocks, and desof those rugged mountains and seques-They preferred these wastes and with liberty and independence, to the fer-leys of the fouth, with plenty embittered avery. They carried their language along them, a branch of the Celtic. With them number of the druidical priefts, who knew lative dialect in all its beauties and varie-They were fequestered by their fituation he reft of the world; and confequently their remust have remained in the same state in they received it from their ancestors. They ed it genuine Celtie, and fuch they preferv-

When the Scots became masters of the low ry, and their kings and a great part of the symbiaced the Saxon manners, and adoptite Saxon language, the genuine Caledonians coully retained their native tongue, dress, and could not genuine the saxon language, and feudal customs, and could not have a superior of the saxon language, therefore, could not be seed with words or idioms borrowed from ladeed the commerce between them and for the south, till about 150 years ago, was transient; nor was their native dialect in the lastested by it.

Their language, however, did not degenerate, and there existed among them a description of what profession obliged them to guard at that misfortune. Every chieftain retained in family a bard, whose province it was to appear poems in honour of his lord, to comme-

morate the glorious exploits of his ancestors, to record the genealogy and connections of the family; &c. (See Bard, § 4, 5.) Those poetic geniuses watched over their vernacular dialect with the greatest care and anxiety; because in their compositions no word was to be lost.

"The use of letters was not known among the ancient Celta; their druidical clergy forbade the use of them. All their religious rites, their philofophical dogmas, their moral precepts, and their political maxims, were composed in verses which their pupils were obliged to commit to memory. Accordingly letters were unknown to the Caledonian Scots, till they learned them from their fouthern neighbours or from the Romans. bards, therefore, committed every thing to memory; and of course the words of their language must have been faithfully preserved. We find that the celebrated poems of Offian, (fee Ossian,) have thus been preferved from father to fon for more than 1000 years. The beauty, fighificancy, harmony, variety, and energy of these verses, strike us even in a profe translation.

"The Gaelic (fays James Grant, Efq. advocate,) is not derived from any other language, being obviously reducible to its own roots. Its combinations are formed of simple words of a known fignification; and those words are resolvable into the simplest combinations of vowers and confonants, and even into simple sounds. In such a language we may expect that some traces will be found of the ideas and notions of mankind living in a state of primeval simplicity; and if so, a monument is still preserved of the primitive manners of the Celtic race, while as yet under the guidance of simple nature, without any artificial restraint or controul.

"The fudden fensations of heat and cold, and bodily pain, are expressed by articulate sounds, which, however, are not used in this language to denote heat, cold, or bodily pain. A sudden sensation shait; of cold, by id; of bodily pain, by sich. All these sounds may be called interjections, being parts of speech which discover the mind to be seized with some passion. Few of the improved languages of Europe present so great a variety of sounds which instantaneously convey notice of a particular passion, bodily or mental seeling.

"The pronouns be and the are expressed by the fimple founds e and i, and these are the marks of the masculine and feminine genders; for a neuter gender is unknown in the Gaelic. The compositions of rude and barbarous ages are univerfally found to approach to the style and numbers of poetry; and this too is a diftinguishing character of the Gaelic. Bodily subsistence will always be the principal concern of an uncultivated people. Hence ed or eid is used upon discovery of any animal of prey or game: it is meant to give notice to the hunting companion to be in readiness to seize the animal: and hence we believe edo fignifies to eat in Latin. and ed in Irish, signifies cattle. These are words importing the simplicity of a primitive frate, and are common in the Gaelic idiom. Traces of imitative language remain in all countries. The word used for cow in the Gaelic language is bo, plainly in imitation of the lowing of that animal.

"In joining together original roots in the progress of improving language and rendering it more copious, its combinations discover an admirable justness and precision of thought, which one would force expect to find in an uncultivated dialect. The Gaelic language, in its combination of words, specifies with accuracy the known qualities, and expresses with precision the nature and properties, which were attributed to the object denominated." Of these Dr Doig gives numerous examples from Mr Grant's Effays; but which we omit, as they can only be interesting to those who understand the Gaelic language; of which we have already given a very concife and comprehensive account, under the article GAELIC, & 2; from Dr James Robertton's flatifical account of Callander; to which we would refer those who with for farther information respecting this ancient language: who may also confult Pezron's Origin of Ancient Nations, Bullet's Mem. de la Langue Celtique, Parfon's Rem. of Japhet, Gebelin's Monde Prim. &c.

"When the Celtic language (fays Dr Doig) was generally spoken over Europe, it feems to have been amazingly copious. By confulting Bullet's Memoirs, it appears that its names for the common and various objects of nature were very numerous. The words denoting water, river, wood, forest, mountain, lake, &c. were most precisely accommodated to specify each modification and variety, with fuch peculiar exactness as even the Greek, with all its boafted idiomatical precision and copiousness, has not been able to equal. The appearances, which divertify the vitible face of inanimate nature, arrest the attention of men in an uncultivated state. Unaccustomed to thought and abstract reasoning, their minds expand and exercife their powers upon fenfible objects, and of course mark all the minutia, and almost imperceptible diffinctions, with an accuracy to us feemingly impossible.

Dr Doig adds, that "the Celtic was one of the dialects of the primitive language; that it once overfpread by far the greatest part of Europe; that the Gaelic now spoken in the northern parts of Scotland and the adjacent islands is the most pure and unmixed relic of that tongue now any where existing. There is lately published an excellent translation of both the Old and New Testaments into Gaelic, which has hitherto been a desideratum among those who speak this language. Such a translation will at once contribute to preserve that ancient tongue, and disseminate the knowledge of the truth among the natives of that country."

On the origin of the name of the people, our author has the following remarks:—" Gaul and Gal, were the two names by which this people was diffinguished by the Greeks and Romans. Mr McPherfon imagines, that the appellation of Gelt is an adjective derived from Gael, the aboriginal name of the inhabitants of ancient Gaul. But we can fee no connection between Gael and Gelt, nor do we think that the latter is an adjective. We believe that those people called themselves Gael, and not Gael. We are fure that Caledonia, or Caledon or dun, was an ancient name of the mountainous parts of Scotland.

"Though many different opinions have been

advanced with relation to the etymology of this word, we imagine that none is so probable as that which supposes that it is compounded of the two Celtic words Cal or Kal, that is Gul or Gaul, and dun, which fignifies a bill or mountain. Upon this ground, the Caledonii will import the Gauls of the mountains, or, which is the same, the Highland Gauls. The Irifh and Highlanders reciprocally denominate themselves by the general title of Cael, Gael, or Gauls. They also diftinguish themselves, as the Welch originally did, and as the Welch diffinguish them both at present, by the appellation of Guidholl, Geuthel and Garled The intermediate th, they fay, is left quielcent in the pronunciation, as it is in many words of the British language; in which case Gathel would in mediately be formed into Gael; and Gathel is tually founded like Gael by both the Irish a Highlanders at prefent. The appellation of G thel, therefore, fay they, was originally the far with Gael, and the parent of it."

## SECT. XI. Of the GOTHIC LANGUAGE.

"The Celtic and Gothic tongues (fays DrDom at one time divided Europe between them. But were of equal antiquity, both originated in the both were dialects of the original language of whind. The Celtic, however, was first imposint Europe. The Gauls or Celts had penetral farthest towards the west; a circumstance who plainly intimates the priority of their arrival.

plainly intimates the priority of their arrival.

"The Goths and Getæ were the fame med people, according to Procopius de bello Gath; and Strabo informs us, that they spoke the lane language with the Thracians, from whose confect they had foread themselves nor hward as far as the W. banks of the Danube. Vopifcus, in the tory of Probus, tells us, that this emperor obligate "the Thracians, and all the Getic tribes, to furrender or accept of his friendship." expression indicates, that the Thracians and Getic tribes were deemed the fame race of people From this deduction it is clear, that the Getz Thracians were brethren; that they spoke fame language: and that their laws, manners, cal toms, and religious tenents, were the same, might eafily be flown.

"The Thracian language, as might be demotstrated from names of persons, offices, places, and customs, among that people, was nearly related to the Chaldean and other oriental languages They are thought to have been the descendants of Tiras, one of the fons of Japhet, and confequently must have preserved the speech of the Noachie family. The Gothic language abounds with Pab lavi, or old Perfic words, which are no doubt remains of the primeval dialect of mankind. The Thracians peopled a confiderable part of the northern coast of Asia Minor; and consequently we meet with many names of cities, mountains, rivers &c. in those parts, exactly corresponding with many names in Europe, evidently imposed by our Gothic progenitors. Any person tolerably acquainted with the remains of the Gothic tongue, will be able to trace thefe with little difficulty.

"We learn from Herodotus, that Darius in his expedition against the wandering Scythians who lived on the other side of the Ister or Danues, in

his progress subdued the Getæ; and he informs us, that these people held the immortality of the human foul, and that they were the bravest and mest just of all the Thracians. After this period, we find them mentioned by almost every Greek writer, even familiarly; for Geta in the comedies of that nation, is a common name for a flave. The Getze then occupied all that large track of country which extended from the confines of Thrace to the banks of the Danube : were a brave nd virtuous people: and fpoke the fame language the Thracians, with whom they are often founded both by Greek and Roman historians. \*But the name of Gorns is by no means fo cent. It was utterly unknown both to the anor Greeks and Romans. The first time that ename Gash is mentioned is in the reign of the speror Decius, about A. D. 250, when they at out of Getia, and rushing like a torrent into empire, laid waste every thing with fire and ord. The name of their leader or king was na. Decius, endeavouring to expel them from ice, was vanquished and slam. After this irtion, we find them frequently in the Latin aununder the name of Getae or Gathi; though Greeks generally denominate them SCYTHE. firestells us, that get and got is the fame word. chanciently denoted a foldier. Got in Icelandic lies a borse or borseman, and gata, a quanderer." other derivations are given of the name. See THS.

The original feat of the Goths (fays Dr Doig) the country now called Little Tartary, into they had extended themselves from the tiers of Thrace. It was called Little Tartary, the Greek writers; and it was the station those innumerable swarms advanced, th, in conjunction with the Alani and other from tribes, at length over-ran and subverted western empire. One part of the Gothic nawas allowed by Constantine II. to settle in Before the year 420, most of the Gothic who had fettled within the limits of the an empire had been converted to the Christian but, unhappily, the greater part of the aby whom they had been profelyted, were which proved fatal to many of the ortho-Christians; for the Arian Goths perfecuted with unrelenting cruelty;" and the orthowere equally cruel to the Arians.

About A. D. 367, ULPHILAS, bishop of the sim Goths, translated the New Testament inthe Gothic language. The remains of this lation furnish a genuine and venerable monnt of the ancient Gothic dialect. No more is extant of that valuable translation than the Gospels, and a fragment containing part of spishle to the Romans. The Gospels have repeatedly published since the first edition Junius, in 1665, down to that of Mr Lye. For fragments of the Gothic language have also found, which our curious readers may see in 1 Notes to his Edition of the Gothic Gospels. Fragment of the Epistle to the Romans was by discovered in the library at Wolfenbuttel, published by Knitel archdeacon of Wolfentel.

"The Goths, prior to the age of Ulphilas,

were ignorant of the use of alphabetical characters. The bithop fabricated an alphabet for them, which is a medley of Greek and Roman letters, but rather inclining to the former. This alphabet con-lists of 25 letters. (See Plate II.) Junius has carefully analyzed those letters, and pointed out their powers and founds in his Gothic alphabet, prefixed to his Gloffarium Gothicum. They were long retained in all the European languages derived from the Gothic source. In what respects the Gothic language agrees with the oriental tongues, or differs from them, is not easy to ascertain. We have observed in Sea. VIIL that a considerable part of the Greek language must have been derived from the Thracian; which, according to Strabo, was the same with the Gothic. The Thracian tongue will be found analogous to the Chaldean. The German, which is a genuine descendant of the Gothic, is full of Persian words: the old Perfian or Pahlavi appears to be a dialect of the Chaldean. The learned Junius remarks, that a very confiderable part of the Gothic language is borrowed from the ancient Greek.

"Both the learned IRRE in his Gloffarium Suic-Gosbicum, and Wachter in his excellent German and Latin Dictionary, remark the coincidence of Gothic and German words with oriental vocables of the like found and of the fame fignification. In the old Saxon, which is another ramification of the Gothic tongue, numberless terms of the same complexion appear. From this deduction it will follow, that the Gothic tongue, in its original unmixed state as it was spoken by the ancient Getz, was a dialect of the primeval language; that language which the sons of Tiras brought with them from the plains of Shinar, or Armenia, where the primitive mortals had fixed their residence.

"The Thracian tribes first took possession of those parts of Asia Minor which stretch towards the east. Thence they crossed the Hellespont; and it is universally agreed, that both sides of the Hellespont were peopled with Thracians.

" In Asia Minor we meet with the city Perga, or Perg. In every tongue descended from the Gothic, the word Berg fignifies a rock, and metaphorically a town or burgh; because towns were originally built on rocks. Hence Pergamos, the fort or citadel of Troy. Beira in Thracian fignified a city; the Chaldaic and Hebrew Beer imports. a well. In ancient times, especially in the East, it was customary to build cities in the neighbourhood of fountains. The word tros feems to be the Gothic trosh, brave. The words fader, moder, dochter, bruder, are so obviously Persian, that every etymologist has affigued them to that language. The Perfian bad or bod fignifies a city; the same word in Gothic imports a house, a manfion, an abode. Band, in Perfic, a strait place; in Gothic, to bend. Heim or bam, a bouse, is of Perfian original. Much critical skill has been displayed in tracing the etymology of the Scotch and old English word Yule, Christmas. Yule, derived from iul, was a festival in honour of the fun, which was originally celebrated at the winter folflice. Wick or wieh is a Gothic term still preserved in many names of towns; it fignifies a narrow corner, or fmall strip of land jutting into the sea, or into a lake or river: hence the Latin view, and the Greek

Digitized by Google

ours. In Spanish, we have many old Gothic words; among others bijo, a fon, the same with. the Greek was. In some places of Scotland, we call any thing that is little, fmall, wee; originally

spelt wi, from the very same word.

"Thefe few examples we have thrown together, perfuaded that almost every word of the language, truly Gothic, may be traced to fome oriental root or cognate. Many Gothic nouns end in a, like the Chaldaic and Syriac; their substantive verb very much refembles that of the Persian, Greek, and Latin; and their active and auxiliary verb has furnished the common przeterperfect tense of Greek verbs in the active voice: that verb is baban, but originally ba, as the common people pronounce it at this day, especially in the north of Scotland, and among the Swedes, Danes, Norwegians, and Icelanders. We now proceed to inquire what modern tongues are deduced from the Gothic as their flock.

"From Moesia the Goths spread themselves into Dacia, and from thence into Germany. countries were fituated in fuch a manner, that the progress of population was forward, and according to the natural course of emigration. From Germany they extended themselves into SCANDI-NAVIA, that is, Sweden, Denmark, and Norway. Their whole ancient Edda, Sagas, or Chronicles, show that the Goths arrived in Scandinavia by this route, without, however, fixing the era of that event with any tolerable degree of accuracy. By the Germans, the ancients understood all the nations E. W. and N. reaching from the Danube on the S. up to the extremity of Scandinavia on the Northern Ocean; and from the Rhine and German Ocean on the W. to the river Chronus or Niemen on the E. All these nations spoke one or other of the Gothic dialects.

"The Francic is a dialect of the Teutonic, Tudefque, or old German; and the Gospels of Ulphilas bear such a resemblance to the Francic, fragments of which are preferved in the early French historians, that some learned men have pronounced those Gospels to be part of an old Francic version; but others have refuted this opinion, both from history and comparison of the dialects. Schilter has given us large monuments of the Tudefque, or old German, from the 7th century, which prove that the Gothic of Ulphilas is the same language. Wachter's learned Glossary of the ancient German confirms this. The Anglo-Saxon is also a venerable dialect of the Tudesque; and is so intimately connected with the Gospels, that some valuable works on this subject are wholly built upon that

fupposition.

"The Icelandic is the oldest relict of the Scandinavian. It begins with Arius Frode in the 11th century, and is a dialect of the German. The remains, we have of it are more modern by four centuries than those of the German, and more poliflied. The Icelandic was polished by a long fuccesfion of poets and historians almost equal to those of Greece and Rome. Hence it has less affinity with the parent Gothic. The Swedish is more nearly related to the Icelandic than either the Danish or Norwegian. That the Swedish is the daughter of the Gothic, is fully shown by Mr Ihre above mentioned, in his Gloffarium Suio-Gothicum

There is, therefore, no doubt as to the identity of the Gothic, preferved in Ulphilas and other ancient remains, with the German and Scandinavian

"The modern German, a language spoken in a far greater extent than any other of modern Etrope, refembles the Gothic Gospels more than the prefent Danith, Norwegian, or Swedish; and h certainly more ancient flamina. Its likenels to the Atiatic tongues, in harfhness and inflexible this

ness of found, is very apparent.

Busbequius shows, that the clowns of Q Tartary, remains of the ancient Goths, speat language almost German. These clowns were doubt descendants of the ancient Goths, whi mained in their native country after the d had emigrated. It is therefore apparent from whole of this investigation, that the Gothic introduced into Europe from the Eaft, a probably a dialect of the language originally ken by men."

#### SECT. XII. Of the Schavonian Langua

"THERE is another language which per confiderable part of Europe, and like the Q feems to have originated in the East; the nic or rather Slavonic, which prevails far an in the E. parts of this division of the globe, spoken by the Dalmatians, by the inhabit the Danubian provinces, by the Poles, Bo ans, and Russians. The word flab, that is (whence the French word esclave, and our flave), fignifies noble, illustrious; but became the lower ages of the Roman empire, ra titudes of these people were spread over rope in the quality of flaves, that worder denote the fervile tribe by way of diffined the same manner as the words Geta, Dura Syrus, did among the Greeks at a more en

" The SLAVI dwelt originally on the the Borysthenes, now the Dnieper. The a tribe of the European Sarmatians who cient times inhabited an immense tract of try, bounded on the W. by the Viftula, " Weisel; on the SE. by the Euxine Sea, t phorus Cimmerius, the Palus Mccotis, Tanais or Don, which divides Europe from In this vast tract of country, which at prefere prehends Poland, Russia, and a great part of tary, there dwelt in ancient times many con able tribes; among whom were the Rozot now the Russians, and the Siavi.

"The Slavi gradually advanced toward Danube; and in the reign of Justinian having fed that river, they made themselves mall that part of Illyricum which lies between Drave and the Sive, and is to this day from called Sclavonia. These barbarians by de over-ran Dalmatia, Liburnia, the western pa Macedonia, Epirus; and on the east they est ed their quarters all along to the W. bank of Danube, where that river falls into the Eu In all these countries, the Sclavonian was de impregnated with the Greek, as the barbaria vaders mingled with the aborigines, who ip corrupt dialect of that language.

"The Pours are the genuine descendant

ne ancient SARMATÆ, and speak a dialect of ieir language, but much adulterated with Lanwords, in consequence of the attachment the olunders have long professed to the Roman ingue. The Silessans and Bohemians have corputed their dialects in the same manner. In those matters, then, we are not to search for the geniar remains of the ancient Sarmatian.

" The modern Russians, formerly the Rhoxalor Roxolani, are the posterity of the Sarmatæ, ma branch of the Slavi: they inhabit a part of mountry which that people possessed before erfeli into the Roman provinces; they speak kame language, and wear the fame drefs; for, the historical pillar at Constantinopie, the Sclamians are drelled like the Russian boors. If on the Slavi are Surmatæ, the Russians must of bute be the descendants of the same people. by were long a fequestered people, altogeye. They were strangers to commerce, inhosto firangers, tenacious of ancient ulages, to improvements of every kind, wonderproud of their imaginary importance; and, word, a race of people, just one degree at absolute savagism. A people of this chaare, for the most part, enemies to innova-; and if we may believe the Russian historino nation was ever more averse to innovathan they. From the ninth century, when embraced Christianity, it does not appear they moved one step towards civilization, Iter the Great, only a century ago, in confeto of his despotic authority, compelled them opt the manners and customs of their more ed neighbours.

We may then conclude, that the Russians has little change in their language during that and, as they did in their dress, habits, and mer of living. Whatever language they spoke much century, the same they employed at braining of the 18th. They were, indeed, ading to Appian de bels. Mithrid. once cond by Diophantus, one of Mithridates's get; but that conquest was for a moment onserver-run, by Tamerlane; but this invasion like a torrent from the mountains, which addedeastation far and wide while it rages, makes little alteration on the face of the last of the same and their country.

Typon fome occasions they made incursions the Roman empire; but made no permanent ments. On the whole, we take the Russians been, with respect to their language, in the predicament with the Highlanders and kis of Scotland, who, according to the geometry, have preserved the Celtic dialect and entire, in consequence of their having a mineled with foreigners.

From this deduction we may infer two things; that the Rushian language is the genuine securian; and, secondly, that the latter is the secondly. In the ancient Sarman. In the Rushian, there are found a great man. In the Rushian, there are found a great the Greek both in found and fignification; its Yol. XVII. Part II.

grammatical genius is nearly the same: and we are informed by the very best authority, that there is in this language a translation of Epictetus, in which there are whole pages, in both original and translation, without one lingle transposition. M. Leveque, who has published a translation of a history of Russa, is so entirely convinced of the strict analogy between the aucient Greek and the modern Russe, that he is positive that the some first derived from the latter. M, Preret, a very learned French academician is clearly of the same opinion. We are, however, persuaded that this opinion is ill sounded. We rather imagine, that those coincidences arise from the relics of the primitive language of mankind; vestiges of which are to be found aimost in every tongue now existing.

ifting.
"We have found a very strong refemblance between the Russian and many oriental words, elpecially Hebrew, Chaldean, and old Persian of which we could produce feveral inflance. The Sarmatæ were divided into two great nations, the Aliatic and European; the former extended very far eastward, behind the mountain Caucatus, the northern shore of the Euxine Sea, &c. These, we may believe, derived their language from the original tongue long before the Greek language existed. This, in comparison of the Hebrew, Phoenician, Egyptian, Arabian, Chaidean, &c. was but of yesterday. The Greek was a late compolition of many different dialects, incorporated with the jargon of the aboriginal Ionim. The Sto matian, on the contrary, was the tongue of a great and populous nation, civilized long before the Greeks began to emerge from a state of savagifin. We are, therefore, by no means disposed to allow, either that the Greek is derived from the Russian, or the Russian from the Greek. We believe there is equal reason for this conclusion, that the Abbé Pezron and M. Gebelin pretend to have discovered, to support their position that the Greek is derived from the Celtic. Certain it is, that the refemblance among the oriental languages, of which we take the Sarmatian to have been one, is so palpable, that any person of a moderate capacity, who is perfectly mafter of the one, will find little difficulty in acquiring any of the other. If, therefore, the coincidence between the Greek and Russian should actually exist, we think this circumstance will not authenticate the suppolition, that either of the two is derived from thé other.

" In the course of this argument, we all along fuppose, that the Sclavonian, of which we think the Ruffian is the most genuine remain, is the fame with the old Sarmatian. We shall now hazard a conjecture with respect to the syntaxical coincidence of that language with the Greek. As the Russians were savages, there is no probability that they were acquainted with letters and alphabetical writing, till they acquired that art by intercourse with their neighbours. It is certain, that few nations had made lefs proficiency in the fine arts; there is little appearance of their having learned this art prior to their conversion to Chriftianity. Certain it is, that the Slavi, who feitled in Daimatia, Illyria, and Liburnia, had no alpha-Fff betical

betical characters till they were furnished with them by St Jerome. The Servian character, which very nearly refembles the Greek, was invented by St Cyril; on which account the language written in that character is denominated Churilizza. These Sclavonic tribes knew nothing of alphabetic writing prior to the era of their convertion. The Mæfian Goths were in the fame condition, till Ulphilas fabricated them a fet of letters.

" If the Slavi and Goths, who refided in the neighbourhood of the Greeks and Romans, had not learned alphabetical writing prior to the era of their conversion to Christianity, it must hold a fortiori, that the Russians, who lived at a very great distance from those nations, knew nothing of this useful art antecedent to the period of their

embracing the Christian faith.

"The Ruffians pretend that they were converted by St Andrew; but this is a fable. Chri-Rianity was first introduced among them in the reign of the grand Duke Wolodimar, who, marrying the daughter of the Grecian emperor Bafilius, became her convert about A. D. 989. About this period, they were taught the knowledge of letters by the Grecian missionaries, who were employed in teaching them the elements of the Christian doctrines. Their alphabet confifts of 31 letters, with a few obsolete additional ones; and these characters resemble those of the Greeks so exactly, that there can be no doubt of their being copied from them; though the shape of some has been somewhat altered. The Russian liturgy was copied from that of the Greeks; and the best specimen of the old Rushian is the church offices for Eafter, in the very words of Chryfostom, who is called by his name translated Zlato-uffii, golden-

As it is impossible that a people so duil and uninventive as the Ruthans originally were, could ever have fabricated a language to artificially constructed as their present dialect; and it is obvious, that, till Chritianity was introduced among them by the Greeks, they could have no correfpondence with that people-it must appear furpriting how their language came to be fashioned fo exactly according to the Greek model. Ruffian letters must have been introduced into that country by the Greek miffionaries. We think it probable, that those apostles, when they taught them a new religion introduced a change into the idiom of their language. If the favage converts accepted a new religion from those Grecian apostles, they might with equal submission adopt improvements in their language. Such of the natives as were admitted to the sacerdotal function must have learned the Greek language, to qualify them for performing the offices of their religion. Hence the natives, who had been admitted into holy orders, would co-operate with Grecian mafters in improving the dialect of the country; which, prior to that period, - uft have greatly deviated from the original Sarmatian tongue."

Atter some farther arguments on this subject Dr Doig draws the following conclusions, which he modefuly entitles conjectures, and, as fuch, fubmits to the learned:-" 1. That the Sarmatian was a dialect of the original language of mankind. 2. That the Sciavonian was a dialect of the Sarmatian. 3. That the Russe is the mok genuine unfophisticated relic of the Schronia and Sarmatian. 4. That the Russians had no al phabetic characters prior to the introduction of Christianity in the end of the tenth century. That they were converted by Grecian million ries. 6. That those missionaries copied their pe fent letters from those of Greece; and in co junction with the more enlightened natives, duced the original unimproved Ruffe to its p fent refemblance to the Greek standard."

"The Ruffian language, (he adds) like I others, contains 8 parts of speech, noun, prom &c. Its nouns have three genders, makuling minine, and neuter; it has also a common ge for nouns, intimating both fexes. It has only numbers, fingular and plural. Its cake are minative, genitive, dative, acculative, vocati striumental, and prepositive. These cases a formed by varying the termination, as in C and Latin; but by placing a vowel afterther as, we imagine, was the original practice of Greeks. (See Sed. VIII.) Thus in Ruffe,

band; nom. eve-a the band; gen. eve & of the &c. See Les Elem. de la Langue Ruffs per pentier. Nouns substantive are reduced to declenfions, and adjectives make a fifthagree with their substantives in case, gende number; they have three degrees of comp as in other languages. The comparative is ed from the feminine of the nominative in of the politive, by changing a into te, that in English; the superlative is made by ing eq, pre, before the positive. These general rules; but there are fome exception

The numeral adjectives in Russe have the ders, and are declined. The pronouns have thing peculiar. Verbs are comprehended two conjugations. The moods are three; dicative, imperative, and infinitive: the tive is formed by placing a particle before, dicative. Its tentes are eight in number ; fent, the imperfect, the preterite simple, terite compound, the pluperfect, the subdeterminate, the future simple, the future The verbs have their numbers an Their other parts of speech differ from those of other languages. Their syntal ly refembles that of the Greek and Laim. Russian Grammar of M. Charpentier in H (Petersburg, 1768,) appears to be a very 🗪

" Towards the era of the subversion of the tern empire, the Slavi and Sarmatæ were for ed and confounded with each other, and Huns and other Scythian or Tartar emi that the most acute antiquarian would find possible to investigate their respective tongu even their original relidence or extraction. have selected the Russe as the most genuine of the old Sclavonian. And we are perfuade the radical materials of which it is composed originated in the oriental regions. Tfars, (which we spell Gzar,) for example, bably the Phoenician and Chaldean Sar or a prince, or grandee. Diodorus Siculus cult

queen of the Massagetæ, who, according to Ctelias cut off Cyrus's head, Zarina; which was not many years ago the general title of the empress of all the Rushas. Herodotus calls the same princess Tongris, which is nearly the name of the famous Timor or Tamur, the conqueror of Asia. The fumer feems to have been the title, and the latter the proper name, of the queen of the Massagetæ. the old Persian or Pahlavi, the word Gard sigin Russian, Gorad or Grad intithe very same idea: hence Constantinople in Ruffe is called Tfargrad or Tfargorad. Thefe adduced as a specimen only; an able etymomight, we believe, discover a great number. The Sclavonian language is spoken in Epithe W. part of Macedonia, in Bosnia, Servia, ans, part of Thrace, Dalmatia, Croatia, Po-Bohemia, Russia, and Mingrelia in Asia, ce it is frequently used in the scraglio at Con-mople. Many of the great men of Turkey affand it, and use it; and most of the janihaving been stationed in garrisons in the frontiers in Europe, use it as their vulgar The Hungarians, however, and the na-of Wallachia, speak a different language: is language bears evident fignatures of the dialect, which was the tongue of the olluns. Upon the whole, the Sclavonian is wh the most extensive language in Europe, atends far into Asia."

## T. XIII. Of the Modern Languages.

Doig remarks, that " if we call all the difdia ects of the various nations that now inthe known earth, languages, the number is reat; and vain would be his ambition who attempt to learn them, though but imper-There are four, which may be called oor mother languages, and which feem to men birth to all that are now spoken in Eu-These are the Latin, Celtic, Gothic, and in. Not that we believe them to have form to us, without alteration, from the of tongues at the tower of Babel. eatedly declared our opinion, that there truly original language, from which all we derivatives variously modified. ruages are original only as being the im-eparents of those now spoken in EUROPE. From the LATIN came. 1. The Portuguese. From the CELTIC; 5. The Erfe, or Gaelic

Highlands of Scotland. 6. Welsh. 7. Irish. I Britagne.

from the Gothic; 9. The German. 10. Paron or Low German. 11. Dutch. in which almost all the nouns substantive kman, and many of the verbs French, Latin, d which is enriched with the spoils of all o-Inguages. 13. Danish. 14. Norwegian. 15. . 16. Icelandic.

From the SCLAVONIAN; 17. The Polonefe, absanian. 19. Bohemian. 20. Transylvani-11. Moravian. 22. The modern Vandalian, Rill spoken in Lusatia, Prussian Vandalia, 23. Croutian. 24. Russian or Muscovite; th, as we have seen, is the purest dialect of i lingua je.

25. The language of the Calmucs and Coffacs. 26. Thirty-two different dialects of nations who inhabit the NE, parts of Europe and Asia, and who are descended from the Tartars and Hunno-Scythians. There are polyglot tables which contain not only the alphabets, but also the principal diffinct characters of all these languages.

" II. The languages at prefent generally spoken in Asia are,

27. The Turkifb and Tartarian, with their different dialects. 28. The Perfian; 29. Georgian (\*) Iberian; 30. Albanian or Greaffian; 31. The Armenian; These 4 languages are spoken by the Greek Christians in Asia, under the patriarch of Constantinople. 32. The modern Indian. 33. The Formosan, 34. Indostanie, 35. Malabarian. 36. Warugian, and the 37. Talmulic or Damulic. The Danish missionaries who go to Tranquebar, print books at Hall in thefe 5 languages. 38. The modern Arabic. 39. Tangufian. 40. Mungalic. 41. The language of the Nigarian or Akar Nigarian.

42. The Grusinic or Grusinian.

43. The Chinefe.
44. The Japonefe.
"We have enumerated here those Afiatic languages only of which we have some knowledge in Europe, and even alphabets, grammars, or other books that can give us information concerning There are doubtless other tongues and dialects in those vast regions and adjacent islands; but of these we are not able to give any account.

" III. The principal languages of Africa are, 45. The modern Egyptian. 46. The Abyfinian. 47. The Fetuitic, or the language of Fetu.

48. The Moroccan; and,
49. The jargons of those savage nations who inhabit the defert and burning regions. 50. The people on the coast of Barbary speak a corrupt dialect of the Arabic. 51. The Chilhic language, otherwise called Tamazeght. 52. The Negritian; 53. That of Guinea; and 54. The language of the Hottentots.

"IV. The language of the native American nations are but little known in Europe. Every one of these, though distant but a few days journey from each other, have their particular language or jargon. The language of the Mexicans and Peruvians feem to be the most regular and polished. There is also one called Poconchi or Pocomana, that is used in the bay of Honduras and toward Guntimal, the words and rules of which are most known to us. The languages of North America are in general the Algonhic, Apalachian, Mohogic, Savanahamic, Virginic, and Mexican; and in South America, the Peruvian, Caribic, the Tucumanian, and the languages used in Paraguay, Brafil, and Guiana.

"V. It would be a vain undertaking for a man of letters to attempt the study of all these languages; but it would be still more abfurd to attempt Some general reflections an analysis of them. therefore must suffice. Among the modern languages of Europe, the French feems to merit great attention; as it is elegant and pleafing in itfelt; as it is become so general, that with it we may travel from one end of Europe to the other, without scarce having any occasion for an inter-Fff2 preter;

Digitized by Google

preter; and as in it are to be found excellent works of every kind, both in verse and prote, useful and agreeable. There are, besides, grammars and dictionaries of this language which give us every information concerning it, and very able masters who teach it; especially such as come from those parts of France where it is spoken correctly; for with all its advantages, the French language has this inconvenience, that it is pronounced fearce any where purely but at Paris, and on the banks of the Loire. The language of the court, of the great world, and of men of letters, is very different from that of the common people; and the French tongue, in general, is subject to great alteration. What pity it is, that the ftyle of the great CORNEILLE and MOLIERE, should already begin to be obsolete, and that it will be but a little time before the inimitable chefs d'auvres of those men of sublime genius will be no longer seen on the stage! The most modern style of the French, Lowever does not feem to be the best. Too much concidencis, the epigrammatic point, the antithefis, the paradox, the fententious expression, &c. diminish its force; and by becoming more polished and refined, it loses much of its energy.

"VI. The GERMAN and ITALIAN languages merit likewife a particular application; as does the English, perhaps above all, for its many and great excellencies. (See LANGUAGE, SECT. V, VI.) Authors of great ability daily labour in improving them; and what language would not become ex-

cellent, were men of exalted talents to make confrant use of it in their works?

" VII. The other languages of Europe have each their beauties and excellencies. But the greater difficulty in all living languages confrantly confift in the pronunciation, which it is scarce pessible for any one to attain, unless he be born or course ted in the country where it is spoken; and this the only article for which a maller is necessary, it cannot be learned but by teaching or by conve fation: all the rest may be acquired by a go grammar and other books. In all larguages who ever, the poetic style is more difficult than profaic: in every language we should endeat to enrich our memories with great store of wo and to have them ready to produce on all on ons: in all languages it is difficult to exterd knowledge to far as to be able to form a cr judgment of them. All living languages are nounced rapidly, and without dwelling on the fyllables; almost all of them have articles w diftinguith the genders.

"VIII. Those languages that are derived the Latin have this further advantage, that adopt without restraint, and without offendinger, Latin and Greek words and expression, which by the aid of a new termination appears to the language. This privilege bidden the Germans, who in their best transition and the control of the language word, unless it be technical term in case of great necessity." Essential

The nightingale.

When rivers rage, and rocks grow cold,

And philomel becometh dumb. Hears the hawk, when philomela fings? Pope. (2.) PHILOMELA, in fabulous history, a daugh-'r of Pandion king of Athens, and fister to Procue, who had married Tereus king of Thrace. Procne, being much attached to Philomela, became melancholy till the prevailed upon her hufband to go to Athens and bring her lifter to Thrace. Tereus obeyed, but had no fooner obtained Pandion's permission to conduct Philomela to Thrace, than he fell in love with her. He dismissed the guards, offered violence to Philomela, and cut out her tongue, that the might not discover his barbarity, and villainy. He then confined her in a lonely castle; and returning to Thace, told Proche that Philomela had died by the way. On this Procne put on mourning for Philomela; but a year had Carcely elapted before the was informed that her fister was not dead. Philomela described on a piece of tapeftry her mistertunes and the brutality of Tereus, and privately conveyed it to Procne.

## P H 1

She haftened to deliver her fifter from her finement, and concerted with her measure punishing Tereus. She murdered her son then in the fixth year of his age, and ferred up as food before her husband during the of Bacchus. Tereus, in the midst of his called for Itylus; when Procne informed h he was then feafting on his flesh, and Phi throwing on the table the head of Itylus, d ced him of the cruelty of the scene. He dr fword to punish the parricidal sisters, be instantly changed into a hoopoe, Philomela nightingale, Procue into a fwallow, and Ity to a pheafant. This tragedy happened at I in Phocis; but Paulanias and Strabo, who tion the story, are silent about the transformation and the former observes that Tereus, and bloody repair, fled to Megara, where hell himself. The inhabitants raised a monume his memory, where they offered yearly fact and placed pebbles instead of barley. Of monument the hoopoes were first observed. I and Philomela died through excess of grief as the voices of the nightingale and swallow peculiarly mournful, the poets embellished fable by the supposed metamorphoses.

converts base metals into gold .-

That stone

Philosophers in vain so long have sought. Milton. (3.) The Philosopher's Stone was the greatest object of alchemy, a long sought for preparation, which, when found, was expected to convert all the true mercurial part of metal into pure gold, better than any that is dug out of mines, or perfected by the refiner's art. Some Greek writers in the 4th and 5th centuries speak of this art as being then known; and towards the end of the 13th century, when the learning of the East had been brought hither by the Arabians, the same pretentions began to spread through Europe. See ALCHEMY, CHEMISTRY Index; and TRANSMU-Alchemists attempted to arrive at the TATION. making of gold by three methods: the first by feparation; for every metal yet known, it is affirmed, contains some quantity of gold; only, in most, the quantity is so little as not to defray the expence of getting it out. The 2d by maturation; for the alchemists think mercury is the base

and matter of all metals; that quickfilver purged from all heterogeneous bodies would be much heavier, denfer, and fimpler, than the native quicklilver; and that by fubtilizing, purifying, and digefting it with much labour, and long operations, it is possible to convert it into pure gold. The 3d method is by transmutation, or by turning all metals readily into pure gold, by meiting them in the fire, and casting a little quantity of a certain preparation into the fused matter; upon which the feces retire, are volatilized and burnt, and carried off, and all the rest of the mass is turned into pure gold. That which works this change in the metals is called the philosopher's flone. This they suppose to be a most subtile, fixed, concentrated fire, which, as foon as it meets with any metal, does, by a magnetic virtue, immediately unite itself to the mercurial body of the metal, volatilize and cleanse off all that is impure therein, and leave nothing but a mass of pure gold. Whether this method be possible or not, it is difficult to fay, tho we are fully perfuaded of the negative. Yet we have so many testimonies of the affirmative, from perfors who on all other occasions speak truth, that it is hard to say they are guilty of direct falsehood, even when they fay that they have been mafters of the fecret. We are told, that it is only doing that by art which nature does in many years and ages. pretended fecret, known afterwards by the name of the philosopher's stone or powder was encouraged by four licences, granted to different projec-tors during the reign of Henry VI, and in fucceeding times was patronized all over Europe.

(1.)\* PHILOSOPHICAL. PHILOSOPHICK. adj. [philosophique, Pr. from philosophy.] 1. Belonging to philosophy; suitible to a philosopher; sormed

by philosophy .--

The stoick last in philosophick pride.

By him call'd virtue. Milton.

How could our chymick friends go on To find the philosophick flowe? Prior. —When the safety of the publick is endangered, the appearance of a philosophical or affected indolence must arise either from stupidity or persidiousiness. Addison. 2. Skilled in philosophy.—We

have our philosophical persons to make modern and familiar things supernatural and causeless. Seas—Acquaintance with God is not a speculate knowledge, built on abstracted reasonings about a nature and essence, such as philosophical mud often busy themselves in. Atterbury. 3. Frugi

But fince among mankind to tew there as Who will conform to philosophick fare,

1'il mingle fomething. Dryd
(2.) PHILOSOPHICAL EGG, among chemita,
thin glass body or bubble, of the shape of an eq
with a long neck or stem, used in digestions.

\*PHILOSOPHICALLY. adv. [from philosocal.] In a philosophical manner; rationally; vly.—The law of commonweales that cut of right hand of malefactors, if philosophically cuted, is impartial. Brown.—No man has treated the paffion of love with so much deit or searched into the nature of it more philocally, than Ovid. Dryden.—If natural laws once settled, they are never to be revested violate and infringe them, is the same as whe call miracle, and doth not sound very philosophic cally out of the mouth of an atheist. Bently.

PHILOSOPHIST, n. f. a lover of sophist false reasoning, in contradictinction to PHIP PHER, who is a lover of true science, some

foning, and practical wildom. \* To PHILOSOPHIZE. v. a. [from phil To play the philosopher; to reason like a pl pher; to moralize; to fearch into nature; quire into the causes of effects. We me philesophine beyond sympathy and anus Glanville. The wax philosophized upon the ter, and finding out at last that it was b made the brick fo hard, cast itself into L'Estrange.-Two doctors of the schools philolophizing upon the advantaces of mank hove all other creatures. L'Estrange - So our philosophizing divines have too much the faculties of our fouls, when they have tained, that by their force mankind has be to find out God. Dryden.

# PHILOSOPHY.

ETYMOLOGY, Definitions, and Objects of Philosophy.

PHILOSOPHY, is thus defined and illustrated

\* by Dr Johnson:

\* PHILOSOPHY. s. f. [philosophie, Fr. philosophia, Latin.] 1. Knowledge natural or moral.—
I had never any taste of philosophy, nor inward feeling in myself, which for a while I did not call to my succour. Sidney.—

Hang up philosophy; Unless philosophy can make a Juliet,

Displant a town, reverse a prince's doom, It helps not.

It helps not.

Shak.

The progress you have made in philosophy, hath enabled you to benefit yourself with what I have written. Digby.

2. Hypothesis or system upon

which natural effects are explained.—We be vain interpret their words by the notions of philosophy, and the doctrines in our schools. It

3. Reasoning; argumentation.—
Of good and evil much they argu'd the
Vain wisdom all and false philosophy.

—His decitions are the judgment of his pa not of his reason, the philosophy of the same of the man. Rogers. 4. The course of six read in the schools.

PHILOSOPHY is derived from pain to love from, swift, swiftom, and literally fignifies the love of dom. In its ufual acceptation, however, it dea a feience, or collection of feiences, of which universe is the object; and of the term thus ployed many definitions have been given. Pythagoras, philosophy is defined suches to the

the knowledge of things existing;" by Cicero, fter Plato, scientia rerum divinarum et bamanarum on CAUSIS; and by the illustrious Bacon, interpre-

According to M. CHAUVIN, the term is deriv-I from to a, defire or fludy, and sopia, wisdom; idtherefore he understands the word to mean the fire or fludy of qui, dom; for (fays he) Pythagoras, occuring that the application of the human mind ult rather to be called fludy than science, but athe appellation of suite as too alluming, and what of philos pher. Whether any of these fufficiently comprchensive, may be questionbut if philosophy in its utmost extent be cale of being adequately defined, it is not here the definition would be given. "Explana-(fays an acute writer), is the first office of a der; definition, if it be good, is the last of inquirer after truth; but explanation is one

e, and definition quite another."

teprincipal objects of philofophy are, God,
trand man. That part of it which treats of is called theology; that which treats of naphysics and metaphysics; and that which

of man, logic and ethics.

#### PART L

## OF PHILOSOPHY IN GENERAL

present Treatise on this comprehensive scirmean only to give 1st, A view of Philosophy mal: and, 2diy, A brief view of Experimental Thy. In doing this, but particularly in the art, we shall chiefly follow the plan laid by the ingenious and learned Prof. Robison and the rev. Dr GLEIG of Stirling, whose in treatife we shall use the freedom to quote.

### SECT. I. HISTORY of PHILOSOPHY.

first people, among whom philosophy paltivated, was probably the CHALDEANS. Chaldean philosophy much has been said, 7 little is known. Astronomy seems to an their favourite study; and notwiththeir extravagant affertions of the antiof that science, which they pretend their anhad continued thro a period of 470,000 In fet Callisthenes, upon the most minute by, which he made at the desire of Aristofound that their observations reached no back than 1903 years, or A. A. C. 2234. this is a more early period, than Procemy their science, for he mentions no Chaldean pations prior to the era of Nabonassar, or ars before Christ. That they cultivated ing which they called philosophy, at a much period than this, cannot be questioned; ustotle, on the credit of the most ancient foraks of the Chaldean magi as prior to Hyptian priests, who were certainly men of ing before the time of Moses. For any other than that of the stars, we do not read that Chaldeans were famous; and this feems to been cultivated by them merely as the founof judicial ASTROLOGY. If any credit be

due to Plutarch and Vitruvius, who quote Berofus, (see Berosus,) it was the opinion of the Chaldean wife men, that an eclipse of the moon happens when that part of its body which is deftitute of fire is turned towards the earth. " Their cosmogony, as given by Berosus, and preserved by Syncellus, feems to be this, that all things in the beginning confifted of darkness and water; that a divine power, dividing this humid mass, formed the world; and that the human mind is an emanation from the Divine nature.

"What particular people made the carlieft figure, after the Chaldeans, in the history of philosophy, cannot be certainly known. The claim of the EGYPTIANS is probably best founded; but as their science was the immediate source of that of the Greeks, we shall defer what we have to say of it, and turn our attention from Chaldean to Indian philosophy, as it has been cultivated from a very early period by the Brachmans and Gymnosophists. We pass over Persia, because we know not of any science peculiar to that kingdom, except the doctrines of the magi, which were religious rather than philosophical; and of them the reader will find fome account under the words MAGI, POLYTHESIM, and ZOROASTER.

We are certain that the Indian philosophers from whatever quarter they received their philosophy, were held in high repute at a period of very remote antiquity, fince they were vifited by PYTHA-GORAS and other fages of ancient Greece, who travelled in pursuit of knowledge. Yet they feem to have been in that early age, as well as at prefent, more distinguished for the severity of their manners than for the acquisition of science. The philosophy of the Indians has indeed from the beginning been engrafted on their religious dogmas. and feems to be a compound of fanatic metaphyfics and extravagant superstition, without the

finallest seasoning of rational physics.

The Pundits, for Pandits of Indostan who are the most learned of the Bramins, allow no powers whatever to matter, but introduce the Supreme Being as the immediate cause of every effect however trivial. " Brehm, the Spirit of God, (says one of their most reverend Bramins). is absorbed in felf-contemplation. (See BRAMA.) The same is the mighty Lord, who is present in every part of fpace, whose omnipresence, as expressed in the Reig-Beid or RIGVEDA, I shall now explain. Brehm is one, and to him there is no fecond; fuch is truly Brehm. His omniscience is felf inspired or self-intelligent, and its comprehenfion includes every possible species. To illustrate this as far as I am able; the most comprehensive of all comprehensive faculties is omniscience; and being felf-inspired, it is subject to none of the accidents of mortality, conception, birth, growth, decay, or death; neither is it subject to passion or vice. To it the three distinctions of time, past, prefent, and future, are not. To it the three modes of being, are not. (To be awake, to fleep, and to be unconscious.) It is separated from the universe, and independent of all. This omniscience is named Brehm. By this omniscient Spirit the operations of God are enlivened. By this Spirit also also the 24 powers † of nature are animated. How is this? As the eye by the fun, as the pot by the fire, as iron by the magnet, as variety of imitations by the mimic, as fire by the fuel, as the shadow by the man, as dust by the wind, as the arrow by the fpring of the bow, and as the shade by the tree; so by this Spirit the world is endued with the powers of intellect, the powers of the will, and the powers of action: so that if it emanates from the heart by the channel of the ear, it causes the perception of founds; if it emanates from the heart by the channel of the skin, it causes the perception of touch; if it emanates from the heart by the channel of the eye, it causes the perception of visible objects; if it emanates from the heart by the channel of the tongue, it causes the perception of tafte; if it emanates from the heart by the channel of the nole, it causes the perception of finell. This also invigorating the five members of action, the five members of perception, the five elements, the five fenses, and the three dispositions of the mind, &c. causes the creati n or the annihilation of the universe, while itfelf beholds every thing as an indifferent spectator."

From this quotation, it is plain that all the motions in the universe, and all the perceptions of man, are, according to the Bramins, caused by the immediate agency of the Spiritof God, which seems to be here considered as the soul of the world. But it appears from some papers in the Assatic Researches, that the most prosound of these oriental philosophers, and even the authors of their sacred books, believe not in the existence of matter as a separate substance. Sir W. Jones says they hold an opinion understance should be according to the second content of the substance of the second content of the second co

respecting it similar to that of the celebrated Berkeley. We have shown elsewhere (See METEMPSY-CHOSIS,) that the metaphyfical doctrines of the Bramins, respecting the human soul, differ not from those of PYTHAGORAS and PLATO; and that they believe it to be an emanation from the great foul of the world, which, after many transmigrations, will be finally absorbed in its parent substance. From the Bramins believing in the foul of the world, not only as the fole agent, but as the immediate cause of every motion in nature, we can hardly suppose them to have made any great progress in that science, which in Europe is cultivated under the name of PHYSICS. They have no inducement to investigate the laws of nature; because, according to the first principles of their philosophy, which, together with their religion, they believe to have been revealed from heaven, every phenomenon, however regular, or however anomalous, is produced by the voluntary act of an intelligent mind. Yet if they were acquainted with the use of fire-arms 4000 years ago, as Mr HALHED seems to believe, he who made that discovery must have had a very considerable knowledge of the powers of nature; for though gunpowder may have been difcovered by accident in the East, as it certainly was in the West many ages afterwards, it is difficult to conceive how mere accident could have led any man to the invention of a gun. In aftronomy, geometry, and chron logy too, they appear to have made some prociency at a very early period. (See Astronomy are deed full of those extravagant sictions, which set to be essential to all their systems; but their culations of eclipses, and their computations time, are conducted upon scientistic principles.

But though the mathematical part of the all nomy of the Pundits is undoubtedly respectal their physical notions of the universe are in highest degree ridiculous and extravagant. In Vedas and Puranas, writings of which no de-Hindoo can dispute the divine authority, of are faid to be occasioned by the intervent the monster Rabu; and the earth to be suppl by a feries of animals. "They suppose (in Halhed) that there are 14 fpheres, feven belo fix above the earth. The feven inferior work faid to be altogether inhabited by an infinite riety of ferpents, described in every months gure that the imagination can fuggeft. The fphere above the earth is the immediate w the visible heavens, in which the sun, moon stars, are placed. The 2d is the first paradil general receptacle of those who merit a m from the lower earth. The 3d and 4th bited by the fouls of those men who, by tice of virtue and dint of prayer, have an extraordinary degree of fanctity. The the reward of those who have all their live formed fome wonderful act of penance 🐗 tification, or who have died martyrs for the ligion. The highest sphere is the relider Brahma and his particular favourites, s those men who have never uttered a fall during their whole lives, and those would have voluntarily burned themselves with husbands. All there are absorbed in the essence." On ethics, the Hindoos have that can be called philosophy. Their duties rai, civil, and religious, are all laid down Vedas and Shafters: and enjoined by what believe to be divine authority, which super all reasoning concerning their fitness or 1

Of the ancient philosophy of the Aral and Chinese nothing certain can be said; at narrow limits of fuch an abstract as this, 6 admit of our mentioning the conjectures learned, which contradict each other, and an equalty groundless. There is indeed fulfat evidence, that both nations were at a very period observers of the stars; and that the nese had even a theory by which they for ecliples; (see Astronomy, Index.) but the reason to believe that the Arabians, like people in their circumstances, were nothing than judicial aftrologers, who possessed of fmallest portion of astronomical science. makes mention of their magi, whilft later tell us, that they were famous for their inco

† The 24 powers of nature, according to the Bramins, are the five elements fire, air, earth, water akash (a kind of fubtile ather); the five members of action, the hand, foot, tongue, anus, and male of generation; the five organs of perception, the ear, eye, note, mouth, and ikin: the five forses, when distinguish from the organs of sensation; the three dispositions of the mind, defire, passion, and it quillity; and the power of consciousness.

in foiring enigmatical questions, and for their skill in the arts of divination: but the authors of Greece are filent concerning their philosophy; and there is not an Arabian book of greater antiquity than the Koran extant. (See Philology, £8. III.)

We therefore pass to the Phoenicians, whose commercial celebrity has induced many learned nen to allow them great credit for early science. If it be true, as feems probable, that the ships of this ration had doubled the Cape, and almost encompified the peninfula of Africa long before the of Solumon, we cannot doubt but that the menicians had made great proficiency in naviatom and aftrozomy, at a period of very remote atiquity. Nor were these the only sciences culwated by that ancient people: Mosebus or Mochus Phonician, who, according to Strabo, flourithbefore the Trojan war, was the author of the mic philosophy, aft. rwards adopted by Leucip-Democritus, and others among the Greeks; at was with fome of the fuccessors of this fage Pythagoras, as Jamblichus tells us, conversed don, and from them received his doctrine of uds. (See Pythagoras.) Another proof of erly progress of the Phoenicians in philosomay be found in the fragments of their hifto-Sinchoniatho, which have been preserved by chius. (See SANCHONIATHO.) This ancient ther teaches, that, according to the aut's men of country, all things arose at first from the neay agency of anactive principle, upon a passive the mass which he calls mot. This chaos worth thinks was the fame with the elemenwater of Thales, who was also of Phænician paction; but Mosheim justly observes, that it rather dark air, fince Philo translates it men Belides Mochus and Sanchoniatho, CADvs, who introduced letters into Greece, may boubtedly be reckoned a philosopher. (See itology, S.a. IV.) Several other Phoenician Mosophers are mentioned by Strabo: but as y flourished at a later period, and philosophizaster the systematic mode of the Greeks, they not properly under our notice. We pass on refore to the philosophy of Egypt.

The Greeks confess, that all their learning and com was derived from the EGYPTIANS, either ported immediately by their own philosophers, brought through Phoenicia by the fages of the and we know from higher authority than be histories of Greece, that at a period so remote the birth of Moses, the wisdom of the Egypms was proverbially famous. Yet the history Egyptian learning and philosophy, though men the first eminence both ancient and modern bestowed much pains in attempts to elucite it, ftill remains involved in clouds of uncerinty. That they had some knowledge of phyology, arithmetic, geometry, and aftronomy, are ad, which cannot be questioned; but there is alon to believe, that even these sciences were in Eypt pushed no farther than to the uses of life. That they believed in the existence of incorporeal substances is certain; because Herodotus affares us, that they were the first afferters of the lumortality, pre-existence, and transmigration of human fouls, which they could not have been Vol. XVII. PART II.

without holding those souls to be at least incorporeal, if not immaterial. The author of Egyptian learning is generally acknowledged to have been THOTH, Theut, or Taaut, called by the Greeks HERMES, and by the Romans Mercury; but of this personage very little is known. (See these articles.) Plato fays that Thoth was the inventor of letters; and left we should suppose that by those letters nothing more is meant than picture writing or fymbolical hieroglyphics, it is added, that he diffinguished between vowels and confonants, determining the number of each. The same philosopher attributes to Thoth the invention of arithmetic, geometry, aftronomy, and bleroglyphic learning.

The art of ALCHYMY has been faid to have been known by the ancient Egyptians; and from Ilen-MES, the author of the Egyptian philosophy, it has been called the Hermetic art. But though this is unquestionably a siction, there is evidence that they were possessed of one art, which is even yet a defileratum in the practice of chemistry; viz. the art of rendering gold potable, which Mofes evidently possessed. (See Calf, Golder, and Exod. xxii, 20.) When the infercourse between the Egyptians and Greeks first commenced, the wisdom of the former people confifted chiefly in the science of legislation and civil policy, and that the philofopher, the divine, the legislator, and the poet, were all united in the same person. Their cosmogony differed little from that of the Phonicians, They held that the world was produced from chaos by the energy of an intelligent principle; and they likewife conceived that there is in nature a continual tendency towards diffolution. In Plato's Timæus, an Egyptian prieft is introduced de-feribing the destruction of the world, and afferting that it will be effected by means of water and fire. They conceived that the universe undergoes a periodical conflagration; after which all things are restored to their original form, to pass again through a fimilar fuccession of changes.

" Of preceptive doctrine" (fays Dr Enfield, in his Hift. of Philof.) " the Egyptians had two kinds, the one facred, the other vulgar. The former, which respected the ceremonies of religion and the duties of the priefts, was doubtlefs written in the facred books of Hermes, but was too carefully concealed to pass down to posterity. The latter confifted of maxims and rules of virtue, prudence, or policy. Diodorus Siculus relates many particulars concerning the laws, customs, and manners of the Egyptians; whence it appears that superstition mingled with and corrupted their notions of morals. It is in vain to look for accurate principles of ethics among an ignorant and superstitious people. And that the ancient Egyptians merited this character is evident from this fingle circumstance, that they suffered themselves to be deceived by impostors, particularly by the professors of the funciful art of astrology." See

EGYPT, MYSTERIES, MYTHOLOGY, &c. "From Egypt and Phænicia (fays Dr Robison and GLEIG,) philosophy passed into GREECE; where it was long taught without fystem, as in the countries from which it was derived. Phoroneus, Cecrops, Cadmus, and Orpheus, were among the earliest instructors of the Greeks; and they incul-

cated Egyptian and Phomician doctrines in detached maxims, and enforced them, not by strength of argument, but by the authority of tradition. Their cosmogonies were wholly Phomician or Egyptian disguised under Grecian names; and they taught a future state of rewards and punishments. The planets and the moon, Orpheus conceived to be habitable worlds, and the stars to be siery hodies like the sun: but he taught that they are all animated by divinities; an op nion which prevailed both in Egypt and the cast: and it does not appear that he gave any other proof of his doctrines, than a consident affertion, that they were derived from some god. See Orpheus.

"Hitherto we have feen philosophy in its state of infancy and childhood, confifting only of a collection of fententious maxims and traditionary opinions; but among the Greeks, an ingenious and penetrating people, it foon assumed the form of profound speculation and systematic reasoning. Two eminent philosophers arose nearly at the fame period, who may be confidered as the parents not only of Grecian science, but of almost all the science cultivated in Europe, prior to the era of the great Lord Verulam: These were THALES and PYTHAGORAS; of whom the former founded the Ionic school, and the latter the Italic: from which two fprung the various feets into which the Greek philosophers were afterwards divided. bare enumeration of these sects is all that our limits will admit of; and we shall give it in the perspicuous language and just arrangement of Dr En-FIELD, referring our readers for a fuller account than we can give of their respective merits to his abridged translation of Brucker's history.

f. "Of the Ionic School were, 1. The Ionic feet proper, whose founder Thales had as his fucceflors Anaximenes, Anaxagoras, Diogenes, Apolloniates, and Archelaus. 2. The Socratic school, founded by SOCKATES, the principal of whose disciples were Xenophon, Æichines, Cimon, Cebes, Ariftippus, Phædo, Euclid, Piato, Antifthenes, Critias, and Alcibiades. 3. The CYRE-NAIC feet, of which Aristippus was the author: his followers, were, his daughter Arete, Hegelias, Anicerris, Theodorus, and Bion. 4. The MEGA-RIC or Eriftic feet, formed by EUCLID of Megara; to whom fucceeded Enbulides, Diodorus, and Stilpo, famous for their logical fubilety. 5. The E-LIAC or Eretriae school, raised by Phædo of Elis, who, though he closely adhered to the doctrine of Socrates, yave name o his school. His successfors were Pliftanus and Menedemus; the latter of whom, being a native of Eretria, transferred the fehool and name to his own country. 6. The A-CADEMIC feet, of which PLATO was the founder. After his death, many of his disciples deviating from his doctrine, the school was divided into the old, new, and middle academics. 7. The Peri-PATETIC fect, founded by Arithotle, whose succeffors in the Lyceum were Theophrastus, Strato, Lycon, Aritho, Critolaus, and Diodorus. Among the Peripatetics, befides those who occupied the chair, were also Dicearchus, Eudemus, and De-metrius Phalereus. 8. The Cysic feet, of which the author was Antisthenes, whom Diogenes, Oneficritus, Crates, Metrocles, Menipus, and Menedemus, fucceeded. In the lift of Cynic philofophers must also be reckoned Hipparchis, the wife of Crates. 9. The Stoic sects, of which Zenowas the founder. His successors in the post were Persaus, Aristo of Chios, Herillus, Sphant Cleanthes, Chrysippus, Zeno of Tarius, Diogethe Babylonian, Antipater, Panazius, and Podenius.

II. " Of the ITALIC SCHOOL were, I. The la fest proper: it was founded by PYTHAGORAS disciple of Pherecydes. The followers of Pyl goras were Aristæus, Mnesarchus, Alemzon, phantus, Hippo, Empedocles, Epicharmus, Q lus, Timæus, Archytas, Hippafus, Philolaus, Eudoxus. 2. The Eleatic feet, of which X phanes was the author: his fuccesfors, Para des, Melissus, Zeno belonged to the metaphy class of this sect; Leucippus, Democritus, I goras, Diagoras, and Anaxarchus, to the phy 3. The Heraclitean sect, which was founded Heraelitus, and foon afterwards expired: and Hippocrates philosophized after the ma of Heraclitus, and other philosophers bond freely from his fystem. 4. The EPICUREAN a branch of the Eleatic, had Epicurus form thor; among whose followers were Metrod Polyænus, Hermachus, Polyftratus, Bafilides Protarchus. 5. The Pyrrhonic or Sceptic let parent of which was Pyrrho: his doction taught by Timon the Phliafian; and after interval was continued by Ptolemy a Cri and at Alexandria by Ænefidemus.

Of the peculiar doctrines of these sets reader will in this work find a short account, in the lives of their respective sounders, or the names of the fects themselves. All the matical philosophers, however, pursued the quiries into nature by nearly the same me Of their philosophy as well as of ours, the verse, with all that it contains, was the vall of but the individual things which compose the verse are infinite in number and ever char and therefore, according to an established of theirs, incapable of being the subjects of h To reduce this intinitude, and those seeting beings, they established certa finite arrangements or clailes, to fome of wh very thing path, prefent, or to come, might ferred; and having afcertained, as they the all that could be affirmed or denied of thele fes, they proved, by a very flort process of gistic reasoning, that what is true of the class be true of every individual comprehended The most celebrated of these arrangement that which is known by the name of CATEGO which Mr Harris thinks at least as old as the of Pythagoras, and to the forming of which kind would, in his opinion, be necessarily in the following confiderations: Every subject of man thought is either fubflance or attribute substance and attribute may each of them be fied under the different characters of mired Hence there arises a quadrup! particular. rangement of things into fulflance waver, a substance particular; into attribute universal an tribute particular; to fome one of avbich for only our words and ideas, but every individu that immense multitude of things which com the universe, may be reduced. This arranged

bibliances with which they were furrounded, the Brecian schools must soon have distinguished between the attributes effential to all fubstances, and those which are only circumstantial; between the unbutes proper to natural substances or bodies, those which are peculiar to intelligible subuces or minds. He likewise thinks, that the and place of the existence of substances not that, must soon have attracted their attention; that in confidering the place of this or that ace, they could hardly avoid thinking of its or fituation. He is of opinion, that the fudaction o one fubstance upon another would ably fuggest the idea of cleathing or bubit, that the variety of co-existing substances and atto would discover to them another attribute, that of relation. Instead therefore of confining lelves to the fimple division of fubstance and the they divided attribute itself into nine distons, some effential and others circumstantial; but by fetting substance at their head, made aprebenfive and univerfal genera, called, with ace to their Greek name, categories, and with ace to their Latin name, predicaments. Thefe Missarc, Substance, Quality, Quantity, Tion, Action, Passion, When, Where, TION, and HABIT; which, according to the latic philosophy of the Greeks, comprehend human science and every subject of human ms, out of suestance; mathematics out utily; optics out of QUALITY and QUALITY and QUALITY and QUALITY out of L Hiftory, natural and civil, fprings, fays medicine out of the fune; aftronomy out of TITY and MOTION, music and mechanics out fame; painting out of QUALITY and SITE;
but of RELATION; chronology out of WHEN; ME;) geography out of WHERE; (or PLACE;) n, magnetism, and attraction, cut of Ac-PASSION; and so in other instances. these categories, considered as a mere arent of science, we are not inclined to make ections. The arrangement is certainly white: but this is a matter of comparamil importance; for a complete arrangeof science cannot, we believe, be formed. that was made of them by almost every opher of the Grecian schools; for those sages reduced the objects of all human science general heads or general terms, instead of themselves to inquire by a painful inducnto the nature and properties of the real obbefore them, employed their time in conwhat could be predicated of substance in , of this or that quality, quantity, relation, the abitract: and they foon found, that of gracial conceptions as the categories there are in nature. first class is that in which the predicate is the of the subjett; the 2d, that in which it is tive of the fubject; the 3d, is when the prehit is a property of the fubject; and the 5th, "it is formething accidental to the fubject. (See

Ac, Part II. Sect. II. and III.) Having pro-

led thus far in their system, they had nothing

however, the learned author thinks too limited;

and he is of opinion, that, by attending to the

to do with individuals, but to arrange them under their proper categories, which was commonly done in a very arbitrary manner; and then, with the formality of a fyllogitm, to predicate of each the predicable of the genus or species to which it belonged. But by this method of proceeding, it is obvious that no progrefs whatever could be made in physical, metaphysical, or ethical science; for if the individual truly belongs to the category under which it is arranged, we add nothing to our stock of knowledge by afterming or denying of it what we had before affirmed or denied of the whole genus: and if it belong not to the category under which we arrange it, our fyllogifing will only give the appearance of proof to what must, from the nature of things, be an absolute falschood.

"This mode of philosophizing, however, spread from Greece over the whole civilized, world. It was carried by Alexander into Afia, by his fucceffors into Egypt; and it found its way to Rome after the conquest of Greece. It was adopted by the Jews, by the Christian fathers, by the Mohametan Arabs during the caliphate, and by the schoolmen through all Europe, till its sutility was exposed by Lord Verulam. The professors of this philosophy often displayed great acuteness; but their fystems were built on mere hypotheses, and supported by fyllogistic wrangling. Now and then indeed a superior genius, such as Alhazen and our countryman Reger Bacon, broke through the trammels of the ichools, and, regardless of the authority of the Stagyrite and his categories, made real discoveries in physical science, by experiments judicioufly conducted on individual substances; (see Bacon, Nos; and Optics, Index.) but the feience in repute still continued to be that of Generals.

What is properly called PHYSICS had in Europe no place in a liberal education, from the end of the 8th century to the end of the 14th. Towards the beginning of this period of darkness, the whole circle of instruction, or the liberal arts as they were called, confifted of two branches, the triviun and the quadrivium; of which the former comprehended grummar, rbetoric, and dialettics; the latter music, arithmetic, geometry, and astronomy, to which was added, about the end of the rith century the study of a number of metaphysical fubtleties equally useless and unintellizible. works of the ancient Greek philosophers had been hitherto read only in imperfect Latin translations; and before the scholiastic system was completely established, Plato and Aristotle had been alternately looked up to as oracles in science. The rigid khoolmen, however, univerfally gave the preference to Aristotle; because his analysis of body into matter and form is peculiarly calculated to keep in countenance the most incredible doctrine of the Romith church; (fee Transubstantiation;) and upon the revival of Greek learning, this preference was continued after the school philosophy had begun to fall into contempt.

At last LUTHER and his associates set the minds of men free from the tyranny of ancient names, both in science and theology; and many philosophers sprung up in different countries of Europe, who prosessed to study nature, regardless of every authority but that of reason. Of these the met

eminent beyond all comparison was Francis Ba-CON, Lord VERULAM. (See BACON, No 2.) This illustrious man, having read with attention the writings of the most celebrated ancients, and made himself master of the sciences which were then cultivated, foon discovered the absurdity of pretending to account for the phenomena of nature by fyllogittic reafoning from hypothetical principles; and with a boldness becoming a genius of the first order, undertook to give a new chart of human knowledge. This he did in his two admirable works, entitled, 1. De dignitate et augmentis fcientiarum; and, 2. Novum organum fcientiarum, sive Judicia vera de interpretatione Natura. In the former of these works, he takes a very minute furvey of the whole circle of human science, which he divides into three great branches, biffory, poetry, and philosophy, corresponding to the three faculties of the mind, memory, imagination, and reason. Each of these general heads is subdivided into minuter branches, and reflections are made upon the whole, which, though we can neither copy nor abridge them, will amply reward the The purpole of perufal of the attentive reader. the Novum Organum is to point out the proper method of interpreting nature; which the author thows can never be done by the logic which was then in fashion, but only by a painful and fair induction.

This great man was not less an enemy to hypothefes and preconceived opinions, which he calls idola theatri, than to syllogisms; and since his days almost every philosopher of eminence, except Descartes and his followers, (see CARTES, and CARTESIANS;) has professed to study nature according to the method of induction, so accurately laid down in his Nevum Organum. On this method a few improvements have been made; but L. Verulam must still be considered as the author of that philosophy, which is now cultivated in Europe, and which will continue to be cultivated as long as men shall have more regard for falls than for hypothetical opinions. Of this mode of philoforhizing we shall now give a short but accurate view, by stating its objects, comparing it with that which it superseded, explaining its rules, and pointing out its uses; and from this view it will appear, that its author thares with ARISTOTLE the empire of icience.

# SECT. II. VIEW of L. VERULAM'S PHILOSOPHY.

THAT unbounded object of the contemplation, curiofity and refearches of man, the universe, may be confidered in two different points of view.

It may first be considered merely as a collection of existences, related to each other by means of retemblances and distinctions; situation, succession, and derivation, as making parts of a whole. this view it is the subject of pure description.

In order to acquire a knowledge of the universe in this point of view, we must enumerate all the beings in it, mention all their fensible qualities, and mark all these relations for each. But this would be labour immense; and when done, an undiffinguishable chaos. A book containing every word of a language would only give us the materials of this language. To make it comprehentible, it must be put into some form, which will con-

prehend the whole in a fmall compass, and enable the mind to pass easily from one word to another related to it. Of all relations among words, the most obvious are those of resemblance and derive tion. An etymological dictionary, therefore, i which words are classed in consequence of the refemblances, and arranged by means of their rivative distinctions, will greatly facilitate the quifition of the language.

Thus too, the objects of nature around us be claffed according to their refemblance, and arranged in those classes by particular distincti In this classification we proceed by our facult abstracting our attention from the circums in which things differ, and turning it to those in which they agree. By this faculty we conly distribute the individuals into classes, but fubdivide those classes into orders, general species. Thus a vast number of individuals re bling each other in the fingle circumstance composes the most extensive kingdon of MALS. If it be required, that they shall fi refemble in the circumstance of having feat prodigious number of animals are exclude we form the inferior class of BIRDS. Wed a great number of birds, by requiring a fun milarity of web feet, and have the order seres. If we add lingua citiata, we con attention to the genus of ANATES. In this may the whole objects of the universe beam divided and fubdivided, into kingdoms, orders, genera, and species.

This classification and arrangement is calle TURAL HISTORY; and is the only foundate any extensive knowledge of nature. To tural historian, therefore, the world is a coll of existences, the subject of descriptive ment. His aim is threefold: 1. To observe care, and describe with accuracy, the varie jects of the universe. 2. To determine merate all the great classes of objects; to di and arrange them into all their subordinate through all degrees of subordination, till he at what are only accidental varieties, whi susceptile of no farther distribution; and to with precision the principles of this diffus and arrangement, and the characterifics various assemblages. 3. To determine with tainty the particular group to which any pro

INDIVIDUAL belongs.

DESCRIPTION, therefore, ARRANGEMENT, REFERENCE, constitute the whole of his em ment; and in this confifts all his fcience.

Were the universe to continue unchanged would constitute the whole of our knowled nature: but we are witnesses of an uninters fuccession of changes, and our attention is nually called to the EVENTS which are income happening around us. These form a set of jects valtly more interesting to us than the for being the fources of almost all the pleasure pains we receive from external objects.

The fludy of the events, which happen at us, is highly interesting, and we are strongly in to profecute it; but they are fo numerous at multifarious, that the labour would be imm without some contrivance for abbreviating an cilitating it. The same help offers itself bere he fludy of what may be called quiescent nature. events, like existences, are susceptible of classifiation, in consequence of resemblances and distincion; and by attention to these, we can acquire a ery extensive acquaintance with active nature. Our attention must be chiefly directed to those acumflances, in which many events refemble each ther, while they differ perhaps in a thousand ohers. Then we must attend to their most genediffinctions; then to diffinctions of finaller exand so on. In this way accordingly we have aced in our knowledge of active nature, and gadually, and by no means flowly, forming ablages of events more and more extensive, distributing these with greater and greater cifion into their different classes.

describing those circumstances of similarity agevents, and in distributing them according those similarities, it is impossible to overlook constancy which is observed in the changes of me, in the events which are the objects of our amplation. Events which have once been obto accompany each other are observed al-to do so. 'The rising of the sun is always acpanied by the light of day, and his fetting by these of night. Sound argument is accomd by conviction, impulse by motion, kindby a feeling of gratitude, and the perception mod by defire. The uniform experience of mind informs us, that the events of nature go certain regular trains; and if sometimes exmore attentive observation never fails to rethe exception. Most of the spontaneous eof nature are very complicated; and it frety requires great attention and penetration, fover the simple event amidst a croud of until circumstances which are at once exhibitto our view. But when we succeed in this very, we never fail to acknowledge the permiformity of the event to what has been fory observed.

mce we firmly believe that this uniformity followinue; that fire will melt wax, will burn a will harden clay, as we have formerly obdit to do; and whenever we have undoubted to that the circumftances and fituation are welly the fame as in fome former case, though once observed, we expect with confidence that

event will also be the same.

Many proofs of the universality of this law of man thought are not necessary. The whole guage and actions of men are instances of the La all languages there is a mode of construculed to express this relation as distinct from others, and the convertation of the most illiteenever confounds them. The general employof the active and passive verb is regulated by "The tower was demolished by the soldiers; town was overthroun by an earthquake;" are dences that express two relations, and no mool-boy will mistake them. The distinction ortfore is perceived or felt by all. Nor is any ruage without general terms to express this re-tion, cause and effect. Nay, even brutes show they expect the same uses of every subject wich they formerly made of it; and without this, mirals would be incapable of subfiftence, and

man incapable of all improvement. From this alone memory derives all its value; and even the constancy of natural operation would be useless, if not matched or adapted to our purposes by this expectation of and confidence in that constancy.

The refult of all the inquiries of ingenious men, to discover the foundation of this irresistible expectation, is " fuch is the constitution of the human mind." It is an universal fact in human thought; and it appears to be an ultimate fact, not included in any other still more general. This is sufficient for making it the foundation of true human knowledge; all of which must in like manner be reduced to ultimate facts in the human thought.

This persuation of the constancy of nature, we must consider as an inflindive anticipation of events similar to those which we have already experienced. The general analogy of nature should have disposed philosophers to acquiesce in this. In no instance of importance to our safety or well being are we left to the guidance of our boasted reason; God has given us the surer conduct of natural instincts. No case is so important as this: In none do we for much stand in need of a guide, which shall be powerful, insallible, and rapid in its decisions. Without it we would remain incapable of all instruction from experience, and therefore of

all improvement.

Our fensations are no doubt feelings of our mind. But all those feelings are accompanied by an infinctive reference to fomething diffinct from the feelings themselves. Hence arise our perceptions of external objects, and our very notions of this externeity, if we may use the term. In like manner, this anticipation of events, this irrefiftible connection of the idea of fire with the idea of burning, is also a feeling of the mind: and this feeling is by a law of human nature referred, without reasoning, to something external as its cause; and, like our fensation, it is considered as a fign of that external femething. It is like the connection of the truth of a mathematical proposition. The conviction is the fign or indication of this relation by which it is brought to our view. In the fame manner, the irrefistible connection of ideas is interpreted as the fensation or fign of a necessary connection of external things or events. These are supposed to include fomething in their nature which renders them inseparable companions. To this bond of connection between external things we give the name of CAUSATION. All our knowledge of this relation of cause and effect, is the knowledge or consciousness of what passes in our own minds, during the contemplation of the phenomena of nature. If we adhere to this view of it, and put this branch of knowledge on the same footing with those called the abstract sciences, considering only the relations of ideas, we thall acquire demonstrative science. Any other view of the matter will lead us into inextricable mazes of uncertainty and error.

Thus the natural procedure of our faculty of abstraction and arrangement, to acquire a more speedy and comprehensive knowledge of natural events, presents them to our view in another form. We not only see them as similar events, but as events naturally and necessarily conjoined. And the expression of resemblance among events is also

also an expression of concomitancy; and this arrangement of events in consequence of their refemblance is in fact the discovery of those accompaniments. The trains of natural appearances being considered as the appointments of the Author of Nature, has occasioned them to be considered also as consequences of laws imposed on his works by their great author, and every thing is said to be regulated by fixed laws.

The philosopher as well as the theologian, who believes in the existence and superintendance of God, knows that the constant accompaniment of events is the confequence of laws, which the great Author and Governor of the universe has imposed on his works. There is also a great refemblance between the expression natural law and grammatical rule. Rule in grammar expresses merely a generality of fact, whether of flexion or construction. In like manner, a LAW OF NATURE is to the philosopher nothing but the expression of a generality of fact. A natural or physical law is a generally observed fact; and whenever we treat any subject as a generally observed fact, we treat it physically. It is a physical law of the understanding that argument is accompanied by conviction; it is a physical law of the affection that diffress is accompanied by pity; it is a physical law of the material world that impulse is accompanied by motion. And thus we fee that the arrangement of events, or the discovery of those general points of refemblance, is in fact the difcovery of the laws of nature; and one of the greateft and most important is, that the laws of nature are conflant.

This view of the universe is incomparably more interesting and important than that which is tak n by the natural historian; contemplating every thing that is of value to us, and, in short, the whole life and movement of the universe. This study, therefore, has been dignited with the name of PHILOSOPHY and of SCIENCE; and natural history has been considered as of importance only in so far as it is conducive to the successful profe-

cution of philofophy.

The philosopher claims a superiority on another account: he confiders himself as employed in the discovery of causes, and that it is by the discovery of these relations that he communicates to the world fuch important knowledge. Philosophy, he fays, is the science of causes. The vulgar are contented to confider the prior of two inseparably conjoined events as the cause of the other; the stroke on a bell, for instance, as the cause of sound. But it has been clearly discovered by the philosopher, that, between the blow on the bell and the sensation of sound, there are in-The blow fets terposed a long train of events. the bell a trembling; this agitates the air in contact with the bell; this agitates the air immediately beyond it; and thus between the bell and the ear may be interposed a numberless series of events, and as many more between the first impression on the ear and that last impression on the nerve by which the mind is affected. He can no longer therefore follow the nomenclature of the vulgar. Which of the events of this train therefore is the cause of the sensation? None of them: It is that

fomething which inseparably connects any two of them, and conflitutes their bond of union. These causes he considers as residing in one or both of the connected objects: diversities in this respect must therefore constitute the most important distinctions between them. They are therefore with great propriety called the qualities, the properties, of these respective subjects. As the everts, from which we inser the existence of these qualities of things, resemble in many respects such events as are the consequences of the exertion of our own powers, these qualities are frequently denominated rowers, forces, energies. Thus, from the instance of the found of a bell, we infer the power of impulse, elasticity, nervous irritability, and a nimal sensibility.

From this necessary connection between the jects around us, we not only infer the position event from the prior, or, in common language the effect from the cause, but we also infert prior from the posterior, the cause from the cite We not only expect that the prefence of amount will be followed by certain motions in ironfilm but when we observe such motions, we infert prefence and agency of a magnet. Joy is in red from merryment, poiton from fudden or un countable death, fire from fmoke, and imp from motion. And thus the appearances of universe are the indications of the powers of objects in it. As all our knowledge of the in ments of others is derived from our confidence their veracity; fo all our knowledge of nature derived from our confidence in the constancy of operations. A credulity in our neighbour's veracity refulting from that law of our mental conflitutions which we speak, conducts us in the one case; the constancy of nature, by which we infer general laws from particular facts, conducts us in the ther. It is by the fuccessful study of this guage of nature that we derive useful knowled The knowledge of the influence of motives on mind of man enables the statesman to gord kingdoms, and the knowledge of the powers magnetism enables the mariner to pilot a hij through the pathlefs occan.

LORD MONBODDO, in his ancient Metaphylete fays, that the ancients were philo ophers, employed in the discovery of causes, and that the moderns are only natural bistorians, contenting themselves with observing the laws of nature, but paying " attention to the e-uses of things. Aristotle's profeffed aim, indeed, in his most celebrated writings, is the investigation of causes; and in his lordship's opinion, he has been fo successful, that he has hardly left any employment for his successors befides that of commenting upon his works. Newton makes no fuch pretentions; his professed aim is merely to investigate the general laws of the plane tary motions, and to apply these to the explanation of particular phenomena. He has discovered but one land, and has enabled us to explain the pheromena comprehended in it alone. But his investigation has been complete; and he has discovered, beyond all possibility of contradiction, 2 fast which is uniform through the whole extent of the folar fystem; namely, that every body, may that every particle in it, is continually DEFLECTED

toward every other body; and that this deflection is, in every inftance, proportional to the quantity of matter in that body toward which the deflection is directed, and to the reciprocal of the fquare of the distance from it. He has therefore discoured a physical law of immense extent. Nor has he been less successful in the explanation of paricular phenomena. Of this there cannot be given better instance than the explanation of the lunar botions from the theory of g. avity begun by New-" Matbefi sua sucem praferente;" " and now might to fuch a degree of perfection, that if the place be computed from it for any till not be found to differ from the place on ich the was actually observed by the 100dth of her own breadth.

We may challenge the Aristotelians to any one cause which has really been di covertheir great master, whether in the opera-of mind or of body. They must not adduce investigation of any natural law in which he concludes succeeded. With still greater cone: may we challenge them to produce any hable inflance of the explanation of natural mena either of mind or body. By explanawe mean an account of the production, and preciation of all the circumstances, suscepof a scrupulous comparison with tact, and by confident with it. It is bere that the of this philosopher's hypothetis is most cuous; and his followers acknowledge, that inquiries which proceed by experiment, e not derived great affiftance from Arifphilosophy. But this, fay they, does not trom the pre-eminence of his philosophy, he has shown that the particular fields of ation are to be cultivated only by means of iment. But surely every field of objervation mentar. There is no abstract object of phical relearch, the ftudy of which shall terin the philosophy of universals. There is or great room for suspecting, that Aristotle followers have not aimed at the discovery but only at the discovery of natural and have failed in the attempt.

Pere feems here to be a previous question:

\*\*phile to discover a philosophical easie, that
him which is neither the prior nor the posiof the two immediately adjoining events, but
bend of union, and this diffinct from the
midff? It is evident that this is an inquiry
dy experimental. It is of buman knowledge
feak. This must depend on the nature of the
mind. This is a matter of contingency,
at our only by experiment and observation.
Merring all the feelings and operations of the
had classing and arranging them like any oobject of science, we discover the general laws
man thought and human reasoning; and this
the knowledge we can ever acquire of it, or
y thing else.

aute observation and found judgment have employed in the study; and considerable prohas been made in pneumatology. Many of human thought have been observed, and

very diffinctly marked; and philosophers are busily employed, fome of them with confiderable fuccefs, in the distribution of them into subordinate classes, so as to know their comparative extent, and to mark their diftinguithing characters with a precition fimilar to what has been attained in botany and other parts of natural history; so that we may hope that this fludy will advance like others. But in all these researches, no phenomena have occurred which look like the perception or contemplation of these separate objects of thought, these philosophical causes, this POWER in abstracto. No philosopher has ever pretended to state such an object of the mind's observation, or attempted to group them into classes. Those causes, those bonds of necessary union between the naturally conjoined events or objects, are not only perceived by means of the events alone, but are perceived folely in the events, and cannot be diffinguished from the conjunctions themselves. They are neither the objects of separate observation, nor the productions of memory, nor inferences drawn from reflection on the laws by which the operation of our own minds are regulated; nor can they be derived from other perceptions in the way of argumentative inference. We cannot infer the paroxyim of terror from the appearance of impending destruction, nor the fall of a stone when not supported, as we infer the incommensurability of the diagonal and fide of a fquare. This last is implied in the very conception or notion of a square; not as a consequence of its other properties, but as one of its effential attributes: and the contrary proposition is not only false, but incapable of being diffinctly conceived. This is not the case with the other phenomenon, or any matter of fact. The proofs, which are brought of a mathematical propolition, are not the reason of its being true, but the steps by which this truth is brought into our view; and frequently, as in the inflance now given, this truth is perceived, not directly, but confequentially, by the inconceivableness of the contrary proposition.

" Mr HUME derives this irrefillible expectation of events from the known effect of custom, the affociation of ideas. The corelated event is brought into the mind by this well known power of cuftom, with that vivacity of conception which constitutes belief or expectation. But without infisting on the futility of his theory of belief, this explanation begs the very thing to be proved, when it ascribes to custom a power of any kind. It is the origin of this very power which is the fubject in dispute. Besides, on the genuine principles of feepticifm, this cuftom involves an acknowledgment of past events, of a fomething different from present impressions, which, in this doctrine, are the only certain existences in nature: and, lastly, it is known, that one clear experience is a fufficient foundation for this unthaken confidence and anti-General custom can never, on Mr Hume's principles, give fuperior vivacity to any particular idea.

"This certain nonentity of it, as a separate object of observation, and this impossibility to derive this notion of necessary and causal connection between the events of the universe from any

Lumice

fource, have induced two of the most acute philosophers of Europe, Leibnitz and Malebran-CHE, to deny that there is any fuch connection, and to affert that the events of the universe go on in corresponding trains, but without any causal connection, just as a well-regulated clock will keep time with the motions of the heavens without any kind of dependence on them. This harmony of events was pre-established by the Author of the Universe, in subserviency to the purposes he had in view in its formation. All those purposes which are cognitable by us, may certainly be accomplished by this perfect adjustment. But without infifting on the fantastic wildness of this ingenious whim, it is enough to observe, that it alfo is a begging of the question, because it supposes causation when it ascribes all to the agency of the Deity.

"Thus have we fearched every quarter, without being able to find a fource from which to derive this perception of a necessary connection among the events of the universe, or of this confident expectation of the continuance of physical laws; and yet we are certain of the feeling, and of the perfualion, be its origin what it may: for we speak intelligibly on this subject; we speak familiarly of eause, effect, power, energy, necessary connection, motives and their influence, argument and convictions reasons and persuasion, allurements and emotions, of gravity, magnetism, irritability, &c.; and we carry on conversations on these subjects with much entertainment and feeming instruction. Language is the expression of thought, and every word expreffes some notion or conception of the mind; therefore it must be allowed, that we have such notions as are expressed by cause, power, energy. But it is here, as in many cates, we perceive a distinction without being able to express it by a definition; and that we do perceive the relation of causation as distinct from all others, and in particular as distinct from the relation of contiguity in time and place; or the relation of agent, action, and patient, must be concluded from the uniformity of language, which never confounds them except on purpole, and when it is perceived. But even here we shall find, that none of the terms used for expressing those powers of substance, which are conceived as the causes of their characteristic phenomena, really express any thing different from the phenomena themselves. Let any perion try to define the terms gravity, elasticity, senfibility, and the like, and he will find that the definition is nothing but a description of the phe-The words are all derivatives, nomenon itself. most of them verbal derivatives, implying action, gravitation, &c. As the general refemblances in shape, colour, &c. are expressed by the natural historian by generic terms, so the general refemblances in event are expressed by the philosopher in generic propositions, which, in the progress of cultivation, are also abbreviated into generic

"This abundantly explains the confiftency of our language on this subject, both with itself and with the operations of nature, without however affording any argument for the truth of the assumption, that causes are the objects of philosophic refearch as separate existences; or that this supposed recessary connection is a necessary truth, wh ther supreme or subordinate. But since the pa ception of it has its foundation in the conflituti of the human mind, it feems entitled to the na of a first principle. We are hardly allowed doubt of this, when we consider the importan of it, and the care of nature to secure us in things effential to our fafety and well-heing, fr all danger, from inattention, ignorance, or in lénce, by an instinct infallible in its informati and instantaneous in its decisions. "It would: be like her usual care (fays Hume), if this opt tion of the mind, by which we infer like ch from like causes, and vice versa, were entral to the fallacious deduction of our reason, which flow in its operations, appears not in any te during the first years of infancy, and in every and period of human life is extremely list error. It is more conformable to her and caution, (mark the acknowledgment,) to fee necessary an act of the mind by some infline blind tendency, which may be infallible and a in all its operations, may discover itself at the appearance of life, and may be independent the laboured deductions of reason. As he taught us the use of our limbs, without us any knowledge of the nerves and must which they are actuated; fo fhe has imply us an inflinct, which carries forward the in a course conformable to that established external objects, though we be ignorant powers and forces on which this regular pends."

"Such a knowledge (fay our learned and is quite unnecessary, and therefore causes more cognoscible by our intellectual powers colours by a man born blind: nay, where he at the pains to consider this matter, and to the received rules and maxims of logs find that necessary connection, or the causation, can no more be the subject of phical discussion by man, than the ultimature of truth. It is precisely the same at or incongruity, as to propose to examine with a microscope. All that we can say their existence is probable, but by no mean tain. But all this is indifferent to the relipation of the philosopher, and does not after the certainty, the extent, or the unit the knowledge which he may acquire.

"We are now able to appreciate the high tensions of the philosopher, and his claim t entific superiority. We see that this can be founded on his object, nor his employ His object is not causes; and his discovered nothing but the discovery of general fall physical laws; and his employment is the with that of the descriptive historian. ferves and describes with care and accura events of nature; and then he groups the classes, from resembling circumstances, d in the midst of many others which are dil and occasional. By gradually throwing out circumstances of resemblance, he renders to fes more extensive; by carefully marking circumstances in which the resemblance is ved, he characterises all the different classes by a comparison of these with each other, in hed to the number of refembling circumstances, te distributes his classes according to their geneality and subordination; thus exhaulting the thole affemblage, and leaving nothing unarranged ut accidental varieties. In this procedure, every pouping of fimilar events is, ipfo facto, discoverog a physical law; and the expression of this asemblinge is the expression of the physical law. and as every observation of this constancy of fact an opportunity for exerting the instinctive bence of natural connection between the redlubjects, every fuch observation is the disny of a power, property, or quality, of na-Inbstance. This observation of event is all show of the connection, all we know of the and power. When the philosopher proceeds ther to the arrangement of events, according their various degrees of complication, he is ing an arrangement of all natural powers, acling to their various degrees of subordinate inof the descriptive historian, classification and gement; and this constitutes all the science table by both.

I.III. Of the Employment of the Philo-

this view, philosophy may be defined, the of the phenomena of the universe, to discover metal laws which indicate the powers of nassistances, to explain subordinate phenomenal to improve art; Or, Philosophy is the of the phenomena of the universe, with a distribution of the universe, with a distribution of the universe, and to improve art. The task contedly difficult, and will exercise our no-powers. The employment is manly, and the important. It therefore justly merits ppellation of philosophy, although its objects wis different from those which occupy the too of other men.

The EMPLOYMENT of the philosopher, like of the natural historian, is threefold; DESTON, ARRANGEMENT, and REFERENCE; the objects are not things but events.

telescription, when employed about events, more properly termed biflory. A philosophiflory of nature consists in a complete or seenumeration and narration of facts, profelected, cleared of all extraneous circumstand accurately narrated. This constitutes materials of philosophy. We cannot give a cample of this branch of philosophical oction than ASTRONOMY.

from the beginning of the Alexandrian school is day, aftronomers have been at immense in observing the heavenly bodies, to detect the motions. This has been a work of promotional difficulty: for the appearances are such as the base been exhibited although the real modad been extremely different. Not that our give us false information; but we form has frequently false judgments, from these introductions; and call those things deceptions of which are in fact errors of judgment. But the motions have at last been discovered, and tibed with such accuracy, that the history to. XVII. Part II.

may be confidered as nearly complete. This is to be found in the usual systems of astronomy, where the tables contain a most accurate and synoptical account of the motion; so that we can tell with precision in what point of the heavens a planet bas been seen at any instant that can be named. Sir Isaac Newton's Optics is such another perfect model of philosophical history, as far as it goes. This part of philosophy may be called Phenomenology.

A general knowledge of the universe may thus be eafily acquired and firmly retained, by claffification and arrangement; which must proceed on refemblances observed in the events; the sublequent arrangement must be regulated by the diftinctions of which those refemblances are full fulfceptible. This affemblage of events into groups must be expressed. They are facts; therefore the expression must be propositions. These propositions must be what logicians call general or abstract propofitions; for they express not any individual fact of the affemblage, but that circumstance in which they all refemble. Such propositions are the following; Proof is accompanied by belief; kindness is accompanied by gratitude; impulse is accompanied by motion. These are usually called general facts; but there are none fuch; every fact is individuals This language, however inaccurate, is very fafe from misconstruction. And we may use it without scruple. These propositions are NATURAL OF PHYSICAL LAWS; and then the detecting and marking those resemblances in event, is the investigation of physical laws; and we may denomia nate this employment of the philosopher INVES-TIGATION.

"In the profecution of this task, the fimilarities of fact will be found of various extent; and thus we form physical laws of various extent; and we find that some are subordinate to others; for the resemblance of a number of sacts in one circumstance does not hinder a part of them from also resembling in another circumstance; and thus we find subordinations of sact in the same way as of quiescent qualities. And it is found here, as in natural history, that our assemblage of resembling events will be the more extensive as the number of resembling circumstances is smaller; and thus we shall have kingdoms, classes, orders, genera, and species of phenomena, which are expressed by physical laws of all those different ranks.

"This observation of physical laws is always accompanied by a reference of that uniformity of event, to a natural bond of union between the concomitant facts, which is conceived by us as the cause of this concomitancy; and therefore this procedure of the philosopher is considered as the discovery of those causes, or powers of natural fubstances, which constitute their physical reations, and may juftly be called their diftingui bing qualities or properties. This view of the matter gives rife to a new nomenclature. We give to those powers generic names, such as fensibility, intelligence, irritability, gravity, elasticity, stuidity, magnetism, &c. Thele terms mark resembling circumstances of events; and no other definition can be given of them but a description of these circumstances. In a few cases which have been

HPP

the subjects of more painful or refined discussion, we have proceeded farther in this abbreviation of

Tlanguage.

We have framed the verb to gravitate, and the verbal noun GRAVITATION, which purely express the fact, the phenomenon; but are conceived to express the operation or energy of the cause or natural power. It is of importance to keep in mind this metaphysical remark of these terms; for a want of attention to the pure meaning of the words has frequently occasioned very great mistakes in philosophical science. We may call this part of the philosopher's employment Altriology. We shall give an instance of its most successful application to the class of events altready adduced, as an example of philosophic history or phenomenology.

Kepler, a celebrated Pruffian aftronomer, having maturely confidered the phenomera regorded in the tables and observations of his predecessors, discovered, amidst all the varieties of the planetary motions, three circumstances of resemblance, which are now known by the name of Kepler's laws." See Astronomy, Index; and Kepler, § 3; also Kepler's problem, § 4.

" Long after this discovery of Kepler, Sir Isaac NEWTON found that these laws of Kepler were only particular cases of a fact or law still more general. He found that the deflections of the planets from uniform rectilineal motion were all directed to the fun; and that the fimultaneous deflections were inverfely proportional to the squares of the distances from him. Thus was established a phytical law of vait extent: but further observation showed him, that the motion of every body of the folar system was compounded of an original motion of projection, combined with a deflection towards every other body; and that the ·fimultaneous deflections were proportional to the quantity of matter in the body towards which they were directed, and to the reciprocal of the fquare of the distance from it. Thus was the law made fill more general. He compared the deflection of the moon in her orbit with the fimultaneous deflection of a ftone thrown from the hand, and deferibing a parabola; and he found that they followed the fame law, that is, that the deflection of the moon in a fecond, was to that of the stone in the same time, as the square of the stone's distance from the centre of the earth, to the iquare of the moon's distance from it. Hence he concluded, that the deflection of a stone from a straight line was just a particular instance of the deflections which took place through the whole folar system.

"The DEFLECTION of a stone is one of the indications it gives of its being heavy; whence he calls it GRAVITATION. He therefore expresses the physical law which obtains through the whole folar system, by saying that "every body gravitates to every other body; and the gravitations are proportional to the quantity of matter in that other body, and inversely proportional to the square of the distance from it." Thus we see how the arrangement of the celestial phenomena terminated in the discovery of physical laws; and that the expression of this arrangement is the law itself. Since the fall of a heavy body is one in-

flance of the physical law, and fince this fall is confidered by all as the effect of its weight, and this weight is confidered as the cause of the fall the fame cause is affigured for all the desicion observed in the folar fystem; and all the matter in it is found to be under the influence of the cause, or to be heavy; and thus his dodrine he been denominated the fisher of universal Gray TATION." See ASTRONOMY, Index.

". Philosophers have gone farther, and have fi poled that gravity is a power, property, or a lity, refiding in all the bodies of the folar fra Sir Ifaic Newton does not expressly by fo. contents himfelf with the immediate confequence of the first axiom in natural philosophy, viz. every body remains in a state of rest, or d form rectilineal motion, unless affected by moving force. Since the bodies of the fold tem are neither in a ftate of reft, nor of uni rectilineal motion, they must be considered affected; that is, that there operates on & one of them a moving force, directed town the others, and having the proportions old in the deflection. Other philosophers afferta all the bodies of the folar fystem are contain impelled by a fluid which they call ether, t is moving in all places, and in all dire or in circular vortices, and hurries along it the planets and all heavy bodies. philosophers who adhere to the rules of fophic discussion, deny the legitimacy pretended investigation of causes; saying fince the full of IMPULSE is not really in the celestial deflections, nor in the me heavy bodies, the law cannot be inferralfay that neither the fluid nor the impule ferved; and therefore they are in the right they affert, that there is inherent in, or acco nies all the bodies of the fystem, a pos which they deflect to one another. See O 9 153-155.

But it is more to our prefent purpose thow the observation and arrangement of mena terminate in the discovery of their or of the powers on properties of natural stances. This is a task of great difficulty, of great importance. There are two chiefs

of this difficulty:

" r. In most of the spontaneous phenome nature there is a complication of many and some of them escape our observation. tending only to the most remarkable, we can these only in our imagination, and are 4 think there the concomitant events in natural proper indication of the cause, and the su of this philosophical relation, and to suppothey are always conjoined by nature. was thought, that there relided in a vib chord a power by which the fentation of was excited, or that a chord had a founding lity. But late observations have shown d that there is an inconceivable number of interposed between the vibration of the and the sensitive affection of our ear; and fore, that found is not the effect of the vib of the chord, but of the very last event of the ries: and this is completely demonstrated showing that the vibration and the found are regurily connected, because they are not always onuccted, but require the interpolition of air or I some other elaitic body. These observations low the necessity of the most accurate and miits observation of the phenomena, that none of of intermediate events may escape us, and we thus exposed to the chance of imaginary conitions between events which are far afunder in e procedure of nature. As the findy has imused, miliakes of this kind have been correcthad philosophers are careful to make their of events under one name as fhort as pos-Thus, in medicine, a drug is no longer dered as a specific remedy for the discase this fometimes cured when it has been used, denominated by its most immediate operam the animal frame: it is no longer called

viege, but a fuderific., When many natural powers combine their mee in a spontaneous phenomenon of na-it is frequently very difficult to discover part of the complicated effect is the effect a); and to state those circumstances of simi-which are the foundation of a physical law, the us to infer the agency of any natural The most likely method for insuring sucfuch cases is to get rid of this complication mis, by putting the subject into such a lituthat the operation of all the known powers refuall be suspended, or so modified as we priedly understand their effects. We can preciate the effects of fuch as we could modify nor fuspend, or we can discover mee of a new law, the operation of a new This is called making an experiment; and most effectual way of advancing in the blge of nature, and has been called EXPE-TAL PHILOSOPHY. See Pari II.

hems, however, at first fight, in direct opto the procedure of nature in forming laws. These are formed by induction mittudes of individual facts, and must be to no greater extent than the induction they are founded. Yet it is a matter a phyficai law of human thought, that Pk, clear, and unequivocal experiment the most complete confidence in the a general conclusion from it to every siak. Whence this anomaly? It is not an yor contradiction of the general maxim bupplical investigation, but the most resinpication of it. There is no law more genethis, that " Nature is constant in all her "." The judicious and fimple form of our ent insures us (we imagine) in the combwledge of all the circumstances of the Upon this supposition, and this alone, we the experiment as the faithful representavery possible case of the conjunction.

last branch of philosophic occupation is luation of subordinate phenomena. This lag more than the referring any particular enon to that class in which it is included; ming out the general law, or that general which the phenomenon is a particular in. Thus the feeling of the obligations of is thought to be explained, when it is to be a particular case of that regard which

every person has for his dearest interests. The rise of water in pumps is explained, when we show it to be a particular case of the pressure of sluids, or of the air. The general law under which we show it to be properly arranged is called the PRINCIPLE of the explanation, and the caplanation itself is called the THEORY of the phenomenon. Thus. Euler's explanation of the lunar irregularities is called the theory of the lunar motions on the principle of gravitation.

H Y.

"This may be done either to advance our own-knowledge of nature, or to communicate it to opthers. If done with the first view, we must examine the phenomenon minutely, and endeavour, to detect every circumstance in it, and thus discover all the known laws of nature which concur in its production; we then appreciate the operation of each according to the circumstances of its exertion; we then combine all these, and compare the result with the phenomenon. If they are similar, we have explained the phenomenon. We cannot give a better example than Franklin's explanation of the phenomena of thunder and

lightning. See ELECTRICITY, Index, and LIGHT-

" If we explain a phenomenon from known principles, we proceed furtherically from the general law already established, and known to exert its influence in the present instance. We state this influence both in kind and degree according to the circumstances of the case; and having com bined them, we compare the refult with the phenomenon, and show their agreement. Thus, because all the bodies of the solar system mutually gravitate, the moon gravitates to the fun as well as to the earth, and is continually, and in a certain determinate manner, deflected from that path which the would describe did the gravitate only to the earth. Her motion round the earth will be retarded during the first and 3d quarters of her orbit, and accelerated during the 2d and 4th. Her orbit and her period will be increased during our winter, and diminithed during our fummer, Her apogee will advance, and her nodes will rea cede; and the inclination of her orbit will be greatest when the nodes are in fyzigee, and least when they are in quadrature. And all these variations will be in certain precise degrees. Then we show that all these things actually obtain in the lunar motions, and they are confidered as explained.

This fummary account of the object and employment in all philosophical discussion is sufficient for pointing out its place in the circle of the sciences, and will serve to direct us to the proper methods of prosecuting it with success. Events are its object; and they are considered as connected with each other by causation, which may therefore be called the philosophical relation of things. The following may be adopted as the fundamental proposition on which all philosophical discussion proceeds, and under which every philosophical discussion or discovery may be

arranged:

Every change that we observe in the state or condition of things 18 CONSIDERED, BY US as an effect, indicating the agency, characterising the kind, and determining the degree of its interred cause."

If h is a As

" As thus enounced, (fay our learned authors,) this proposition is evidently a physical law of human thought. It may be enounced as a necessary and independent truth, by faying, every change in the state and condition of things IS AN EFFECT, &c. And accordingly it has been fo enounced by Dr Reid in his Essays on the Intellectual Powers of Man; and its title to this denomination has been abundantly supported by him. But we have no occasion to consider it as possessing this quality, We are speaking of philosophy, which is something contingent, depending on the existence and constitu-ion of an intellectual being fuch as man; and in conformity to the view which we have endeayoured to give of human knowledge in the fubjects or philosophical relation, it is quite sufficient for our purpose that we maintain its title to the rank of an universal law of human thought. This will make it a first principle, even although it may not be a necessary truth.

"All the proof necessary for this purpose is univerfality of fact; and we believe this to be without exception. We are not to expect that all mankind have made, or will ever make, a formal declaration of their opinion; but we may venture to fay that all have made it, and continually do make it, virtually. What have the philosophers of all ages been employed about, but the discovery of the causes of those changes that are incellantly going on? Human curiofity has been directed to nothing so powerfully and so constantly as to this. Many abfurd causes have been alligned for the phenomena of the universe; but no set of men have ever faid that they happened without a cause. This Is so repugnant to all our propensities and instincts, that even the atheistical lest, who, of all others, would have profited most by the doctrine, have never thought of advancing it. To avoid so shocking an abfurdity, they have rather allowed that chance, and the concourse of atoms, are the causes of the beautiful arrangements of nature. The thoughtless vulgar are no less solicitous than the philosophers to discover the causes of things. Had men never speculated, their conduct alone gives fufficient evidence of the universality of the opini-The whole conduct of man s regulated by it. nay almost wholly proceeds upon it, in the most important matters, and where experience feems to leave us in doubt: and to act otherwise, as if any thing whatever happened without a cause, would he a declaration of infanity. Dr Reid has beautifu'ly illustrated this truth, by observing, that even a child will laugh at you if you try to perfuade him that the top, which he milles from the place where he left it, was taken away by nobody. may persuade him that it was taken away by a fairy or a upnit; but he believes no more about this nobb. y, than the master of the house, when be is told that nobody was the author of a picce of theft or mischief. What opinion would be formed, fays Dr Reid, of the intellects of the julyman, on a trial for murder by persons unknown, who should say that the fractured skull, the watch and money gone, and other like circumstances, might possibly have no cause? he would be proficunced infane or corrupted.

"We believe that Mr ITOME is the first author who has ventured to call the truth of this opinion

in question; and even be does it only in the w of mere possibility. He acknowledges the gene lity of the opinion; and he only objects to foundation of this generality, merely because does not quadrate with his theory of belief; . therefore it may happen that fome men may h no fuch opinion. But the opinion of a philosop is of no greater weight in a case like this, than t of a ploughboy. If it he a first principle, dir ing the opinions and actions of all, it must open on the minds of all. The philotopher is the c person who may chance to be without it; for it quires much labour, and long habits refolm maintained, to warp our natural fentiments; experience shows us that they may be warped are at sufficient pains. It is also worthy of rethat this philosopher feems as much under fluence of this law as ordinary mortals. It st when he is aware of its not tallying with his doctrines that his fcruples appear. Obleve he speaks when off his guard: " As to thak pressions which arise from the senses, then mate cause is, in my opinion, perietly merp ble by human reason; and it will always be possible to decide with certainty whether the rife immediately from the object, are produc the creative power of the mind, or are from the Author of our heing." Amount alternatives he never thought of their not in rived from any cause.

H

"But it is not enough to show, that the physical law of the human mind: we have ed it as a first principle, the foundation of a fcience; therefore not included in or derived any thing more general. Mr Hume's ender to show, that it is not a necessary truth with sufficient evidence that most attempts rive it in the way of argument are patitives cipii; a thing very common in all atter prove first principles. It cannot be prove duction of facts that every event has a ca cause induction always supposes an object or event. Now in by far the greatest nur events the causes are unknown. Perhaps # vent whatever do we know the real cause, power or energy which, without any interest produces the effect. No man can fay, that! simplest event which he ever observed, he ly apprifed of every circumftance which cond to its production. We suppose that no nature can be ad uced more fimple than th tion of a suspended glass ball, when gently by another glass ball; and we imagine tha of our readers will fay that he perfectly fee You thing which happens in this phenomenon believe, too, that most of our readers are nion, that a body is never put in motion the impulse of another, except in the cases mal motion; and that they are disposed to that magnets put iron in motion, and that lectrified body moves another by means of terposed though invisible fluid somehow of ting round them. But unless the stroke ha very fmart, so smart indeed as to shatter th balls, the motion of the suspended ball w duced without impulse; that is, the two were not in contact during the flicke; a distance between them was not less than

coth part of an inch, and probably much great-It is not certain that even the most violent oke, such as would shatter them to pieces, is ough to bring them into real contact. The bofs of this fingular position are stated under

11Cs, § 154, 155.

Unless, therefore, our readers are willing to m, that the suspended ball was put in motion a repulsive force inherent in one or both balls, must acknowledge that they do not fully know the circumstances of this so simple phenomehorall the train of events which happen in it; therefore they are reduced to the necessity of thing, although they do not fee it, an interven-fluid or matter, by the immediate action of he adjoining particles the motion is produced. being the case in the simplest phenomenon, t stall we say of the numberless multitudes th are incomparably more complex? Muft at acknowledge that the efficient causes, even e vulgar sense of the word, the immediately ding events, are unknown, because the conions are not observed? and therefore it cane faid that it is from experimental induction this truth gains univerfal belief. Nothing to remain, therefore, but to allow that this tallaw of human judgment is inflinctive, a ituent of the human foul, a first principle; ecapable of any other proof than the appeal

efellings of every man. imply to fay, that every change is confideran effect, is not giving the whole characters physical law. The cause is not always, never, observed, but is inferred from the mena. The interence is therefore in every te dependant on the phenomenon. menon is to us the language of nature. Afgravitation as the cause of the planetary lions from uniform rectilineal motion, we fay the gravitation of the moon is but Togoth If the gravitation of a stone thrown from the but we say this only from observing that ffection of the Rone is 3600 times greater the fimultaneous deflection of the moon. In our whole knowledge of the cause is not founded on our knowledge of the phenomeout it is the same. This will be found a reof immente confequence in the profecution philosophical refearches; and a strict attention it will not only guard us against a thousand fishes, into which the reasoning pride of man and continually lead us, but will also enable us ly to detect many egregious and fatal blinders. de in confequence of this philosophical vanity. such is the account which is given by our णब्दी authors, of PHILOSOPHY, the fludy of the the of God, as related by causation. It is of extent, reaching from an atom to the glorious thor of the Universe, and contemplating the ole connected chain of intelligent, sensitive and nimate beings. The philosopher makes use of descriptions and arrangements of the natural onan, in the beginning of his career; confidin the uniformity of nature, and expecting t limitarity in the quietcent properties of things be accompanied by fome refemblances in

le more important properties which constitute

ir mutuai dependences, linking them together

in a great and endlessly ramified chain of events. We have endeavoured to ascertain with precision the peculiar province of philosophy, both by means of its object and its mode of procedure. After this, it will not require many words to point out the methods for profecuting the study with expedition and with fuccess.

#### SECT. IV. SIR ISAAC NEWTON'S RULES OF PHILOSOPHIZING.

The rules of philosophizing, which NEWTON premises to his account of the planetary motions, which he so scrupulously followed, and with a fuccess which gives them great authority, are all in ftrict conformity to the view we have now given

of the subject.

"The chief rule is, that finilar causes are to be affigued to fimilar phenomena. This is indeed the fource of all our knowledge of connected nature; and without it the universe would only present to us an incomprehentible chaos. It is by no means, however, necessary to enjoin this as a maxim for our procedure: it is an inflinctive propenfity of the human mind. It is absolutely necessary, on the contrary, to caution us in the application of this propenfity. We must be extremely confident in the certainty of the refembrance before we venture to make any inference. We are prone to reason from analogy: the very employment is agreeable; and we are ever disposed to embrace oppor unities of engaging in it. For this reason we are fatisfied with very flight refemblances, and eagerly run over the confequences, as if the refembiances were complete; and thus our refearches frequently terminate in fallehood.

"This propenfity to analogical reasoning is aided by another equally strong, and equally useful, when properly directed; we mean the propenfity to form general laws: it is in fact a propenfity to discover causes, which is equivalent to the establifting of general laws. It appears in another form, and is called a love of or tafte for simplicity; and this is encouraged or justified % agreeable to the uniformity and simplicity of nature. "Natura semper fibi similis et consona," says NEWTO: " Frustra sit per plura quod sieri potest per paucicia;" says another. The beautiful, the wife economy of nature, are phrases in every body's m uth; and Newton enjoins us to adopt no more causes than are fufficient to explain the phenomena. Ail this is very well, and is true in its own degree: but it is too frequently the fubterfuge of human vanity and felf-love. This inordinate admiration of the economy and fimplicity of nature is generaily conjoined with a manifest love of tystem, and with the actual production of some new system, where from one general principle fime extensive theory or explanation is deduced and offered to the world. The author fees a tort of refemblance between a certain feries of phenomena and the confequences of fome principle, and thinks the principle adequate to their explanation. Then, on the authority of the acknowledged fimplicity of nature, he roundly excludes all other principles of explanation; because, tays he, this principle is sufficient, et fiustra fit per plura, &c. We could point out many inflances of this kind in the writings of perhaps the first mathematician and the

poorest

poorest philosopher of the last century; where extensive theories are thus cavalierly exhibited, which a few years examination have shown to be nothing but analogies, indiffinelly observed, and, what is worfe inaccurately applied.

"To regulate these hazardous propensit es, (fay our learned authors,) and keep philotophers in the right path, Newton inculcates another rule, or rather gives a modification of this injunction of fimplicity. He enjoins, that no carf's shall be admitred but fuch as are true, and fufficient to account for the phenomena. The meaning of this rule has been mistaken by many philosophers, who imagine that by true he means causes which really exist in nature, and are not mere creatures of the imagination. We have met with fome who would boggle at the doctrines of Aristotle respecting the planetary motions, viz. that they are carried along by conducting intelligent minds, because we know of none such in the universe; and who would nevertheless think the dostrine of the Cartesian vortices deferving of at least an examination, because we fee fuch vortices exift, and produce effects which have fome refemblance to the planetary motions, and have juftly rejected them, folely because this refemblance has been very imperfect. We apprehend Newton's meaning is, that no cause of any event shall be admitted, or even considered, which we do not know to be actually concurring or exer ing some influence in that very event. If this be his meaning, he would reject the Cartefian vortices, and the conducting spirits of Aristotle for one and the fame reason; not because they were not adequate to the explanation, nor because such cases did not exist in nature, but because we did not fee them any how concerned in the phenomenon under confideration. We neither fee a fpirit nor a vortex, and therefore need not trouble ourselves with enquiring what effects they would produce. This was his conduct, and has diffinguished him from all philosophers who preceded him, though many, by following his example, have been rewarded by fimilar fuccess. This has procured to Newton the character of the modest philosopher; and modest his procedure may be called, because the contrary procedure of others did not originate to much from ignorance as from vanity. Newton's conductor in this was not modefty, but fagacity, prudence, caution, and in a word, found judgment.

"For the bonds of nature, the supposed philosophical causes are not observed; they are inferred from the phenomena. When two substances are observed, and only when they are observed, to be connected in any feries of events, we infer that they are connected by a natural power: but when one of the fubstances is not feen, but fancied, no law of human thought produces any inference whatever. For this reason, Newton stopped short at the laft FACT which he could discover in the folar fythem, that all bodies were deflected to all other bodies, according to certain regulations of diffance and quantity of matter. When told that he had done nothing in philosophy, that he had difcovered no cause, and that to merit any praise he must show how this deflection was produced :he faid, that he knew no more than he had told them; that he faw nothing causing this deflection;

and was contented with having described it to exactly, that a good mathematician could now make tables of the planetary motions as accurate as he pleafed, and with hoping in a few years to have every purpole of navigation and of philosophical curiofity completely answered. He was not disappointed. When philosophers were contriving hypothetical fluids, and vortices which would produce these desections, he contented himfelf with showing the total inconfishency of these explanations with the mechanical principle acknowledged by their authors; and that ther canfes were neither real, nor fufficient for explaining the phenomena. A cause is sufficient for oplanning a phenomenon only when its legitimate consequences are perfectly agreeable to these place nomena.

PART I.

" New ron's discoveries remain without dimnution or change: no philosopher has yet advaced a flep further. But let not the authority, or even the fuccess, of Newton be our guide, father than they are supported by experiment. If phlofophy be only the interpretation of nature's laguage, the inference of causes from the phones na, a fancied or hypothetical phenomenon co produce nothing but a fanciful cause, and co make no addition to our knowledge of real man

### SECT. V. Of the DANGER OF HYPOTHESIS PHILOSOPHY.

" All hypotheses must be banished from phile phical difention as frivolous and ufeless, admis ftering to vanity alone. As the explanation of any appearance is nothing but the pointing or the general fact, of which this is a particular in france, a hypothesis can give no explanato knowing nothing of cause and effect but the junction of two events, we fee nothing of a tion where one of the events is hypothetical. though all the legitimate confequences of all thetical principle should be perfectly similar the phenomenon, it is extremely dangerous to fume this principle as the real cause. It is cal to make use of the economy of nature 28. argument for the truth of any hypothelis: far true, it is a physical truth, a matter of fact, true only to the extent in which it is oblered and we are not entitled to fay that it is fo one le farther, till it be observed. But the proposition that nature is so economical is false; and it aftonishing that it has been so lazily acquiefeed by the readers of hypotheles: for it is not the thers who are deceived by it, they are generalled by their own vanity. Nothing is more obla vable than the prodigious variety of nature. The the same phenomena may be produced by differ ent means is well known to the aftronomers, when must all grant, that the appearance of motion be precifely the fame, whether the earth mo round the fun like the other planets, or which the fun with his attendant planets moves rou the earth; and that the demonstration of the opinion is had from a fact totally unconnect with all the deflections or even with their causes for it may be afferted, that Dr BRADLEY's dico very of the ABERRATION of the fixed stars, in confequence of the progressive motion of light, wa the first thing which put the Copernican system beyond beyond question; and even this is still capable of being explained in another way. The Author of Nature seems to delight in variety; and there cannot be named a single purpose in which the most inconceivable fertility in resource is not observed. It is the most delightful occupation of the inquisitive mind and the sensible heart to contemplate the various contrivances of nature in accomplishing similar ends.

mplifting fimilar ends.

\*\*As a principle therefore on which to found
maxim of philosophical procedure, this is not
injudicious, because imprudent and apt to
ad, but as false and almost sure to mislead.

This indeed has done so much harm in philomaxim as the introduction of beautifus.

y, as the introduction of *bypotheles*.

Authors have commonly been fatisfied with r light refemblances, and readers are eafily led by the appearances of reasoning, which resemblances have countenanced. The antelemblances have countenanced. its, and above all Aristotle, were much to this mode of explanation, and filled phiphy with abfurdities. The flightest resemces were with them fufficient foundations of hes. It has been by very flow degrees that have learned caution in this respect; and we put yet cured of the disease of hypothetical matizing. Nay, modern philosophers even greatest name are by no means exempted the reproach of hypothetical theories. writings abound in ethers, nervous fluids, lipirits, vortices, vibrations, and other inagents. Ali these attempts may be shown ther unintelligible, fruitless, or faise. (See **3**5, § 153—156.)

may here be asked, Whether, is the ease of oft perfect agreement, after the most extenmanison, a hypothesis should be admitted? must be left to the feelings of the mind. the belief is irressible, we can reason no But as there is no impossibility of as peragreement with some other hypothesis, it emt that it does not convey an irrefragable our hypothesis.

word, it is impossible, that hypothetical exms can give any addition of knowledge. hypothesis we thrust in an intermediate etween the phenomenon and fome general and this event is not feen but supposed. fore, according to the true maxims of phihad investigation, we give no explanation; re are not thereby enabled to affign the gein which this particular phenomenon is inis may, the hypothesis makes no addition lift of general laws; for our hypotheses feleded, to tally with all the phenomena. pothefis therefore is understood only by and phenomena; and it must not be made more than the phenomena themselves. The thelis gives no generalifation of facts. Its application is founded on a coincidence of and the hypothetical notion is thrust in betwo facts, which we really observe to be by nature. Let us then throw away enthe hypothetical law, and infert the observin our lift of general laws: it will be in ent language from the hypothetical law, but reprefs the facts in nature.

"It is in experimental philosophy alone, that hypotheses can have any just claim to admission: and here they are not admitted as explanations, but as conjectures ferving to direct our line of experiments. Effects only appear; and by their appearance, and the previous information of experience, causes are immediately ascertained by the perfect fimilarity of the whole train of events to other trains formerly observed': Or they are fuggefted by more imperfect refemblances of the phenomena; and these suggestions are made with stronger or fainter evidence, according as the resemblance is more or less perfect. These suggestions do not amount to a confidential inference, but only raife a conjecture. Withing to verify or overturn this conjecture, we have recourse to experiment. In this way conjectures have their ufeand are the ordinary means by which experimental philosophy is improved. But conjectural fiftems are worse than nonsense, filling the mind with false notions of nature, and generally leading us into a course of improper conduct, when they become principles of action. This is acknowledged even by the abettors of hypothetical systems themselves, when employed in overturning those of their predecessors, and establishing their own: witness the successive maintainers of the many hypothetical fystems in medicine, which have had their short-lived course within these two last centuries.

"Let every person therefore who calls himself a philosopher resolutely determine to reject all temptations to this kind of system-making, and let him never consider any composition of this kind as any thing better than the amusement of an idle hour.

SECT. VI. Of the PROPER MODE OF PROSECU-TING PHILOSOPHICAL INVESTIGATIONS.

"AFTER these observations (our learned authors observe,) it cannot require much discussions to mark the mode of procedure which will infure progress in all philosophical investigations. The iphere of our intuitive knowledge is very limited; we must be indebted for the greatest part of our intellectual attainments to our rational powers, and it must be deductive. In the spontaneous phenomena of nature, whether of mind or body, it ferdom happens that the energy of that natural power, which is the principle of explanation, is so immediately connected with the phenomenon that we fee the connection at once. Its exertions are frequently concealed, and in all cases modified, by the joint exertions of other natural powers: the particular exertion of each must be confidered apart, and their mutual connection traced out. It is only in this way that we can discover the trainof intermediate operations, and fee in what manner and degree the real principle of explanation concurs in the oftenfible process of nature.

"In all such cases it is evident, that our investigation must proceed by steps, conducted by the sure hand of logical method. To take an instance, let us listen to Galileo, while he is teaching his riends the cause of the rise of water in a pump. He says that it is owing to the pressure of the air. This is his principle; and he announces it in all

its extent. "All matter, fays he, is heavy, and in particular air is heavy. He then points out the connection of this general principle with the phe-

nomenon. Air being heavy, it must be supported: it must lie and press on what supports it; it must press on the furface AB of the water in the ciftern furrounding the pipe CD of the pump; and also in the water C within Н this pipe. He then takes no- F tice of another general principle which exerts its fuhordinate influence in this pro-Water is a fluid; a cels. fluid is a body whose parts yield to the smallest impresfion; and, by yielding, are eafily moved among themfelves: and no little parcel of the fluid can remain at rest unless it be equally pressed in every direction, but will recede from that fide where it fustains the greatest presfure. In consequence of this fluidity, known to be a pro-perty of water, if any part of it is pressed, the pressure is propagated thro the whole; and if not refifted on every E fide, the water will move to that fide where the propagated pressure is not relisted. All these subordinate or coilateral propositions are sup-B posed to be previously demonstrated or allowed. Water therefore must yield to the pressure of the air unless pressed by it on every side, and must move to that side where it is not with-held by some opposite pressure. H-

then proceeds to show, from the structure of the pump, that there is no opposing pressure on the water in the inside of the pump. "For (says he) suppose the piston thrust down till it touches the furface of the water in the pipe; suppose the pifton now drawn up by a power fufficient to lift it, and all the air incumbent on it; and suppose it drawn up a foot or a fathom—there remains nothing now to press on the surface of the water. In short, the water in the pump is in the same situation it would be in, were there no air at all, but water poured into the eiftern to a height AF, fuch, that the column of water FABG presses on the furface AB, as much as the air does. In this case the water at C is pressed upwards with a force equal to the weight of a column of water, having the fection of the pipe for its base and CH for its height. The water below C therefore wili be pressed up into the pipe CD, and will rise to G, so that it is on a level with the external water FG; that is, it will rife to H. This is a necessary consequence of the weight and pressure of the incumbent column FABG, and the fluidity of the

water in the ciftern. Consequences persetty milar must necessarily follow from the weight pressure of the air; and therefore on drawing the piston from the surface of the water, which it was in contact, the water must sold till it attain that height, which will make its weight a balance for the circumambient air. cordingly the Italian plumbers inform me, the pump will not raise water quite 50 paims; from their information I conclude, that a pof water of 50 palms high is somewhat he than a pillar of air of the same base, and rece to the top of the atmosphere."

"Thus is the phenomenon explained, rife of the water in the pump is shown to particular case of the general fact in hydret that fluids in communicating vessels will all heights which are inversely as their desting that columns of equal weights are in equal

"This way of proceeding is called are priori, or the fynthetic method. It is found just principles; and the great progres me the mathematical sciences, by this mode of sing, shows to what length it may be carried irresistible evidence. It has long been contact the only inlet to true knowledge; and was allowed to be known with certainly could not be demonstrated in this way be Accordingly logic, or the art of reason nothing but a set of rules for successfully ting this argument.

"Under the direction of this infallible philosophy has made sure progress towar section, and the progress has not only but great. The explanation of an appearature is nothing but the arrangement of that general class, in which it is competed that general class, in which it is competed in the class has its distinguishing mark, which it is found in the phenomenon, fixes it in there to remain for ever an addition to of knowledge. Nothing can be lost way but by forgetting it; and the dophilosophers must be stable like the last ture.

"We have seen, however, that the ver of all this was long the case; that philos but latery emerged from total darkness rance; that what passed under the same soft were termed doctrines, delivered with the imposing apparatus of logical demonstration besied in aimost every instance by experied affording no affistance in the application powers of nature to the purposes of life.

"It is allowed by ali that this has been in those branches of study at least, which plate the philosophical relations of the world, in astronomy, in mechanical phi in chemistry, in physiology, in medicine, culture. It is also acknowledged, that course of less than two centuries we have red much knowledge on these subjects, more conformable to the natural course that the deductions made from it by the soft the synthetic method are more comfort fact, and therefore better fitted to direct duct and improve our powers. It is also

that these philosophical systems have more stability than in ancient times; and though fometimes in part superfeded, are seldom wholly exploded.

"This cannot perhaps be affirmed with equal terifidence with respect to those speculations which have our intelled or mental propensities for Heir object. We have proceeded in the old Arif-Melian method when investigating the nature of mind. There has been a material defect in our mode of procedure, in the employment of this second of reasoning as an inlet to truth. Philohave long mistaken the road of discovery, have fet out in their investigations from the m where this journey should have terminated. The Aristotelian logic, the fyllogistic art, that so much boasted of, as the only inlet to k knowledge, the only means of discovery, was forced opposition to the procedure of nature, which we acquire knowledge and discover the The ancient logic supposed, that all the principles are already known, and that noig is wanted but the application of them to peular facts. But were this true, the applicaof them each hardly be called a diffeovery: his false; and the fact is, that the first prin-are generally the chief objects of our reth, and that they have come into view only and then as it were by accident, and never he labours of the logician. But curiofity was kened, and men of genius were fretted as well feeled with the disquisitions of the schools, one moment rasted expectations by the try of composition, and the next moment them by their inconfishency with experi-They faw that the best was to begin anew, how away the first principles altogether, bit exception, and endeavour to find out which should in every case be agreeafact.

ailsophers began to reflect, that under the liced tuition of nature menhad acquired much knowledge. The exercise of the inductive ple, by which nature prompts us to inter gews from the observation of particular facts, Ipreies of logic new in the schools, but old an nature. It'is a just and rational logic; is founded on, and indeed is the only habimellation of, this maxim, "That whatever with respect to every individual of a class tests, is true of the whole class." This is the inverse of the maxim on which the Ariffrom logic proceeded.

This new logic, therefore, or the logic of INmon, must not be considered as subordinate oid, or founded on it. See Logic, Part that the increasing demand for practical de, particularly in the arts, made inquimen fee how useless and insufficient was the mag of the ichools in any road of investigation was connected with life and bufiness; and re, that fociety had received ufeful informathirdly from persons actually engaged in the which the speculatists were endeavouring to ilme; and that this knowledge conlifted chiefly of kniments and observations, the only contribuh which their authors could make to science. MANUEL PART IL

"The Novum Organism of BACOK, (fay our learned authors,) which points out the true method of forming a body of real and ufeful knowledge, namely, the fludy of nature in the way of description, observation, and experiment, is undoubtedly the noblest present that science ever re-ceived. It may be considered as the grammar of nature's lurguage, and is a counter part to the logic of Ariflotle. As the logic of Ariflotle had its rules, so has the Baconian or inductive; and the Nortum Organum Scientiarum contains them ali. The chief rule, and indeed the rule from which all the rest are derived, is, that "the induction of particulars must be carried as far as the general affirmation which is deduced from them." If this be not attended to, the mind of man, which, from his earliest years, shows great eagerness in searching for first principles, will be apt to afcribe to the operation of a general principle events which are merely accidental. Hence the popular belief in omens, palmiftry, and all kinds of superstition.

"This rule has evidently given a new turn to the whole track of philosophical investigation. To discover first principles, we must make extenfive and accurate observations, so as to have copious inductions of facts, that we may not be deceived as to the extent of the principle inferred from them. We must extend our acquaintance with the phenomena, paying a minute attention to what is going on all around us; and we must fludy nature, not shut up in our closet drawing the picture from our own fancy, but in the world, copying our lines from ber own features. To delineate human nature, we muft fee how men act. To give the philosophy of the material world, we

must notice its phenomena.

"This method of fludying nature has been profecuted during these two last centuries with great eagerness and succeis. Philosophers have made accurate observations of facts, and copious collections of them. Men of genius have discovered many general powers both of mind and hody; and refemblances among these have suggested powers still more general. By these efforts investigation became familiar; hypothefes were banish ed, and nothing was admitted as a principle which was not inferred from the most evident in duction. Conclusions from fuch principles her came every day more conformable to experience. Mistakes sometimes happened; but recourse being had to more accurate observation or more certain induction, the mistakes were corrected. In the present study of nature, our steps are more flow, hefitating and painful; our conclusions are more limited and modest; but our discoveries are more certain and progressive, and the results are more applicable to the purposes of life. pre-eminence of modern philosophy over the and clent is feen in every path of inquiry. It was first remarkable in the fludy of the material world and there it ftill continues to be most confpicuous. But it is no less to be seen in the later performances of philosophers in metaphysics, pneumatology, and ethics, where the mode of investigation by analysis and experiment has been greatly adopted; and this has reflered philotophers to the

the world, to fociety. They are no longer to be found only in the academies of the forbifts and the cloitters of a convent, but in the discharge of

public and private duty.

" After faying so much on the nature of the employment, and the mode of procedure, it requires no deep penetration to perceive the value of the philosophical character. If there is a propenfity in the human mind which distinguishes us from the inferior orders of fentient temps, a propenfity which alone may be taken for the characteristic of the species, and of which no trace is to be found in any other, it is difinterested intellectual curiofity, a love of discovery for its own take, independent of all its advantages.

We think highly, and with justice, of our ragional powers; but we may carry this too far. To every man who enjoys the chearing thought of living under the care of a wife Creator, this boafted prerogative will be riewed with modely and diffidence; and He has given marks of the rank in which He effects the rational powers of man. In no case of essential importance, of indispensable necessity, to our weil-being or our existence, has He left man to the care of his reason

plane.

" God has not trusted either the preservation of the individual or the continuance of the race, to man's opinion of the importance of the talk, but has committed them to the furer guards of hunger and of sexual defire. In like manner, He has not left the improvement of his nobiest work, the intellectual powers of the foul of man, to his own discovery how important it is to his comfort, that he be thoroughly acquainted with the objects a-gound him. No: He has committed this to the fure hand of curiofity: and He has made this fo Arong in a few superior souls, whom He has appointed to give light and knowledge to the whole pecies, as to abstract them from all other purfuits, and to engage them in intellectual research with an ardour, which no attainment can ever queuch, but, on the contrary, inflames it the more by every draught of knowledge.'

The wildom and goodness of the Creator appear equally in His beneficence. Human life is a feene filled with enjoyment; and the foul of man is flored with propenfities and powers which have pleasure, in direct terms, for their object. Not to expatiate on the great variety of corporeal pleasures, which the present state of human existence affords. Man has improved this anxious deive of the knowledge of the objects around him, fo se to derive from them not only the means of subfiftence and comfort but the most elegant and pleasing of all gratifications, the accumulation of NTELLECTUAL KNOWLEDGE, independent of interligition of its advantages. It is therefore not only lawful but highly commendable, in such as polless the means of intellectual improvement, without relinquishing the indispensable social duties, to push this advantage as far as it will go; and in all ages and countries, it has been confidered as forming the greatest distinction beween then of ally fortune and the majority of the inferior ranks, who must procure their own upport, while they contribute to the good of the ommunity, by their manual labour. The plebeian must learn to work, the gentleman must learn to think; and nothing can be a furer man of a groveling foul than for a man of forune t have an uncultivated mind.

" Let us then cherish to the utmost this diffir guithing propenfity of the human toul; but let u do even this like philosophers. Let us cultivat it as it is; as the handmaid to the arts and durk of life; as the guide to fomething yet more exact A character is not to be estimated from what the person knows, but from what he ca perform. The accumulation of intellectual know ledge is too apt to create an inordinate appeal for it; and the man habitnated to speculion to become like the miler, too apt to place M pleafure in the mere possession, which he qualitation for only or chiefly in the judicious use differentiate object."

To conclude, in the words of our learned thors, The "folid advantages, which philosofis able to bestow, are great. To enumerate describe them all would be to write a volum We may take notice of one, which is an object confequence of that simple view which we given of the object; and this is, a model open of our attainments. Appearances are all that know; causes are for ever hid from our new powers of our nature cannot reach them. therefore, relinquish all purspits which ultimate principles for objects of examination us attend to the subordination of things, is our great bufiness to explore. Among there is such a subordination as that of mea ends, and of instruments to an operation will acknowledge the abfurdity of examining with a microscope. It is equally abfurd for to examine the nature of knowledge, of und infinite wisdom, by our intellectual powers have a wide field of accessible knowledge the works of God; and one of the greate wantages, and of the most sublime pla which we can derive from the contemplation the view which a judicious philosophical ref will most infallibly give us of a world, nato ing of a number of detached objects, com only by the fleeting tie of coexistence, but a werse, a system of beings, all connected together causation, with innumerable degrees of subs nation and subserviency, and all co-operation the production of one great and glorious por The heart which has but a spark of sensible must be warmed by such a prospect, must pleased to find itself an important part of this pendous machine; and cannot but adore the comprehenfible Artist who contrived, and and directs the whole.

" PHILOSOPHICAL DISQUISITION Will CO these general laws of the universe, that wond concatenation and adjustment of everything material and intellectual, as the most firikit stance of incomprehensible wisdom; which means to few and to simple, can produce t which by their grandeur dazzle our imagini and by their multiplicity elude all politib Of all the obstacles which enumeration. weakness, the folly, or the vanity of men, he thrown in the way of the theologian, there is a so fatal, so hostile to all his endeavours, at a co

and comfortiefs lystem of MATERIALISM, which the reasoning pride of man first engendered, which made a figure among a few speculatists in the 17th century, but was from forgotten by the philofophers really huly with the observation of nature and of nature's God. It has of late reared up its head, being cherished by all who wish to get rid of the fings of remorfe, as the only opinion compatible with the peace of the licentious and the fenfu-L In vain will the divine attempt to lay this deal with the metaphysical exorcisms of the - don't it is philosophy alone that can detect the that. Philosophy fingles out the characteristic , menomena which diffinguish every substance; and abilolophy never will helitate to conclude, that there is one fet of phenomena which characterise mid, and another which characterise body, and that these are toto calo different. Continually appaling to fact, to the phenomena, for our knowdee of every cause, we shall have no disficulty deciding that thought, memory, volition, joy, pe, are not compatible attributes with buik, right, elasticity, fluidity. Tuta sub agide Palphilosophy will maintain the dignity of hunature, will detect the foohilins of the mateids, confute their arguments, and reftore to countenance of nature that ineffable beauty of heh those would deprive her, who would take my the supreme Mind which shines from withand gives life and expression to every feature."

## PART. II. O EXPERIMENTAL PHILOSOPHY.

ESPERIMENTAL PHILOSOPHY is that which its foundation in experience, wherein nothing sumed as a truth but what is founded upon obr demonstration, or which cannot be denied about violating the common fense and percepbe of all mankind. It proceeds entirely on periments; deduces the laws of nature, and the wers and properties of hodics, with their effects ach other, from experiments and observa-

former times philosophers, when reasoning but natural things, instead of following this thod, assumed such principles as they imagin-sufficient for explaining the phenomena, withat confidering whether these principles were just From. Hence for a geat number of ages no prores was made in science; but systems were heapsupon systems, having neither confistency with reanother nor with themselves. No proper extestions indeed were given of any thing; for all bee systems, when narrowly examined, were to confift merely in changes of words, were often very absurd and barbarous.

The first who deviated from this method of phi-Mophizing, was Friar Bacon, who lived in the hth century, and who spent 2000 l. (an immense m in those days) in making experiments. mirable Crichton, who flourshed about the rar 1580, not only disputed against the philosoby of Aristotle, which had for fo long been rogue, but wrote a book against it. Cotempoby with this celebrated personage was FRANCIS, Acon, lord chancellor of England, who is look-1 upon to be the founder of the present mode of

phiosophising by experiments. But though of there might lay the foundation, Sir Isaac New-TON is justly allowed to have brought this kind of philotophy to perfection; and to him we are certainly indebted for the greatest part of it. Unfortunately, however, neither Lord VERULAM nor Sir Isaac Newton had an opportunity of know ing many important facts relating to the principles of FIRE and BLECTRICITY, which have fince been brought to light. Hence all their philosophy was merely mechanical, or derived from the villa ble operations of folid bodies, or of the groffer fluids upon one another. In fuch cases therefore, where the more fubtile and active fluids were concerned, they fell into mislakes, or were obliged to deny the existence of the principles altogether, or make use of terms which were equally unintelligble and incapable of conveying any information with those of their predecessors. A remarkable instance of the errors into which they were thus betrayed, we have in the doctrine of projectiles, where the most enormous deviations from truth were fanclified by the greatest names of the 17th. century, merely by realoning from the relistance of the air to bodies moving Jowly and vifibly, to its reliftance to the same bodies when moved with high degrees of velocity. (See Projectiles.) In other cases they were reduced to make use of words to express immechanical powers, as attraction, repullion, refraction, &c. which have fince tended in no fmall degree to embarrafs and confound science by the disputes that have taken place concerning them. The foundations of the prefent system of experimental philosophy are as fol-

I. All the material substances of which the universe is composed are called natural bodies. we perceive uniform and invariable in these substances we call their properties. Some of these are general and common to all matter, as EXTENsion; others are proper to particular fubstances, for instance FLUIDITY; while some appear to be compounded of the general and particular properties, and thus belong to a fail finaller number a as the properties of air, which are derived from the general property of extension combined with those of fluidity, elasticity, &c.

II. In taking a particular review of the properties of bodies, we naturally begin with that of EXTENSION. This manifelts itself by the three dimensions of length, breadth, and thickness. Hence proceeds the divisibility of matter; which the present system supposes to reach even to infinity: but though this propolition be supported by mathematical demonstrations, it is impossible we can rither have any distinct idea of it, or of the opposite doctrine, which teaches that matter is composed of excellively minute particles called atoms, which cannot be divided into fmaller ones. The subtilty indeed to which folid hodies may be reduced by mechanical means is very functing; and in some cases is so great, that we might be tempted to suppose that a farther division is impos-Thus, in grinding a speculum, the inequalities of its furface are so effectually worn off, that the whole becomes in a certain degree invilible, fhowing not itself by the light which fails upon it, but the image of other bodies; but the smallest liia

ferateb

436 P H I L O

is at once diffinctly visible.

III. From the arrangement of these ultimate particles of matter, whatever we suppose them to be, arife the various figures of bodies: and hence figure is a property of all bodies no less univertal than extention, unless we speak of the ultimate particles of matter, which, as they are supposed to be deflitute of parts, must consequently be equally deflitute of figure; and the fame confequence will follow whether we adopt this supposition or the other. The figures of bodies are to extremely various and diffimilar, that it is impossible to find any two perfectly alike. It is indeed the next thing to impossible to find two in which the diffimilarity may not be perceived by the naked eye; But if any fach thould be found, the microfcope will quickly discover the imbecility of our senses in this respect. Solidity is another property effential to all matter. By this we mean that property which one quantity of matter has of excluding all other from the space which itself occupies at that Hence arises what we call RESISTANCE, which is always an indication of folidity; and no less so in those bodies which we call fluid than in those which are the most folid. This may at first feem to be a contradiction; but fluids yield only when they can get away from the preflure; in all other cases they relist as violently as the most sofid bodies. Thus water confined in a tube will as effectually relift the impression of a piston thrust down upon it as though it were the most solid substance. Air indeed will yield for a certain time; but this, as appears from feveral experiments, is entirely owing to a more fublile fluid, viz. that of elementary fire being preffed out from among its particles. As long as this fluid can be forced out, either from among the particles of air, water, or any other more grefs fluid fubRance, the latter will be found compressible, as a heap of wet fand would be by fqueezing the water out from it: but when we come to the most subtile of all elements, such as we suppose that of fire to be, there cannot be any possibility of compressing it, even though we had a veilel to close as to prevent it from cfcaping through its fides; because its parts

are already as near each other as they can be.

IV. The diffance of the parts of bodies from each other is called their POROSITY, and was formerly supposed to be owing to a vacuum intersperfed between them; but now it is generally allowed that the pores of folid bodies as well as of fluids are filled with an extremely fubtile matter which pervades all nature. The porofity of bodies with regard to one another may be thus explained. Wood, or a fponge, is porous with regard to water; but water itself is porous with regard to air, which it abforbs in confiderable quantity. Both air and water are porous with regard to the element of fire, which produces very confiderable changes upon them, according to the quantity of it they contain, or the manner it acts in their pores. This element itself, however, is not porous with regard to any other fubstance. Its pores, therefore, if it has any, must be absolute vacuities deflitute of any matter whatever. Vacuities of this kind indeed are supposed to be absolutely necessary to motion; for though we

may fay, matter being divisible almost ad infaition, that a body or fubiliance more fould, may move in another substance that is more fibule, and that will give way to its motion, we mult to verthelefs have recourse to a last result, and admit of an ultimate vacuum, which will give room fufficient to the leaft expufele, that its put a may take the place of its part B without the lot refiftance: betides, it is not to be imagined, that nature, in fact, admits of that infinite divisibility which our imagination can conceive, and that e very thing, which is possible in idea, is at all time practicable. All that exists is possible, but althe is possible does not however exist. By DENSITY understood the proportion between the exical and folidity of a body: one body therefore is 24 denfe than another, when, under the fame de of extension, it contains more folid matter: this quality arifes from condensation and cons fion. ELASTICITY is nothing more than that fort by which certain bedies, when comprehe endeavour to reftore themselves to their form flate; and this property supposes them come fille. As all these natural properties of besits of great utility in explaining the principles of fies, and in applying them to all the arts, open mental philosophy proves their reality by

fand examples.

V. We discover still other properties in the Inch as MODILITY, which we must not here found with Morion. This mobility miss certain dispositions which are not in an equal gree in all bodies; whence it comes that kine more eafily moved than others: and this proceed from the reliftance to motion which is perceiin all bodies having regard merely to their man and this reliftance is called vis INERTIE, or force. A body is faid to be in motion, when actually moving from one place to another whenever a body changes its fituation with to the objects that furround it, either nearly morely; it is faid to be in motion. That three principal matters to be confidered in a ing body; its direction, its velocity, and quantity of its motion; and here physics exp the force of moving power; it likewise diffingu es between fimple and compound motion. So motion is that which arifes from only one force which tends to only one point. It describes laws, and explains the reliftance, of mediums; relistance of friction; the difficulties of a pore al motion; the alteration of direction occasion by the opposition of a fluid matter; restable reverberated motion; the communication of tion by the shoels of bodies, &c. Company tion is that of a body impelled to move by kin causes or powers which aft according to their Physics here likewise in ferent directions. gates the laws of motion; and is particularly plied to the explaining, under this head, whi called the central forces, which produce a me that is either circular or in a curve line, and w incessantly urge the moving body either to proach or recede from the centre. To disting these from each other, the former is called centripetal force, and the latter the centrifigal for

VI. The powers of ATTRACTION and REPT sion frem to be common to all matter, and d compeara component parts of all fubilitances are kept in their places by the due baiance of these opposite powers. If, by any means, the particles of any iditance be removed beyond their sphere of mulal attraction, they repel one another, as those of sucremen it becomes steam. Of the different inds of attraction, that of GRAVITATION seems mented to the greatest possible distance; but he which keeps together the parts of the same subtance, thence called the attraction of confion, solve different kinds of chemical attractions, called affects, only act at a finall distance. Of the same of these attractions we are entirely ignorant. See ATTRACTION.

VII. By GRAVITY, or PONDEROSITY, is to be neurlocd that force which occasions bodies to no from a higher to a lower place, when noby opposes their course, or when the obstacles R not fufficient to ftop them. Speculative phisophy investigates its cause, and perhaps in vain. permental philosophy contents itself with debing the phenomena, and teaching the laws paying, which are thoroughly established by a find reiterated experiments. In order proto understand this subject, we must take care to confound the term gravity with that of by the former, we understand that force the arges bodies to descend through a certain ema given time. By the latter, is meant the try of a heavy body that is contained under bulk. The phenomena are explained by experiments themselves, and by inferences defrom them.

III HYDROSTATICS is a science of which the fis the gravity and equilibrium of fluids in whir. Tho' the gravity of these bodies is the with that of others, and is subject to the same, set their state of fluidity gives rise to partiphenomena, which it is of consequence to. But as hydrostatics cannot be successfully tel on without the assistance of calculation, it been ranked among the mathematical sciences. Hydrostatics.

We fay the fame with regard to MECHA-; which is the art of employing, by the of machines, the motion of budies, in conity to its properties and laws, as well with my to folids as fluids, either more commodiy or more advantageoufly.

After it has made the most accurate experiints, and the most judicious observations, on these different subjects, and the properties of es in particular, Experimental Philosophy to the examination of the air, the water, the wind, colours, &c. The air is a fluid which we are lurrounded from the instant of birth, and without which we cannot exist. by the properties and the influences of the that nature gives increase and perfection to that it produces for our wants and convenienit is the spirit of navigation: sound, voice, ech itleif, are nothing more than percuttions the air: this globe that we inhabit is completefurrounded by air; and this kind of coverture, hich is commonly called the ATMOSPHERE, has ch remarkable functions, that it evidently apun to concur to the mechanism of nature. mmental physics, therefore, confiders the air,

1. Of itself, independent of its bulk, and the his gure of its whole body : it examines its effential properties; as its gravity, denfity, spring, &c. The air-pump is here of indispensable wie; and by this machine physics examines in what manner space, or a vacuum, is made. It likewise shows the necessity of air to the preservation of animal life; the effect it has on found, fire, and gurpowder, in vacuo; and a hundred other experiments of various degrees of curiofity. 2. It confiders the air as the terrestrial atmosphere, sometimes as a fluid at rest, and sometimes as in motion. And by these means it accounts for the variation of the mercury in the barometer, and why it finks in proportion as the height of the atmofphere diminuhes; as also for the figure, the extent, and weight of the atmosphere : it shows the method of determining the height of mountains, the nature of found in general, of its propagation, and of fono: ous bodies. The late discoveries of Dr Pricftley and others have added a new and very confiderable branch to experimental philosophy in this respect. See Aerology.

XL It is here also, that experimental philosoply confiders the nature of the wind; which is nothing more than agitated air, a portion of the atmosphere that moves like a current, with a certain velocity and determinate direction. fluid, with regard to its direction, takes different names according to the different points of the horizedo from whence it comes, as east, west, north, and fouth. Winds are likewise distinguished into three forts; one of which is called general or coustant, as the trade winds which continually blow between the tropics: another is the periodical, which always begin and end within a certain time of the year, or a certain hour of the day, as the monfoons, the land breezes, and fea breezes, which arise constantly in the morning and evening; and lastiy, such as are variable, as well with regard to their direction as their velocity and duration. M. Mariotte computes the velocity of the most impetuous wind to be at the rate of 32 feet in a second, and Mr Derham makes it 66 feet in the same time. The first, doubtless, meant the wind of the greatest velocity that had then come to his knowledge. The invention of aerostatic machines has tended more to show the real velocity of the wind than any other invention yet made public: but all of them move flower than the aerial current; so that the real velocity of the wind remains yet undetermined.

XII. The force of the wind, like that of other bodies, depends on its VELOCITY and mass; that is, the quantity of air which is in motion: to the fame wind has more or less force on any obstacle that opposes it, in proportion as that obstacle prefents a greater or a lefs furface: for which reason it is, that they spread the sails of a vessel more or less, and place the winds of a wind-mill in different directions. The machines by which the winds are measured, are called ANEMORE-TEAS. They show the direction, the velocity, and the duration of winds. It is by the agitations of the wind that the air is purified; that the feeds of trees and herbs are conveyed through the forefts and fields; that flips are driven from one pole to the other; that our mills turn upon their axes, &c.; and art, by imitating nature, fometimes procures us artificial winds, by which we refresh our bodies, invigorate our fires, purify our corn, &c.

XIII. WATER is an universal agent, which nature employs in all her productions. It may be confidered as in three states, r. As a liquid; 2. As a vapour; 3. As ice. • These three different states do not in any manner change its essence, but make it proper to answer different ends. The natural state of water would be that of a folid body, as fat, wax, and all those other bodies which are only fluid when hented to a certain degree: for water would be conftantly ice, if the particles of fire, by which it is penetrated in the temperate climates, did not render it fluid, by producing a reciprocal motion among its parts; and, in a country where the cold is continually strong enough to maintain the congelation, the assistance of art is necessary to make it finid in the same manner as we do lead, &c. Water, when not in ice, is a fluid that is inlipid, transparent, without colour, and without fmell, and that eafily adheres to the surface of some bodies, that penetrates many, and extinguishes fire. mental philosophy investigates the origin of fountains; the cause of the saltness of the sea; the means of purifying water; what is its weight, and what are its effects when heated, &c. It likewise examines this fluid in the state of vapour; and finds that a drop of water, when in vapour, occupies a space vastly greater than it did before. It explains the EOLIPILE and its effects; fire engines; and the force of vapours that give motion to immense machines in mines and elsewhere, &c. and lastly, it considers water in the state of ICE. Ice confequently is more cold than water; and its coidness increases if it continue to lose that matter, already too rare, or too little active, to render it fluid. Experimental physics endeavours to investigate the causes of the congelation of water, and why ice is lighter than water; from whence it derives that expanfive force by which it breaks the containing vefsel; the difference there is between the congelation of rivers and that of standing waters; why ice becomes more cold by the mixture of falts; and many other fimilar phenomena.

XIV. The nature of FIRE is yet very much unknown to the most learned philosophers. As obfects when at a great distance are not perceptible to our fenses, so when we examine them too nearly, we difcern them but confusedly. It is still disputed whether fire be a homogene, unalterable matter, defigned, by its presence, or by its action, to produce heat, inflammation, and diffolution, in bodies; or if its effence confifts in motion only, or in the fermentation of those particles which we call inflammable, and which enter as principles, in greater or less quantities, in the composi-tion of mixed bodies. The most learned inquirers into nature incline to the former opinion; and to have recourse to a matter which they regard as the principle of fire. They suppose that there is in nature a fluid adapted to this purpose, created fuch from the beginning, and that nothing more is necessary than to put it in action. The numberless experiments which are daily made in electricity feem to favour this opinion, and to pro that this matter, this fluid, this elementary i is diffused through all nature, and in all bod even ice itself. We cannot say to what imp tant knowledge this great discovery of electric may lead if we continue our inquiries concern It appears, however, that we may belie without any inconvenience or abfurdity, that and light, confidered in their first principle, one and the fame substance differently modified See ELECTRICITY, Index.

XV. Be this, however, as it may, expen tal philosophy is employed in making their ingenious and most useful researches come the nature of fire, its propagation, and the by which its power may be excited or an ed; concerning the phosphorus and its inhi tion; fire excited by the reflection of the rays from a mirror; and on the effects of general: concerning lightning and its effects fusion of metals; gunpowder and its capit flame and the aliments of fire; and an infin like objects which it explains, or concerning it makes new discoveries, by the aid of the ments.

XVI. By the word LIGHT, we unduft agent by which nature affects the eye will lively and almost constantly pleasing which we call feeing, and by which we the fize, figure, colour, and fituation of when at a convenient diffance. All phila agree, that the light, which is diffuled place, is a real body. But what this body by what means it enters that place where the ceived, is a question about which philosoph divided.

XVII. Experimental philosophy is app discovering or proving, by an infinity of ments, what is the nature of light, in wh ner it is propagated, what are its velocity gressive motion. It also investigates and the principles of OPTICS properly fo call shows the directions which light observer motions. From thence it proceeds to the of the principles of catoptrics, and defails laws and effects of reflected light. It next of the principles of dioptrics, and explains the of refracted light; and lastly, it teachers from principles of natural and artificial vision, the struction of optical instruments, as lenses, con mirrors, prilms, telefcopes, &c. &c. and the to which they are applied.

XVIII. By refolving or feparating the 17 light, philotophy has obtained true and clean coveries of the nature of COLOURS. We H turally led to imagine that colours, and the ferent degrees, make a part of the bodies present them to our fight; that white is in in inow, green in leaves and grafs, and restuff dyed of that colour. But this is far being true. If an object, which prefents a lour to our fight, be not illuminated, it p no colour whatfoever. In the night all is Colours therefore depend on light; for will that we could form no idea of them: but depend also on bodies; for of several objects fented to the fame light, some appear whith there red, blue, &c. But all these matters be (cpara parate from our own bodies, we should never quire any ideas of them, if the light, transmitdor reflected by these objects, did not make emsensible to us, by striking upon the organs our sight, and if these impressions did not reen us those ideas which we have been used express by certain terms. For these reasons its stoppy considers colours from three points of y. 1. As in the light; 2. In bodies, as being lured; and, 3. From the relation they have in stall faculties, which they particularly asand by which we are enabled to distinguish

on colour in particular, or experimental philosophy in general. The different subjects of this collective article are particularly treated under their proper names, in the order of the alphabet: the reader will therefore turn, as he has occasion, to Acoustics, Catoptrics, Chromatics, Dioptrics, Hydrostatics, Mechanics, Optics, Pneumatica, Electricity, Magnetism, &c. &c. &c. Also Airology, Aerostation, Atmosphere, Burning-Glass, Cold, Colour, Congelation, Evaporation, Fire, Flame, Fluidity, Heat, Ignition, Light, Sound, Steam, Water, Wind, &c.

## PHI

ILOSOPHY has been distinguished by diftepithets; partly from its subjects, and partm its Teachers: as,

moecessary in this place to say more either

PHILOSOPHY, ARISTOTELIAN. See ARI-BLIANS, ARISTOTLE, § 3, and PHILOSO-Led. 1.

HILOSOPHY, CARTESIAN. See ASTRONO-

Ma, and Cartesians. System of Science, (if indeed it may be so founded by Immanuel Kant, regius pro-Logic and Metaphylics, in the university righerg. This fystem, it is faid, is very mired in Germany, though for what, we much at a loss to discover. "To exphilosophy of Kant," (fays a learned who describes it in the Supp. to the id.) " in all its details, would require a d painful fludy, without producing any tailage to the reader. The language of thor is equally obscure, and his reasonings with those of the commentators ale in the 15th century." "The source obscurity (says Dr Gleig) is sufficiently obedides employing a vast number of words n invention, derived from the Greck, expressions, which have been long fametaphylicians, in a fense different from which they are generally received; and large portion of time is requisite to enamost sagacious mind to ascertain with on the import of his phraseology. The y of comprehending this philosophy has outed more than any thing elfe, to bring it were, and to raife the fame of its author." divides all our knowledge into that which in and that which is a posteriori. Know-Piori is conferred upon us by Nature. Re a posteriori is derived from our tensafrom experience, and is by our author ated empyrie. One would be induced, account, to believe, that Kant intended the lystem of innate ideas; but such is lystem. He considers all our knowledge red. He maintains that experience is the cause, or productrice of all our knowand that without it we could not have a idea. Our ideas a priori, he says, are prowith experience, but they are not produor do not proceed from it. They exist

### PHI

in the mind; they are the forms of the mind.-Time and space are two cifential forms of the mind.—Extension is nothing real but as the form of our fentations. - Arithmetic is derived from the form of our internal lense, and Geometry from that of our external. Our understanding collects the ideas received by the impressions made on our organs of fense, confers on these ideas unity by a particular force a priori; and thereby forms the representation of each object. Thus, a man is successively struck with the impressions of all the parts, which form a particular garden. His understanding unites these impressions, or the ideas resulting from them; and in the unity produced by that unifying act, it acquires the idea of the garden. If the objects, which produce the impressions, afford also the matter of the ideas, then the ideas are empgric; but if the objects only unfold the forms of the thought, the ideas are a priori!" "The writings of Kant are multifarious. The work entitled, The Critique of Pure Reason, is divided into several sections, under the ridiculous titles of Efthetic transcendental; of Transcendental Logic; of the pure ideas of the understanding; of the transcendental judgment; of the paralogism of pure reason; of the ideal tranfeental; of the criticism of speculative theologies; of the discipline of pure reason," &cc. Such is the wonderful jargon of literary nonsense, which of late has attracted the attention of the Literati in Germany. Our readers, we are perfuaded, will think we have given a fufficient specimen of our professor's Gritical Philosophy. We shall therefore conclude with a very short specimen of his theological and moral philosophy. After arguing, that "The proofs of natural theology, taken from the order and beauty of the universe, &c. are proofs only in appearance;—that it is impossible to know that God exists," and that "the proof of a God is nothing more than the persuasion, that happiness is connected with virtue by a Being upon whom nature depends;" he makes the following fingular remark upon oaths: " As it would be absurd to swear, that God exists, it is still a question to be determined, whether an oath would be possible and obligatory, if one were to make it thus: —I fwear on the supposition, that God exists. It is extremely probable, (adds he,) that all fincere oaths, taken with restection, have been taken in no other sense!-Dr Gleig concludes his account

of Kant's extraordinary system, with the following summary of his moral principles: "Kant Seems to contend, that the actions of men should be directed to no end whatever; for he expressly condemns, as an oud of action, the pursuit either of our own happiness, or of the happiness of others, whether temporal or eternal; but actions performed for no purpose are surely indications of the very effence of folly. Such actions are indeed impossible to beings enduced with reason, passions, and appetites; for if there be that beausy in virtue, for which Kant and the Stoics contend, it cannot be, but that the virtuous man must feel an internal pleasure, when he performs a virtuous action, or reflects upon his past co -On the whole, professor Kant's system of Critical Philosophy affords ap additional evidence , to the many which modern philosophy affords, of the truth of Cicero's remark, " That there is nothing fo abfurd, but what has been advanced by some philosopher or other."

PHILOSTORGIUS, an ecclefiaftical historian of the 4th century, born in Cappadocia, who wrote an abridgment of ecclefiaftical history, in which he treats Athanasius with some severity. This work contains many curious and interesting particulars. The best edition is that of Henry de Valois in Greek and Latin. There is also attributed

to him a book against Porphyry.

· (1.) PHILOSTRATUS, Flavius, an ancient Greek author, who flourished between A. D. 290 and 244. He wrote The Life of Apollonius Tyaneus, and some other tracts still extant. Eusebius calls him an Athenian, because he taught at Athens; but Eunspius and Suidas always speak of him as a Lemnian: and he himself hints as much He frequented the an his Life of Apollonias. schools of the sophists, particularly Damianus of Ephefus, Proclus Naucratitas, and Hippodromus of Larissa. He was one of those learned men whom the philosophic empress Julia Augusta, wife of Severus, had continually about her. By her command he wrote the Life of Apollonius, as he himself informs us. Suidas and Helychius fay that he was a teacher of rhetoric, first at Athens, and then at Rome, from the reign of Severus to that of Philip, who obtained the empire in 244. Philostratus's Life of Apollonius has erroneoully been attributed to Lucian, because it has been printed with some of that author's pieces. Philostratus endeavours, as Cyril observes, to represent Apollonius as a wonderful and extraordinary person. (See Apollonius, N° 3.) phistical and affected style of Philostratus, the fources whence his materials have been drawn, and the absurdities and contradictions with which be abounds, plainly flow his history to be nothing but a collection of fables. His works, however,

have engaged the attention of critics of the fall class. A very exact and beautiful edition was published at Leipsic, 1709, in folio, by Otenta professor of Greek and Latin. A translation in English was published by Blount. (See Bloury N° 1.) At the end of Apollonius's Life there ago Letters which go under his name. They not, however, believed to, be his; the style let very affected, and they bear all the math of sugery. Some of them, though it is not ensured the end of the last 18 in the bod images. This is the reason why the litterus Philostrati, but Philostratorum que superfinate

(2-4.) PHILOSTRATUS, nephew of theping, flourished in the relign of Hellogable wrote an Account of the Lives of the Sophitis extant, and contains many particular, are to be met with no where else. That other two Philostrati, both philosopher, flourished, the one under Augustus, the other

PHINEAS, or ) or, as the Jews pronounce it, PHINEHAS, PINCHAS, the fon of Eleazar, and grandfon of Aaron. He was the third high prieft of the Jews, and discharged this office from A. M. 2571, till 2590. He is particularly commended in Scripture for the zeal he showed for the preferention of his countrymen from idelatry, on two different occasions; as recorded, in Num. xxv. 7-15; and Josh xxii. 13-34. The just vengeance he executed on Zimri, a prince of Simeon; and Cozb, a princess of Midian, happened A. M. 2553. The dignity of the high pricithood continued in the race of Phinehas, from AARON down to the high-prieft ELI, for about 333 years; when it was forfeited by the wickedness of Eli's fons. It returned, however, again into the family of Eleazar in the reign of Saul, who, having killed Abimelech, and the other priests and people of Nob. (fee Does,) gave the high priesthood to Zadok, of the race of Phinehas. At the fame time, David had Abiathar with him, of the race of Eli, who performed the functions of high pricit. So that after the death of Saul, David continued the priefthood to Zadok and Abiathar conjointly. But towards the end of David's reign, Abiathar having joined in the conspiracy of Adontian, to the prejudice of Solomon, he was difgraced, and Zadok only was acknowledged as high prieft. The priesthood continued in his family till after the captivity of Babylon, and even to the destruction of the temple. But from the beginning of Zadok's priesthood alone, and the exclusion of Abiathar, to the ruin of the temple, is 1084 years. As Phinehas lived after the death of Joshua, and before the first servitude under Cushan-rishathaim. during the republic; (Judges xvii 6. xviii. 1. xi. 24.) his death is supposed to have happened A. M. 2590. It was under his pontificate that the robbery of Micah happened; that the tribe of Dan' made a conquest of Laish; and the enormity was committed upon the wife of the Levite. (Judges xx. 28) Phinehas's fuccessor in the high priesthood was Abiezer, or Abishuah. The Rabbins allow a very long life to Phinehas. Some fay he lived to the time of the high priest Eli, or even to that of Samion.

PHINEUS, in fabulous history, was fon of A-. genor, king of Phænicia, or according to some of Neptune. He became king of Thrace, or Bythi-He married Cleopatra or Cleobula, the daughter of Boreas, by whom he had Plexippus and Paudion. Atter her death, he married Idwa or Idothea, the daughter of Dardanus. jezlous of his former wife's children, accused them of attempts upon their father's life and crown, or, as others atlert, of attempts upon her virtue; on which they were condemned by Phineus to be deprived of their eyes. This cruelty was foon after punished by the gods; for Phincus fuddenly became blind, and the Harpies were fent by Jupiter to keep him in continual alarm, and to spoil the meats on his table. He was afterwards delivered from their monsters by his brothers-in-law Zetes and Calais, who purfued them as far as the Strophades. He ikewife recovered his fight by means. of the Argonauts, whom he had received with

**K**kk

great hospitality, and whom he instructed in the easiest and speediest way of arriving in Colchis. He was killed by Hercules.

PHIPPS, Constantine-John, Lord Mulgrave, and F. R. S. a late celebrated British navigator, born in 1746. He was great-grandfon of Conftantine Phipps, lord chancellor of Ireland in 1714, and fon of Constantine, the 1st lord Mulgrave, by Catharine daughter of the E. of Anglesea. He fucceeded his father in 1775. He entered young into the naval service, under his uncle, the E. of Briftol. He was elected M. P. for Lincoln, and became an able speaker. He was also eminent as a naval commander, and made a Voyage to the North Pole, from June 4, to Sept. 24, 1773, to determine how far navigation was practicable to the North Pole; an accurate account of which he published in 1774. He is also said to have written the mafterly Introduction to Capt. Cook's last Voyage. He married Anne-Elizabeth, daughter of Nath. Cholmondeley, Etq. of Honfham, in Yorkshire, June 20, 1787; a rich heiress, who died in 1788, leaving a daughter. He was created a British Peer, June 17, 1790; and died at Leige, October 10, 1792; leaving a large fortune, and the most complete library in England, for all works on Naval Science.

OEUS, an epithet of BACCHUS.

OGISTIC, adj. [from phlogiston.] Inflam-'; of or belonging to phlogiston, or inbility. In this sense it is used by Dr Culf inflammatory difeafes. See MEDICINE, Dr Brown, also in his first edition of his ta Medicina, used this word in a sense somemilar, and the opposite term Anti-phlogifdiseases of debility; but he afterwards d thefe terms to STHENIC and ASTHENIC proper to express diseases of strength taldels. See Brunonian System, § 4. OGISTICATED, adj. in chemistry, imled with the imaginary principle of Phlo-i; a word now nearly obsolete, the prinpon which it was founded being found

PHLOGISTON. n. / [phrysis, from physis] remical riquor extremely inflammable. 2. flummable part of any body.

Phlogiston (6 1. Def. 2.) was a term is used by chemists, to express a principle was supposed to enter the composition ons bodies, but which is now exploded, wed to have no existence. The bodies were thought to contain it, in the largest ly, are the inflammable substances; and the

property which these substances possess of being fusceptible of inflammation was thought to depend on this principle; and hence it was sometimes called the Principle of INFLAMMABILITY. Inflammation, according to this doctrine was the , separation of this principle, or phlogiston, from the other matter which composed the combustible body. As the emission of light and beat, always attended its separation, the chemists concluded that it was light and heat combined with other matter in a peculiar manner, or that it was some highly elastic and very subtile matter, on certain modifications of which heat and light depended. But its existence, as a chemical principle in the composition of bodies is now fully proved to be false. Sir Isaac Newton was the first who established chemistry on scientific ground. From his time till the middle of the 18th century, no real improvement was made. The progress this science has made since that period is owing to the important discovery of the existence of HEAT in a state of composition with other matter, Heat thus combined loses its activity, or becomes insentible, just as acids, or any other active substance lose their apparent qualities in composition. Heat, in this combined state, was called by its ingenious discoverer, Dr Black, latent heat, and it was found to be very abundant in the atmosphere, which owes its existence as an elastic fluid to the quantity of latent heat that it contains. After this discovery, Dr Crawford, considering that air was absorbed by a burning body, concluded that the heat which appears in the combustion of a combustible body, is the heat that had before existed in the air which was consumed by the burning body. M. LAVOISIER and others, profecuting this inquiry, found that the combuftible body, while it is burning, unites with the basis of the air, and that the heat which the air contained, and which was the cause of the air existing in the state of air, is expelled. This abforption of the basis of the air by the burning body, and the reduction of this basis to a folid form, accounts for the increase of weight which a body acquires by burning; or, in other words, gives a reason why the matter into which a combustible body is converted by combustion, is heavier than the body from which it was produced. The same absorption of air is observable, when a metal is converted into a calz, and the additional weight of the calx is found to be precisely equal to the weight of the air absorbed during the calcination. On these principles, therefore, we now explain the phenomena in a much more fatisfactory manner, than by the supposition of phlogifton, or a principle of inflammability. This theory is more fully elucidated under feveral other articles in this work. See CHEMISTRY, Index ; Flane, Heat, Inflammation, Oxygen, &c.

PHLOGONIÆ, a class of compound, inflammable, and metallic fossils, found in small masses of determinately angular figures; comprehending the pyricubia, pyroctogonia, and pyripolygonia.

PHLOGOSIS. See Medicine, Index.

PHLOMIS, the SAGE TREE, or Jerusalem Sage; a genus of the gymnospermia order, belong-K k k a ing ing to the didynamia class of plants: and in the natural method ranking in the 42d order, Verticillars. There are 14 species, all of which have perennial roots, and of many the stalks also are perennial. The latter rise from two to sive or six seer high; and are adorned with yellow, blue, or purple flowers in whorls. They are all ornamental plants; and deferve a piace in gardens, as they are sufficiently hardy to endure the ordinary winters in this climate: they require, however, a pretty warm situation. There are two species peculiarly adapted to the shrubbery, viz.

1. PHLOMIS ERUCTICOSA, a native of Spain and Sicily. Of this there are 3 varieties, 1. The broad-leaved Jerufalem Sage tree, is now very common in our gardens. Its beauty is great, and its culture very early. It grows to about 5 feet high, and spreads its branches without order all around. The older branches are covered with a dirty, greenish, dead, falling, ill-looking bark; and this is the worst property of this shruh; but the younger shoots are white and beautiful; they are four-cornered, woolly, and fost to the touch. The leaves are roundish, oblong, and moderately large; these grow opposite at the joints of the shrub on long foot-stalks. They are hoary to a degree of whiteness, and their foot-stalks are wooily, white, tough, and firing. The flowers are produced in June, July, and August, at the top joints of the young thoots, in large whorled bunches. They are labiated, each confifting of two lips; the upper end forked, and bending over the other. The colour is a most beautiful yellow, and being large, they exhibit their golden flowers at a great distance. 2. The narrow-leaved Jerusalem Sage tree, is of lower growth than the other, feldo a ming higher than a yard or 4 feet. This shrab is in every respect like the other; only the shoots have a more upright tendency. The leaves also are narrower, and more inclined to a lanceolate form: they are numerous in both forts, and hide the deformity of the bark on the older In short, these forts are qualified for shrubberies of all kinds, or to be fet in borders of flower-gardens, where they will flower and be exceeded by very few shrubs. : 3. The Cretan Sage tree, is still of lower growth than either of the former, feldom arifing to a yard in height. The leaves are of the fame white hoary nature; they are very broad, and stand on long foot-stanks. The flowers are of a delightful yellow colour, very large, and grow in large whorls, which give the plant great beauty.

2. PHLOMIS PURPUREA, Purple Phlomis, or Portugal Sage, is 4 feet high; the stalks are woody, and fend forth feveral angular branches, which are covered with a white bark. The leaves are spear shaped, oblong, woolly underneath, crenated, and grow on fhort footstalks. The flowers are produced in whorls from the joints of the branches. They are of a deep purple colour, and have parrow involucra. They appear in June and July, but are not fucceeded by ripe feeds in England: There is a variety of this species with iron-coloured flowers, and another with flowers of a bright purple. There are some other shrubby forts of phlomis, of great beauty; but these not only often lose their leaves, and even branches, from the first

frost, but are frequently wholly destroyed, if a happens to be fevere. They are low flmibs, rest beautiful, and look well among perennial flowers, where they will not only class as to fize with many of that fort, but, being rather tender, may with them have fuch extraordinary care as the own may think proper to allow them. The protest tion of the above forts is very eafy, and is according plished either by layers or cuttings. 1. If alis earth be thrown upon the branches any time the winter, they will flrike root and be good pl by the atumn following, fit for any place. In easy is the culture by that method: 2. The tings will also grow, if planted any time of Those planted in winter should be woody shoots of the former summer: The be set close in a shady border; and being in dry weather, will often grow. This shad be propagated by young slips also, in any the fummer months. These should be planted fhady border, like fage, and well watered. border is not naturally shady, the beds me hooped, and covered with matting in hot wa Watering must be constantly afforded them; with this care and management many of the grow.

PHLOX, the LYCHNIDEA, or Baftard La genus of the monogynia order, belonging pentandria class of plants; and, in the national thod, ranking under the 20th order Rotacea are 7 species, all natives of N. Amenca have perennial roots, from which arise her falks from nine inches to two feet in her dorned with tubulated flowers of a purper of they are propagated by offsets, and will be winters in this country. They require a rich foil, in which they thrive better and

taller than in any other.

PHLYCTENÆ, u. f. in medicine, final tions on the fkin.

PHOBETOR. [from cosin, to terrify] thology, one of the fons of Sonnus, prime minister. His office was to terrify or ring sleep, by appearing to them in the form wild beast or servent. Ovid. Met. xi. 640.

PHOCA, in zoology, a genus of quadrupthe order of feræ. There are fix sharp-po fore teeth in the upper jaw, the 2 outermost larger; and 4 blunt, parallel, distinct, equal teeth in the under jaw. There is but one tooth, and 5 or 6 three-pointed grinders; and hind legs are united so as to resemble a she tail; are stretched much backwards, and be together. Mr Kerr enumerates 19 species, a varieties.

fhort pointed external ears, and inhabits the land Isles. The colour is cinereous; the tipt with a dirty white; the nose is thout, as see with strong black briftles; the fore feet no claws; the hind paws have 4 long claws animal measures 4 feet.

white whiskers with curled points. The lar arched; black, very deciduous, and very the dispersed over a thick skin, which is almost in summer. The teeth of this species are those of the common seal; (N° 18.) the fore

re like the human hand, the middle toe being the outeft and the thumb thort. They are upwards if is feet long. The Greenlanders cut out of the kin of this species thongs and lines, a finger thick, or the feat filnery. Its flesh is as white as yeal, and reteemed the most desicate of any. They probee plenty of lard, but very little oil. The skins f the young are fometimes used to lie on. They whit the high sea about Greenland, are very inid, and commonly rest on the floating ice. Betemales breed about March, and bring forth the ingle young one on the ice, generally active islands. The old ones swim very slowly. the N. coast of Scotland is found a species 12 k long. A young one, 74 feet long, was from maturity as to have scarcely any teeth: the common feals have them complete before of attain the fize of fix feet, their utmost growth. of this species, larger than an ox, was found the Kamtichatcan leas from 56° to 64° lat. N. and by the natives Lach-tak. They weighed th and were eaten by Bering's crew; but their was loathfome. The cubs are entirely black. PHOCA CHILENSIS, the Chilefe Seal, has a in finite in the first part of the second of L inhabits the coasts of Chili and Juan modez.

PHOCA CRISTATA, the Klapmus, or Hooded Pennant, has a creft on the fore part of the the body is of a gray colour, having a thick fblack wool, interspersed with white hairs. Hurge animal, and has a strong folded skin fore-head, falling over its eyes and nose. Precies inhabits the S. coasts of Greenland, wilctland and Newfoundland.

Proca Fasciata, the Harnoffed Seal, or Sal of Pennant, is of a blackish colour, and with yellow stripes resembling barness the neck, along the fides, and haunches.

miabit the Kurile Isles.

i PHOCA GROENLANDICA, the Swartside, meben, the Attarjoak of Crautz, or Harp Pennant, has a smooth head, no external the body grey, with a black semilunar mark tide. Both fore and hind paws have disais; the head is black and pointed; the out and horizontal. The animal is 9 feet They inhabit Greenland, Newfoundland, in, the White Sea, the Frozen Ocean and Mehatka. The skin is good and the oil much

PHOCA GROENLANDICA NIGRA, the Bedis a blackith variety of the above.

PHOCA HISPIDA, or PHOCA FOETIDA, the is or rough feal, is diffinguilled by a fhort and fhort round head; a body almost eliptovered with lard almost to the hind feet. Secies seldom exceeds 4 feet in length-bairs are closely set together, soft, long, and that erect, intermixed with curled. They a dusky colour; mixed with white, which imes varies to white, with a dusky dorful. They never frequent the high seas, but keep fixed ice in the remove bays near the fratering and when old never forsake their baunts. Touple in June, and bring forth in January the ice. In that cold situation they have a hole

for fishing; near which they generally remain folitary, being rarely found in pairs. They often sleep on the surface of the water, and thus become an easy prey to the eagle. They feed on small sish, shrimps, &c. The skin, tendons, and lard, are used in the same way with those of other scals. The slesh is red and section, especially in males, which is nauscated even by the Greenlanders.

ii. PHOCA HISPIDA QUADRATA, or Newfound-land Seal is a larger variety of the above, called by the feal-hunters in Newfoundland, the fa are phipper. It weighs 500lb. Its coat is like that of a water dog; to that it appears by the length of its hair to be allied to this species; but the vast difference in fize admits not of that decision.

8. PHOCA JUBATA, the Maned Seal, of Schrebef, or Leonine Seal of Pennant, inhabits the coafts of the N. Pacific Ocean, W. coaft of America, Falklands Islands, Patagonia, Kamtschatka, and the Kurile Isles. The colour is reddish; the males are sometimes 25 feet long, weigh 15 or 1600lb and have a long flowing mane on their necks. Their voice is like that o a bull; the head is large, nose short and turned up; with large, strong whiskers; the eyes are large, the fore feet black, resembling fins, without toes; the hind feet very broad, with small nails, and very short tails. They live in families, each male having many semales, about which they often quarrel and fight.

9. PHOGA LANIGER, OF PHOCA LEPORINA, the keporine leal, of Pennant, has hair of a dirty white colour, tinged with yellow, but never spotted. The hairs are erect, interwoven, and foft like those of a hare, especially in those of the young. The head is long; the upper lip fweiling and thick; the whiskers very strong and very thick, ranged in 15 rows, covering the whole front of the lip, fo that it appears bearded; the eyes are blue, and the pupil black; the teeth are strong; the forefeet thort; the membranes of the hind feet even and not waved; the tail is short and thick, it being 4 inches two lines in length; the cubs are of a milk white colour. The length of the species is about fix feet fix inches, and the circumference where greatest 5 feet 2. This species inhabit the White Sea in the summer time, and ascend and descend the rivers with the tide in quest of prey. They are likewise found on the coasts of Iceland, and within the polar circle from Spitzbergen to Tchutki Nofs, and thence S. about Kimifenatka. 10. PHOCA LEONINA, the fea lion of Anton, the fea wolf of Pernetty, or the bottle nofe of Pennant, is found near the S. pole. One variety of this species is described at some length by the publimer of Anfon's voyage. Of thefe we have the following account from Pernetty's Historical Journal. "The hair that covers the back part of the head, neck, and shoulders, is at least as long as the hair of a goat. It gives this amphibious animal an air of refemblance to the common lion of the forest, excepting the difference of fize. These fea-hons are 25 feet in length, and from 19 to 20 in oircumference. Those of the small kind have a refembling a mastisff's, with close cropt cars. The teeth of those which have manes, are much iai , cr and more folid than those of the reft. In these, all the teeth in the jaw-bone are hollow. They

have

have only four large ones, two in the lower and two in the upper jaw. The rest are not even so large as those of a horse. They inhabit the coasts of Chid, New Zealand, Juan Fernandez, Falkland Isles, and New Georgia. These sea lions that have manes are not more mischievous or formidable than the others. They are equally unwieldy and heavy in their motions; and are rather disposed to avoid than to fall upon those who attack them. Both kinds live upon fifth and water fowls, which they catch by furprife. They bring forth and fuckle their young ones among the corn flags, where they retire at night, and continue to give them fuck till they are large enough to go to ica. In the evening they affemble in herds upon the thore, and call their dams in cries to much like lambs, calves and goats, that, unless apprifed of it, one would eafily be deceived. The tongues of these animals are very good eating. The oil which is extracted from their greafe is of great use. It is preferred to that of the whale; it is always clear, and leaves no fediment. The fkins of the fea-ions are chiefly used in making portmanteaus, and in covering trunks. When they are tanned they have a grain almost like Morocco. They are not fo fine, but are iefs liable to tear, and keep fresh a longer time. They make good shoes and hoots, which, when well feafoned, are waterproof.

11. PHOCA MACULATA, the spotted seal of Pennant, inhabits the Kurile Isles, and the seas of Kamtschatka. The body is spotted with brown.

12. PHOCA MONACHUS, the booded feal, or Mediterranean feal of Pennant, inhabits chiefly the coast of Dalmatia. It has no external ears; only a cutting teeth in each jaw; the fore paws are not divided; the hinder paws have no nails. The film of it folds like a Monk's bood, whence the names. The body is 8 feet 7 inches long, and 5 feet round.

13. PHOCA MUTICA, the long-neeked feal of Fennant; has a flender body, and no claws on

the fore feet, which refemble fins.

14. PHOCA NIGRA, the black feal of Pennant, has a peculiar, but undefcribed, conformation of the hind legs. They inhabit the coast of the Kurile Isles.

15. PHOCA PUNCTATA, the fpeckled feal of Pennant, is elegantly speckled all over the body, head, and limbs. They inhabit the feas of Kamt-

schatka and the Kurile Isles.

16. PHOCA PUSILLA, the little feal of Schreber, Pennant, and Buffon; the foun of Aristotle; the vitulus marinus of Piny, and fea calf of Dampier; has a smooth head, and the rudiments of external ears; the body is brown, and measures 2 feet 2 inches.

17. PHOCA TESTUDO, the tortoife-headed feal of Pennant, has a head like that of a tortoife, a flender neck, and feet like those of the common feal. It is found on the coasts of many places of Eu-

rope.

18, i. PHOCA VITULINA, the fea calf, or common seal, inhabits the European ocean. It has a fmooth head without external ears; and the common length is from 5 to 6 fect. The fore legs are deeply immerfed in the fkin of the body; the hind legs are placed in fach a manner as to

point directly backwards: every foot his ; tori connected by a strong and broad web, covered in both fides with fhort hair. The toes are furnilla ed with strong claws, well adapted for climbing the rocks: the claws on the hind feet are Bender and ftraight; but at the ends a little incurvated The head and note are broad and flat, like the of the otter; the neck short and thick; the eye large and black; in lieu of external ears, it i two fmall orifices: the noftrils are obiong: each fide the nofe are feveral long ftiff hairs: a above each eye are a few of the same kind. T form of the tongue is very fingular, being forker or flit at the end. The cutting teeth are 6 in the upper jaw, and only 4 in the lower. It has to canine teeth above and below, and on each M of the jaw five grinders; in all 34. The who body is covered with short hair, very closely together: the colour of that on the body is got rally dusky, spotted irregularly with white; the belly white: but feals vary greatly in their lours: some have been found entirely white. T feal is common on most of the rocky shores Great Britain and Ireland, especially on the coafts: in Wales, it frequents the coafts of Car narvonshire and Anglesey. They inhabit all European feas, even to the extreme nord; found far within the arctic circle, in the of Europe and Afia, and even those of Kanton ka. They prey entirely on fish, and never the sea fowls, for numbers of each are often floating on the waves, as if in company, eat their prey beneath the water; and when vouring any very oily fish, the place is known the smoothness of the waves immediately a They are excellent fwimmers, ready divers, very bold when in the fea, fwimming care about boats: their dens are in caverns Res fea, but out of the reach of the tide: in features they will come out of the water, to bak an fun on large rocks; and that is the opposite our countrymen take of shooting them: 1 chance to escape, they hasten towards their per element, flinging stones and dirt behind? as they foramble along; and expressing their by piteous moans: but if they be overtaken, will make a vigorous defence with their feet teeth till they are killed. They are taken for fake of their fkins, and for the oil their fat yie the former fell for 4s. or 4s. 6d. a-piece; who when drefled, are very ufeful in covering true making waiftcoats, pouches, &c. The fight these animals, and even of porposes, some found a place at the tables of the great; 25.2 pears from the bill of fare of that vaft feat ! Abp. Nevill gave in the reign of Edward They couple about April, on finall islands to the fliore; and bring forth in those vast care that are numerous on our coafts: they commo bring two at a time, which in their infant are covered with a whitish down or woolly In Oct. and Nov. the seal-hunten Cance. Caithness enter the mouth of the caverns ab midnight, and rowing up as far as they can, the land; each of them being provided with a bi geon, and properly flationed, they light the torches, and make a great noise, which bri down the fais from the farther end in a confe-

ody with fearful shricks and cries: at first the en are obliged to give way for fear of being orrbom; but when the first crowd is past, they ill as many as ftraggle behind, chiefly the young, , firking them on the nose: where a very slight low dispatches them. Seals are seen in the greatt plenty on the shores of Cornwall in May, me, and July. Their heads in swimming are ways above water. They sleep on rocks furmoded by the sea, or on the less accessible parts for cliffs left dry by the ebb of the tide; and Midurbed by any thing, take care to tumble othe rocks into the fea. They are extremely habil, and never sleep long without moving; mile their heads, and lie down again, and m raising their heads and reclining them alterbely in about a minute. They use this precauma being unprovided with external ears; and sequently not hearing very quick, nor from great distance. These animals are so very It to the inhabitants of Greenland and other ic people, that they may be called their flocks. tals (fays Mr Crantz, who long refided in these ons, are more needful to them than sheep are 🛰 though they furnith us with food and raiit; or than the cocoa-tree is to the Indians. kali flesh, with that of the rein-deer, supplies utives with their most substantial food. Their railhes them with oil for lamp-light, chamal kitchen fire. They also mollify their dry mostly fish, in the train; and they barter kinds of necessaries with the factor. They better with the fibres of the feals finews ith thread or filk. Of the fkins of the enthey make their windows, curtains for their flirts, and part of the bladders they use at harpoons; and they make train bottles of Formerly, for want of iron, they made pager of instruments and working tools of hones. Neither is the blood wasted, but with other ingredients, and eaten as foup. thin of the seal they stand in the greatest as they cover over with it their boats in they seek their provisions. They also cut aps out of them, make the bladders for irpons, and cover their tents with them; which they could not sublist in summer. a their chief bufiness and labour from their bood. The Greenlanders have 4 ways of ing feals: either fingly, with the bladder; company, by the clapper-hunt; or in winter eice; or by shooting them with a gun. The ipal and most common way is the taking with the biadder. When the Greenlander u equipped, and fpies a feal, he tries to furand thrike it with his harpoon. The mothe scal is pierced, the Greenlander must the bladder, tied to the end of the firing, the water, on the same side as the seal runs fires; for that he does instantly like a dart. kal often drags the bladder under water, but aries itself with it, that it must come up a-15 minutes to breathe. The Greenlander to the spot, smites the seal with a long hand kilis it, but stops the wound directly referre the blood; and lastly, he blows it up, a bladder, to make it swim after him, fastento the left fide of his boat. In this exercise the

Greenlander is exposed to the most imminent dans ger of his life; which is probably the reason that that they call this bunt or fishery kamavock, i. c. the extinction, viz. of life. For if the line should entangle itself, or catch hold of the kajak, or boat, or twine round the oar, hand, or neck, or if the feal should turn suddenly to the other side of the boat, the kajak must be overturned by the string, and drawn down under water. Nay sometimes the feal will bite him in the face or hand, or bite a hole in his kajak, fo that he must fink. Several in company must pursue the cautious kassigiak by the clapper-hunt. In the same manner they also furround and kill the attarfoak in great numbers at certain seasons of the year, for in autumn they retire into the creeks or inlets in stormy weather, as in the Nepifet found in Ball's river, between the main land and the island Kangek, which is full 2 leagues long, but very narrow. There the Greenlanders cut off their retreat, and frighten them under water by shouting, clapping, and throwing ftones; but as they must come up again to draw breath, they kill them with darts. This is a very profitable diversion for the Greenlanders, for often one man will have 8 or 10 feals for his share. The 3d method of killing feals upon the ice is mostly practifed in Disko, where the bays are frozen over in the winter. The feals make sometimes holes in the ice, where they breathe; near fuch a hole a Greenlander places himself, and when the seal puts its nose to the hole, he pierces it inftantly with his harpoon; then breaks the hole larger, draws it out, and kills it. When the current wears a great hole in the ice in fpring, the Greenlanders plant themselves all round it, till the feals come in droves to the brim to breathe, when they kill them with their harpoons. Many also are killed on the ice while sleeping. Mr Pennant in his Arctic Zoology, vol. 1. after describing the manner in which the Kamtschatkans prepare their scals flesh and fat for winter provisions, adds. " Belides the ules which are made of the flesh and fat of feals, the skins of the largest are cut into foles for shoes. The women make their summer boots of the undreffed skins, and wear them with the hair outmost. In a country which abounds fo greatly in furs, very little more use is made of the skins of seals in the article of dress than what has been mentioned. But the Koriaks, the Oloutores, and Tchutschi, form with the skins canoes and veffels of different fixes, fome large enough to carry 30 people. Seais swarm on all the coafts of Kamtichatka, and will go up the rivers 80 verits in pursuit of fish. The Tungufi give the milk of these animals to their children inflead of physic. The navigators observed abundance of feals about Bering's Illand, but that they decreased in numbers as they advanced towards the firaits: for where the walrufes abounded, the feals grew scarce. Seals are now become a great article of commerce. The oil from the vast whales is no longer equal to the demand for supplying the magnificent profusion of lamps in and round the capital. The chase of these animals is redoubled for that purpofe; and the skins, properly tanned. are in confiderable use in the manufactory of boots and thoes."

ii. Phoca Vitulina Botnica is a variety differing

differing in having a broader nofe, longer nails, and a darker colour. They inhal t the Gulf of Bothnia.

iii. PHOCA VIT. CASPICA, the Caspian Seal, is of a mixed colour, and inhabits the Caspian Sea. iv. Phoca Vit. Sibirica, the Siberian Seal,

is of a filver white colour, and inhabits the lakes

Baikai and Orom in Siberia.

19 PHOCA URSINA, the fea bear, or urfine feal, has external ears. The male is greatly superior in fize to the female. The hodies of each are of a conic form, very thick before, and taper to the tail. The length of a large one is eight feet; the greatest circumference, tive feet; n ar the tail, 20 inches; and the weight is about 800 lb. note projects like that of a pug-dog, but the head rifes fuddenly; the teeth tock into one another when the mouth is that: the tongue is rarge; the eyes are large and prominent, and may be cover ed at measure by a fleshy membrane. The length of the forcoegs is 24 inches; they are like those of other quadrupes s, not immerfed in the body like those of sears; the feet are formed with toes like thefe of other animals, but are covered with a naked ikin, to that externally they feem to be a fhapeless mais; the hind legs are fixed to the body quite behind, like those of com non feats; but are capable of being brought forward, fo that the animal makes use of them to scratch its head. These an mals are found in the northern feas. They are found in amazing quantities between Kamtichatka and America; but are feareely known to land on the Analic fhore: nor are they even taken except in the three Kurilian islands, and from thence in the Bobr wore More, or Beaver Sca, as far a the Kronski headland, off the river Kimifehatka, which comprehend only from 50° to 56° Lit. N. It is observable that they never double the fouthern cape of the pennifula, or are found on the western file in the Penf hinska fea: but their great refort has been observed to be to Bering's iffends. They are regularly migratory. They first appear off the three Knrile islands and Kimtscharka in the earliest spring. There is not one temale which does not come pregnant. Such as are then taken are opened, They are the young taken out and ikinged. found in Berng's ift and only on the western shore, being the part opposite to Alia, where they first appear on their migration from the fouth. Urfine feais are also found in the S. hemisphere, from under the are, in the ifle of Gallipagos, to New Georgia, in Lat. 54° 15' S. and Lon. 37° 15' W. In the intermediate parts, they are met with in New Zealand, in the ifle of Juan Fernandez, and Maila Fuera, and along the coasts of Chili to Terra del Fuego an I Staten Land. In Juan Fernaridez, Staten Land, and New Georgia, they fwarm, as they do at the N. extremity of this valt ocean. Those of the S. hemitohere also migrate. - Alexander Silkirk, who palled a lonery years on the ifle of Just Fernandez, remarked that they come ailioie in June, and fray till S. ptember. Captain Cook found them again in their place of remigrafrom in equal abundance, on Staten Land and New Georgia in Dec. and Jan.; and Don Pernetty found them on the Pilkiand illands in Febr. According to the Greenlanders, this species in-

habits the S. parts of their country. They call? Auvek.ejak, and fay it is very fierce, and team to pieces whatfoever it meets; that it lives on land as well as in water, and is greatly dreaded by the hunters. During the three months of fumre they lead a most indolent life: they arrive at the islands vastly fat; but during that time they refeared ever in motion, confine themselves for whole weeks to one fpot, fleep a great part of the time, eat nothing, and, except the emplo ment the females have in fuckling their you are totally inactive. They live in families: de maie has from 8 to 50 females, whom he gund with the jealouly of an eaftern monare ; and the they lie by thousands on the shores, each family keeps itself separate from the rest, and sometime with the young and winarried ones, amount 120. The males are very trafcible and often for about the females. The battles are very violation the wounds they receive are very deep, and a femble the cuts of a fabre. At the end of a fall they leap into the fea, to wath away the bis The males are very fond of their young, but to tyrunnical towards the females. They frim fwiftly, at the rate of feven miles an hour. wounded, they wal feize on the boat, and on it along with vast impetuosity, and on fink it. They can continue a long times! water. When they want to comb the they fasten with their fore paws, and drawle ferves up. They are very tenacious of life " will live for a fortnight after receiving fuch wo as would immediately deftroy any other and The Kamtichatkans take them by harpooning. they never land on their shore. To the bar is taftened a long line, by which they does animal to the boat after it is spent with talp but in the chase, the hunters are afraid of near an approach, least the animal should on, and fink their vessel. The slesh of the males is rank and nauleous; that of the feet faid to refemble lamb; that of the your roafted, a facking pig. The skins of the por cut out of the bellies of the dams, are effect for clothing, and are fold for about 3 s. 4 d. a those of the old for only 4 s. Their remirror is in Sept. when they depart excessively lean, take their young with them. On their ret they again frequent the same places which the did in the fpring. Their winter retreats are known; they are supposed to be the islands tween Kuriii and Japan, called Compagni L Staten Land Jefo Gafima, which were discover by Martin Uriel in 1642; as by his account, natives employed themselves in the capture They arrive along the shores of the Ko iflinds, and part of those of Kamtschatka, the S. They inhabit only the W. fide of Bert ifle which faces Kaintschatka; and when they turn in September. their route is due S. pon towards the discoveries of Uriel.

PHOCEA the last town of Ionia, and of & lis, because lituated on the right or N. fide of Hermu, which he makes the boundary of a to the S. (Mela, Piin. Ptol.) It flood far in the lan', on a bay or arm of the fea; had two no fafe harbours, the one called Lampter, the man Nauflathmos. (Livy.) It was a colony of let

in, fittated in the territory of Æolis. (Herod.) Milliain Gaul was a colony from it. It was one if the 12 cities which affembled in the Panioniin, or general council of Ionia. Some writers tell nother while the foundations of this city were layig, there appeared near the shore a great shoul of is calves; whence it was called Phocaea, from poun fusalf. Polemy, who makes the Hermus the findary between Æolix and Ionia, places Pho-🖢 m Æolis; but all other geographers reckon the cities of Ionia. It flood on the fea-Hermus; and was anciently one of the realthy and powerful cities of all Alia; but Pra poor vill ge, though the fee or a billiop. ng the Greeks that undertook long voyages; they performed in galleys of 50 oars. As applied the offices to trade and navigation, became acquainted pretty, early with the hand illands of Europe, where they are faid we founded feveral cities, viz. Velia in Ihow Marseilles) in Gaul. Neither were macquainted with Spain; for Herodotus is, that, in the time of Cyrus the Great, Carliz, were treated with extraordinary by Argathonius king of that country; caring that they were under apprehention growing power of Cyrus, invited them to his kingdom. The Phoceans could not liked upon to forfake their country; but alarge fum of money, which that prince My gave them, to defray the expence of a ftrong wan round their city. This wall on their return; but it was unable to power of Cyrus, whose general Hirparefling the city with a numerous army, duced it to the utmost extremities. The offered to capitulate, but the conoffered by Harpagus seeming severe, they he would allow them three days to deand, in the mean time, withdraw his Harpigus complied with their request, 1600224ns put their wives, children, and hable effects on board feveral veffels, and them to the island of Chios. Their deto purchase the Enessian islands, which to the Chians, and fettle there. But ins, jealous of lofing their trade, refuted: put to sca again, and having taken Phoarprife, put all the Perfians in it to the They next went to Corfica; but great them returned very foon. They then Imperior either to the Perfians, or tytheir own. Among the latter we find made of Laodamus, who attended Didaspis in his expedition against the Seyand of Dionylius, who, joining Ariftagoof Miletus, and chief author of the 1belion, retired, after the defeat of his counto Poœnicia, where he made an immenfe civing on all the flips he met with trad-nat country. From Phænicia he failed to where he committed great depredations on thaginians and Tufcans; but is faid never te molested the Greeks. In the Roman DL. XVII. PART II.

times the city of Proces. a with Antiochus the Great; whereupon it was belieged, taken, and plotidered, by the Roman general; but allowed to be governed by its own laws. In the war which Aristonicus brother to Attalus, king ef Pergamus, raifed against the Romans, they assis ed the former to the utmost of their power; which fo highly displeased the senate, that they commanded the town to be demolished, and the whole race of the Phoeman's to be exterminated. But the Maffilienfes interpoled, and, with difficulty, affinged the anger of the fenate. Pompey declared Phocæa a free city, and reflored the inhabit ints to all their privileges; whence, under the first emperors, it was reckoned one of the most flourithing cities of all Asia Minor. It is now called Forma.

PHOCÆANS, ¿ PHOCÆENSES, the people of PHOCÆI, or \$ Phocæa.

PHOCAICUS, a name given to MARSEILLES. Lucan.

PHOCAS, a Roman centurion, who was made emperor by the ariny, and was crowned it Constantinople about A. D. 603. The emperor MAURI-TIUS, thus deferted, fled to Chalcelon with his five children, whom Phoeas caused to be infutmanly murdered before his eyes, and then he murdered Mauritius himfelf, his brother, and feveral others who were attached to him. Phocas then fent his own image and that of his wife Leontia to Rome. Gregory the Great, then bishoo of Rome, cauted the images to be lodged in the oratory of the martyr Castarius, and wrote congratulatory letters to the ufurper. As foon as the murder of Mauritius was known, Naries, who commanded the troops on the frontiers of Perlin, revolted. Phocas, however, managed matters to as to gun him over to his interest, and then treacheroully burnt him thre Phocas, by his cruelty, & foon became generally hated, for he spared nerther fex nor age, and amongst others he murdered Constanting the widow of Mauritius, and hee daughters. In 609 a conspiracy was formed against him, but was discovered, and the person; concerned in it put to death. In 610, however, he was overtaken by the fate he had fo long deferved. Heracijus, the fon of Heracijus governos of Africa, being acknowledged as emperor by the people of Africa, filled thence with a formidable flect, and a powerful army for Constantinople. where he defeated the tyrant's fleet. Phocas took refuge in the palice; but one Photinus, whose wife he had debauched, purfuing him, forced the gates, dragged the cowardly emperor from the throne, and having stripped him of the imporial robes, and clothed him with a black veft, carried him in chains to Heraclius, who commanded his hands and feet, then his arms, and at last his head, to be cut off: and his body was delivered to the fo diers, who burnt it in the forum. Such was the end of this cruel tyrant, after he had reigned 7 years and some months. He was greatly addicted to wine and women, inexorable, a ftrainger to compallion, and in his principles a heretic.

PHOCENSES, PHOCENSIANS, the inhabi-phocians, tanta of Phoces.

PHOCICU .I.

PHOCICUM BELLUM, the Phocian or Sacred War. carried on by the Thebans and Philip II. against the Phocians, for plundering the temple of Apoilo at Delphi. See Macedon, § 8, and Pho-

PHOCILIDES, a Greek poet and philosopher of Miletus, who flourished about A. A. C. 540. The poetical piece now extant, attributed to him, is not of his composition, but of another poet who lived in the reign of Adrian.

Pilo CION, a distinguished Athenian general and orator in the time of Philip II. of Macedon. He was too modest to folicit command, though, either as a foldier, orator, statesman, or general, he was by far the most eminent Athenian of his time. As he was a most difinterested patriot, he could entertain no affection for Philip: but as he knew the disposition of his countrymen, and how unlikely they were to support measures necessary to humble the Macedonian power, he chose rather to cultivate the effect which Philip showed for the state of Athens, as a mean of preserving her, when she should be reduced to that fituation which he conceived they wanted virtue to prevent. (See Macedon, § 8.) He was, however, appointed to command the semy which was fent to affift the Byzantines against Philip, whom he obliged to return to his own dominions. This truly great man, whom (though extremely poor) no fum offered by Philip or klexander could bribe to betray his country, and who on all occafions gave them found advice, was at length accused by his ungrateful countrymen. This hapbened A. A. C. 318. He was fent to Athens by Polyperehon, head of a faction in Macedonia, with his friends, chained in carts, with this meffige, " That though he was convinced they were traitors, yet he left them to be judged by the A-thenians, as a free people." They were all in a furniary manner condemned to death, viz. Phocion, Nicocles, Ahendippus, Agamon, and Pythocles; these were present: Demetrius Phaiereus, Callimedon, Charicles, and others, were condemned in their absence. The spleen of his enemies was not extinguished with his life; they decreed that his corple should be banished the Athenian territories. When the Athenians began to cool, and remember the many fervices they had received from Phocion, they decreed him a fiatue of brass; ordered his bones to be brought back at the public expence; and decreed that his accusers should be put to death.

PHOCIS, a country of Greece, between Bootia on the E. and Locris on the W. extending from the Sinus Corinthiacus on the S. to the sea of Euboes on the N. and, according to Dionysius, as far as Thermopyla; but reduced afterwards to narrower bounds. (Demoft. Strab. Pauf.) Its greatest length was from N. to S. between 38° 45' and 39° 20', about 35 miles; but not extending 30 miles, from E. to W. i. e. from 23° 10' to 23° 40' at the wideft, but about 23 miles towards the Corinthian bay, and much narrower fill towards the N. It was named from Phocus the fon of Ornytion, a native of Corinth; but was foon after invaded by the Æginetæ, under Phocus, the fon of Æacus king of Ægina. In Phocis there were many ce-

rebrated mountains, particularly Cytheros, Ha-LICON, and PARNASSUS. (See thek two li Cythæron was confectated to the Muks as i as these, and was equally celebrated by the po The chief river, was the Cephisus, running h the foot of Parnaffus northward, and falling the Pindus, near the boundary of that kingin had feveral confiderable cities; such as C Criffa, and ANTECYRA, which, according to lemy, were on the fea coafts; and Pyrnia PHIA, Daulis, Elatia, Ergofthenia, and which were inland towns. Elatia was the and richest after Delphi. Daulis was we for the stature and prowefs of its inhabitan for the tragical events said to have happy it. (See Philomela, No II.) Deucay king of that part of Phocis which lies a nassus, at the time that Cecrops I. so Attica; but the Phocians afterwards for felves into a commonwealth, governed b affemblies, chofen from among themse changed frequently. Of the history of the cians little is known till the time of the of which the following was the on Phocians aving prefumed to plough the ries of the city of Cyrra, confecrated to phic god, were fummoned by the other states before the court of the Amphily a confiderable fine was imposed upon their facritege. They refused to pay it next affembly their dominions were confiscated to the use of the temple. perated the Phocians Rill more; who stigation of one PHILOMEEUS, seized temple, plandered it of its treasure, and facred depositum for a confiderable in gave rife to the Phocian or Haly war, thens, Sparta, and some others of the R fian states declared for the Phocianes Thebans, Theffalians, Locrians, and oth them. The various particulars of this lafted to years; and wherein Philip IL took an active part; with the defeata PHAYLLUS and Onomarchus, the Phot rais, are related under MACEBON, § & being ended, the grand council affect imposed an annual fine of 60 talents Phocians, to be paid to the temple, and ed till they had fully repaired the dama fustained, and, tili this reparation should they were excluded from dwelling towns, and from having any vote in the fembry. They did not, however, costs under this beavy fentence: their known made their affistance so necessary to the they were glad to remit it; after which they continued to behave with their rage and refolution, and foon obliterated mer guilt.

PHOCUS, the name of three ancient r. the founder, and, 2. the first invades cis; which last was the fon of Eacus the, one of the Nereids, and brother of and Telamon; who killed him: 3. The celebrated Phocion, who avenged be death, but never did any other memoral

PHOCYLIDES. See Proculing

PHOEBE, in the mythology, r. a name of ima: (See Diana.) 2. A daughter of Leucippus, other of Tyndarus, K. of Sparta, by Philodice, e daughter of Inachus. She and her fifter Hiis were betrothed to their coufins Lynceus and as, but were carried off and married by their her coufins, CASTOR and POLLUX.

PHOEBEUM, a town of Laconia, near Sparta. PHŒBIDAS, a Spartan general. Sent to assist the melonians against the Thricians. He seized stadel of Thebes, for which act of perfidy, praise, initead of rewarding, difgraced and ad him, though they full retained the ci-(C. Nepos.) He died A. A. C. 377.

MEBUS, one of the names given by ancient Mologifts to the Sun, So., or Apollo. See A-

HOEMOS, a lake of Arcadia. Lempr. PHOENICE, an afficient town of Epirus.

XXIX. C. 12. PHOENICE, or the ancient name of a BENICIA, country lving between 14th and 36th degrees of Lat. N.: hounded mis on the N. and E.; by Judæa on the S.; the Mediterranean on the W. Some dethame from one Phoenix; others from a palm or date, as these trees abounded in pentry. Some suppose that Phanice is oriya translation of the Hebrew word Edom, the Edomites who fled thither in the days nd. By the contraction of Canaan it was ed Chna, and anciently RHABBOTHIN and The Jews commonly named it CANAAN; fome part of it they knew by the name of mossice. Bochart tells us, that the most ke etymology is Phene Anak, i. e. " the deto this finall country; though Phoenice was hes extended to all the maritime countries na, Judza, and Canaan to the Philistines, to the Amalekites. But these two and the fest, were most generally swalup by those of PALESTINE and SYRIA. is some disagreement among authors with to the northern limits of this country. makes the river Eleutherus the boundary piece on the N. but Pliny, Mela, and Steher. Strabo observes, that some will have her Eleutherus to be the boundary of Seon the fide of Phoenice and Coelofyria. On of Phoenice, and S. of the Eleutherus, the following cities: SIMYRA, Orthofia, ous, Botrys, Bybius, Paizhyblus, Berytus, , SAREPTA, TYRUS, PALÆTYRUS. Phoemended, according to Prolemy, even bemount Carmel; for that geographer places Enice not only Ecdippa and Ptolemais, but mum and Dæra, which stand S. of that These, however, properly speaking, out the bounds of the midland Phoenice. by reckons in it the following towns: Arhebyblus, (Old Byblus,) Gabala, and Cæ-Pane. This province was confiderably exin the times of Christianity; when, being dred as a province of Syria, it included both are and Palmyra. The foil is good, and

productive of many necessaries for food and clothing. The air is wholesome, and the climate agreeable. It is pientifully watered by imail rivers; which, running down from mount Libanus, fometimes fwell to an immoderate degree, either increased by the melting of the snows on that mountain, or by h avy rains. Upon these occafions they overflow, to the great danger and hinderance of the traveller and damage of the country. Among these rivers is that of ADONIS.

(1.) PHOENICIAN, adj., Of or belonging to Phænicia.

(2.) PHOENICIAN LANGUAGE. See PHILOLO-GY, Sca. IV.

PHOENICIANS, the inhabitants of Phoeni-CIA. It is univerfally allowed that the Phoenicians were Canaanites by descent. Their blood must have been mixed, however, with that of soreigners in process of time, as happens in all trading places. The Phoenicians were governed by kings; and their territory, small as it was, included several kingdoms; namely, those of Sidon, Tyre, Aradus, Berytus, and Bybins. In this particular they adhered to the primitive sovernment of their forefathers; who, like the other Canaanites, were under many petty princes, to whom they allowed the fovereign dignity, referving to themselves their natural rights and liberties. Of their civil laws we have no fystem. With regard to religion, the Phænicians were the most gross and abominable idolaters. Baal-berith, Balzebub, Baaifamen, &c. mentioned in scripture, were some of the Phoenician gods; as were also Moloch, Ashtaroth, and Thammuz. Among the Phoenicians, the chief deity was named Baal, or Baal-samen; whom the Hebrews called Baul shemim, or the God of heaven. (See BAAL.) Diodorus Siculus says their chief deity was that of Carthage, Chronus, or SATURN. The facrifices offered up to him were children of the best families. Our author also tells us, that the Carthaginians had a brazen flatue or colossus of this god, the hands of which were extended in act to receive, and bent downwards in fuch a manner, that the child laid thereon immediately fell down into a hollow where there was a fiery furnace. He adds also, that this inhuman practice seemed to confirm a tradition, handed down to the Greeks from very early antiquity, viz. that Saturn de-voured his own children. The goddess Coelestis, or URANIA, was held in the highest veneration by the Carthaginians. She is thought to have been the same with the queen of heaven mentioned in Jeremiah, the Juno Olympia of the Greeks. lides these there were several other deities of later date, who were worshipped among the Phœnicians, particularly those of Tyre, and consequently among the Carthaginians also. These were Jupiter, Apoilo, Mars, and Bacchus. Jupiter was workinged under the name of Belus or Baal. To him they addressed their oaths. The same name was also given to the other two, whence they were frequently mistaken for one another. Apoilo or the fun went either by this name fimply, or by others of which Baal made a part. ASTARTE, or Ashtaroth, was also a chief goldess of the Phoenicians. See Ashtaroth, and Polytheism. Herodotus supposes the Phoenicians to Lliz

have been circumcifed; but Josephus afferts, that none of the nations included under the vague name of Pilettine and Syria used that rite, the Jews excepted. They abit uned, however, from the fleth of fwine. Much is faid of their arts, faiences, and manufactures; but in general terms only. The Sidonians, who were a branch of the Phoenicians, were of a most happy gamus. They were early addicted to philosophical exercifes; infomuch that Moschus, a Sidonian, taught the dostrine of atoms before the Trojan war: and Abomenus of Tyre puzzled Solomon by his questions. Phænice continued to be one of the feats of learning, and both Tyre and Sidon produced their philosophers of later ages; namely, Boethus and Diodatus of Sidon, Antipater and Apollonius of Tyre, who gave an account of the writings and disciples of Zeno. As to their manufactures, the glass of Sidon, the purple of Tyre, and the exceeding fine linen they wove, were the product of their own country, and their own invention; and for their extracrdinary skill in working metals, in hewing timber and stone; in a word, for their perfect knowledge of what was folid, great, and ornamental in architecture—we aged only mention the large share they had in eneeting and decorrying the temple at Jerusalem under their king Hiram. Their same for taile, defign, and ingenious invention, was fuch, that whatever was elegant, great, or pleafing, in apparel, veffels, or toys, was diftinguished by the epithet of Sidonian. The Phoenicians were likewife celebrated as merchants, navigators, and plunters of colonies in foreign parts. As merchants, they may be faid to have engroffed all the commerce of the western world: as navigators, they were the holdest, the most experienced, and greatest discoverers, of the ancient times: they I id for many ages no rivais. In planting colonies they exerted themselves so much, that, considering their babitation was little more than the flip of ground between mount Libanus and the fea, it is furprising how they could furnish such supposes of people, and not wholy depopulate their own country. It is generally supposed, that the P' enicians were induced to deal in foreign commodities by their neighbourhood with the Syriins; and that, from their example, they turned their thoughts to trade and navigation, and by an u common application from eclipfed their mafters in that art. That some of the Edomites fled into this country in the Cays of David, and that they were a trading people, is evident. The whole thoughts of the Phænicians were employed on schemes to advance their commerce. They afrected no empire but that of the fea; and feemed to zim at nothing but the peaceable enjoyment of ti or trade. This they extended to all the known 12 ets they could reach; to the British isles, comto only understood by the Cashierides; to Spain, a, I other places in the ocean, both within and without the Straits of Gibraltar; and, in general, to all the ports of the Mediterranean, the Black S.a. and the Like Mxotis. In all thefe parta 1. , y had fettiements and concipondents, from y ligh they drew what was dieful to themselves, comight be so to others; and thus they exercised the three great branches of trade, importation,

exportation, and transportation. Such was their trade by feat; and for that which they carried on by land in Syria, Vicios otamia, Affiria, Babylia nia, Perlia, Arabia, and India, it was of no les extent, and may give us an idea of what that people once was, how rich and how defending their merchants are montioned in Scripture as 6 qual to princes. Their country was, at that have the great warehouse, where every thing that might either administer to the necessities or assury mankind was to be found; which they dutaba ed as they judged would be belt for their on interest. As to their navigation, then ange to barkations were of two torts; they divided the into round flips or sauli; and long thips, gale or tricenes. When they drew up in line di tle, the gauli were dispoted at a final dis from each other in the wings, or in the man the rear: their triremes were contracted to in the centre. To discourage other nation is engaging in commerce, they practifed practithus grasped at the whole commerce of tieth known world. They very early applied and my to navigation. See Astronomy, lake

PHOENICOPTERUS, the FLAMINGO, IN nithology, a genus of birds belonging to buy der of grallæ. The beak is naked, technibent as if it were broken; the noftrils are the feet are palmated, and four-toed. The

but one species; v.z.

PHOENICOPTERUS BAHAMENSIS of Ca a native of Africa and America. This specia fembles the heron in shape, excepting the which is of a very fingular form. It is two old before it arrives at its perfect colour; then it is entirely red, excepting the quile thers which are black. A full grown one by qual weight with a wild duck; and whenth erect, it is five feet high. The feet are we The fleth is deficate; and mostly resembed a partridge in tafte. The tongue, above ther part, was in the highest efteen mile luxurious Romans. These birds make the on hillocks in thatlow water; on which the with their legs extended down, like a man on a flool. They breed on the coalts of and the Bahama islands in the West Indies frequent till water only. By the particular of its bil, this bird, in eating, twifts its neck fide to fide, and makes the upper mandick! the ground. They are very flupui, and will rife at the report of a gun; nor is it any wall to those who furvive, that they see others by their fide; to that, by keeping himfelt o fight, a towler may kill as many as he pe See Plate CCLXXIII. These birds prefer a climate. In the old continent they are not met with beyond Lat. 40° N. or S. They are with everywhere on the African coast and cent ifles, to the Cape of Good Hope; and times on the coafts of Spain, Italy, and the France lying on the Mediterranean; bei times found at Marfeilles, and for tome wa the Rhone. In some seasons they frequent leppo and the parts adjacent. They are led fo on the Perlian fide of the Caspian Scale thence youg the W. coast as far as the Wo though this is at uncertain times, and chick antiderable flocks coming from the NE. mostly (Cel. and Nov.: but to foon as the wind chanis, they totally diffappear. They breed in the ape Veid illes, particularly in that of Sal. They For the most part in flocks, except in breeding ze. Dampier fays, that, with two in company, skilled 14 at once, which they effected by fering themselve. Korben tells us, that they riviy numerous at the Cape; keeping in the ny on the borders of the takes and rivers, and riging at might in the long grafs on the hills. Agaire aifs common in the warm parts of Ame-14. Peru, Chili, Cayenne, Brafit, and the vari-ந்கியம் of the West Indies. Sloane found them Junica, at the Bahama Islands and Cuba, beet ey breed. Their food chiefly confists of un fill or their eggs; and of water infects, but they fearch after by plunging in the bill # part of the head. What feeding, one of un to faid to fland centinel, and the moment he poli the alarm, the whole flock takes wing. pabird, when at reft, flands on one leg, the oprocing drawn up close to the body, with the d placed under the wing on that fide of the If it fixeds on. They are fumetimes caught sa, and are brought up tame; but are always Boent of cold: and in this flate tedom live. BOENICURUS. See Moracilla, No 10. PHOENICUS, in ancient geography; 1. PilO! - IX, fon of Amyutor king of Arby Cleubule or Hippodamia, was preceptor w g Achilles. Illis father having proved ris to his wife, through fonducts for a cone called Glytta, Cleobule perfunded her fon wax to ingratuate himfeir with his father's lack. Phoenix catily fucceeded; but Amynbeovering his intrigues, pronounced a curfe him, and the fon was foon after deprived of hin, and the ion was room mice fay that A-ht by divine vengeance. Some fay that Am himself put out his son's eves, which fo Led him, that he meditated the death of his Fiety, however, prevailed over paffion; that he might not become a parricide, Phœ-Had from Argos to the court of Peleus king Pathia. Here he was treated with tenderness; we carried him to Chiron, who restored him in eje fight; foon after which; he was made exptor to Achilles, his benefactor's fon. He Blo prefented with the government of many and made king of the Dolopes. He went his pupil to the Troun war. After the of Achilles, Phænix, with others, was comound by the Greeks to return into Greece, ong to the war young Pyrrhus. This comlot Troy, he returned with Pyrrhus, and died Phrace. He was buried, according to Strabo, # Trachinia, where a fmall river in the neighwhood received the name of Phenix.

32) PROTRIX, the fon of Agenor, by a nymph to was called Telephoffu, according to Apollome and Moschus, or, according to others, E-

pinnedufa, Perineda or Agriope. He was, like his brother Cadmus, and Cinx, fent by his father in purfuit of his fifter Europa, whom Jupiter, under the form of a bull, had carried away; and when his inquiries proved unfuccefsful, he fettled in a country, which was from him called PHOENICIA. From him also the Carthaginians were called POENI.

(3.) PHOENIX, in aftronomy, one of the new Southern Conficulations. See Astronomy, § 549.

(4.) PHOENIX, in botany, the Great Palm, or Date tree; a genus of plants belonging to the order of palma. There is only one species, viz.

PHOENIX DACTYLIFERA, the common DATE TREE, a native of Africa and the eaftern countries, where it grows to 50, 60, and 100 feet high. The trunk is round, upright, and fludded with protuberances, which are the veftiges of the decayed leaves. From the top iffues forth a clufter of leaves or branches 8 or 9 feet long, extending all round like an umbrella, and bending a little towards the earth. The bottom part produces a number of stalks like those of the middle, but feedom flooting fo high as 4 or 5 feet. Thefe stalks, fays Adanson, diffuse the tree very confiderably; fo that, wherever it naturally grows in forests, it is extremely difficult to open a passage through its prickly leaves. The date tree was introduced into Jamaica foon after the conquest of the island by the Spaniards. There are, however, but few of them in Jamaica at this time. The fruit is somewhat in the shape of an acorn. It is composed of a thin, light, and glo.ly membrane, formewhat pellucid and yellowish; which contains a fine, foft, and pulpy fruit, which is firm, fweet, and fomewhat vinous to the tafte, efculent, and wholesome; within this is inclosed a folid, tough, and hard kernel, of a pale grey colour on the outlide, and finely marbled within like the nutmeg. For medicinal use, dates are to be chosen large, full, fresh, yellow on the surface, foft and tender, not too much wrinkled; fuch as have a vinous taste, and do not rattic when shaken. They are produced in many parts of Europe, but never ripen perfectly there. best are brought from Tunis; they are aifo very fine and good in Egypt and in many parts of the eaft. Those of Spain and France look well; but are never perfectly ripe, and very hibject to decay. They are preferred three different ways; fome prefied and dry; others prefied more moderately, and again montened with their own juice; and others not prefied at all, but moistened with the juice of other dates, as they are packed up, which is done in balkets or skins. Those preferred in this last way are much the best. Dates have always been effected moderately throughtening and aftringent. Though the date tree grows everywhere indiferiminately on the northern coasts of Africa, it is not cultivated with care, except beyond Mount Atlas; because the heat is not fufficiently powerful along the coasts to bring the fruits to maturity. M. Des Fontaines fays, all that part of the Zaara which is near Mount Atias, and the only part of this vaft defert which is inhabited, produces very little corn; the foil being fundy, and burnt up by

the fun, is almost entirely unfit for the coltivation of grain, its only productions of that kind being a little barley, maize, and forgo. The date tree, however, supplies the deficiency of corn to the anhabitants of these countries, and furnishes them with almost the whole of their subfisience. They have flocks of theep; but as they are not numerous, they preferve them for the take of their wool; belides, the flesh of these animals is very unwholesome food in countries that are excessive-The date trees are planted without order, 12 feet distant from each other, near rivulets and streams. Forests of them may be seen here and there, fome of which are feveral leagues in circumference. The extent of these plantations depends upon the quantity of water which can be procured to water them. All these forests are intermixed with orange, almond, and pomegranate trees, and with vines which twift round the trunks of the date trees; and the heat is ftrong enough to ripen the fruit, though they are never exposed to the fun. Along the rivulets and ftreams, dykes are erected to ftop the course of their waters, that they may be distributed amongst the date trees by small canals. The number of canais is fixed for each individual; and in feveral cantons, to have a right to them, the proprietors are obliged to pay an annual furn proportionable to the number and extent of their plantations. Care is taken to till the earth well, and to raise a circular border around the root of each tree, that the water may remain longer and in larger quancity. The date trees are watered in every feafon, but more particularly during the great heats of fummer. In winter, new plantations of this tree are formed. For this purpose those who cuitivate them take fhoots of those which produce the best dates, and plant them at a small distance one from the other. At the end of 3 or 4 years, these shoots begin to bear fruit; but this fruit is as yet dry, without fweetness, and even without kernels; they never reach the highest degree of perfection of which they are fusceptible till they are about 15 or 20 years old. These plants are, however, produced from the feeds taken out of the fruit, provided they are fresh. They should be fown in pots filled with light rich earth, and plunged into a moderate hot-bed of tanners bark, which should be kept in a moderate temperature of heat, and frequently watered. When the plants are come up to a proper fize, they should be each planted in a separate small pot, filled with the same light earth, and plunged into a hot-bed again, observing to refresh them with water, as also to let them have air in proportion to the warmth of the feafon and the bod in which they are placed. During the summer, they should remain in the fame hot-bed; but in the beginning of Angust, they should have a great share of air to harden them against the approach of winter; for if they are too much forced, they will be fo tender as not to be preserved through the winter without much difficulty, especially if there is not a bark flove to keep them in. The foil, in which these plants should be placed, must be composed in the following manner, viz. half of light fresh earth taken from a pasture ground, the other half

fea fand and rotten dung, or tanners bank in equal proportion; these should be carefully mixed, and laid in a heap 3 or 4 months at kall before it is used, but should be often turned over to prevent the growth of weeds, and to sweeten the earth. The trees, however, which spring from feed, never produce so good dates as those that are raifed from fhoots; they being always pur and ill tafted. It is and oubtedly by force of cub tivation, and after feveral generations, that the The date trees which acquire a good quality. have been originally fown, grow rapidly, and be fruit in the 4th or 5th year. Care is taken to d the inferior branches of the date tree in prop tion as they rife; and a piece of the mot is ways left of some inches in length, which if the easy means of climbing to the summit. trees live a long time, according to the of the Arabs; who fay that, when they have tained to their full growth, no change is oblin in them for the space of three generations. I number of females which are cultivated is m fuperior to that of the males, because they much more profitable. The fexual organs of date tree grow upon different staiks, and in trees flower in Ap il and May, when the cut the male branches to impregnate the For this purpole, they make an incifion it trunk of each branch which they with duce fruit, and place in it a falk of mar !ers; without this precaution the datetre = produce only abortive fruit. In force can the male branches are only fhaken over the The practice of impregnating the tree in this manner is very ancient. Pier feribes it very accurately in that part of his where he treats of the palm tree. There is a ly any part of the date tree which is not " The wood, though of a fpongy texture, in the a number of years, that the inhabitants di country fay it is incorruptible. They for making beams and instruments of hull it burns flowly, but the coals which refult its combustion are very strong, and production great heat. The Arabs ftrip the bark and file parts from the young date trees, and cat the stance, which is in the centre; it is require ing. and has a fweet tafte; it is known by name of the marrow of the date tree. The aifo the leaves, when they are young and ice with lemon juice; the old ones are laid of dry, and are employed for making mats at ther works of the same kind, which are most fed, and with which they carry on a comfed trade in the interior parts of the country. the fides of the stumps of the branches! have been left, arise a great number of di filaments, of which they make ropes, and might ferve to fabricate cloth. Of the fresh and fugar, fays Haffelquift, the Egyptians conserve, which has a very pleasant taste. gypt they use the leaves as By-flaps, for away the numerous infects which prove to blesome in hot countries. The hard books uled for fences and other purpoles of bulbs the principal frem for building. The frest fore it is ripe, is fomewhat aftringent; but

thoroughly mature, is of the nature of the fig. The Senegal dates are shorter than those of Egypt, but much thicker in the pulp, which is faid to have a sugary agreeable take, superior to that of the best dates of the Levant. A white liquor, known by the name of mile, is drawn also from the date tree. To obtain it, all the branches are en from the fummit of one of thefe trees, and fer feveral incitions have been made in it, they eco ered with leaves, in or ler that the heat of the may not dry it. The fap drops down inselfel placed to receive it, at the loctom of kular groove, made below the incifions. The of the date tree has a fweet and agreeable when it is new; it is very refreibing, and it pres given to fick people to drink, but it geby turns four in 24 hours. Old trees are of for this operation, because the cutting of branches, and the large quantity of ap which on from them, greatly exhaust them, and often the them to decay. The male flowers of the them to decay. te tree are also useful. They are eaten when I tender, mixed up with a little lemon juice. ley are reckoned to be very provocative: the ar which they exhale is probably the cause of property being ascribed to them. These date we very lucrative to the inbabitants of the Int. Some of them produce 20 bunches of ks; but care is always taken to lop off a part them, that those which remain may become m; 10 or 12 bunches only are left on the rigorous trees. It is reckoned that a good roduces, one year with another, about the of 10 or 12 shillings to the proprietor. A y confiderable trade is carried on with dates interior part of the country, and large puties of them are exported to France and I-The crop is gathered towards the end of mber. Whe the bunches are taken from the, they are hung up in some very dry place he they may be sheltered and secure from in-Dates afford wholesome nourishment, and la very agreeable tafte when they are fresh. Arabs eat them without feafoning. They d harden them in the fun, to reduce them and of meal, which they iay up in store to themselves with food during the long jourwhich they often undertake across their de-This simple food is sufficient to nourish them a long time.—The inhabitants of the Zaara cure also from their dates a kind of honey th is exceedingly sweet. For this purpose schoole those which have the foftest puip; baving put them into a large jar with a hole bottom, they squeeze them by placing ohem a weight of eight or ten pounds.—The fluid part of the substance, which drops agh the hole, is what they call the boney of date. Even the stones, though very hard, are thrown away. They give them to their ca-and sheep as food, after they have bruised or laid them to fosten in water. The date, reli as other trees which are cultivated, exhigreat variety in its fruit, with respect to , fize, quality, and even colour. There are coned to be at least 20 different varieties. Dates t very liable to be pierced by worms, and they a corrupt in moift or rainy weather.

(5.) PROBRIX, in ornithology, a fabulous bird of antiquity. The ancients speak of this bird as fingle, or the only one of its kind; they describe it as of the faze of an eagle; its head finely crested with a beautiful plumage, its neck covered with feathers of a gold colour, and the rest of its body purple, only the tail white, and the eyes sparkling like stars: they say, that it lives above 500 years in the wilderness; that when thus advanced in age, it builds itself a pile of sweet wood and aromatic gums, and fires it with the wasting of its wings, and thus burns itself; and that from its ashes arises a worm, which in time grows up to be a phoenix. Hence the Phoenicians gave the name of phanix to the palm-tree; because when burnt down to the root it rifes again fairer than ever. In the fixth book of the Annals of Tacitus, sect. 28, it is observed that, in the year of Rome, 787, the phænix revifited Egypt; which occasioned among the learned much speculation. being is facred to the fun. Of its longevity the accounts are various. The common perfualion is, that it lives 500 years; though by some the period is extended to 1461. But Ausonius makes it no less than 69,984 years! Eidyl. 18. The several esas when the phoenix has been feen are fixed by tradition. The first was in the reign of Sesostris; the 2d in that of Amasis; and, in the period when Ptolemy IIL was on the throne of Egypt, another phænix directed its flight towards Heliopolis. When to these circumstances are added the brilliant appearance of the phoenix, and the tale that it makes frequent excursions with a load on its back, and that when, by having made the experiment through a long tract of air, it gains sufficient confidence in its own vigour, it takes up the body of its father and flies with it to the altar of the fun to be there confumed; it cannot but appear probable, that the learned of Erypt had enveloped under this allegory the philosophy of COMETS.

(6.) PHOENIX, a river in Trachinia.

PHŒNOMENOLOGY, n. f. a system of, or treatise on phænomena. See Philosophy, Seft. III.

PHOENOMENON. See PHENOMENON. PHOLAS, a genus of infects, belonging to the order of vermes teftacea. The shell is doublevalved and divaricated; the cardo is turned backwards, and connected by a cartilage. There are fix species, distinguished by the figures of their shells. The name pholas is derived from the Greek, and fignifies fomething which lies hid. This name they derive from their property of making themselves holes in the earth, fand, wood, or stone, and living in them. The means of their getting there, however, are as yet entirely unknown. All that we can know with certainty is, that they must have penetrated these substances when very small; because the entrance of the hole in which the pholas lodges is always much left than the inner part of it, and indeed than the shell of the pholas itself. Hence some have supposed that they were hatched in holes accidentally formed in stones, and that they naturally grew of such a shape as was necessary to fill the cavity. The holes in which the pholades lodge are usually twice as deep, at least, as the shells themselves are long; the figures of the holes is that of a truncated cone, excepting that they are terminated at the

bottam

bottom by a rounded cavity, and their position is this fish certed to shine when it became putil. ufually fomewhat oblique to the horizon. The openings of these holes are what betray the pholas being in the ftone; but they are always very fmall in proportion to the fize of the fifh. feems to be no progressive motion of any animal in nature fo flow as that of the pholas; it is immerfed in the hole, and has no movement except a finail one towards the centre of the earth; and this is only proportioned to the growth of the animal. Its work is very difficult in its motion; but it has great time to perform it in, as it only moves downward, finking itself deeper in the ftone as it increases in bulk. That part by means of which it performs this, is a fleshy substance placed near the lower extremity of the shell; it is of the shape of a lozenge, and is considerably large in proportion to the fize of the animal; and though it be of a foft substance, it is not to be wondered at that in fo long a time it is able, by conftant work, to burrow into a hard flone. How they perform this may be feen by taking one of them out of the flone, and placing it upon fome foft clay; for they will immediately get to work in bending and extending that part abouted to dig for them, and in a few hours they will bury themfelves in the mud in as large a hole as they had taken many years to make in the stone. find little refiftance in fo foft a fubitance; and the necessity of their hiding themselves evidently makes them haften their work. The arimat is lodged in the lower half of the hole in the stone, and the upper half is filled up by a pipe of a flefhy fubfrance and conic figure, truncated at the end: this they ufually extend to the orifice of the hole, and place on a level with the finface of the flone; but they feldom extend it any farther than this. pipe, though it appears fin le, 13 in reality composed of two pipes, or at least it is composed of two parts separated by a membrane. The use of this pipe or probofcis is the fame with that of the probofcis of other flieli-fish, to take in fea-water into their bodies, and afterwards to throw it out again. In the middle of their bodies they have a fmall green veffel, the use of which has not yet been discovered. This, when plunged in spirit of wine, becomes of a purple colour: but its colour on linen will not become purple in the fun like that of the murex; and even if it would, its quartity is too finall to make it worth preferving. pholas is remarkable for its luminous entity, which was noticed by Play, who observes that it shines in the mouth of the perlon who eats it; if it touch his hands or clothes, it makes them inminous; and that its light depends upon its moitture. M. Reammur observes, that whereas other fishes give light when they tend to patreforace, this is more luminous in proportion to us being freth; that when dried, its light will revise if they be moistened either with neth or falt water, but that brandy immediately extinguishes it. He endeavoured to make this light permanent, but none of his fehemes facededed. The attention of the Bolognian academicians was cryaged to this fubject by M. F. Mathlius in 1724, who brought a number of these fishes, and the stones in which they were inclosed, to Bologna, on purpose for their examination. Beccasius observed, that the

yet that in its most putrid state it would sow, and make the water in which it was immerfed in minous when it was agitated. Galeatius and Metius found that wine or vinegar extinguished the light; that in common oil it continued fone day but in rectified spirit of wine or urine hardly a conute. To discover in what manner this light affected by different degrees of heat, they made: of a Reaumur's thermometer, and found that wa rendered luminous by there fithes increased in l till the heat arrived to 45°, but that it then becar fuddenly extinct, and could not be revived a, In the experiments of Beccarius, a folution of a fait increased the light of the luminous water; folution of nitre did not increase it quite so me Sal ammoniac diminished it a little, oil of ta per deliquium nearly extinguished it, and the so entirely. This water poured upon fresh rikes gypfum, rock cryftal, cerufe, or fugar, box more luminous. He also tried the effects of when poured upon various other fubfigues, there was nothing very remarkable in them. terwards, using luminous milk, he found that of vitriol extinguished the light, but that of increased it. He had the curiofity to try how ferently coloured substances were affected by kind of light; and having, for this purposped several ribbons in it, the white came brightest, next to this was the yellow, and the green; the other colours could hardly & ceived. It was not, however, any partenlar lour, but only light, that was perceived a case. He then dipped boards painted with the ferent colours, and also glass tubes filled with frances of different colours, in water rendered minous by the fillies. In both thefe cafes, the was hardly visible, the vellow was the book and the violet the dulleft. But on the board blue was nearly equal to the yellow, and the more languid; whereas in the glaffes, the inscrior to the green. Of all the liquo which he put the pholades, milk was render most luminous. A single pholas made 7 4 of milk to luminous, that the faces of might be diffuguified by it, and it looked transparent. Air appeared to be necessary to light; for when Beccarius put the luminous into glass tubes, no agitation would make it unless bubbles of air were mixed with it. In tius and Galcatius found, that, in an extent receiver, the pholas loft its light, but the will was fometimes made more luminous; which the aicribed to the rifing of bubbles of air through Beccarius, as well as Reaumur, tried many few to render the light of these pholades pental For this purpose he kneaded the juice into a of parte with flour, and found that it would light when it was immerfed in warm water; it answered best to preserve the fish in hone; any other method of preservation, the presof becoming luminous would not continue to than fix months, but in honey it had lafted all a year; and then it would, when plenged in w water, give as much light as ever. See Bar-Genera Verminum, p. 14, &c. Alfo Plan : 19. PHOLEY, Foul, or Fully, a country kingdon of Africa, in Guineas on the batter

PHO (457) PHO

the Sengal, divided from that of the MANDISgors by lake Cayor; extending 160 leagues, or 43 miles from E. to W. Its breadth from N. to 8 is not afcertained. The country is populous and the foil very fertile; producing rich crops of form tive, milet, peafe, cotton, tebacco, and great variety of fruits and roots. It feeds great numbers of theep, goats, horfes and black cattle; and abands with lions, tigers, elephants, erocodiles, ad other wild beafts. The king is called Siratics, this faid to have great authority over his fub-

MOLEYS, or FOULIES, the inhabitants of the kingd im, are a people of very peculiar man-Mr Moore however fays, that the Pholeys in clans, build towns, and are in every king-m and country on each fide the river; yet are flight to any of the kings of the country, though the in their territories; for if they are used to one nation, they break up their towns, and have to another. He gives a beautiful account their character, dispositions and morals, which partly quoted under the article GUINEA, § 4. ey are rather of a low flature, but have a gen-land eafy fhape, with an air peculiarly deheate agreeable. Though they are ftrangers in the later, they are the greatest planters in it. They extremely industrious and frugal, and raise more corn and cotton than they confume, they fell at reasonable rates; and are so reble for their hospitality, that the natives es-It a bleffing to have a Pholey town in their bourhood; and their behaviour has gained fuch reputation, that it is effected infamas y one to treat them in an unhospitable man-Their humanity extends to all, but they are wkind to people of their own race. They lowever as brave as any people of Africa, and expert in the use of their arms, which are jas cuttaffes, bows and arrows, and upon ocguns. They usually settle near some Muntown, there being scarce any of note up the that has not a Pholey town near it. Most of speak Arabic, which is taught in their is; and they are able to read the Koran in figuage, though they have a vulgar tongue Pholey. Their houses are built in a very remanner, they being round structures, placed wat a distance from each other to avoid fire, each of them has a thatched roof formewhat bing a high-crowned hat. They are also buotimen, and not only kill lions, tygers, other wild beafts, but frequently go 20 or 30 company to hunt elephants; whole teeth they whose slesh they smoke, dry and eat, keepfor feveral months together. They are althe only people who make butter, and fell at fome distance up the river. They are particular in their diels, and never wear any clothes but long robes of white cotton, they make thenselves. They are always clean, especially the women, who keep their txceedingly neat.

HOUDOTUS. See PANGOLIN.

4) PAOLIS, in ichthyology, the name of a supulliform fith. The back is brown, the y white, the whole back and fides are spotand the skin is soft, free of scales, but with our XVII. PART H.

a tough mucilaginous matter like the eel. This species most of all approaches to the alouda; and though usually larger, yet Mr Ray doubts whether it really differs from it in any thing essential; the distinction is its colour, which though a very proportion of the control of

obvious is certainly a very precarious one.

(2.) Phous, in the old lystem of mineralogy, the name of a genus of foilils of the class of gypfums or plafter-ftones. Its difting uifhing characters are, that the bodies of it are tolerably hard, compered of particles fornewhat broad, and of a bright crystalline lustre. The name is derived from \$1211, a fiele or small flake, because they are compoled of particles of that form. The species are very valtable, and perhaps the most so of all the gypfums, because they burn to the best and finest plaster, but so far as is yet known, there are but 2 of them: viz. the fine plafter-stone of Montmartre in France, called by us plaffer of Paris stone and parget; and the other, the coarfer and fomewhat reddiffe kind, common in many parts of England, and called ball plafter. See PLASTER OF Paris.

PHOLOE, 1.1 mountain of Arcadia, near Pifafo named from Pholos, who was buried in it: 2. another in Theffally, near mount Othrys. Plin, iv. 6. Lucan. 3.

PHOLUS, in fabrilous history, one of the Centaurs, who entertained Hercules, when going against the Erymanthian boar. Pauf. 3. Virg. Ex.

PHONASCUS. See Music, § 42.

PHONIA, a town of European Turkey, in the Morea, 32 miles WSW. of Corinth.

(1.) \* PHONICKS. n. f. [from quin.] The doctrine of founds.

(2.) Phonics is otherwise called Acoustics. See that article.

\* PHONOCAMPTICK. adi. [porn and round.]
Hiving the power to inflect or turn the found, and by that to alter it.—The magnifying the found, by the polyphonisms or repercussions of the rocks, and other phonocamptick objects. Derkam.

PHORCUS, or in the mythology, the fon of PHORCYS, Sheptune by Thooffa, who married his fifter Ceto, by whom he had the Gorgons, the dragon, that kept the gardens of the Helperides, and other monsters. Hefod.

PHORMIO, an Athenian general, who reduced, himfelf to poverty to maintain the dignity of his army. The Athenians paid his debts, and offered to make him head general, which he declined.

PHORMIUM, in botony, a genus of the mornogynia order, belonging the bexandria class of plants. The most remarkable frecies is,

PHORMIUM TENAX, (of Forfler,) the FLAX PLANT, a plant that ferves the inhabitants of New Zealand inflead of hentp and flux. Of this plant there are two forts; the leaves of both refemble those of flags, but the flowers are fmailer, and their clutters more numerous; in one kind they are yellow, and in the other a deep red. Of the leaves, with very little preparation, they make all their common appurel, and also their strings, lines, and cordage, for every purpose; which are much strenger than my thing we can make with hemp. From the same plant, by another praparation, they draw long, Mmm flender

flender fibres, which shine like silk, and are as white as snow: of these, which are very strong, they make their finest cloths; and of the leaves, without any other preparation than splitting them into proper breadths, and tying the strips together, they make their fishing nets, some of which are of an enormous size. The seeds of this valuable plant have been brought over into England; but, upon trial, appeared to have lost their vegetating power.

(1.) PHORONEUS, in fabulous history, the fon of Inachus by Meiisla, brother of Io, and the 2d king of Argos. He married the nymph Laodice, by whom he had Apis and Niobe; civilized his subjects; built a temple to Juno, &c. and after death was worshipped as the god of the river, No

2. Pausan.

(2.) PHORONEUS, a river of Peloponnefus. PHORONIS, a pantronymic of Io, or Iss. PHORONIUM, a town of Argolis.

I. PHOSPHAS. \ n.f. [from phosphorus.] in che-I. PHOSPHAT, mustry, a fast formed by the union of the phosphoric acid, with different bases. (See CHEMISTRY, Index, and Vocab. I. and II.) Phosphats are ranked by the ingenious Dr Themas Thomson, in his Syft. of Chem. vol. Ild.) as the "7th genus of alkaline and earthy falts." "This class of falts, (fays the Dr) was first diftingushed by Pott and Margrass. Several of the Phosphats were afterwards examined by Haupt, Schloffer, Rouelle, Prouft, Westrum, and Scheele; but for the most complete account of them we are indebted to Fourcroy and Vauquelin. They may be diftinguished by the following properties: 1. When heated along with combustibles, they are not decomposed, nor is phosphorus obtained. 2. Before the blow-pipe they are converted into a globule of glass, which in some cases is transparent, in others opaque. 3. Soluble in nitric acid without effervescence, and precipitated from that folution by lime-water. 4. Decomposed, at least partially, by su'phuric acid; and their acid, which is separated when mixed with charcoal and heated to redness, yields phofphorus. 5. After being strongly heated, they often phosphoresce. The earthy phosphats at prefent known amount to 13; fome of which are

found native in great abundance."

1. "PHOSPHAT OF ALUMINA. This fait has only been examined by Fourcroy. It may be formed by faturating phosphoric acid with alumina. It is a tatteless powder, insoluble in water. Diffolved in phosphoric-acid, it yields a gritty powder, and a gummy solution, which by heat is convert-

ed into a transparent giafs.

2. "PHOSPHAT OF AMMONIA exists in urine, and was first accurately distinguished by Rouelle. It was afterwards examined by Lavois 12 R in 1774, and fill more lately by Vauque lin. It is usually prepared by saturating with ammonia the superplicitly phase of lime obtained from bones, and evaporating the solution to such a confistency, that, when allowed to cool, the phosphat of an monia is obtained in crystals. It crystallizes in four-fided prisms, terminated by equal-sided pyramids. Its taste is cooling, falt, and ammoniacal. Its specific gravity is 18051. It is soluble in 4 parts of water at the temperature of 60°, and in rather a

smaller proportion of boiling water. By spontaneous evaporation it is obtained in the flate of regular crystals. It is not altered by exposure to When heated it undergoes the watery the air. fusion: it then dries; but if the heat be continued, it swells up, loses its alkaline base, and the acid melts into a transparent glass. It is the only one of the earthy and alkaline phosphats which can be decomposed by heat: hence the reason, that it yields phosphorus when distilled along with charcoal. It is decomposed by the sulphune, it ric and muriatic acids, and by the fixed aikaling and alkaline earths. It is capable of combining with an additional dose of acid, and of staffing in the state of a super-phosphat. According to Forcroy, it is decomposed by the following salts: 1 Sulphats of strontian, lime, magnesia, glucina, alsmina, zirconia. 2. Sulphites of barytes, lime, potafs, foda, strontian, magnesia, glucina. 3. Nitrati, of barytes, strontian, lime, magnefia, glucina, s lumina, zirconia. 4. Muriats of barytes, firontes, lime, magnefia, glucina, alumina, zircona. Phosphats of lime, barytes, ftrontian, magneta potafs, foda. 6. Fluats and borats of lime, bertes, strontian, magnesia, potass, soda. 7. Care nats of barytes, strontian, lime, potass, soda. The falt is much employed as a flux, in expense with the blow-pipe. It enters also as an are dient in those coloured glasses called pastes, the are made in imitation of precious stones." & PASTES.

3. " PHOSPHAT OF AMMONIA AND MAGNE SIA was first discovered by Foureroy, in a colo reous concretion formed in the coion of a bord Since this difcovery, Fourcroy and Vauquelin ferved it also in human urine. It may be po pared by mixing folutions of the photphatiammonia and magnelia in water: the triple immediately precipitates in the state of a powder. When urine is allowed to remain an fiderable time in close vessels, it often depthis falt in regular crystals on the sides and tom of the veilel. These crystals are small fided prifms, terminated by irregular fourpyramids. This falt is tafteless, scarcely fall in water, and not liable to be altered by expour to the air. When heated, it falls to power gives out its ammonia, and in a high temperature melts into a transparent globule. When difful along with charcoal, phosphorus is obtained Fourcroy has afcertained, that the phosphat ammonia and magnefia, obtained from the culous concretion of the horfe, is composed 33 phosphat of ammonia, 33 phosphat of mage fia, and 33 water.

4. "PHOSPHAT OF BARTTES has hitherto be deferibed only by M. Vauqueiin. It may be pared either by faturating phosphoric acid with barytes, or carbonat of barytes, or by mixing alkaiine phosphat and nitrat or muriat of rytes. In either case the phosphat of barytes cipitates immediately in the form of a white peder. This salt is tasteless, incrystallizable by a insoluble in water, and not altered by exposure the air. Its specific gravity is r2867. When the same of the proportion of its component parts a unknown. According to Fourcroy, it is decomponent parts and shown.

PHO. (459) PHO

posed by the following salts: 1. All the earthy and alkaline sulphats. 2. Sulphite of lime. 3. Natrats of strontian, lime, alumina. 4. Muriats of time, glucina, zirconia. 5. Carbonats of potas, soda.

6. " PHOSPHAT OF GLUCINA has only been exmined by Vauquelin. He obtained it by pouring phosphat of soda into the solution of glucina in appluric, nitric, or muriatic acids. The phofthat of glucina is precipitated in the state of a white powder. It does not crystallize. It is talces, infoluble in water, unless it contains an exti of acid, and not liable to be altered by expofare to the air. When heated strongly, it melts ato a transparent glass. According to Fourcroy, tis decomposed by the following salts: 1. Sulhats of alumina, zirconia. 2. Sulphites of bares, lime, potass, soda, strontian, ammonia, tagnelia. 3. Nitrats of alumina, zirconia. 4. Cinits of alumina, zirconia. 5. Phosphites, bats, and borats, of lime, barytes, strontian, benefia, potafs, foda, ammonia. 6. Carbonats buytes, strontian, lime, potass, soda, ammo-

6 "PHOSPHAT OF LIME. This interesting ," (fays our learned author,) " which conftites the basis of BONES, was pointed out by arde and Gahn in 1774: but for the first preaccount of its properties we are indebted to the states. Fourcroy, and Vauquelin. As this tenfitutes the basis of bones, it is not necessitation in the state of prepare it artificially. It may be obtained the of purity by the following process: Calthe bones to whiteness, reduce them to powand wash them repeatedly with water, to sebefeveral foluble falts which are prefent. After edulcoration, there remains only phosphat of a little carbonat of lime. This last falt be diffolved by means of weak acetous acid; the phosphat, after being well washed, re-min a state of purity. Phosphat of lime, thus ared, is always in the state of a white powbut it is found native in regular crystals. In sate it is known by the name of Apatite. The live form of its crystals is, according to the regular fix-fided prism; and the priform of its integrant particles is a three-fided m, whose bases are equilateral triangles: But buy often affumes other forms. It is destia d'taste, insoluble in water, and not liable to aftered by exposure to the air. It may be exled to a strong heat without undergoing any Mr; but in a very violent heat it becomes foft, a converted into a white semi-transparent enaor rather porcelain. According to the exmuriatic, fluoric, and feveral vegetable aare capable of decomposing phosphat of \*; but the decomposition is only partial. Fourand Vauquelin have ascertained, that these to are only capable of abstracting 040 parts the lime, while the remainder continues comed with phosphoric acid, constituting a Super-Aphat of Lime. Hence the reason that phoionic acid is capable also of decomposing partialthe combinations of these acids with lime: it

abstracts as much of the lime as is sufficient to convert it into super-phosphat. Phosphat of lime, according to Fourcroy and Vauquelin, is composed of 41 acid, 59 lime. According to Fourcroy, it is decomposed by the following salts: 1. Pluats of barytes, potass, soda. 2. Borat of barytes. This salt is employed for making cupels: from also almost the whole of the Phosphorus employed by chemists is extracted. It is employed likewise as a medicine in rickets.

7. "Super-PHOSPHAT OF LIME was discovered in 1795, by Fourcroy and Vauquelin. It had indeed been often formed before, but chemists had neglected to examine it. It is this falt, which always remains in the aqueous folution, when calcined bones are decomposed by sulphuric acid; and it may be formed artificially by diffolving phosphat of lime in phosphoric acid, till the acid refuses to take up any more, and afterwards evaporating the folution till the fait crystallizes. Its crystals are usually thin brilliant plates resembling mother-of-pearl, which eafily adhere together, and acquire a kind of gluey confiftency. Its tafte is strongly acid. Water dissolves it; and in a greater proportion when boiling hot than when cold: hence a faturated folution of it in boiling water crystallizes on cooling. It attracts a little moisture when exposed to the air. When heated, it readily undergoes the watery fusion; then swells up and dries. In a high temperature, it melts into a femitransparent glass, which is tasteless and infoluble, and is not altered by exposure to the air. When this falt is heated to redness along charcoal, its excess of acid is decomposed, and converted into phosphorus, and phosphat of lime remains behind. It is from this falt that Phos-PHORUS is usually obtained: but the process of Fourcroy, which confifts in decomposing the fuper-phosphat of lime by acetite of lead, and afterwards decomposing the phosphat of lead by means of charcoal, must yield a much greater proportion of phosphorus. No acid hitherto tried is capable of decomposing this salt except the oxalic, which abstracts its base completely, and precipitates with it in the form of oxalat of lime; but it is decomposed and reduced to the state of phosphat of lime by all the alkaline and earthy bases. It is composed, according to Fourcroy and Vauquelin, of 54 acid, 46 lime.

8. " PHOSPHAT OF MAGNESIA Was first formed by Bergman in 1775. It has been lately examined with much precision by the celebrated and indefatigable Vauquelin. It is usually prepared by diffoling carbonat of magnefia in phosphoric acid, and evaporating the folution gradually till the falt crystallizes; but it may be obtained in large regular crystals by a much easier process first pointed out by Foureroy. Mix together equal parts of the aqueous folutions of phosphat of foda and fulphat of magnetia. No apparent change takes place at first; but in a few hours large transparent crystals of phosphat of magnetia appear in the folution. Its crystals are sixfided prisms, the fides of which are unequal. It has very little tafte; however, it leaves a cooling and fweetish impression upon the tongue. Its specific gravity is 1'5489. It requires about 15 parts of cold wa-Mmm a

ter to distolve it. It is more foluble in boiling water, but it croftalizes in part as the folution cools. When exposed to the air, it loss its water of crystalization, and falls down in powder. When heated moderately, it is also reduced to a dry powder. In a high temperature, it melts into a transparent glass. According to Fourcroy, it is decomposed by the following falts: 1. Surphats of glucina, zirconia. 2. Sulphites of barytes, lime, potass, soda, glucina. 3. Nitrats of barytes, frontian, lime. 4. Muriats of barytes, frontian, glucina, potass, soda. 6. Fluats of lime, barytes, strontian, potass, soda, ammonia. 7. Borats of lime, barytes, strontian, potass, foda. 8. Carbonats of strontian, lime, potass, foda.

9. " PHOSPHAT OF POTASS Was first formed by Lavoisier in 1774. It was afterwar s examined by Vauguelin. It is prepared by faturating phosphoric acid with potass, and evaporating the folution to the required confiftency. This falt does not crystallize when evaporated sufficiently: it assumes the form of a jelly; and if the evacuation be carried farther, it becomes dry altogether. Its specific gravity, when dry, is 2.8516. It is exceedingly foluble in water; and when dry readily attracts moisture from the atmosphere, and is converted into a viscid liquid. When heated, it first undergoes the watery fulion; then allows its water of crystallization to evaporate, and is reduced to drynefs. In a high temperature it melts into a transparent glass, which deliquesces again when exposed to the air. It is completely decomposed by the fulphuric, nitric, and muriatic acids; and by barytes, ftrontian, and lime. The following falts, according to Fourcroy, have the property of decomposing it: 1. Sulphate of foda, strontian, lime, ammonia, magnefia, glucina, alumina, zirconia. 2. Sulphites of barytes, lime, strontian, giucina. 3. Nitrats of barytes, foda, strontian, lime, ammonia, magnefia, glucina, alumina, zirconia. 4. Muriats of barytes, foda, strontian, lime, ammonia, magnefia, glucina, alumina, zirconia. 5. Profphites of lime, barytes. 6. Fluats

bota's, and carbonats of barytes, lime.
10. "PHOSPHAT OF SODA. This falt exifts ready formed in urine, and was the first known of all the phosphats. It occupied a good deal of the attention of chemists; and the difficulty of analyzing it gave occasion to various hypothesis concerning its nature. Heliot remarked it in urine; and described it, in 1737, as a falt different from those that had been usually observed. Hupt deferibed it in 1740, under the name of Sal mi abile per lation, or 'wonderful perlated fait.' called perlated from the grey opaque pearl-like colour, which it affumed when melted by the blowpipe. Margraff described it in 1745, and found it would not yield phosphorus when treated with charcoal, at the other falts of urine did. Rouelie jun, analyzed it in 1976, and concluded that it was a compound of phosphoric acid and foda; but Mr Prouft, being unable to obtain phosphorus from it, concluded that it did not contain phofphoric acid, but another acid analogous to the boracic acid. To this substance, which Mo-Proust actually obtained, Bergman gave the name of perlated atid, and Morveau afterwards cal-

led it ouretic acid But Mr Klaproth foon after wards analyzed it, and proved that it confiled of it do superfaturated with phosphoric acid. School from after made the fame discovery. The audit Mr Prouft, then, is merely phosphat of soda, con bine I with phosphoric acid, or furer-phosphat of da. Dr Pearfon afterwards introduced it with god adventage into medicine, as a purgative. gives the foll wing process for preparing it: D folve in a long-necked matrafs 1400 grains of or tallized carbonat of ioda in 2100 grains of wa at the temperature of 150°. Add gradually gr. of photphoric acid of the specific gravity of Boil the liquor for fome minutes; and while boiling hot, filtrate it, and pour it into a he veffel. Let it remain in a cool place, and q will continue to form for feveral days. In above quantities of materials he has obtained 1450 to 1550 grains of cryftals. Apother fually prepare it from the fuper-phosphat of (N-7.) obtained from bones by fulphunc An excess of carbonat of foda is added to fee the lime. The liquid is then filtered and of rated flowly till it crustalitizes. Its crylid rhomboid il prifin, of which the acute and 60°, and the obtuse angles 120°, terminal a three-ficied pyramid. Its specific go 1'333. Its tafte is almost the same with common falt. It is foluble at the tempor 60°, in about 4 parts of water, and 2 of wa er. This folution cryftallizes on coolin to obtain the falt properly cry stallized, the should contain a slight excess of alkali, exposed to the air, this falt very foon of on the furface. When heated it under watery fusion. At a red heat it mela white enamel. Before the blow-piper med a transparent giobule, which becomes op cooling, and its furface acquires a polyt gure. It is not altere ! by combuftibles, tals. With metallic oxides it enters in and forms a coloured globule of glass ric, nitric, and muriatic acids, decompose tially, and convert it into fuper-phophat In this state it is more foluble in water. fo eafily crystallized; but may be obtained per evaporation in the state of thin scale, like boracic acid. It was this super-ph which Proust obtained, and which he could as a peculiar acid. The greater number of may be fused along with this falt, and com into glass. It is decompesed, says Fourcial the following falts: 1. Sulphats of lime, and magnefia, alumina, giucina, zirconia. 1. Sul of barytes, lime, potafs, ftrontian, giech Nitrates of barytes, fime, ammonia, magretis cina, alumina, zirconia. 4. Muriats of b fliontian, lime, ammonia, magnefia, glucis mina, zirconia. 5. Phofphites of 11mc, 1 potals. 6. Finats, borats, and carbonats of barytes, potals. This falt has been applied rious uses: It has been introduced into me as a purgative, and on account of its pigalant has of late been much used. It is ulually in broth, which it is employed to feafon infici a common falt. It may be substituted for b to promote the foldering of metals. ifts employ it very much as a flux; where

is the blow-pipe.

11. " PHOSPHAT OF SODA AND AMMONIA. Though this falt, known to chemifts by the names sis of omic falt, and fufible falt of urine, was exrailed from urine, and examined much fooner, han any of the other phosphats, it was long beor philosophers were able to form precise noions concerning its nature, or even to obtain it 1 thate of purity. This indeed could not be pedid, till the phosphats of soda and of amhad been accurately examined, and their apolition afcertained. Foureroy was the first, gave a precise account of the proportion of component parts, viz. 32 acid, 24 fida, 19 monia, 25 water. The properties of this fait pearly those of" the 2d and " last species and together. It answers better than the first them" (No 2.) " as a flux; because the heat m drives off the ammonia, and leaves an excels acid. Its specific gravity is 1.509. When exled to the air, this falt efflorefees, and graally ioles its ammionia; a fact first observed by Duke de Chaulnes.

13. " PHOSPHAT OF STRONTIAN WAS first difpred by Dr Hope; but it was more particularly and by Vauquelin in 1797. It may be formfroiving carbonat of itrontian in phosphoed, or by mixing together nitrat of strontian phoipnat of foda. A white precipitate imately falls, which is the phosphat of stron-This falt is tafteless, infoluble in water, and trable by exposure to the air. It is soluble access of phosphoric acid: a property which mustics it from phosphat of barytes. Before tion-pipe it fufes into a white enamel, and fame time emits a phosphoric light. It is pletely decomposed by sulphuric acid, but to other. According to Vauquelin, it is comof 41'24 acid, 58'76 strontian. According tourcroy, the following falts decompose it: 1. bats of barytes, time. 2. Nitrites of time. 3. at of lime, z rconia. 4. Phosphites of bappotals. 5. Piuats of barytes, poras, soda.

" PHOSPHAT OF YTTRIA. This falt has been formed by Vauquelin. When the foof phosphat of foda is mixed with the fulnitrat or muriat of yttria, phosphat of yttria

upitates in gelatinous flakes."

L PHOSPHATS, METALLINE, falts formed by thion of the phosphoric acid with different pluc bales. Or these Dr Thomson enumerates exics, under the different genera of their re-6" Vol. II and III.

PHOSPHAT OF ANTIMONY is mentioned but oricribed by Dr Thomson. " The action (he nt phosphoric acid on antimony has never a examined. Neither is the falt better known, that ac d may be capable of forming with oxides of that metal."

PHOSPHAT OF COBALT. " Phosphoric acid alves cobalt, and forms a reddish coloured soin which deposites phosphat of cobalt when

L PHOSPHAT OF COPPER. "Phosphoric acid that attack copper immediately; but when

mine the action of heat on minerals by means allowed to remain long upon it, oxidation takes place, and the phospnat of copper is formed, This falt may be obtained with great facility, by pouring photphat of foda into a folution of nitrat of copper. A bluith-green powder immediately precipitates, which is phosphat of copper. This falt is infoluble in water. Its specific gravity, according to Hassenfratz, is 1'4158. When exposed to a red heat, it loses its water, and acquires a brown colour. When violently heated, phosphorated copper comes over. According to M. Chevenix, it is composed of brown oxide, 49'5, water 12, forming hydrat of copper 61.5; acid 35, and water 3.5.

р н о

iv. "PHOSPHAT OF IRON. When fulphat of iron, diffolved in water, is mixed with a folution of phosphat of potass, a blue powder precipitates, which is phosphat of iron. This powder is infoluble in water, and does not lofe its colour when exposed to the air. This falt is found native, and constitutes the colouring matter of a blue mineral, cailed Native Pruffian Blue, found in bogs, and first analysed by Klaproth. Native Prusian Blue, when dry out of the earth, is at first often cotourless; but when exposed to the air, it be-

comes blue.

v. "Oxy-Phosphat of Iron. This falt may be readily procured by mixing the folutions of oyx-muriat of iron and phosphat of potass or soda. A white powder immediately falis which is oxy-phosphat of iron. This salt, like almost all the phosphats, is soluble in acids, but precipitated undecomposed by ammonia. It is almost infoluble in water, as it requires more than 1500 parts of that liquid to diffolve one part of oxyphosphat. When heated violently, it melts into an ash-coloured globule. When mixed with charcoal, and heated to redness, it is converted into phosphuret of iron.

vi. "Sub-oxy-Phosphat of Iron. When the oyxphosphat of iron" (No v.) " is treated with the pure fixed alkalies, a red, or rather brownishred, powder is separated, while the alkali combines with phosphoric acid. This powder was, examined by Fourcroy and Vauquelin, and found by them still to contain a portion of acid. It is therefore merely oxy-phosphat with excess of base. This falt is scarcely soluble in acids or in water; but it dissolves readily in the white of an egg, or in the ferum of blood, and communicates to thefe liquids a brown or red colour. Its folubility is increased, and its colour heightened, by the pre-fence of a portion of fixed alkali. This is the fait, which gives a red colour to the blood." See

BLOOD, § 8. vii. "Phosphat of Lead. Phosphoric acid has but little action on lead; however, when allowed to remain long in contact with it, the metal is partly oxidated, and converted, into an infoluble phosphat. The phosphat of lead may be eafily formed by mixing the alkaline pholphats with nitrat of lead. The falt immediately precipitates in the state of infoluble powder. falt is found native in different parts of the world." (See MINERALOGY, Part Il. Chap. VII. Class IV. Order VIII. Gen. III. Sp. 3.) "Its colour is then utually green or yellow, and it is often crystallized in fix-sided prisms. It is insoluble in water, unless there be a considerable excess of acid; but it is soluble in pure soda, and probably forms with it a triple salt. When heated, it melts, and assumes on cooling a regular polyhedral form. In a red heat it is decomposed by charcoal, which absorbs the oxygen from both of its component parts. The sulphuric, nitric, and muriatic acids, decompose it by abstracting its base while cold; but these decompositions do not take place in a krong heat. The yellow phosphat of lead, from Lead-Hills in Scotland, is composed according to my analysis," (says the Dr) "abstracting the impurities with which it is usually mixed, of 18 acid and 82 white oxide."

viii. "PHOSPHAT OF LIME AND ANTIMONY. The well known medicine, called JAMES'S POWDER, has been shewn by the analysis of Dr Pearfon, to be a compound of phosphoric acid, lime and oxide of antimony; we may therefore consider it as a triple salt." (See PHARMACY, Index.) "The energy with which it acts as an emetic is well known. From Dr Pearson's analysis, it appears to be composed of about 43 parts phosphat of lime, 57 oxide of antimony. It may be composed by calcining into a white heat a mixture of equal parts of sulphuret of antimony and the athes of bones."

ix. "PHOSPHAT OF MANGANESE. Phosphoric acid has but little action on mangancse or its oxides, because it forms with them a salt difficultly soluble in water. But phosphat of manganese may be obtained in the form of a precipitate, by mixing an alkaline phosphat with the solution of manganese in any of the three mineral acids. This salt has not been examined."

x. "PHOSPHATOF MERCURY. Phosphoric acid does not act on mercury, but combines with its exide, and forms phosphat of mercury. This salt is formed most conveniently by mixing together the solutions of nitrat of mercury and phosphat of solutions. The salt immediately precipitates in the state of a white powder. This salt has been lately introduced into medicine, and seems to answer equally well with the other mercurial preparations. It phosphoreses when rubbed in the dark; and when distilled it yields phosphorus, like the other metallic phosphats. Its specific gravity is 40825.

4'9835.
xi. "PHOSPHATOF NICKEL. Phosphoric acid is capable of dissolving only a very small portion of the oxide of nickel. The solution does not yield crystals, and has scarcely even a green colour. Hence it would feem that the phosphat of nickel

is nearly infoluble."

xii. "Phosphat of Silver. Phosphoric acid does not act upon filver, but it combines readily with its oxide. Phosphat of filver is precipitated in the state of a white powder, when phosphoric acid is poured into liquid nitrat of filver. It is infoluble in water, but soluble in an excess of phosphoric acid; when heated strongly in a crucible, a little phosphorus comes over, and phosphuret of filver remains in the retort."

xiii. "PHOSPHAT OF TIN. Phosphoric acid (fays our learned author) has scarcely any actron on tin, unless when it is exposed dry, and mixed with that metal, to the action of a strong beat. In that case part of the acid is decom-

posed, its phosphorus combines with one portion of the tin, and forms a phosphoret, while the oxide of tin unites with the undecomposed action and forms a phosphat. This salt precipitates also when the alkaline phosphats are mixed with solution of muriat of tin; but its properties has never been examined."

xiv. "PHOSPHAT OF URANIUM. Phosphoriacid forms with oxide of uranium yellowish white flakes, scarcely fosuble in water. The fall makes precipitated by adding phosphoric acid to the

acetite of uranium.

EV. "PHOSPHAT OF ZINC. Phosphoric acid tacks zinc with effervescence, and a white powis gradually deposited, which is the phosphoric of the falt may be formed also by pouring a kaline phosphat into the solutions of solutions, or muriat of zinc. It is nearly insolute water."

To PHOSPHATE. v. a. To combine with phosphoric or phosphorous acid.

(1.) PHOSPHATED, part. adj. Combined with phosphoric or phosphorous acid.

(2.) PHOSPHATED IRON, a species of falt dim of which the ingenious Dr Thomson gives the lowing account: " Phosphoric acid has but I action upon iron. However, if that metal exposed to the contact of phosphoric acidal ven to the folutions of falts that contain that it is gradually oxidated, and converted into phate of iron. The properties of phosphated have not been examined with attention. Sci has thewn that the acid combines with both ides, and forms both a phosphat and any the of iron. Fourcroy and Vauquelin have land certained that there are two varieties of this falt; one of which had been described by Burg Meyer, Klaproth, and Scheele, and another excess of bale, and consequently a fub-ony which these philosophers first observed." See PHAT, No II, 4. 5, and 6.

PHOSPHIS, a falt formed by the min PHOSPHITE, the phosphorous acid, different bases. (See Chemistry, Inder Vocab. II.) Phosphites form the 8th genus of in Dr Thomson's System of Chemistry. "Th falts (fays he) have been lately examined, for first time, and their properties described, by Fo croy and Vauquelin. They may be diftinguil by the following properties: 1. When heated, the emit a phosphorescent flame. 2. When diffiled a strong heat, they give out a little phosphor and are converted into phosphats. 3. Detos when heated with nitrat or oxy-muriat of pot and are converted into phosphats. 4. Come into phosphats by nitric and oxy-muriatic 5. Fufible in a violent heat into glass. The pl phites at prefent known amount to feven," or ther eight: viz.

r. "Phosphite of Alumina may be proved by faturating phosphorous acid with aluminand then evaporating the alumina to a proper of fiftence. It does not crystallize, but forms a stronus mass, which dries gradually, and does afterwards attract mossture from the air. Its is aftringent. It is very soluble in water. Whe heated it frothes, and gives out phosphorus, but heated it frothes, and gives out phosphorus, but it does not readily melt into a globule of glass.

". " PHOSPHITE OF AMMONIA may be prepared or diffolying carbonat of ammonia in phosphorous cid, and evaporating the folution flowly till it deofites crystals of phosphite of ammonia. It crysillizes sometimes in long transparent needles, and metimes in four-fided prisms terminated by fourded pyramids. It has a very fharp faline tafte. the foluble in two parts of water at the temperape of 60°, and still more foluble in boiling wa-When exposed to the air it attracts moisture, becomes slightly deliquescent. When distibuted in the ammonia is disengaged, partly and partly in the state of gas, holding phosin folution, which becomes luminous when with oxygen gas. Before the blow-pipe on toal, it boils and loses its water of crystallizait becomes furrounded with a phosphoreslight, and bubbles of phosphorated hydrogen e emitted, which burn in the air with a liveme, and form a fine coronet of phosphoric vapour. This gas is emitted also, when the beated in a small glass bulb, the tube belongto which is plunged under mercury. This composed of 26 acid, 51 ammonia, and 23

H

PHOSPHITE OF AMMONIA AND MAGNESIA. falt may be formed by mixing together the in folutions of its two component parts. It ingly foluble in water, and may be obtained talt; but its properties have not been exa-

with precision.

PHOSPHITE OF BARYTES may be formed ring phosphorous acid into barytic wathis last water into a solution of phosphite In either cate phosphite of barytes prein the form of a white powder. It is and but very sparingly soluble in water, . here be an excess of acid. It is not altered Mure to the air. Before the blow-pipe it end is furrounded with a light fo brilliant eye can fearcely bear it. The globule forms becomes opaque as it cools. It is d of 41'7 acid, 51'3 barytes, and 7 water. OSPHITE OF LIME may be formed by dif-ine in phosphorous acid; when the fatucomplete, the falt precipitates in the state e powder. It is tasteless and insoluble in but it dissolves in an excess of acid, and herphosphite. This last falt may be obprilmatic crystals by evaporating the fo-This falt is not altered by exposure to the hea heated, it phosphoresces, and emits a ophorus. In a violent heat, it melts into ment globule. It is compeled of 34 acid, and 15 water."

tosthite of Magnesia is best formed by together aqueous solutions of phosphite is or soda and sulphat of magnesia; the le of magnesia gradually precipitates in all white stakes. It has no sensible takes, lebke in 400 parts of water, at the temper 60°, and scarcely more soluble in boiling. When its solution is evaporated slowly, arent pellicle forms on its surface: stakes offied, and towards the end of the process trahedal crystals are precipitated. When it to the air it effloresces. When heated, it bresces and melts into a glass, which be-

comes opaque on cooling. It is composed of 42 acid, 20 magnetia, 36 water."

7. PHOSPHITE OF POTASS is formed by diffolving carbonat of potass in phosphorous acid, and evaporating the solution slowly, till it deposites crystals of phosphite of potass. It crystallizes in sour-sided octangular prisms, terminated by dihedral summits. Its taste is sharp and faline. It is soluble in 3 parts of cold water, and still more soluble in boiling water. It is not altered by exposure to the air. When heated, it decrepitates, and then melts into a transparent globule, which becomes opaque on cooling. It does not phosphoresce so evidently as the other phosphites, perhaps because it contains an excess of potass, which saturates the phosphoric acid as it forms. It is composed of 39.5 acid, 49.5 potass, 11 water.

composed of 39'5 acid, 49'5 potass, 11 water.
8. "Phosphite of Soda. This salt (fays the Dr) may be prepared exactly in the fame way as phosphite of potass:" only substituting (we suppose) carbonat of soda for the carbonat of potais. -" Its crystals are irregular four-sided prisms, or elongated rhomboids. Sometimes it assumes the form of square plates, or of plumose crystals. Its tafte is cooling and agreeable. It is foluble in two parts of cold water, and scarcely more soluble in boiling water. When exposed to the air, it effloresces. Before the blow-pipe it emits a beautiful yellow flame, and melts into a globule, which becomes opaque on cooling. It is composed of 16.3 acid, 23'7 foda and 60 water. It is decomposed by, 1. Sulphats of lime, barytes, strontian, magnesia. 2. Nitrats and muriats of lime, barytes, strontian, magnesia.

\* PHOSPHOR. See Phosphorus § 1.

PHOSPHORACEOUS, adj. [from pho/phorus.] Refembling phosphorus; partaking of the nature of phosphorus.

To PHOSPHORATE. v. a. To combine the phosphoric or phosphorous acid with any base; to endure any substance with the properties of phosphorus.

(1.) PHOSPHORATED, part. adj. combined with phosphoric or phosphorous acid: endued

with the properties of pholphorus.

(2.) PHOSPHORATED AZOTIC GAS, an aerial fluid, thus described by the ingenious Dr Thomfon in his Elem. of Chem. vol. i. p. 67, 68. "Azotic gas very readiny diffolves phosphorus plunged into it. Its bulk is increased about one 40th, and Phosphorated Azotic Gas is the resuit. When this gas is mixed with oxygen gas it becomes luminous, in consequence of the combustion of the dissolved phosphorus. The combustion is most rapid when bubbles of phosphorated azotic gas are let up into a jar full of oxygen gas. When phosphorated oxygen gas, and phosphorated azotic gas, are mixed together, no light is produced, even at the temperature of 82°.

(3.) PHOSPHORATED HYDROGEN GAS, a very combustible aerial fluid, which, according to our learned author, is thus produced:—"When photphorus is introduced into a glass jar of hydrogen gas standing over mercury, and then melted by means of a burning glass, the hydrogen gas diffelives a very great proportion of it. The new compound, thus formed, has received the name of phosphorated hydrogen gas. It was discovered in

#983 by Mr Gengembre, and in 1784 by Mr Kirwan, before he became acquainted with the experiments of Gengembre. But for the fullest investigation of its properties, we are indebted to Mr Raymond; who published differtations on it in 1791 and 1800.—It has a very fetid odour, exactly fimilar to the finell of putrid fish. When it comes into contact with common air, it burns with great rapidity; and if mixed with it, detonates violently. Oxygen gas produces a flili more rapid and brilliant combustion. When bubbles of it are made to pais up through water, they expiode in succession, as they reach the surface of the liquid; a beautiful coronet of white smoke is formed, which rifes flowly to the ceiling. gas is the most combustible substance known. is obvious that its combustion is merely the combination of its phosphorus and its hydrogen with the oxygen of the atmosphere; the products, of course, are phosphoric acid and water. These two lubstances mixed, or rather combined, constitute the coronet of white smoke. Pure water, agitated in contact with this gas, diffolves at the temperature of between 30° and 60° about the 4th part of its bulk of it. The folution is of a colour not unlike that of roll fulphur; it has a very bitter and difagreeable tafte, and a ftrong unpleafant When heated nearly to boiling, the whole of the phosphorated hydrogen gas is driven off unchanged, and the water remains behind in a state of purity. When exposed to the air, the phosphorus is gradually deposited in the state of red oxide; the hydrogen gas makes its eleape, and at last nothing remains but pure water." Sift. Chem. Vol. 1. p. 53.

(4.) PHOSPHORATED OXIDE OF MERCURY, BLACK, an oxide thus described by Dr Thomson: " Mr Pelietter, after feveral unfoccefsful attempts to combine phosphorus and mercury, at last fucceeded by diffilling a mixture of red oxide of mercury and photohorus. Part of the photohorus combined with the oxygen of the oxide, and was converted into an acid; the rest combined with the mercury. He observed that the mercury was converted into a black powder before it combined with the phosphorus. On making the experiment, I found that phosphorus combines very readily with the black oxide of mercury, when melted along with it in a retort filled with hydrogen gas, to prevent the combustion of the phofphorus. As Peiletier could not fucceed in his attempts to combine phosphorus with mercury in its metallic state, we must conclude, that it is not with mercury, but with the black oxide of mercury, that the phofphorus combines. The compound, therefore, is not phosphuret of mercun, but black profeborated oxide of mercury.

(5.) PHOSPHORATED OXIDE OF ZINC. " Phofphorus (fays Dr Thomson) combines with oxide of zinc; a compound which Margraff had obtained during his experiments on phosphorus. When 12 parts of oxide of zinc, 12 parts of phosphoric glais, and 2 parts of charcoal powder, are diffilled in an earthen ware retort, and a firong heat applied, a metallic fubstance sublimes of a fiver wnite colour, which, when broken, has a ritreous appearance. This according to Pelletier is Phofphorated swide of zine. When heated by the blow-

pipe, the phosphorus burns, and leaves behild glafs, transparent while in fulion, but op que an cooling. Profphorated oxide of zinc is obtained also when a parts of zine and one of pheigher are diffilled in an earther returt. The production 1. zine; 2. oxide of zine; 3. a red lubimat which is phosphorated oxide of zige; 4. Ned form crystals, of a metallic brilliancy, and a b ish colour."

PHOSPHORFAL, edj. Of or belonging phosphorus; refembing phosphorus; illumina

brilliantly like phosphorus.

To PHOSPHORESCE, v. n. To take in burn with a lively brilliant flame like phosphor to become phosphoric.

PHOSPHORESCENCE, n. f. The propor

quality of burning like phosphorus.
PHOSPHORESCENT, part. ad. Fiam burning like phosphorus: partaking of the or acid of phosphorus.

PHOSPHORET. See PHOSPHURET. (1.) PHOSPHORIC, adj. Of or belongs phosphorus: partaking of the nature of profit

(2.) PHOSPHORIC ACID, or the Acid of PHORUS, formerly called the MICROCOSNIC See CHEMISTRY, Index. " Phosphore (lays Dr Thomson, in his Seft. of Chem. W 27.) may be formed by fetting fire to a g of phosphorus, contained in a veliel and oxygen gas. The phosphorus burns with rapidity, and a great number of white fall deposited, which are phosphoric acid in 1 purity. It may be obtained too by heating phorus under water till it melt, and their a stream of oxygen gas to pass through means of a tube. In this case the acid ask combines with the water; but the liquel evaporated off by the application of heats the acid remains behind in a flate of per may be procured aifo by diffilling off from phosphorus; but the process is a as the quantity of nitric acid required is able. Phosphoric acid remained unknown ter the discovery of phosphorus. Bujie haps the first chemist who mentions it; graff first examined its properties, and dell ted it to be a peculiar acid. Its properties afterwards more completely investigated by man, Scheele, Lavoisier, Pearson, Fourcie Vauquelin, and several other distinguished mists. Lavoisier first proved that it is com of phosphorus and oxygen. From his d ments it follows, that it is composed of abo photphorus and 61 oxygen. Photpheric when pure, is folid, colourless, and transp It reddens vegetable blues; It has no fud tafte is very acid, but it does not defirey ! ture of organic bodies. When exposed to the air it foon attracts moisture, and deligned to a thick oily-like liquid, in which flate it ally kept by Chemists. When exposed to a na platinum crucible, its water graduals porates, and leaves it in the flate of a trans jelly. If the heat be increased it boils and be owing to the separation of the remainder water, accompanied with a fmall portion of At a red heat it remains in the form of a tra РНО

ent liquid, and when cooled affumes the form of in the urine it exists in excess, holding phosphate be purel crystal. In this state it is known by of lime in solution." e pured crystal. In this state it is known by a nime of Phosphoric Glass. This glass is knely phosphoric acid totally deprived of water. las an acid tait, is very foliable in water, and bquefees when exposed to the air. The speci-M1; in the state of glass, 2.8516; in the state designescence 1'417 .- When in the state of me Bakes, it difforces in water with a hilling fimilar to that made by red hot iron plungno water. When in the flate of gials it difsmuch more flowly. The heat evolved, the combination of this acid and water, is inferior to that evolved when fulphuric enters into a fimilar combination. Phosphoed obtained by deliqueicence, when mixed an equal quantity of diftilled water, acquir-Intle beat as to raise the thermometer only degree, as Mr Sage observed. M. Lavoisier the thermometer from 50° to 63° by mixholphoric acid boiled to the confistence of sup with an equal quantity of water; and \$ 50° to 104° when the acid was as thick as mine. Oxygen gas has no action on phofacid, whatever be the temperature. Neitit decomposed or altered by any of the combustibles, except chargonl; which, tho no action on it while cold, at a red heat detes it completely: carbonic acid is formed, ofphorus sublimed. This is the common for obtaining Phosphorus. This acid table of combining with metals; but when add flate it is capable of oxidating fome of especially when affished by heat; at the he hydrogen gas is emitted. Hence the is owing to the decomposition of wa-Inosphoric acid is capable of oxidating iron, zinc, antimony, bifmuth, manganete. foled with several of these metals, as tin, dzine, it is converted into phosphorus; a, that they have a ftronger affinity for oxygen. saut act upon gold, platinum, filver, copdeury, arfenic, cobalt, nickel. It appears to have some action on gold in the dry it is called; for when fused with gold flumes a purple colour; a proof that the been oxidated. Phosphoric acid comwith acids, earths, and metallic exides, and with them falts, named l'hosphats. (See PHATS, § 1, II.) Its affinities are as follow: ks, frontian, lirne, potafs, foda, ammonia, ida, glucina, alumina, zirconia, metallic oxflica. This acid is too expensive to be into common use. If it could be procu-# a cheap rate, it might be employed with lege, not only in several important chemical baures, but also in medicine, and perhaps he the purposes of domestic economy." (Syll. m Vol. 11, p. 27—30.) Our learned author m Vol. iv. p. 355, "The phosphoric acid is the most abundant of all the acids found in is Combined with lime, it constitutes the of lose; and the phosphat of lime is found muscles and almost all the solid parts of ily neither are there many of the fluids which it is absent. In the blood phosphond is found combined with oxide of iron, and OL. XVII. PART IL

PHOSPHORIZED, adj. a word used by some chemists for phosphorated. See PHOSPHORATED.

(1.) PHOSPHOROUS, adj. Of or belonging to phosphorus: partaking of the nature of phosphorus: combined with the phosphoric or phosa' phorous acid.

(2) Phosphorous Acio. Sec CHEMISTRY, "The acid, (fays Dr Thonnson,) " obtained by the burning of phosphorus, differs according to the rapidity of the combustion; or, which is the same thing, according to the temperature in which the process is conducted. When burnt in oxygen gas, in which case the temperature is the highest possible, the product is pho phoric acid, which contains a maximum of oxygen: When allowed to burn gradually, at the common temperature of the air, the product is pho phorous acid, which contains a minimum of oxy gen. The difference between these two acids had been remarked by Sage, by Prouft, and by Morveau; but it was Lavoifier who first, in 1777, demonstrated that they form different compounds with other bodies, and that the difference between them is owing to the different proportions of Oxygen, which they contain. Phosphorous acid is prepared by exposing phosphorus during some weeks to the ordinary temperature of the atmoiphere, even in winter; when the phosphorus undergoes a flow combustion, and is gradually changed into a liquid acid. Por this purpose, it is ufual to put small pieces of phosphorus on the inclined fide of a glass funnel, through which the liquor, which is formed, drops into the bottle placed to receive it. From one ounce of phofe phorus about 3 oz. of acid liquor may be thus prepared. It was called phlogiflicated phofiloric acid by Morveau, from a supposition that it was a compound of phesphoric acid and phlogiston. Phosphorous acid, thus prepared is a vilcid liquid, of different degrees of confiftence, adhering like oil to the fides of the glass vessel in which it is contained. It emits the smell of garlic, especially when heated. Its tafte is acid, like that of phosphoric acid, and it produces the fame effect upon vegetable colours. It combines with water in every proportion, but it cannot, like phosi horic acid, be obtained in a concrete state. We en heated, part of the water which it contains is at first evaporated; then large bubbles of air rise to the furface, there they break and emit a done white imoke, or even take fire, if the experiment be performed in an open vettel. The emiffion of there bubbles of phosphorated hydrogen gas continues for a long time: when the process is finished, the acid which remains is no longer abospha-Nun

row out phosphoric acid. These phenomena would lead one to suspect, that phosphorous acid is not, as has been hitherto supposed, a compound of phosphorus and oxygen, but that it is phosphoric acid faturated with photphorated hydrogen gas. This acid is converted into phosphoric acid by expolure to air or oxygen gas. The process is exceedingly flow, and the conversion is never complete. It fucceeds better when the acid is diluted with a great proportion of water. Phosphorous acid is not acted upon by any of the simple combuffibles, except charcoal, and perhaps hydrogen. Charcoal decomposes it at a red heat, as well as phosphoric acid. The products are carbonic acid and phosphorus. Its action on metals is exactly fimilar to that of phosphoric acid, excepting only that the hydrogen gas, evolved during the oxidation of the metals, has a fetid finell, and holds phosphorus in solution. It combines with alkalies, earths and metallic oxides, and forms compounds distinguished by the name of Phosphites." PHOSPHITE, No 1-8.) " Sulphuric acid produces no change upon it while cold; but at a boiling heat it parts with some of its oxygen, and the phosphorous acid is converted into phosphoric acid. Nitric acid also, when assisted by heat, converts it readily into pholphoric acid. This furnishes us with by far the best process for obtaining PHOSPHORIC ACID at prefent known. Mix phosphorous acid, obtained by flow combustion, with one 8th of its weight of nivic acid of the same specific gravity 1 3, and distil. The nitric acid is decomposed, and pure phosphoric acid remains behind. For this process we are indebted to Fourcroy. (ii, 86.) The affinities of phofphorous acid, as afcertained by Bergman, Foureroy, and Vauquelin, observe the following order: Lime, barytes, strontian, potass, soda, ammonia, glucina, alumina, zirconia, metallic oxides." Syff. of Chem. Vol. II. p. 30-33.

(3.) Phosphorous Hydrogen Gas, a compound aerial fluid, thus produced: "When bits of phosphorus" (fays our learned author) " are kept for some hours in hydrogen gas, part of the phosphorus is dissolved. This compound gas, to which Fourcroy and Vauquelin, the difcoverer of it, have given the name of phosphorous hydrogen gas, has a slight smell of garlic. When bubbles of it are made to pass into oxygen gas, a very brilliant bluish slame is produced, which pervades the whole veffel of oxygen gas. It is obvious, that this flame is the confequence of the combustion of the diffolved phosphorus." (Syft. Chem. Vol. I. p. 57.) Perhaps it is by this preparation of the hydrogen gas, or by that of the phosphorated hydregen gas, that Mr Lebon illuminates his THER-MOLAMPE. See HYDROGENE GAS, and Phos-FHORATED, § 3. (1.) \* PHOSPHORUS. PHOSEROR. n. f.

[phofehorus, Lat.] 1. The morning flar. Why fit we fad when phosph'rus shines so clear?

2. A chemical fubflance which, exposed to the air, tales fire.—Phosphorus is obtained by distillation from urine putrified, by the force of a very vchement and long continued fire. Pemberton .- Of lambent flame you have whole sheets in a handful of phosphor. Addison.-Liquid and folid phosphorus,

thow their flames more confpicuously, when exposed to the air. Cheyne.

(2.) PHOSPHORUS, (§ 1. d.f. 2.) 18 a name given to certain ful ftances which shine in the dark without emitting heat. By this circumstance ther are distinguished from the Pyrophon, which though they take fire on being exposed to the an are yet entirely destitute of light before the expofure. See CHEMISTRY, Index. Befides the however, it has been found that almost all tend trial bodies, upon being exposed to the light, of appear luminous for a little time in the dak, at tals only excepted. This points out a gental vision of the phosphori into two classes; sam fuch as require to be exposed to the light of of the fun or of fome artificias fire, befores become luminous; and fuch as do ret. 0 former kind are the Bolognian phosphorus, ton's phesphorus, the phosphori from eaths Of the latter kind are rotten wood, the kin fishes, and the phosphorus of urine. (See Lin To thefe we may add forme others 9, 10.) stances which become luminous in another ri viz. the mass which remains after the dalla of volatile fal ammoniac with chalk, lost in and the phosphorus of tirine dissolved in of wine. The first, which is a composite the muriatic acid of the fal ammoniac with chalk, after being fused in a crucible, be luminous when struck with any hard bodys fugar is luminous when grated or fcraped dark; and the foiution of phosphorus in fra wine is luminous only when dropped into w and even then the light is only perceited the drops fall into the liquid. One part of phorus communicates this property to be parts of spirit of wine. There is a new difference between the light of rotten wood es, and that of phosphorus of urine, even is not in an ignited state; for this last de cease to be luminous even when included an exhausted receiver; the contrary happens to rotten wood and fishes. I strongly blown upon this phosphorus from of bellows, it will extinguish its light for time, which is not the case with the other When kept in water, and placed in a walk the phelphorus of prine discharges such and bright flashes into the air above it, as me to surprise, and even frighten those who are acquainted with it. These coruscations are tracted in their passage through the walcaexpand as foon as they get above it; how the experiment can only be tried to advantage warm weather, and in a cylindrical glass to bove three quarters filled with water. The nonicina exhibited by the earthy phosphoria ry curious; both on account of the tingular cumftances in which they exhibit their lights the varieties observed in the light itself. Ail emit no light till they have been first expent the light of the fun, or fome other luminers dy. After that, they are luminous in the for a confiderable time; but by degrees light dies away, and they emit no more till another exposure to the sun. But if this happen to be too long continued, they are then incorrably spoiled. The same thing will happen in his too much heated without any exposure to tht. If a pholphorus, which has just coased to luminous, be heated, it will again emit light ithout any exposure to the fun; but by this its isophoric quality is weakened, and will at last dettroyed. Indeed these phosphori are so tenr, and impatient either of light or heat, that sheft method of rendering them luminous ocsmally, is by discharging an electric bottle them. The light of the flash immediately the phosphorus, and it continues lumi-for a confiderable time, after which it may be revived by another flash, and so on. wer, with all the ware that can be taken, phosphori are very far from being perpetufor his any method been yet fallen upon to er them fo. . The fingularities in the light e pholobor, arc, that they emit light of ma-liferent and most beautiful colours. This difone will at first emit a green, others a red, n a noiet, &c. at their formation. How-the best kinds agree in this strange proper-at if they are exposed to a red light, they are light in the dark; and the same of owours. But this must not be understood it limitation; nor is the phosphoreal light time fo bright as the luminous body, whatwas, by which it was kindled. Neither to imagine, that any particular phosphoa particular kind of light appropriated to the same phosphorus which at one time purple light, will at another emit a green, t of some other colour.

" Phosphorus," (says Dr Thomson,)
pure, is of a clear, transparent, yellowish but when kept fome time in water, it sopaque internally, and then has a great since to white wax. Its confiftence is that of wax; it may be cut with a knife, led to pieces with the fingers. It is infolurater. Its specific gravity is 1.714. It melts emperature of 99°. Care must be taken to osphorus when meited under water; for combustible, that it cannot be melted in air, without taking fire. When phofa newly prepared, it is always dirty, beed with a quantity of charcoal dust and Inpurities. These may be separated by it under water, and squeezing it while through a piece of clean shamoy leather." sequent operations are described under STRY, as well as the history of its disco-1669, by Brandt, Boyle, and Kunckel; frand respecting it by Kraft. made it from urine; but in 1769, Gahn, the chemist, discovered that phosphorus is kd in bones; after which, it was repeatedaded from them by Scheele, Chaptal, and Dr Thomson recommends the following 🏲 🍕 Fourcroy and Vauquelin: "Let a of bones be burnt, till they ceale to or to give out any odour; and let them and be reduced to a fine powder. Put owder into a bason of porcelain; dilute it times its weight of water, and then add

(Firring the mixture after every addi-

tion) two 5ths of the weight of the powder of fulphuric acid. The mixture becomes hot, and a vast number of air bubbles are extricated. Leave the mixture in this state for 24 hours, taking care to flir it well every now and then with a glass or porcelain rod, to enable the acid to act upon the powder. The whole is now to be poured on a fister of cloth; the liquid which rups through is to be received in a porcelain bason; and the white powder which remains on the filter, after pure water has been poured on it repeatedly, may be thrown away. Into the liquid in the porcelain baton, which has a very acid tafte, fugar of lead is to be poured flowly; a white powder immediately falls to the bottom; the fugar of lead must be added as long as any of this powder is formed. Throw the whole upon a filter. The white powder which remains is to he well washed, allowed to dry, and then mixed with one 6th of its weight of charcoal powder. This mixture is to be put into the earthen wave retort; A, Plate 273. The retort is to be put into a find bath B, and the beak of it plunged into a vessel of water C, just under the surface. Heat is now to be applied gradually till the retort be made red bot. A vast number of air bubbles iffue from the beak of the retort, some of which take fire when they come to the furface of the water. At last there drops out a substance, which has the appearance of melted wax, and which congeals under the water. This substance is phosphorus."—" If the air be excluded, phosphorus evaporates at 219°, and boils at 554°. When phosphorus is exposed to the atmosphere, if the temperature be not lower than 43°, it emits a white smoke, which has the smell of garlic, and is luminous in the dark. It is occasioned by the gradual combustion of the phosphorus, which at last disappears. The combustion of phosphorus, like that of fulphur, is nothing elfe than its combination with oxygen: for during the process, no new fubftance appears, except the acid, accompamed with much heat and light.-Phosphorus is capable of combining with many other bodies: the compounds produced are called Phosphu-RETS. Phosphorus, used internally, is poisonous. In very small quantities, (as one 4th of a grain,) when very minutely divided, it is faid by Leroi to be very efficacious in restoring the force of young persons exhausted by sensual indulgences." Sift. of Chem. vol. 1. p. 34-43.

(4.) PHOSPHORUS, in altronomy, the name among the Greeks for the Morning Star, or the planet Venus, when the rifes before the Sun; called by the Latins LUCIFER, and by the French, Etoile de Berger.

(8.) PHOSPHORUS, MEDICINAL EFFECTS OF.
This extraordinary fubstance, has littly been employed as a medicine, by Alphonsus Leroi, professor at the Medical School of Paris. Its effects are thus described in the Bulletin de la Societé
N n n 2

Philo-

Philomatique, 1798. 1. Phosphorus, administered Internally in confumptions, gives a certain degree of activity to life, and revives the patients without raising their pulse. Leroi being called to a woman, at the point of death, who was quite worn out in that disease, which she had laboured under for 3 years, in compliance with the defire of her husband, composed a medicine of a portion of fyrup diluted with water, in which a few flicks of phosphorus had been kept. Next day the found herfelf much better. She was greatly revived for a few days; and did not die till about a fortnight after. 2. Leroi himfeif was so imprudent, as to take 2 or 3 gr. of folid phosphorus, combined only with treacle, from which he experispeed the most dreadful symptoms. At first be felt a burning heat in the whole region of his fromach, which feemed to be filled with gas that escaped by the mouth. Being dreadfully tormented, he tried to vomit, but in vain; and found relief only by drinking cold water from time to time. His uneasy sensations were at length allayed; but next murning be was endued with an aftonishing muscular force, and was urged with an almost irresissible impulse to try its energy. The effects of this medicine at length ceased, adds the author, a la fuite d'un priapifme violent! 3. In many cases he employed, and still employs, phosphorus internally with great benefit, to reftere and revive young persons exhausted by excelles. He divides the phosphorus into very small particles, by fliaking it in a glass filled with boiling water. He continues to shake it, plunging it into cold water, and thus obtains a kind of precipitate of phosphorus, exceedingly fine, which he bruifes flowly with a little oil and fugar, or afterwards uses as a liquid electuary, by diluting the whole in the yolk of an egg. By this medicine he has made attonishing cures, and reflored the strength of his patients in a very short time, 4. In malignant fevers, the use of phosphorus internally, to check the progress of ganguene, has The author refucceeded beyond expectation. lates feveral inftances. 5. Pelletier told him, that having left, through negligence, some phosphorus in a copper bason, that metal was oxydated, and remained suspended in the water. remained suspended in the water. Having thoughtlessly thrown out the water in a small court in which ducks were kept, these animals drank of it, and all died. Mais le male (fays the author) convrit toutes ses semelles jusques au dernier ir ftant de sa vie !" This accords with the effect experienced by Leroi. 6. He relates a fact which proves the allonishing divisibility of phosphorus. Having administered to a patient some pills, in which there was above 4 of a grain of phosphorus, and having occation afterwards to open the body, he found all the internal parts luminous; and even the hands of the person, who had per-formed the operation, though washed, and well dried, retained a phosphoric splendor for time after. 7. The phosphoric acid, used as a lemonade, has been serviceable in the cure of a great number of diteases. 8. Leroi says, that he bxydated iron with phosphorus, and obtained, 1. the common means, a white oxyd, almost irreducible, which he thinks may be employed with advantage in the arts, particularly in paint-

ing with oil, and in enamel, instead of the whi oxyd of lead. This white oxyd of hon occalion ed violent retchings to the author, who rentme to put a small particle of it on his tongue. I therefore confiders this oxyd as a terrible police He was not able to reduce it but by fixed alka and the glass of phosphorus. 9. By phosphor he decomposed and separated from their ba the fuiphuric, muriatic, and nitric acid; by t phosphoric acid he transmuted earths; and w calcargous earth he can make magnetia. By ph phorus he can effect the diffipation of rubes, fusion of emeralds, and the vitrification of a cury. (Philaf. Mag. Vol. 2.) If Botth at tioners wish to try this medicine, they need, after Leroi's experiments, to do it utmost caution.

(9.) PHOSPHORUS OF HOMBERG is the with the MURIAT OF LIME. See CHEMIN

Index.

PHOSPHURE, or PHOSPHORET. A PHOSPHURE I, return, a compound produced by a combination of non-orgholophorus with different bases. Of thek a described by Dr Thomson, in his Spt of Vol. 1.

1. PHOSPHURET OF ANTIMONY. "We qual parts of antimony and phosphorical mixed, with a little charcoal powder, and in a crucible, phosphuret of antimony acced. It is of a white colour, britte, appearing the when broken, and at the fraction number of small cubic facettes. When me emits a green flame, and the white oxydomeny sublimes. It may likewise be proposed fusing equal parts of antimony and poof glas; or by dropping phosphorus more antimony." Sift. of Obem vol. 1. 188.

antimony." S.ft. of Chem vol. 1. 188.

2. PHOSPHURET OF ARSENIC. "And bines readily with phosphorus. The ple may be formed by diffilling equal partie gredients over a moderate fire. It is brilliant, and ought to be preferved in may be formed also by putting equal phosphorus and arfenic into water, and the mixture moderately hot." Syst of Chem.

p. 197.
3. "PHOSPHERET OF BARYTES may be ed, by putting a mixture of phosphorus as rytes into a glifs tube close at one end, and ing the mixture, by putting the tube upon ing coals. The combination takes place upoidly. This phosphuret is of a dark how lour, very brilliant, and very suffice. When tened, it exhaies the odour of phosphorus drogen gas. When thrown into water, it dually decomplosed, phosphorated hydres is emitted, which takes fire when it comes suffice of the water, and the phosphorus dually converted into phosphoric acid."

4. PHOSPHURET OF CARROY. "Phosp is capable of combining with carbon or charles the capable of combining with carbon or charles the capable of carbon was first examined by Prous, the celebrated professor of chemistres of Spain. It is the red substance from in Spain. It is the red substance from the capable of the capable

from it a small quantity of phosphorus which it contains in excess, it should be put into a retort, and exposed for some time to a moderate heat. What remains behind is the pure phosphuret of carbon. It is a light slocky powder, of a lively range red, without taste or smell. When heated in the open air, it burns rapidly, and a quantity of charcoal remains behind." Ibid. p. 51.

5. "PHOSPHUAET OF COBALT may be formed by heating the metal red hot, and then gradually dropping in small bits of phosphorus. It comparabout one 15th of phosphorus. It is white and butle, and when exposed to the air, soon has its metallic luttre. The phosphorus is separated by heat, and the cobalt is oxydated. This phosphuret is much more sufficient much cobalt.

Nd. p. 204.

6. "PHOSPHURET OF COPPER WAS first formid by Margraf, by distilling phosphorus and oxide I copper together. It formed most easily by soleding phosphorus into red hot copper. It is it a white colour, and, according to Pelletier, is purposed of 20 parts of phosphorus, and 80 of apper. It is harder than iron; it is not ductile, at cannot eafily be pulverifed. Its specific graity is 7 1220. It crystallizes in four-sided prisms. is much more fulible than copper. When exled to the air, it loses its luttre, becomes black, to pieces, the copper is oxydated, and the phorus converted into phosphoric acid. en heated, the phosphorus burns, and leaves supper under the form of black scorize. M. dier formed this phosphuret by melting 16 of copper, 16 of phosphoric gials, and one

PHOSPHURET OF GOLD. "Mr Pelletier being gold with phosphorus, by melting to-ther in a crue-ible haif an ounce of gold and an acc of phosphoric glass, surrounded with character of phosphuret of gold thus produced was the, whiter than gold, and had a crystalized granance. It was composed of 23 parts of gold, one of phosphorus. He formed the same pound by dropping small pieces of phospho-

into gold in fution." Ibid. p. 90.

"PHOSPHURET OF IRON may be formed fuling in a crucible 16 parts of phosphoric 1, 16 parts of iron, and half a part of charcoal arder. It is magnetic, very brittle, and appears its when broken. When exposed to a strong that melts, and the phosphorus is dissipated. Imy be formed also by melting equal parts of sosphoric glass and iron filings. Part of the iron minises with the oxygen of the phosphoric 1s, and is vitrified; the rest forms the phosphorus, which sinks to the bottom of the crucible. The britten into iron since ir

\*\* PHOSPHURET OF LEAD may be formed writing together equal parts of filings of lead and phosphoric glass, and then fusing them in a ruchle. It may be cut with a knife, but speates into plates when hammered. It is of a filter white colour with a shade of blue, but soon amilies when exposed to the air. It may also

be formed by dropping phosphorus into melted lead. It is composed of 12 parts of phosphorus, and 88 of lead." Ibid. 154.

10. " PHOSPHURET OF LIME may be formed by the following process: put into the bottom of a glass tube, close at one end, one part of phosphorus; and holding the tube horizontally, introduce 5 parts of lime in powder, fo that they shall be about two inches above the phosphorus. Then place the tube horizontally among burning coals, so that the part of it which contains the lime may be made red bot, while the bottom of the tube containing the phosphorus remains cold. When the lime becomes red hot, raise the tube, and draw it along the coale, till that part of it which contains the phosphorus is exposed to a red heat. The phosphorus is immediately volatilized, and paffing through the hot lime, combines During the combination, the mass bewith it. comes of a glowing red heat, and a quantity of phosphorated hydrogen gas is emitted, which takes fire when it comes into the air. Phosphuret of lime has a deep brown colour, and is moulded into the shape of the tube. It has no smell, and falls to pieces in the arr. It is infoluble in water, but it decomposes it. Phosphorated hydrogen gas is emitted, which takes fire as foon as it comes to the furface of the water. If phosphuret of lime, after being kept for some time in water, be taken out and dried, it flames when muriatic acid is poured upon it, owing to the rapid emission of phosphorated bydrogen gas." Ibid. p. 432.

phorus may be combined with manganese by meiting together equal parts of the metal and of phosphoric glas; or by dropping phosphorus upon red hot manganese. The phosphuret is of a white colour, brittle, granulated, disposed to crystallize, not altered by exposure to the air, and more sufficient than manganese. When heated, the phosphorus burns, and the metal becomes

oxydated." Ibid. p. 211.

12 "PHOSPHURET OF NICKEL may be formed either by fuling nickel along with phosphoric glass, or by dropping phosphorus into it while red hot. It is of a white colour, and when broke, exhibits the appearance of very slender prisms collected together. When heated, the phosphorus burns, and the metal is oxydated. It is composed of 83 parts of nickel, and 17 of phospho-

rus." Ibid. p. 164.

13. Phosphuret of Platinum. " Platinum unites without difficulty to phosphorus. By mixing together an ounce of platinum, an ounce of phosphoric glass, and a drachm of powdered charcoal, and applying a heat of about 32° Wedgwood. M. Pelletier formed a phosphuret of platinum weighing more than an ounce. It was partly in the form of a button, and partly in cubic crystals. It was covered above by a blackish glass. It was of a filver white colour, very brittle, and hard enough to fireke fire with steel. When exposed to a fire strong enough to melt it, the phosphorus was disengaged, and burnt on the furface. He found also, that when phosphorus was projected on red hot platinum, the metal infantly fused, and formed a phosphuret. As heat expels the phosphorus, Mr Pelletier has proposed this as an easy method of purifying platinum."

Ibid. p. 95.

14. PHOSPHURET OF SILVER. "Silver was fast combined with phosphorus by Mr Pelletier. If one ounce of filver, one ounce of phosphoric gass, and a drams of charcoal, he mixed together, and heated in a crucible, Phosphuret of silver is It is of a white colour, and appears formed. granulated or crystallized. It breaks under the hammer, but may be cut with a knife. It is composed of 4 parts of filver and 1 of phosphorus. Heat decomposes it by separating the phosphorus. Pelletier has observed, that filver in fusion is capable of combining with more phosphorus than solid filver: for when phosphuret of filver is formed by projecting phosphorus into melted filver, after the crucible is taken from the fire, a quantity of phosphorus is emitted the moment the metal congeals. Ibid. p. 99.

15. "PHOSPHURET OF STRONTIAN may be prepared (fays Dr Thomson, p. 436.) by the same process as the phosphuret of barytes;" (see N° 3.)

only fubilituting ferontian for barytes.

16. PHOSPHURET OF SULPHUR. " Phosphorus combines readily with fulphur, as Margraf discovered during his experiments on phosphorus. This combination was afterwards examined by Mr Pelletier. The two fubstances are capable of being mixed in different proportions: 72 grains of phosphorus and 9 of sulphur, heated in 4 oz. of water, melt with a gentle heat. The compound remains fluid till it be cooled down to 77°, and then becomes folid: 72 gr. phosphor. 18 sulphur, coageal at 50°: 72 phof. 36 fulph. at 50°: 72 phof. 72 fulphur at 41: 72 phof. 216 fulphur at 99°. Phosphorus and fulphur may be combined also by melting them together without water; but the combination takes place fo rapidly, that they are apt to rush out of the vessel, if the heat be not exceedingly moderate." Syft. Chem. Vol. I. p. 42.

17. " PHOSPHURET OF TIN may be formed by melting in a crucible equal parts of tin and phofphoric glass. Tin has a greater affinity for oxygen than phosphorus has. Part of the metal therefore combines with the oxygen of the glass during the fusion, and flies off in the state of an oxide, and the reft of the tin combines with the phosphorus. The phosphuret of tin may be cut with a knife; it extends under the hammer, but separates in laminz. When newly cut, it has the colour of filver; its filings refemble those of lead. When these are thrown on burning coals, the phosphorus takes fire. This phosphuret may also be formed by dropping phosphorus gradually into melted tin. PFLLE-TIER, to whom we are indebted for our knowledge of all the phosphurets, fays, it is composed of 85 parts of tin, and 15 of phosphorus." Ib. p. 144.

18. "PHOSPHURET OF TITANIUM has been formed by Mr Chevenix: He put a mixture of charcoal, phosphat of titanium, (phosphoric acid combined with exide of titanium,) and a little borax, into a double crucible, well luted, and exposed it to the heat of a forge. A gentle heat was first applied, which was gradually raised for three quarters of an hour, and maintained for half an hour as high as possible. The phosphuret was found in the crucible in the form of a metallic

button. It is of a pale white colour, brittle and granular; and does not melt before the blow-pip: Ibid. p. 225.

19. PHOSPHURET OF TUNGSTER. "Phosphorus is capable of combining with tungsten, be none of the properties of the phosphure beautiful to the

been ascertained." Ib. p. 216.

20. PHOSPHURET OF ZINC. "Zinc may be combined with phosphorus, by dropping implies of phosphorus into it while in a state of a fion. Pelletier added also a little resin, to prevent the oxidation of the zinc. Phosphuret of zinc is of a white colour, and metallic splends but resembles lead more than zinc. It is sonce malleable. When hammered or filed, it emanded our of phosphorus. When exposed to a highest, it burns like zinc." Ibid. p. 171.

PHOTINIANS, in ecclefialtical history, if of heretics in the 4th century, who denied to vinity of our Lord. They derive their names

PHOTINUS, their founder, who was hiller Sirmium, and a disciple of Marcellus. Photo published, in the year 343, his notions reposit the Deity, which were repugnant both to the thodox and Arian systems. He asserted, that fus Christ was born of the Holy Chost and Virgin Mary; that a certain divine eman which he called the Word, descended upon and that because of the union of the divices with his human nature, He was called the & God, and even God himself; and that the l Ghost was not a person, but merely a celestial tue proceeding from the Deity. Both parist demned the bishop in the councils of Artical Milan, held in the years 345 and 347. lk condemned also by the council at Sirmium 181 and was afterwards degraded from the oping dignity, and at last died in exile in the year or 375. His opinions were afterwards remain Socinus.

PHOTINX. See Music, § 30.

PHOTIUS, patriarch of Constantinoph, one of the finest geniuses of his time. It born in Constantinople, and descended of all family. His merit raised him to the paining for Bardas having driven Ignatius from the Photlus was confecrated by Asbestus in 859. condemned Ignatius in a fynod, whereupon pope excommunicated him, and he, to have the account, anathematized the pope. Balling Macedon, the emperor whom Photius had reved for the murder of Michael, expelled him, reftored Ignatius; but afterwards re-clabin Photius, upon Ignatius's death, in 878. All being wrongfully accused of a conspirary at Leo the philosopher, son and successor to Ball he was expelled by him in 886, and died food ter. He wrote a Bibliotheca, which contains examen of 280 authors: also 253 epiftles; the macanon under 14 titles; an abridgment of the of feveral councils, &c. His natural abilities very great. There was no branch of art or ence, in which he was not versed. He was raifed to the chief dignities of the empire, bell made principal secretary of state, captain of the guards, and a fenator; and in all these stations 20 quitted himself well. His rise to the patriarchal was very quick; for being a layman, he was made

ats, to be one 3d of the whole that fell ue mirror. OXUS, a general of the Phocæans, who Lampfacus. Polyan. 8.

RAATES, or PHRAHATES. The name of of Parthia. See Parthia, § 3-5.

AGANDÆ, an ancient people of Thrace. 26, c. 25.

MORTES, the fon of Dejoces, and the 2d the Medes, succeeded his father about 657, and reigned 22 years. He was killfruitless attempt on Nineveh, and was suc-

by his fon Cyaxares L PHRASE. n. f. [peneis.] 1. An idiom; a of speech peculiar to a language. 2. An ex-

a mode of speech. Now mince the fin,

mollify dampation with a phrase. Dryden. fear the Lord, and depart from evil, are which the scripture useth to express the of religion. Tillotfon. 3. Stile; expression.—
Thou speak'st

better pbrose and matter than thou didft. Sbak.

(24) PHRASE, in grammar, an elegant turn os manner of speech, peculiarly belonging to this or that occasion, this or that art, or this or that language. Thus we fay, an Italian phrase, an eastern pbrase, a poetical pbrase, a rhetorical phrase.

(3.) PHRASE is fometimes also used for a short fentence, or imall fet or circuit of words, constructs ed together. In this sense, Father Busher divides phrases into complete and incomplete. Phrases are complete where there is a noun and a verb, each in its proper function; i. e. where the noun expresses a subject, and the verb the thing affirmed of it. Incomplete phrases are those where the nound and the verb together only do the office of a noun; confishing of several words without affirming any thing, and which might be expressed in a single word. Thus, that which is true, is an incomplete phrase, which might be expressed in one word? truth; as, that subich is true fatisfies the mind, i. e. truth fatisfies the mind.

(4.) PHRASE, in music. (See Music, Part I. Chap. IV. 9 43.) A phrase, in melody is a series of modulations, or in harmony a fuccession of chords, which form without interruption a fenfe more or less complete, and which terminate in a repose by a cadence more or less perfect, Rousseau.

\* To Phrase. v. a. [from the noun.] To ttile; to call; to term.

These suns,

For so they phrase them, by their heralds challenged

The noble spirits to arms. Shak. Henry VIII. (1.) \* PHRASEOLOGY. n. f. [φρασιι and λιγω.] 1. Stile; diction.—The scholars of Ireland seem not to have the least conception of a stile, but run on in a flat phraseclogy, often mingled with barbarous terms. Swift's Miscellanies. 2. A phrase book. Ainsworth.

(2.) PHRASEOLOGY is also used for a collection of the phrases or elegant expressions in any lan-

guage. See Phrase, § 2.
PHREAS, John, M. D. an English physician, born at London, in the end of the 14th century. He was educated at Oxford and became fellow of Baliol college. He translated from the Greek into Latin, Diodorus Siculus, and other ancient works. He read lectures on medicine at Ferrara, Florence and Padua, at which last university he was prefented with his degree. He died in 1465.

PHREATIS, or in Grecian antiquity, was a PHREATIUM, court belonging to the civil government of Athens, fituated upon the fea-shore, in the Piræus. The name is derived from are me penales, because it stood in a pit; or, as others suppose, from the hero Phreatus. This court heard fuch causes as concerned persons who had fled out of their own country for murder, or those that sleet for involuntary murder, and who had afterwards committed a deliberate and wilful murder. The first who was tried in this place was Teucer, on a groundless suspicion that he had been accessory to the death of Ajax. The accused was not allowed to come to land, or so much as to east anchor, but pleaded his eause in his bark; and if found guilty, was committed to the mercy of the winds and waves, or, as fome fay, fuffered there condign punishment; if innocent, he was only close of the fecond tact, and, according to cuttom, underwent a twelvemonth's banishment for the former.

See Potter's Gr. Antig. vol. i. p. 111.
(1.) PHRENETICK. PHRENTICE. adj. [perm-Dass; phrenetique, Fr.] Mad; inflamed in the brain; frantick.—Phreneticks imagine they fee that without, which their imagination is affected with within. Harvey.-

What cestrum, what phrenetick mood,

Makes you thus lavish of your blood? Hudibras. The world was little better than a common fold of phrenticks and bedlams. Woodward's Nat. Hift.

(2.) PHRENETICK is used of those who, without being absolutely mad, are subject to such strong fallies of imagination as in some measure pervert their judgment, and cause them to act in a way different from the more rational part of mankind.

(1.) \* PHRENITIS. n. f. [peinris.] Madness; inflammation of the brain.—It is allowed to prevent

a phrenitis. Wifeman's Surgery.

(2.) PHRENITIS is the fame with PHRENSY; an inflammation of the meninges of the brain, attended with an acute fever and delirium. See MEDI-CINE, Index; also an account of a strange degree of phrenzy which attacked Charles VI. of France, under the article FRANCE, § 33.

PHRENSY. n. f. [from Pennes; phrenefie, Fr. whence, by contraction, phrensy.] Madness; frantickness. This is too often written frenzy.] See FRENZY.-Many never think on God, but in extremity of fear, and then they think and do as it

were in a phrenfy. Hooker .-

Demoniack phrenfy, moping melancholy. Milt. -Would they only please themselves in the delusion, the phrenfy were more innocent; but lunaticks will needs be kings. Decay of Piety. - Phrenfy or inflammation of the brain, profuse hemorrhages from the nose resolve, and copious bleeding. Arbutbnot on Aliments.

60 miles N. of Barguzinsk.

PHRONIMA, the daughter of Elearchus, K. of Crete, wife of POLYMNESTUS and mother of Battus, the founder of Cyrene.

PHRURI, an ancient nation of Scythia.

(I.) PHRYGANEA, a genus of infects, of which Barbut gives the following characters. " The mouth is without teeth, but furnished with four palpi: the stemmata are three in number: the antennæ are filiform, and longer than the therax. The wings are incumbent; the under ones are folded." He also informs us, that the genus is divided into two sections; the first of which is characterized, by having two truncated fetæ at the extremity of the abdomen, refembling the beard of an ear of corn; while the second has the abdomen simple, or without appendices. The tarfi of the feet of the first family confist of three articulations; those of the second are composed of five. The wings of this section decline from the

inner margin towards the fides, so as to releable the ridge of a house, and are curved, or turn up wards at their extremity. "This infect (fays Mr Barbut), before it becomes an inhabitant of the air, has lived under water, lodged in a kind of tube or sheath, the inward texture of which is filk; outwardly covered with fand, straws, be of wood, shells, &c. When the hexapod war is about to change to a chryfalis, he ftops up! opening of his tube with threads of a look ture, through which the water makes its but prevents the approach of voracious in The chryfalis is covered with a thin gauze, the which the new form of the infect is eafily d The phryganea, on the point of change element, rifes to the furface of the water, its tube, rifes into the air, and enjoys the of the country, flutters upon flowers and but is foon called away to the water-fide to fite its eggs; whence proceeds its posterity. aquatic larvæ are often found in stagnating where they wrap themselves up in the water cut out into regular squares, and fitted one nother. Trouts are very greedy of thee which is the reason, that in some countries, stripping them of their coats, they make them for fishing-baits." There are various rent species of the phryganea; but exq phryganea bicauda and firiata, they do not rially differ from one another, except in colour.

1. PHRYGANEA BICAUDA is of a deep brown colour; having a fingle yellow long band running across the head and thurs legs are of a brown colour, as are the which are also long and filiform. Two threads, almost as long as the antenna, the abdomen; whence the name, bicand tailed. The wings, which are about a ti er than the body, are veined with brow are narrow at the top, broad below, at were fluck upon the body; which the croffing one over the other. This into is met with on the banks of rivers and waters, carries its eggs in a clufter at its like some spiders.

2. PHRYGANEA STRIATA is a large in a dun colour, except the eyes, which are and has a confiderable refemblance to the plant in the carriage of its wings. The antenral long as the body, and are born straight for The wings are a third larger than the body ving veins of a colour rather deeper than the The feet are large, long, and fomewhat Mr Yeats tells us, that the periæ of Geofron phryganeæ of Linnæus, do not differ general It appears, however, from Yeats's expense that the phryganese remain longer in the than the periæ.

(II.) PHRYGANEE, THE LESSER, VERY IN femble the tineæ; but, upon examining them a glass, the former will be found to be an with small hairs instead of the scales which? the wings of the latter.

PHRYGES, a river of Ana Minor, Phrygia from Caria and falling into the Head

PHRYGIA, a country in Aug. From wh

derived its name is not certain: fome fay it was from the river PHRYX (now Sarabat), which diles Phrygia from Caria, and falls into the Heru; others from Phrygia, the daughter of Aioand Europa. The Greek writers tell us, that country took its name from the inhabitants, these from the town of Brygium in Macedofrom whence they first passed into Asia, and the name of Phrygia or Brygia to the counwhere they fettled. Bochart is of opinion that tract was called Phrygia from the Greek verb not burn or parch; which, according to him, andation of its Hebrew name, derived from of the same signification. No less various opinions of authors as to the exact boundthis country; an uncertainty which gave an observation made by Strabo, viz. that arygians and Mysians had distinct boundabut that it was scarce possible to ascertain The same writer adds, that the Trojans, ms, and Lydians, are, by the poets, all ed under the common name of Phrygians, Claudian extends to the Pfidians, Bithyni-

MERGIA MAJOR, and indeed all Asia Milying in the fifth and fixth northern cliwas in ancient times greatly celebrated for hity. It abounded in all forts of grain; bethe most part, a plain country covered deep rich foil, and plentifully watered by ivers. It was in some parts productive of and other combustible substances. It Il flocked with cattle, having large plains nure grounds. The air was anciently most pure and wholesome, though it is some parts thought extremely gross, great the country lying uncultivated. In Phrywere anciently feveral cities of great cefuch as Apamea, Laodicea, Iliera-Gordium, &c .- There were also some faivers; fuch as Mariyas, Maander, &c. einder is now called Madre or Mindre. Exper. The Phrygians accounted theme most ancient people in the world. Their however, is extremely dark and uncertain. and St Jerome lay, they were descended ogarmah, one of Gomer's fons; and that he known to the Hebrews under the name LAMMANES. The Heathen authors derive on the Brygians, a people of Macrdonia. Phrygians were the offspring of Gomer of fon of Japhet; the word Phrygia being the fimilarity of names. Bochart thinks translation of his name. Josephus Comer the father of the Galatians; but the Galatians, must necessarily mean the as inhabiting that part of Phrygia which ations had made themselves matters of; the funts of Gomer being placed by Ezekiel and of Judgea, near Togarmah (which Botakes to be Cappadocia), long before the pailed over into Afia. The ancient Phrydescribed as superstitious, voluptuous, infinate, without any prudence or forecast, fuch a fervile temper, that nothing but mand ill ufage could make them comply with DL. XVII. PART II,

their duty; which gave rife to several trite and well known proverbs. They are said to have been the first inventors of divination by the singing, slying, and seeding of birds. Their mulic, commonly called the Phrygian mood; is alleged by some as an argument of their effeminacy: Their government was monarchical; and all Phrygia was; during the reigns of some kings, subject to one prince. Ninnacus, Midas, Manis, Gordius, and his descendants, were undoubtedly sovereigns of all Phrygia. But some time before the Trojan war, this country was divided into several petty kingdoms, and we read of divers princes reigning at the fame time. Apollodorus mentions a king of Parygia contemporary with Ilus king of Troy. Cedrenus and others speak of one Teuthras; king of a small country in Phrygia, whose territories were ravaged by Ajax, himfelf flain in fingle combat, his royal feat laid in affice, and his daughter, Tecmessa, carried away captive by the conqueror. Homer mentions Phoreys and Afcanius, both princes and leaders of the Phrygian auxiliaries that came to the relief of Troy. Tantalus was king of Sipylus only, and its diffrict; a prince no lefs famous for his great wealth, than infamous for his covetousness and other detestable vices. That Phrygia was fubdued either by Ninus, as Diodotus siculus informs us, or by the Amazons, as we read in Suidas, is not sufficiently warranted. Most authors, who mention Gordius, tell us, that the Phrygians having fent to confult an oracle, to know how they might put an end to the intestine broils which rent their country into many factions and parties, received for answer, that the most effectual means to deliver themselves and their country from the calamities they groaned under, was to commit the government to a king. This advice they followed, and placed Gordius on the throne. See Gordius, No I. As to their commerce, all we know is, that Apamea was the chief emporium of all Alia Minor.-Thither reforted merchants and traders from all parts of Greece, Italy, and the neighbouring islands. Syncetius fays that the Phrygians were for some time masters of the fea; and none but trading nations ever prevailed on that element. The country produced many choice and uleful commodities, which afforded confiderable exports. They had a fafe coast, and convenient harbours. The Phrygian idols were very numerous. The chief of these was Cybele, who went by a variety of names. (See CYBELE.) They also worshipped Bacchus under the name of Sabazios; and his priests they called Saboi. The hiltory of their kings is uncertain, and the dates of their feveral reigns and actions cannot now be fixed; we shall refer such of our readers, therefore, as with to know what is certain respecting them, to the Ancient Universal History, already quoted more than once in the prefent article. See allo Gordius, Midas, &c.

II. PHRYGIA MINOR. See TROY.

MI. PHRYCIA PROPER, according to Ptolemy, was bounded on the N. by Pontus and Birhynia; on the W. by Myfia, Troas, the Ægean Sea, Lydia, Mæonia, and Caria; on the S. by Lycia; on the E. by Pamphylia and Galatia. It lies between 37° and 41° Lat. N. extending in Lon. from 57° to

62°. The inhabitants of this country, mentioned by Ptolemy, are the Lycaones and Anthemifenii, towards Lycia; and Moccadelis or Moccadine, the Cyddefes or Cydiffes towards Bithynia; and between these the Peltini or Speltini, the Moxiani, Phylacenses, and Hierapolitæ. To these we may add the Berecyntes mentioned by Strabo. Phrygia is commonly divided into the Greater and Lesser Phrygia, called also Troas. But this division did not take place till Troas was subdued by the Phrygians; and hence it is more considered by some Roman writers as a part of Phrygia, than Bithynia, Cappadocia, or any other of the adjacent provinces. In after ages, the Greater Phrygia was divided into two districts or governments; called,

1. PHRYGIA PACATIANA, from Pacatianus, who, under Constantine, bore the great office of the præfectus prætorio of the East: and

2. PHRYGIA SALUTARIS, from some miraculous cures supposed to have been performed there by the archangel Michael.

(1.) PHRYGIAN, adj. Of or belonging to

PHRYGIA.

(2.) Phrygian Stone, in natural history, is the name of a stone described by the ancients, and used by them in dying; perhaps from some vitriolic or aluminous salt contained in it, which served to enliven or fix the colours used by the dyers. It was light and spungy, resembling a pumice; and the whitest and lightest were reckoned the best. Pliny gives an account of the method of preparing it for the purpose of dying, which was by moistening it with urine, and then heating it red hot, and suffering it to cool.—This calcination was repeated three times, and the stone was then fit for use. Dioscorides recommends it in medicine after burning; he says it was drying and astringent.

(1.) PHRYGIANS, the ancient inhabitants of

Phrygia. See PHRYGIA.

(2.) PHRYGIANS, a Christian sect. See CATA-

PHRYGIANS and MONTANISTS.

PHRYMA, in botany, a genus of the gymnofpermia order, belonging to the didynamia class of plants; and in the natural method, ranking in

ine 40th order, Personata.

(1.) PHRYNE, a famous profitute, who flourished at Athens about A. A. C. 328. She was mistress of Paxiteles, who drew her picture, which was one of his best pieces, and was placed in the temple of Apollo at Delphi. We are told that Apolles painted his Venus Anadyomene after he had seen Phryne on the sea-shore naked, and with dishevelled hair. Phryne became so very rich by the liberality of her lovers, that she offered to rebuild Thebes at her own expence, which Alexander had destroyed, provided this inscription was placed on the walls: Alexander diruit, sed meretrix Phyne refecit; which was resused. See Plin. 34, c. 8.

(2.) PHRYNE, a woman who was accused of impiety. When she found that she was going to be condemned, she unveiled her bosom, which so influenced her judges, that she was immediately

acquitted.

PHRYNICUS; 1. a general of Samos, who endeavoured to betray his country. 2. A flatterer

at Athens. 3. A tragic poet of Athens, ellipse to The spis. He was the first who introduced female character on the stage.

PHRYNIS, r. a mulician of Mitykar, was the first who obtained a musical prize #1 Panathenæa at Athens. He added two sings the lyre, which had always been used with by all his predecessors. He stourshed A. A. C. 438. He was originally a cook house of Hiero king of Sicily. 2. A writer reign of Commodus, who made a collection of books, of phrases and sentences from a Greek authors, &c.

PHRYNO, a celebrated general of who flourished about A. A. C. 590.

(1.) PHRYXUS, in fabulous history, Athamas king of Thebes, by Nephele his mother was repudiated, he was pa with the most inveterate fury by his in Ino, because he was to sit on the throne mas, in preference to her children. His apprized him of Ino's intentions upon his according to others, his preceptor; and ter to make his escape, he secured part of ther's treasures, and privately left Book his fifter Helle, to go to their relation Ed of Colchis. They embarked on board a as we are informed by the poets and myth they mounted on the back of a ram, who was of gold, and proceeded on their jour the air. The height to which they were made Helle giddy, and she fell into the feat us gave his fifter a decent burial on the and after he had called the place Hau from her name, he continued his the rived fafe in the kingdom of Æetes, fered the ram on the altars of Mars received him kindly and gave him C daughter in marriage. She had by Melas, Argos, and Cylindrus, whom Crtorus. He was afterwards murdered ther-in-law, who envied him the poster golden fleece; and Chalciope, to pr children from tharing their father's fate, privately from Colchis to Bosotia, as Ino dead. The fable of the flight of Phryxo chis on a run has been explained by the ship on which he embarked was ent by that name, or carried on her prow a that animal. The fleece of gold is according by observing, that Phryxus carried away treatures from Thebes. Phryxus was p mong the conftellations of heaven afterde ram which carried him to Alia is faid to the fruit of Neptune's amour with The daughter of Atlas. This ram the gods by to Athamas to reward his piety and religi and Nephele procured it for her children they were going to be facrificed to the jet Ino. Phryxus's murder was some time after revenged by the Greeks; it having occase famous expedition atchieved under Jason. ny of the princes of Greece, which had for ject the recovery of the golden fleece, punishment of the king of Colchis for his to the fon of Athamas.

(2, 3.) PHRYXUS, a town and river

PHRIXUS.

PHTEMPH

PHTEMPHUTI. See PHUT.

PHTHIA, an ancient town of Thessay, in Phthiotis, E. of mount Othrys, famous for being the birth-place of ACHILLES, hence called Pthius level.

PHTHIOTIS, in ancient geography, a proince of Theffaly between the Sinus Pelafgicus and hus Maliacus, Magnelia, and mount Oeta: also alled ACHAIA. Pauf. x. c. 8.

PHTHIRIASIS, the LOUSY EVIL, [from plue, [ lass.] It is a lousy distemper; children are lequently its subjects, and adults are sometimes mubbed with it. The increase of lice, in a warm wift fituation, is very great; but a cold and dry ke soon destroys them. On the human body 4 hals of lice are diftinguished: 1. The pediculi, so illed because they are more troublesome with eir feet than by their bite. These are in the ads of children, especially if sore or scabby; it often in those of adults, if they are slothful d nasty. (See Pediculus.) 2. Crab-lice, see LICE. 3. Body lice; these infest the body, d breed in the clothes of the nafty and flothful. A fort which breed under the cuticle, and are and in the hands and feet: they are of a round m, and fo minute as often to escape the sight: creeping under the scarf skin they cause an intable itching; and when the skin bursts where y lodge, clufters of them are found there. See atus. A good diet and cleanliness conduce to the destruction of lice. When they are he head, comb it every day; and after each hing, sprinkle the pulv. sein. staph. agr. or ful. Ind. among the hairs every night, and con-it with a tight cap. Codrochius, in his tream lice, fays, that the powdered coc. Ind. exall other remedies; and that it may be mix-In the pulp of apple, or in lard, and applied evehight to the hair. Some affert, that if the pulv. th rad fassafr, is sprinkled on the head, and mined with a handkerchief, it destroys the lice to the skin. The black soap, and the flowtalled cardamine or lady's-smock, are said to be tifics in all cases of lice on the human body. MITHIROPHAGES. See Pediculus.

PHTHISICAL adj. [49-mm, phtyfique, Fr. m petrifick.] Wasting.—Collection of purulent ter in the capacity of the breast, if not suddenly ed, doth undoubtedly impell the patient into a

bifical consumption. Harvey.

PHTHISICK. n. f. [29.06; phtyfic, Fr.] A sumption.—His disease was a phthifick or assistance.

Harry.

L) PHTHISIS. n. f. [49ms.] A confumph-If the lungs be wounded deep, though they upe the first nine days, yet they terminate in a

less or fiftula. W. seman.

2.) PHTHISIS is a species of confumption, ocloud by an ulcer in the lungs. See MEDICINE, 2x. Dr Beddoes has suggested a new theory phihifs, founded on the prevailing pneumatic strine in chemistry. He sixes on the effect of gaaucy in suspending the progress of phthiss, a fact which, by its mode of operation, might gest a method of diminishing the havock oc-

casioned by this distemper. " The foctus (1246) he,) has its blood oxygenated by the blood of the mother through the placenta. During pregnancy there feems to be no provision for the reception of an unufual quantity of oxygen. the contrary, in confequence of the impeded action of the diaphragm, less and less should be continually taken in by the lungs. If, therefore, a fomewhat diminished proportion of oxygen be the effect of pregnancy, may not this be the way in which it arrefts the progress of phthisis? and if so, is there not an excess of oxygen in the fyslem of consumptive persons? and may we not, by pursuing this idea, discover a cure for this fatal disorder." Dr Beddoes thinks, that this supposition is countenanced by the deficiency of oxygen in the blood of pregnant women, of althmatic patients, and of those who labour under fea-scurvy; and by the super-abundance of it in the blood of phthifical persons, indicated by its colour, as well as by the aggravation of the symptoms of consumption by breathing oxygen air, and by the relief from inspiring atmospheric air mixed with carbonic acid air; and, laftly, from the small proportion of deaths among sea-faring people. Supposing acids to act by decomposition, their alleged effects in producing confumption are confiftent with the author's doctrine, as well as the emaciation preceding and accompanying phthisis. From these facts, Dr Beddoes concludes, that " 1. The phthifical inflammation may so alter the structure of the lungs, as to cause them to transmit a more than ordinary portion of oxygen to the blood; or, 2. Some unknown cause having enabled them to transmit, or the blood itself to attract, more oxygen, an in-flummation of the lungs might ensue." Our author in a letter to Dr Erasmus Darwin, gives an account of his treating with success several cases of phthisis according to the principles of this theory. After distinguishing consumptions into two kinds, the florid and the pituitous or catarrhal, he observes, " that the system may be as variously affected by means of the lungs as of the fromach: that it is impossible to doubt, that we are nourished by the lungs as truly as by the stomach: and that what we take in at the former entrance, becomes, like our food a part of the substance of our folids as well as of our fluids. By the lungs we can also introduce effectual alteratives of the blood, and by consequence of all the parts nourished by the blood." He then acquaints us more particularly with the apparatus requifite for the practice proposed. Ist, it should be able to furnish azotic, hydrogen, carbonic, and oxygen airs: our author having, as he fays, " no intention to confine himself to one incurable disorder. adly, The refervoirs should be large, that the patients may be supplied with any quantity that their symptoms may require: and, 3dly, It is neceffary to be able to mix these airs with one another, as well as with atmospheric air, in any pro-portion." These objects, we are told, have been completely attained by a construction not very unlike to that employed in the gazometers of M. Lavoisier, and Dr Van Marum.

PHUL, or Pul, king of Affyria, is by fome
O o o 2
historiana

Liftorians faid to be Ninus under another name,

and the first founder of that monarchy: A renowned warrior. He invaded Ifrael in the reign of Menahem, who became tributary to him, and paid him 1000 talents of filver for a peace: A. A.

PHUT, or PHUTH, the 3d fon of Ham. (Gen. x. 6.) Calmet is of opinion, that Phut peopled either the canton of PHTEMPHU, Pitemphuti, or Phtementi, set down in Pliny and Ptolemy, whose capital was Tharia in Lower Egypt, inclining towards Lybia; or the canton called PHTENOTES, of which Buthus was the capital. The prophets often speak of Phut. In the time of Jeremiah, Phut was under the obedience of Necho king of Egypt. ' Nahum (iii. 9.) reckons up his people in the number of those who ought to have come to the affiftance of No-ammon or Diospolis. See Nu-MIDIA, § 3.
PHYA. See ATTICA, § 9.

PHYCUS, (untis.) a promontory near Cyrene,

now called RAS EL SEM. Lucan. 9.

(1.) PHYLACE, an ancient town of Theffaly, built by Phylaeus. Protefilaus reigned in it, hence called Phylacides. Lu.an. vi. 252.

(2, 3.) PHYLACE, I. a town of Arcadia: Pauf.

viii. 54. 2. A town of Epirus, Liv. 45. c. 26. (1.) \* PHYLACTERY. n. f. [pulax from: phylattere, Fr.] A bandage on which was inferibed fome memorable fentence.—The phylacteries on their wrifts and foreleads were looked on as ipells. Hammond .-

Golden fayings, On large phylatleries expressive writ, Were to the foreheads of the Rabbins ty'd.

Prior. (2.) PHYLACTERY, in general, was a name given by the ancients to all kinds of charms, spells, or characters, which they wore about them, as amulets, to preferve them from dangers or diseases.

(3.) PHYLACTERY also denoted a slip of parchment, wherein was written some text of Holy Scripture, particularly of the decalogue, which the devout people among the Jews wore on the forehead, the breaft, or the neck, as a mark of their religion. The primitive Christians also gave the name phyladeries to the cales wherein they inclosed the relies of their dead. Phylacteries are often mentioned in the New Testament, and appear to have been very common among the Pharilees in our Lord's time.

PHYLACUS, the fon of Deion, K. of Phocis, and founder of PHYLACE in Theffaly. He married Clymene, the daughter of Mynias, by whom he had Iphiclus, the father of PROTESILAUS.

PHYLARCHUS, an ancient Grecian biogra-

pher, who flourished A. A. C. 220. PHYLE, a well fortified village of Attica, near

Athens. Cor. Nop.

PHYLEUS. See PHILEUS.

PHYLICA, BASTARD ALATERNUS; a genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 43d order Dumofe. There are 6 species, of which three are kept in the gardens of this country; but, by reason of their being natives of warm climates, they require to be kept in pots, and housed in winter. They are all

flirnbby plants, rifing from three to five feet high and adorned with beautiful clusters of white flow They are propagated by cuttings.

PHYLLACHNE, in botany, a genus of the ma nandria order, belonging to the monœcia class

PHYLLALIA; 1. a district of 'Arcadia: 2.1

town of Theffaly

PHYLLANTHUS, in botany, SEA-SIDE LAD REL; a genus of the triandria order, belonging ! the monocia class of plants; and in the natur method ranking in the 38th order, Trices There are fix species, all natives of warm counter and rife from 12 to 14 feet to the height of me dling trees. They are tender and cannot bem pagated in this country without artificial heat.

PHYLLEIUS, a mountain, and country, a

Macedonia. Apol. Arg.

(1.) PHYLLIS, in tabulous history, a daughter of Sithon, or, according to others, of Lycura king of Thrace, who received Demophoes I fon of Thefus; who, at his return from the To jan war, had stopped on her coasts. She bear enamoured of him, and did not find him in ble to her passion. After some months of and tenderness and affection, Demophoon set fall Athens, where his domeftic affairs recalled ! He promised faithfully to return within a men but either his diflike for Phyllis, or the imble fituation of his affairs, obliged him to his engagement: and the queen, grown delpe on account of his absence, hanged herself, or cording to others, threw herfelf down a prointo the fea and perished. Her friends mill tomb over her body, where there grew up us trees, whose leaves, at a particular feason de year, fuddenly became wet, as if shedding to for the death of Phyllis. According to as tradition mentioned by Servius, Virgil's come tator, Phyllis was changed by the gods into almond tree, which is called phylla by the Some days after this metamorphofis, Demorevisited Thrace; and when he heard of the of Phyllis, he ran and clasped the tree, who though at that time stripped of its leaves, some ly that forth, and blotfomed, as if still sensible tendernels and love. The absence of Demoph from the house of Phyllis has given rise to aber tiful epiftle of Ovid, supposed to have been wo ten by the Thracian queen about the 4th met after her lover's departure.

(2.) PHYLLIS, in botany, DASTARD HARE EAR, a genus of the digynia order, belonging the pentandria class of plants; and in the nature method tanking under the 47th order, Stellate.

(3.) PHYLLIS, in geography, a country

Thrace, near mount Pangæus.

PHYLLOS; 1. a country of Arcadia: 5 PHYMOSIS. See MEDICINE, Index.

PHYSALIS, the WINTER CHERRY; a genus the monogynia order, belonging to the pentis dria class of plants; and in the natural method ranking under the 28th order, Lurida. Then are 16 species; of which the most remarkable is

PHYSALIS ALKEKENGI, or common winter cherry. This grows naturally in Spain and Italy, The

The roots are perennial, and creep in the ground o a great distance if they are not confined. These, in the spring, shoot up many stalks, which sie to the height of a foot or more, garnished with leaves of various sorts; some of which are agular and obtuse, some oblong and sharp pointed, with long soot-stalks. The slowers are projected from the wings, standing upon slender out stalks; are of a white colour, and have set one petal. They are succeeded by round serie, about the size of small cherries, inclosed a ministed bladder, which turns red in autum, when the top opens and discloses the red sery, which is soft, pulpy, and silled with slat since-shaped seeds. Soon after the fruit is ripe, he stalks decay to the root. The plant is easily ropagated, either by seeds or parting the roots. PHYSALUS. See SCOLOFENDRA.

PHYSCELLA, a town of Macedonia. Mela. PHYSCION, a cape or rock of Bœotia, fa-

PHYSCON, [\$\psi\_n\text{op}, i. e. Big-bellied,] a nickme of a tyrant of Egypt. See EGYPT, \$ 13, 14. PHYSCOS, a town of Caria, opposite Rhodes.

PHYSCUS, a river of Afia, running into the less. Xenophon croffed it with his 10,000 tecks, in their famous retreat from Cunaxa.

HYSETER, the SPERMACETI FISH, in zooth, a genus of mammalia, belonging to the orof cete. There are four species, according to Kerr:

PHYSETER CATODON, the round headed ca, with a fiftula in the finout, and having no
fin. Of this species, 102 of different fizes
cast assore at one time on one of the Orklles, the largest 24 feet in length. The head
mund, the opening of the mouth small. Sibsitys it has no spout-hole, but only nostrils:
Aff Pennant is of opinion, that the former
placed at the extremity of the nose, has
mistaken by him for the latter. Some teeth
his species are an inch and a quarter long, and
he largest part of the thickness of one's thumb.
It top is quite flat, and marked with concentric
tip the bottom is more slender than the top,
pierced with a small orifice; instead of a
thin, there was a rough space. For the meed of extracting the spermaceti from the brain
these creatures, see Spermaceti.

2. PHYSETER MACROCEPHALUS, the bluntyed cachalot, the blunt-beaded cachalot of Pennant, fremaceti whale of Dudley, has no fin on the lek; and the blowing pipe is lituated on the pe of the neck. Of this species Mr Kerr enulates; avarieties: viz.

i. Physerer Macr. Albicans, the white mi-nofed eachalot, of a white colour with a both back. This is about 15 or 16 feet long; it relembles the common whale.

A. PHYSETER MACR. CYNEREUS, the grey bluntfed cachalot; of a blackish ash colour, with a sup on the back. This variety grows to 60 ad cten 70 feet long, by 30 or 40 in circumfeacc; has a very large head, with very small fes; the lower Jaw is much narrower than the Per, and is surnished with a considerable numuly of teeth, which are received into sockets of

The roots are perennial, and creep in the ground the upper jaw when the mouth is shut. It has a o a great distance if they are not confined, hump on the back, about a foot above the generates, in the spring, shoot up many stalks, which rai surface. It is found in Davis's Straits.

iii. Physeter Macr. niger, is black coloured, and has a hump on the back 12 inches high. This variety is found in the European seas; it grows to about 60 feet long and 36 in circumference: the head is exceedingly thick, and the lower jaw, which is fmailer than the upper, has 46 teeth in 2 rows, which rife 21 inches above the gums, and are received into fockets in the upper jaw. The female teats are retractile. The subflance improperly named Spermaceti is procured from this species; and the spermaceti, or white oil is extracted from it. It is found in the S. coasts of Brasil, Patagonia and the Pacific Ocean. Dr Schwediaur fays that AMBERGREASE is ejected from this animal. It feeds on the Sepia Odopodia.

3. PHYSETER MICROPS, the black-beaded cachalot, with a long fin on the back, and the upper jaw confiderably longer than the under one. A fish of this kind was cast ashore on Cramond isle, near Edinburgh, December 22, 1769; its length was 54 feet; the greatest circumference, which was just beyond the eyes, 30: the upper jaw was 15 feet; the lower 10. The head was of a most enormous fize, very thick, and above one 3d the fize of the fish: the end of the upper jaw was quite blunt, and near 9 feet high; the spout-hole was placed near the end of it. The teeth were placed in the lower jaw, 23 on each side, all pointing outwards; in the upper jaw, opposite to them, were an equal number of cavities, in which the ends of the teeth lodged when the mouth was closed. One of the teeth measured 8 inches long, the greatest circumference the same. It was hollow within-fide for the depth of three inches, and the mouth of the cavity very wide: it was thickest at the bottom, and very small at the point, bending very much; but in some the flexure is more than in others. These, as well as the teeth of all other whales are very hard, and cut like ivory. The eyes are very small, and remote from the nose. The pectoral fins were placed near the corners of the mouth, and were only 3 feet long; it had no other fin, only a large protuberance on the middle of the back. The tail was a little forked, and 14 feet from tip to tip. The penis 74 feet long. Linnæus informs us, that this species pursues and terrifies the porpoiles to fuch a degree as often to drive them on shore.

4. Physeter Tursio, the high-finned cachalot. has a very long fin on the back and the ends of the teeth are flat. It inhabits the Northern oceau, and grows fometimes to 100 feet long; the back fin is very long, tharp-pointed and erect, like a fhip's maft, and the blowing pipe is placed flat on the forehead: the teeth are flightly bent and have their ends flattened.

PHYSIC, or PHYSICK, n. f. the art of healing; properly called MEDICINE. The word is formed from the Greek quest, nature; in regard medicine confifts principally in the observation of nature. See MEDICINE, PHYSICK, and PHYSICS.

(1.) \* PHYSICAL. adj. [phyfique, Fr. from phypres, and is furnished with a confiderable numfick.] t. Relating to nature or to natural philosophy;
of teeth, which are received into sockets of not moral.—The phyfical notion of necessity, that
without

without which the work cannot possibly be done. Hamm.—I call that physical certainty, which doth depend upon the evidence of sense. Wilkins.—To reflect on those inumerable secrets of nature and physical philosophy, which Homer wrought in his allegories, what a new scene of worder may this afford us! Pope.—Charity in its origin is a physical and necessary consequence of the principle of reunion. Cherne's Philos. Princ. 2. Pertaining to the science of healing: as, a physical treatise, physical herbs. 3. Medicinal; helpful to health.—

Is Brutus fick? and is it phyfical

To walk unbraced? Shak. Jul. Cafar.
The blood I drop is rather physical

Than dangerous to me. Shak. Coriol.
4. Refembling physick: as, a physical taste.

(2.) PHYSICAL, fomething belonging to, or really existing in, nature. In this sense we say a physical point, in opposition to a mathematical one, which only exists in the imagination; a physical substance or body, in opposition to spirit, or me-

taphytical fubstance, &c.

\*PHYSICALLY. adv. [from physical.] 1. According to nature; by natural operation; in the way or sense of natural philosophy; not morally.—
Time, measuring out their motion, informs us of the periods and terms of their duration, rather than effecteth or physically produceth the same. Brown's Vulg. Err.—The outward act of worship may be considered physically and abstractly from any law. Stilling sleet.—The act of the will commanding, and the act of any other faculty, executing that which is so commanded, be physically and in the precise nature of things distinct. South.—I am not now treating physically of light or colours. Locke. 2. According to the science of medicine; according to the rules of medicine.—He that lives physically, must live miserably. Cheyne.

\* PHYSICIAN. n. f. [physicion, Fr. from physick.] One who professes the art of healing.—

Trust not the physician,

His antidotes are poison. Timos of Athens.

- Some physicians are so conformable to the hu-

mour of the patient, as they press not the true cure of the disease. Bacon.—His gratulatory verse to king Henry is not more witty than the epigran upon the name of Nicolas, an ignorant physical with had been the death of thousands. Peoclam.—

Taught by thy art divine, the fage physician Eludes the urn; and chainsor exiles death. Prior (2.) Physicians, Colleges of. See Col

LEGE, No 6 and 7.

\*PHYSICK. n.f. [borne, which, originally is nifying natural philosophy, has been transferred many modern languages to medicine.] 1. The sence of healing.—Were it my business to medicine frand physick, would not the lafer way be to as full nature herself in the history of disease! La Medicines; remedies.—In itself we define her physick only for health's sake. Hooker.—Use physick only for health's sake. Hooker.—Use physick for many melancholy disease. here

He scapes the best, who nature to repair Draws physick from the fields.

As all scalons are not proper for physics, in times are not fit for purging the body purge.

Davenant. 5. [In common phrase.] A purge. The people use physics to purge themselves all mours. Abbot's Description of the World.

\* To Physick. v. a. [from the noun] purge; to treat with physick; to cure.

The labour we delight in physics, pain.

—It is a gastant child; one that indeed physics subject. Shak. Wint. Tale.—

That will physick the great myrmiden.

We love to be instructed, as well as physical as physic

with pleasure. L'Estrange.

PHYSICO-MATHEMATICS, a science, which of clides those branches of physic, which, of observation and experiment to mathematic culation, undertake to explain the phenomenature.

\* Physico-Theology. n. f. [from the theology.] Divinity enforced or illustrated

tural philosophy.

## PHYSICS.

## DEPINITIONS and OBJECTS OF PHYSICS.

PHYSICS, [Gr. pours, from foru, NATURE,] in its most enlarged sense, comprehends the investigation of every object in nature; and NATURAL Philosophy is a term of the same extent : but ordinary language, particularly among British naruralifts, employs both thefe terms in a much narrower fenle, which it is proper here to define. Under the article Philosophy, we gave an account of that view of nature in which the objects of our attention are confidered as connected by causation; and endeavoured to point out the manner in which this fludy may be most advantageously cultivated. The objects of the contemplation both of the philosopher and the naturalist (if these characters can be supposed distinct) are the whole Universe, which confifts, not of a number of independent existences detached from each other, but of a number of fubitances connected by various refactions and dependencies, to as to form a WHOLE, which is generally flyled the System of

This confideration of the individual of which compose the universe in one fiften is the fult of sober contemplation. The natural his an attempts in vain to describe objects, by informing us of their shape, colour, and other fible qualities. In describing a piece of m for instance, he tells us, that it takes a fine pa that it flrikes fire with feel: that it but quicklime; that it diffolves in aquafortis, precipitated by aikalis; &c. and thus it a that even the description of any thing, with view of afcertaining its specific nature, and the fole purpole of discrimination, cannot be complished without taking notice of its relations to other things. But after all this del tion we are full ignorant of its nature; of its fence, or what makes it that thing and no of thing. We must content ourselves with the covery of its qualities or properties; and it is f assemblage of these which we call its nature. But this is inaccurate. These do not constitute its essence, but are the consequences of it. Yet this is all we can know of its nature. The term property is nothing but a name expressing some relation which the substance under consideration has to other things. This is true of all such terms. Growity, elasticity, sensibility, gratitude, and the size, express nothing but certain matters of full, which may be observed respecting the object of the contemplation in different circumstances of substances with regard to other things. Our notions individuals, therefore, as distinct from each or imply their relations to other things.

PARTS of the Universe.

THE most superficial view of the universe shows serident connection between all its parts. All ings on this globe are connected with each oor by the laws of motion and of mind. Our obe is connected with the whole of the folar tem by gravitation. If we extend our observato the fixed stars, the connection by no ems fails. Their inconceivable distance, ined, renders it impussible for us to acquire any has knowledge of their nature. But they are deatly connected with the folar fystein by the ratity of the light which they emit with that eand by our fun or any shining body. It moves the same velocity, it consists (in most of them) the same colours, and it is reflected, refracted, inflected, according to the fame optical laws. this great and unbounded scene of contemion, our attention is naturally directed to the trut ciaffes of objects in proportion to the inwe take in them. There is nothing in which are so much interested as our seilow men; and before we study their distinctive nature by atding to their characteristic appearances. them continually producing, like ourn of furrounding objects; and these changes residently directed to certain ends which re-# thomseives. Observing this subserviency of reflects which they produce to their own acmmodation, we consider this adjustment of cans to ends as the effect of an intention, as resperience it to be in our own caf, where we t confeious of this intention, and of thefe its lds. We therefore interpret those actions of her men, where we observe this adjustment means to ends, as marks or figns of intenmin them fimilar to our own. And thus austy, power, or faculty, is supposed to exist in em from its fign, although the quality itself is # immediately cognifible by our finfes.

As this intention in ourfelves is accompanied by recption of external objects, knowledge of their operties, defire of good, aversion from evil, votion, and exertion, without all which we neither uld nor would perform the actions which we daiperform, we suppose the same perception, knowlege, defire, aversion, volition, and exertion in them. by the constitution, of our minds, we conser the employment of means, by which ends minating in the agent are gained, as the natufigns of design or intention. Art, therefore,

or the employment of means, is the natural fign of intention; and wherever we observe this adjustment of means to ends, we infer the agency of detign.

A very superficial acquaintance with the objects around us, leads us to extend this inference to a great number of beings besides our fellow men, namely, to the whole animal creation: for in all we observe the same subserviency to the ends of the agent, in the changes which we find them continually producing in the objects around them. These changes are all adjusted to their own well being. In all fuch cases, therefore, we are forced, by the constitution of our minds, to infer the existence of design or intention in these beings also. But in numberless changes produced by external objects on each other, we observe no such fitness in the effects, no such subserviency to the wellbeing of the agent. In fuch cases, therefore, we make no such inference of thought or defign.

SECT. II. Of the GENERAL DIVISION OF EXTER-NAL OBJECTS.

The general view of things, above taken notice of, leads us to make an important diffinction, by which we arrange all external objects into two classes. The first resembles ourselves, in giving external marks of that thought or intention of which we are conscious; and we suppose in them the other properties which we discover in ourselves, viz. thought, perception, memory, foresight, and all that collection of faculties which we feel in ourselves, and which constitute the animal. The other class of objects exhibit no such appearances, and we make no such inference. Thus we divide the whole objects of external nature into the classes of thinking and unthinking beings.

Our first judgments about these classes however must be very inaccurate. But when an animal dies we observe that it no longer gives the former marks of thought and intention, and that it now retembles the class of unthinking beings, althor it ftill retains all that fitness of organical firecture which it had before. This leads us to conclude, that the diffinction does not arise from a difference in organical functure, but from a diffinct fubfiance common to all thinking beings, but feparable from their organical frame. To this fubstance we ascribe thought, intention, contrivance, and all that collection of faculties which we feel in ourfelves. To this fubstance in ourfelves we refer all fensations, pleasures, pains, remembrances, defices, purpofes; and to this aggregate, however imperiectly understood, we give the name of MIND. Our organical frame, which feenis to be only the infirament of information and operation to the mind, we call our body.

But, as the animating principle is not, like curbody, the immediate object of the fenses, we hattirally conceive it to be a substance effentially different from those which are the objects of our senses. The most savage nations have shown a disposition to form this conclusion. Observing that animal life was connected with breathing, it was natural to imagine that breathing was living, and that breath was life. It is a remarkable sact, that in most languages the term for breath is one of the terms for the soul; no, wings, spiritus, in

the Hebrew, Greek, and Latin, express both; gheist or ghost, in the Teutonic, comes from gheisen, to breathe or sigh; ducha or duba, the soul, in Sciavonic, comes from duichat, to breathe; and so

in many other languages.

Very little refinement, however, is necessary to convince us, that air or breath cannot be the fubstance which thinks, wishes and defigns: and that the properties of this substance, whatever it is, must be totally different from, and incompatible with, any thing that we know of the immediate objects of our fenfes. Hence we are led to conclude that there are two kinds of fubstances in nature: One, which is the principle of fensation; and therefore cannot be the object of our fenses, more than light can be the object of the microfcope. This substance alone can feel, think, defire, and propose, and is the object of reflection alone. The objects of our fenses compose the other clais, and therefore can have none of the other properties which are not cognoscible by the sen-These have all the properties which our fenses can discover: and we can have no evidence of their having any other, nor indeed any conception of their having them. This class is not confined to the unorganized masses of matter; for we see that the bodies of animals lose after death that organical form, and are affimilated to all the rest of unthinking beings.

From such views as these, while all nations have agreed to call this class of objects by the name BODY, which originally expresses our organical frame, some nations, farther advanced in cultivation or refinement, have contrived an abstract term to express this general substance of which all inanimate beings are composed. Such terms we have in the words materies, who, matter, Gr.

## SECT. III. Of the DISTINCTION between MATE-BIAL and IMMATERIAL SUBSTANCES.

MATTER is that substance which is immediately and obviously cognoscible by our senses. Whatever is not thus cognotcible by our fenfes is immaterial; hence mind is faid to be immaterial. It is of importance to keep in mind this distinction, which 15 more than merely grammatical. Little more is necessary for detecting the sophism of Helvetius, Mirabeau, and other fages of the Gallic school, who have endeavoured to remove the ties of moral and religious obligation, by lowering our conceptions of our intellectual nature. It also shows how haltily they have formed their opinions, who have afcribed to the immediate agency of mind, ail those relations which are observed in the actions of bodies on each other at a distance. The characteristic phenomenon, or distinguishing quality of mind is INTENTION. The shenomenton by which this quality is suggested to us is art, of the employment of means to gain ends; and the mark of art is the supposed conduciveness of these ends to the well-being of the agent. Where this train 19 not evident, defign or intention is never thought of. We have, and can have, no notion of mind different from those of our own minds; and we discover the existence of other minds as we discover the existence of bodies, by means of phenomena which are characteristics of minds, and which relemble those phenomena that follow the

exerti: n of our own mental facilities, by the employment of means to attain felfish ends; and where such appearances are not observed, no existence of a mind is inferred. When we see a man sall from the top of a house, and dash out his brains on the pavement, we never ascribe this most ion to his mind. Although the stues of man of the celestial motions for most important purposes makes us suppose design and contrivate somewhere, and therefore a Supreme Mind, who more think of inferring a mind in the affirm the fitness of its motions for purpose abeneficial to its inhabitants, than of inferring mind in a bit of bread from its sitness for nous ing our bodies.

The term MIND therefore, in the ordinary guage of all men, is applied to what defined wills, at the fame time that it perceives and stands. If we call that mind which product tion, we must derive our notions of its quite attributes from observing their effects. Wes therefore discover the general laws by which act, that is, the general laws observed in the motions which we confider as their effects. It these are the general laws of motion; and in of these can we find the least coincidence what we are accustomed to call the laws of Nay, it has been the total want of fi which has given rife to the distinction whi men, in all ages and countries, have made bet mind and matter. This diffinction is found languages; and it is an unpardonable which men take with languages when they term of distinction, a specific term, to express of a different species. What some models thors have been pleafed to call mind, the world befides have called by another name, For which though borrowed from our own tree is yet sufficiently diffinctive, and never kids confound things that are different, excepting language of some modern philosophers, ply it to the laws of agency of mind; and speaking of the force of motives, &c. com fame mistakes which the followers of M commit in the use of the term mind. Fou, language of these philosophers, means what nects the operations of mind; as mind, in the guage of Lord Monboddo, is that which com the operations of body.

The doctrine of elemental minds, therefore the immediate causes of the phenomena of material world is an abuse of language. It is jargon and a frivolous abuse, for it offers no

planation whatever.

"Of all mistakes that the naturalist can fall to, there is none more fatal to his progression, there is none more fatal to his progression which can be made among the objects of our templation, there is none of equal philosophical portance with this between mind and matter: when we consider the consequences which trally follow from this consustion of ideas, and ticularly those which follow from finking the tal faculties of man to a level with the operation of mechanics or chemistry, consequences with the experience of the present eventful day for the experience of the present eventful day for the destructive of all that is noble or definable

igian nature, and of all that is comfortable in is life, and which blafts every hope of future ecilence—we cannot be too anxious to have is capital distinction put in the plainest point of s. When we see the frenzy which the reaing pride of man has raifed in our neighbourshand hear the dictates of philosophy inceftly appealed to in defence of whatever our rts shudder at as shocking and abominable; lwhen we fee a man (M. DE LA METHERIE, pr. d- Pbyf. 1792-3.) of great reputation as a milit, and of profetted humanity and political deation, congratulating his countrymen on the Improvement and almost perfection of phithy; and after giving a short sketch of the intion of the vilible universe, summing up with a table of elective attractions, and that hular combination and mode of crystallization in conflictates God (barrefco referens!)—is it full time for us to stop short, and to ask our hearts " whither are you wandering?"—But philosophy, reasoning from effects to their By will here liften to the words of our facred s: "By their fruits ye shall know them." bland confequences of the sceptical philoso-Berkley and Hume have been thought, by ding it without examination. The no and and the shocking conference ical philosophy now in vogue should give ame abhorrence; and should make us aits blood-stained road, and return to the a paths of nature, to furvey the works of d feast our eyes with the displays of mind, fer themselves on every hand in defigns of extensive influence and the most beauetrivance." Enc. Brit.

IV. Of the Extent of Philosophical Study.

are the objects of this Science, the subjects sophical study. The extent of the science unbounded, reaching from an atom to ness. It is necessary for the successful of this immense field of knowledge, committed to different cultivators, and various portions be treated in different Accordingly, the various tastes of menen this curioity different directions; and y, like all other tasks, has been promoted division of labour.

ringcoious naturalists have attended only pearances of fitness, which are exhibited quarter of the universe; and by arranginto different classes, and interpreting indications of thought and intention, wired the knowledge of many classes of and intelligent beings, actuated by propared to the knowledge of many classes of reason. It contemplation of these appearances intought and defign in any individual of the classes, and brings its propensities and of action, and the ends gained by these sinto view, the contemplation of these sinto view, the contemplation of these sinto view, and ends, occasions an interpretable of a much more general kind.

these sentient beings give indications of XVII. PART II.

knowledge and of power; but their knowledge bears no proportion to their powers of action. and of attaining important ends; and their power is neither always, nor often the confequence of their knowledge. Where the effects of their actions are most eminently conducive to their interefts, the power of attaining these ends is generally independent on any attention to the fitness of the means, and the exertion is often made without their even knowing of the end. weil-being of the individual is fecured against danger by an extinctive propentity, which leads it to the performance of the necessary action, which is thus made immediately and ultimately defirable, without regard to its ultimate and important end. Thus, in our own nature, the support of animal life, and the improvement of the means of sublistence by a knowledge of the objects which furround us, are not intrusted to our apprehensions of the importance of these ends, but are committed to the furer guides of hunger and curiofity.

There is also a connection between the individuals of a class, different from that which arises from the mere resemblance of their external appearance, or even of their propensities and pursuits. These propensities are such, that while each individual seeks only its own enjoyment, these enjoyments are in general such as contribute to the support of the species and the enjoyment of other individuals. Thus, in the classes of animals, and in human nature, the continuance of the race, and the enjoyment of the whole, are not intrusted to the apprehension we entertain of the importance of these ends, but are produced by the operation of sexual love and the love of society.

Even the different classes of sentient beings are connected together; and while the whole of each class aim only at their own enjoyment, they contribute also to the well-being of the other classes. Even man, the selfish lord of this sublunary world, is not the unconnected inhabitant of it. He cannot reap all the fruits of his fituation, without contributing to the enjoyment of thousands of the brute creation. Nay, it has even been proved, that while one race of animals, in confequence of its peculiar propensities, subfifts by the deftruction of another, the fum total of animal life and enjoyment is prodigiously increased. See a very judicious differtation on this curious and puzzling Subject, entitled A Philosophical Survey of the Animal Creation; where it appears that the increase of animal life and enjoyment which is produced by these means, beyond what could possibly obtain without it, is beyond all conception. See likewise the last edition of King's Origin of Evil, by Dr Law, late bithop of Carlifle.

In short the whole animal creation seems connected, and jointly employed in increasing the sum total of possible happines. This sitness of the various propensities of sentient and intelligent beings, this subserviency to a general purpose, appear evident marks of intention, distinct from, and independent of, all the particular intentions, and superior to them all; and thus irrestibly lead to infer the existence of a supreme mind, directing the whole of this intellectual system, while the individuals of which it consists appear the un-

Ppp

confcion4

confcious instruments in the hand of a great Artist, with which he executes his grand and beneficent

But the bodies of the inanimate creation are not only connected with each other by a mutual dependence of properties, and the relation of causation, but they are also connected with the fentient beings by a subserviency to their purposes of enjoyment. The philosopher observes that this connection is admirably kept up by the constancy of natural operations and the expectations of intelligent beings. This adjustment, this fitness, of which the effect is the enjoyment of the fentient inhabitants of the universe, appear to be the effect of an intention of which this enjoyment is the final cause. This constancy therefore in the operations of nature; both in the intellectual and material world, and the concomitant expectation of fentient beings, appear the effects of laws imposed on the different parts of the universe by the Supreme Mind, who has formed both these classes of beings to admirably fuited to each other.

#### SECT. V. Of the ORIGIN OF NATURAL THEO-LOCY.

To those who take such a comprehensive view of the prefent state of things, the world appears a WORK OF ART, a lystem of means employed for gaining certain proposed ends, and it earries the thoughts forward to an ARTIST; and we infer a degree of fkill, power, and good intention in this Artift, proportioned to the ingenuity, extent, and happy effect which we are able to discern in his works. Such a contemplation of nature, therefore, terminates in NATURAL THEOLOGY, or the discovery of the existence and attributes of Gop.

Our ideas of this SUPREME MIND arise from the indications of defign which we observe. These will differ from our notions of other minds only in the degrees which we are able to observe, and which we allign to these faculties; for the phenomenon or the effect is not only the mark, but also the measure of its supposed cause. These degrees must be in proportion to our capacity of appreciating the extent, multiplicity, and variety of the contrivance. In proportion as our acquaintance with the operations of nature around us is extended, we perceive higher degrees of power, skill, and intention: and as the feene of observation is unbounded, we cannot affix any boundaries to these attributes, and we conclude that they are infinite or unbounded in their own nature. When our attentive furvey of this universe, and a careful comparison of all its parts, have made us conclude that it is one defign, the work of one Artist; we must infer, that, His power, wisdom, and benevolence, are indeed infinite.

When mankind had been led to draw this conelufion from the appearances of fitness observed confiancy which they observe in natural operations, whether in the material or the intellectual fystem, and that expectation of, and confidence in, this constancy, which renders the universe a source of fequences of laws imposed by the Almighty Ar-

· every where around them, they confidered that enjoyment to its fentient inhabitants, as the contift on his works.

This view of nature is extremely captivation and has engaged the curiofity of speculaire no respecting the phenomena of mind in all Hence the general laws of moral fentiment to be confidered with attention. This gradual ripened into a regular fystem of moral duty, and panied by its congenial study, the investigation the fammum bonum, or the chief constituent of man felicity; and thefe two branches of intelle al science were always kept in a state of allies by the philosophers of antiquity. But jum dence, the science of government, legislation, police, were certainly previoully cultivated a in Subserviency to the demands of cultivated ety; and all these so nearly related parts of the dy of human nature had made a very couls progress, in the form of precepts, for dias conduct, before speculative men treated fubjects of philosophical study. Our mon ments, always involving a feeling of del are expressed in a language considerably from the ufual language of pure philosophy, ing of things which ought to be rather than a which are; and this distinction of language increased by the very aim of the writers, to ence the conduct as well as the opinion fcholars. It was referved for moden i bring this study into the pure form of pu by a careful attention to the phenomena fentiment, classing these according generality, and ascertaining their respecti by an appeal to the general conduct of si and thus in the modern treatifes on ethic prudence, &c. there is less frequent no made to the officia or duties, or to the con of the fummum bonum, than among the

#### SECT. VI. Of the ORIGIN of the INTELL SCIENCES.

It was impossible to proceed far in quifitions without attending to the power understanding. Differences of opinion ported by reasonings, or attempts to Both fides could not be in the right. Ra gumentation behoved to be acquiefeed in parties; and it could hardly escape the inquilitive minds, that there were rules and faljebood as well as of right and wrong the human understanding became an study, first in subserviency to the demand moralists, but afterwards for its own fake gradually grew up into the fcience of Farther refinement produced the science THYSICS. But all these were posterior to trines of morals; and difquifitions on but principles of tafte, the precepts of the criticism, were the last additions to the the phenomena of mind. And now, find fophers have agreed in the mode of inve of general laws by experiment and oband that this is all the knowledge we can of any subject whatever, it is to be be this branch of philosophical discussion the same degree of improvement (by the tion of facts and experience) that has been ed by other sciences.

The necessary occupations, however, nary life have oftener directed the efforts genius towards material objects, and engaged rattention on their properties and relations; as all sciences have arisen from arts, and were inally implied in them till separated from them peculatifis, the knowledge of the material fyfof nature was possessed in detached scraps by practitioners in the various arts of life, long re the natural philosopher thought of collecting mito a body of science. But there have been lagismen of curiofity, who have been flruck e uniformity of the operations of nature in enterial world, and were eager to discover quites. Accordingly, while the moralists and hylicians spent their time in investigating becomena of mind, and have produced the ers of Pheumatology, Logic, Ethics, uprudence, and natural Theology, these ners of nature found fufficient employment midering the phenomena of the material

bodies of which it confifts are evidently eded by those properties by which we obthat they produce changes in each other's fi-This affemblage of objects is therefore called the MATERIAL SYSTEM. It is frely termed NATURE; and the terms NATURAL ARANCES, NATURAL CAUSES, NATURAL have been generally restricted to those take place in the material system. This reon, however, is improper, because there is crence in the manner in which we form our s of those laws, and reason from them, both espect to mind and body. If there is to be striction, and if any part of the study of the te is to be excluded in the application of erms, it is that part only which confiders obligation, and rather treats of what ought han of what is. But there is a considerable nce in the language which must be employough there is none in the principles of intion. We have no proof for the extent of oral law but an appeal to the feelings of the of men, indicated by the general laws or hich are observed in their actions. Some s use the term natural law to express every tence of fact; and this is certainly the prothe term loi phifique in this enlarged fense. any authors, milled by, or taking advantage ambiguity of language, after having estaa law founded on a copious and perhaps acepted induction of the phenomena of the terial lystem, (in which case it must be considerin its restricted sense,) have, in their explanaof phenomena, extended their principle much ther than the induction on which they had unded the existence of the physical law. extended it to the phenomena of mind, and e led their followers into great and dangerous takes. In nothing does the imperfection of guage appear so remarkably as in distinctions cerning MIND. Being a late subject of discus-, and interesting only to a few speculatists, we e no appropriated vocabulary for it; and all disquilitions concerning its operations are in tinual metaphor or figure, depending on very ht analogies or resemblances to the phenomena the material world. This makes the utmost caution necessary; and it justifies the British philosophers who have successfully studied the intellectual fystem, in having, almost without exception, refiricled the terms natural laws, natural causes, natural philosophy, and such like, to the material fystem. With us pneumatology makes no part of physics. And the sciences have fared better by the restriction of the terms. In no country has the spirit of liberal discussion been more encouraged and indulged than in Britain; and her philosophers have been equally eminent in both. branches of science. Their performances in ethics, jurisprudence, and natural theology, are considered by all Europe as fountains of knowledge on these subjects; and LOCKE and CLARKE are names no less familiar on the continent than Newton. The licentious and degrading doctrines of the French school have as yet made little impression in Britain; and man is still considered among us as a glorious creature, born to, and fitted for, the nobleft prospects.

Physics, then, is with us the Rudy of the material fystem, including both natural history and philosophy. The term is not indeed very familiar in our language; and in place of physicus and difciplina phylica, we more generally use the terms naturalist and natural knowledge. The term natural philosopy, in its common acceptation, is of less extent. The field of physical investigation is fill of prodigious extent; and its different departments require very different treatments, and have engaged in their cultivation persons of very differ-

ent talents.

All the various phenomena of the material system may be arranged into two classes, distinguished both by their objects and by the manner of treating them. The 1st class comprehends all the appearances which are exhibited in the fenfible motions of bodies, and their actions on each other producing fenfible motion. The 2d class comprehends the appearances which are exhibited in the infenfible motions and actions of the invilible particles of matter.

We have examples of the phenomena of the first class in the planetary motions, the motions of heavy bodies, the phenomena of impulse, the motions and actions of machines, the pressure and motions of sluids, the lensible actions of magnetical and electrical bodies, and the motions of light. We have examples of the ad class in the phenomena of heat and mixture, and those exhibited in the growth of animals and vegetables, and many phenomena of folid, fluid, magnetical, electrical, and luminous bodies, in which no change of place can be observed. Thus there is a distinction in the phenomena sufficiently great to warrant a division of the study, and to make us expect a more rapid improvement by this division.

SECT. VII. Of the ORIGIN of the USEFUL ARTS.

IT is probable, that before man had recourse to agriculture as the most certain means of procuring fublishence, his acquaintance with external substances was principally that of the natural historian; confisting of a knowledge of their fitness for food, medicine, or accommodation, their places of growth or habitation, and the means of procuring them, depending on their manner of life or existence. It required a Rudied attention to these circumstances to give rise to agriculture, which therefore generally made its appearance after men had been in the practice of keeping stocks; by which means they were more at their ease, and had some leisure to attend to the objects around them, and in particular to those circumstances of soil and weather which affected the growth of their pasture.

When husbandry and simple medicines were thus established, they were probably the first arts which led men to artend to the operations of nature; and with these arts the general fludy of nafure, was thus divided into two different branches. The rude physician would be at first a collector of specifics; but by degrees he would observe resemblances among the operations of his drugs, and would class them according to these resembiances. ) is frequent recourse to the vegetable kingdom for medicines would cause him to attend more minutely to the plants which he had occasion to study than the husbandman to the multitude he is obliged to rear. The physician then would learn to think, the husbandman to work. An analogy Between the economy of animal and vegetable life could hardly fail to engage the attention of the physician, and would make him a botanist.

From the same source, another science must have arisen, by contemplating the appearances of animal and vegetable life, sounded on a cartful observation and accurate description of the wonderful machine. The phenomena of anatomy would be gradually discriminated and arranged; and the action of medicines, and the practice of physic and surgery, established in the form of a liberal or scientific art.

The husbandman in the mean time must have laboured the ground. He, too, was interested in the knowledge of the vegetable kingdom, and formed some rude system on the subject by which he regulated his labours: but he faw, that whatever was the nature of vegetable life, he must work hard, and he would fearth about for every thing which could diminish his labour. The preperties of the lever, the wedge, and the inclined plane, would become familiar to him; and withcut knowing on what their efficacy depended, he ided them with confident fagacity and effect. The strength of timber, the pressure and force of water, were daily feen and used by him and other artifans for their mutual accommodation; and f me rude principles on these subjects were committed to memory. Many tools and fimple machines become familiar; and thus the general properties of matter; and the general laws of the actions of bodies on each other, become gradually bliefts of observation and improvement. general aim is to produce a greater quantity of work by the fame exertion. When a man finds, that by increasing the length of his lever he increases his power of overcoming relistance, curiohty and interest lead him to inquire in what proportion his advantage increases. When he finds that a double length gives him a double energy, he will be surprised and mortified to find, that at the end of the day he has not performed twice the quantity of work: but, after much experience, he will learn, that every increase of energy, by a 

machine, is nearly compensated by an increase of time in the performance of his talk; and thus one of the leading principles of practical mechanic was inculcated in a manner not to be forgotte, and the practical mechanic was brought to pealate about motion and force, and by gradual and easy steps the general laws of simple motions was established.

SECT. VIII. Of the ORIGIN of the MATHEMATICA

IT is clear that fuch speculations could not it carried on, nor any confiderable knowledge quired, without some acquaintance with the at measurement; and the very questions which mechanic wished to solve, would lead to admit in this art, which in process of time refined into mathematics, the most perfect or all this ences. All the phenomena of fentible mount ford employment to the mathematician. It performed in a double or triple time, three double or triple space, by a double or trip body, by the exertion of a double or tripic him produces a double or triple effect, is more to right or to the left, upwards or downwards, In short, every affection of nuction is an ject of mathematical discuttion. Such a lim must have appeared early in the form of make consequence of the mutual transactions of These among an uncultivated people are d in the way of barter. Numbers, weights and fures would of confequence foon be fludied, a of the properties of plane and folid numbers figures would become known, and the operation or multiplication and division, where arithmet combined with geometry. To most men the formance of a machine is a more attractive of than the properties of a figure, and the properties of a figure move entertaining than that of at ber; but the fact feems to have been others mong the ancients. Before Pythagoras had ed the theorem that bears his name, (see M GORAS.) and which is among the first clear geome ry, he had reformed the Grecian nai the addition of a note to their scale, which ceeds on a very refined speculation on the pri ties of numbers; so that among the Greeks metic must have made confiderable progress geometry was yet in its cradle: and we know what aftonishing length they profecuted the kind of pure geometry, while their knowledge of chanical principles was almost nothing. fuch a distance, in point of simplicity, between pure mathematics and the most elementary ned nics, that the former continued to make rapid to improvement in more modern times, while latter hardly deserved the name of science ull lately, when the great demand for it, by the crease of manufactures, both interested man the study, and facilitated its progress, by the titude of new machines invented by manufactu and artifans: and even at prefent, to them we indebted for almost every new invention of med nics, and the speculatift seldom has done me than improve the invention, by exhibiting its pi ciples, and thus enabling the artift to correct imperfections; and now science and art go ha in hand, mutually giving and receiving affitte The demands of the navigator for mathematic and aftronomical knowledge have dignified these ciences; and they are no longer the means of eleant amusement alone, but merit the munificence i princes, who have erected observatories, and missiled voyages of discovery, where the mathetalical sciences are at the same time cherished and policid to the most important purposes.

ICT. IX. Of the UNDISCOVERABLE PHENOMENA of Physics.

is various branches of Physics, particularly in eperations of chemistry, for instance, the imbe exertion of the cause is not perceived; all two observe is the affemblage of particles which the before mixture, and that which takes place in it is completed, and which we confider as triult. The procedure of nature in producing change is unfeen and unknown. The steps are ifrom our observation. We are not only ignotof the cause which determines one particle of food to become a part of our body while onare rejected, but we do not fee the operation. rare not only ignorant of the cause which demes a particle of the fulphuric acid to quit fulfil alkali with which it is united in Glauber (20) to attach itself to a particle of magnefia by united with the muriatic acid, which also it to unite with the alkali, but we do not fee paration. The particles and their motions the epicets of our fenses; and all that we the Epiom falt and common falt separated water in which we had formerly diffolved mirabile and the muriated magnetia. which are the immediate effects of the re causes, and therefore their only indicasboracteriffics, and measures, fitted to show mure, are hid from our view.

wknowledge therefore of these phenomena is what that of other phenomena; and we Relations and more remote causes, and with thefe changes are brought about, and which poscible only by their immediate effects, motions which they produce unseen. The dre which we do really acquire is someinular to what the mechanical philosopher wired when he has discovered, by many ments and investigations, that magnets attach other by their diffimilar poles, and repel wher by their fimilar poles, and do not act any bodies but loadstones and iron. Here we undiscovered all that is most curious in enomenon, viz. how these attractions and cs are produced; and even here the magphilosopher has the advantage of feeing the and the operation.

Mosophers attending to this circumstance, even in these cases the changes are produced wins, or consist in motions, however unpersisted these may be, have concluded, that the seconding to which nature operates in protections to the changes are similar to the laws which the her operations in the sensible actions of the operations in them; and that the man, though unseen, and the moving forces, writefully similar. They have therefore em-

ployed fimilar modes of investigation, applying the laws of impulse, and calling in the aid of mathematical knowledge. Of this we have many examples in the writings of Dr Freind, Keil, Bernoulli, Helfham, Boerhaave, Hartley, and others, who have delivered theories of fermentation, folution, precipitation, crystallization, nutrition, secretion, mulcular action, nay even of fensation and intelligence, founded, as they think, on the laws of motion, and illustrated and supported by mathematical reasoning. Lord Verulam himself, that careful and fagacious diftinguisher of inteilectual operations, has gone into the fame track in his explanation of the phenomena of fire and combuttion: and even Sir Isaac Newton has made several attempts of the same kind, though with peculiarities which always characterife his difcuffions.

But the success of these philosophers has been fuch as they had reason to expect; for their whole trains of reasoning have proceeded on analogies which were assumed or supposed without autho-These ill-founded analogies have been mixrity. ed with hypotheses completely gratuitous. Certain forms have been affigued to the particles, and certain modes of action have been laid down for them, for whose reality we have not the leaft indication; and these fancied forms and laws of action have been fuch as are either felf-contradictory and inconfiftent, or fuch as would produce effects totally different from those which are observed. These atomical theories, as they are called, transgress every rule of phitosophical discuffion, and even the best of them are natic better

than trifling. See Optics, § 153-156.
This kind of inquiry has of late, however, become more rational; and along with the improvement and extension of mathematical philosophy, philosophers have given over their incessant attempts to explain every thing by impulse. We need not despair therefore of making still farther advances, if we will content ourselves with going no farther than Newton has done in his explanation of the planetary motions. He has immortalized his own name, and has added immenfely to our flock of ufeful knowledge; yet he has flopped short at the discovery of the fact of universal gravitation; and all who have endeavoured to explain or account for this fact have only exposed themselves to pity. The road to farther discoveries has been also hinted by Sir Isaac Newton, who has expressed his suspicion, that as the great movements of the folar system are regulated by universal gravitation, so the mutual actions of the particles of matter are produced and regulated by tendencies of a fimilar kind, equally but not more inexplicable, and of which the laws of action are to be discovered by as careful an attention to the phenomena, and by the same patient thinking, which he has employed on the planetary motions. And a beautiful introduction to this new and almost unbounded field of enquiry has been given us by the celebrated Abbe Bosco-VICH, in his Theory of Natural Philosophy, where he has shown how such mutual tendencies, similar in every ultimate particle of matter, and mos dified by conditions that are highly probable, nay almost

almost demonstrable, will not only produce the sensible forms of solidity, hardness, elasticity, ductility, suidity, and vapour, under an inconceivable variety of subordinate appearances, and the observed laws of sensible motion, but will go far to explain the phenomena of susion, congelation, solution, crystallization, &c. &c. &c. both in chemistry and physiology. We recombed this work to the perusal of all who wish to have a clear idea of the internal constitution of natural bodies, and of the manner in which the uniting forces produce their sensible effects. Any person, possessing of a small share of mathematical knowledge, will be satisfied that the process of nature is not very different from what he describes.

But nature opens an immense and instructive volume; and posterity will long find employment in the perusal, even though advancing with the eagerness and success of the last century. We have not yet arrived at the threshold in many researches. In many parts of chemistry, for instance, we are as yet uncertain with respect to the phenomena themselves, which are the subjects of discussion. The composition of bodies must be fully understood before we explain the forces which unite their particles, or their modes of action. As long as WATER was confidered as an element, we were ignorant of the forces inherent in its particles; we are perhaps still ignorant of this; but we now know that they are extremely different from what they were formerly supposed to be. It is but in a very few cases of chemical combination, that we even know what are the ingredients: it is therefore too foon to speculate about their mode of union. Our ignorance of the real events in the animal and vegetable economy is ftill greater. Our first bufiness therefore is to proceed in the accurate examination and classification of the phenomena; and without attempting to give mechanical explanations, let us drop thefe hidden operations, and augment to the atmost our lift of secondary laws of visible connections. All the mechanical speculations of Boyle himfelf about the fenfible qualities of things are now forgotten; but his chemical experiments preferve all their value, and are frequently referred to. The same may be said of the sagacious Dr Hales, whole fanciful notions of internal conflicts, collifions, and vibrations have hardly diminished the value of the curious facts which he has established in the animal and vegetable economy.

This diffusction in the nature of the phenomena, and this difference in the nature of the knowledge which is to be acquired, and the means which are to be employed for the successful prosecution of these two branches of general physics, has occationed a farther restriction of the term NATURAL PHILOSOPHY, at least among British naturalists. It is particularly applied to the study of phenomena of the first class, while those of the second have produced the sciences of Chemistry and Physiology. Natural philosophy and chemistry have generally been made particular institutions in our seminaries of learning, but physiology has more commonly been taught in conjunction with anatomy, medicine, and botany.

The phenomena of the first class have been u-

fually called MECHANECAL, to diffinguish then from those observed in the operations of chemitry, and in the animal and vegetable economy; and the explanations which have been attempted of some of the last, by applying the laws observed in the phenomena of the first class, have been called mechanical explanations. As thus first class is evidently but a part of general physics, there is some impropriety in giving the name natural photosphy to a course of doctrines which is confined to these alone.

But, be that as it may, fince the terms that sy and physiology have been applied to two important branches of general physics, we had that a more specific or characteristic name be appropriated to the other, and that most improperly be named Mechanical most improperly be named as see always advantages which may fully be expected in careful prosecution of them: and as the slum is fully treated the under articles Chemist Physiology, &c. we shall confine ourselve what is usually called NATURAL PHILOSOPH

SECT. X. Of NATURAL or MECHANICAL LOSOPHY.

MECHANICAL PHILOSOPHY may be different the fludy of the fensible motions of the hold the universe, and of their actions producing with a view to discover their causes, to of the phenomena, and to improve art." The ciple upon which all philosophical discussive edges, that "every change which we old the condition of things is confidered by a effect, indicating the agency, characterising the and measuring the degree of its cause."

In the ftyle of mechanical philosophy, the of any change of motion is called a me

changing Forcs.

The disquistions of natural philosopy therefore begin with the consideration of rion, carefully noticing every affection of lity of it, so as to establish marks and measures of the chare the only marks and measures of the chare the only marks and measures of the chare to the motions which we observe universe.

From the general principle of philosophical cussion already mentioned, there flow date two axioms: 1. " Bvery body perseveres in a of reft, or of uniform reddineal motion, I affected by some moving force. 2. Bony of motion is in the direction and in the degrade force impressed." These are usually called force impressed." LAWS OF MOTION. They are more pro laws of human judgment, with respect to Perhaps they are necessary truths less it be alleged that the general princip which they are necessary consequences, is it contingent though universal truth. By these axioms, applied in abstracto to every variation, we establish a system of general documents. concerning motions, according as they are in or compounded, accelerated, retarded, retails curvilineal, in fingle bodies, or in fyftems of connected bodies; and we obtain corresponding chanecteristics and measures of accelerating or retarding forces, centripetal or centrifugal, simple or compound.

For an illustrious example of this abstract system of motion and moving forces, see Sir Isaac Newton's Math. Princ. of Nat. Philos. Book I. Ever's Mechanica, five Scientia Matus, Herman's Thoronomia, five de Viribus Corporum, and D'Alember's Traité de Dynamique, are also excellent waks. In this abstract system no regard is paid take casual differences of moving forces, or the brees from which they arise. It is enough to harderise a double accelerating force, for in-boce, that it produces a double acceleration. It may be a weight, a stream of water, the pressure fa man; and the force, of which it is said to be bable, may be the attraction of a magnet, a cursus of air, or the action of a spring.

Having established these general doctrines, the binopher applies them to the general phenomena of the universe, to discover the nature of he forces which really exist, and the laws by shich their operations are regulated, and to extend the chief business of the mechanical philosocial philosoci

The phenomena must be classed according to be resemblances, which infer a resemblance in a reasses, and these classes must be arranged arding to some principle. We have seen no bod which appears to us less exceptionable the following.

the principle of arrangement is the generality to phenomena; and the propriety of adoptit arises from the probability it gives of readiscovering the most general actuating-forces, of agency is implicated in all other phenomenation of less extent; and therefore should be presently discussed, that we may detect the discriming circumstances, which characterise the admate phenomena, and mark the distinbing inferior natural powers.

the most general of all phenomena is the curtal motion of bodies in free space; it is obtained through the whole extent of the solar system, fore, with aftronomy. Here, from the general phenomena of the planetary motions, is exact the fact of the mutual deflection of every towards every other body, and this in the size proportion of the squares of the distance, the direct proportion of the quantity of mathematical force of the size of the size of the distance, indicating the agency, and measuring the sty, of the universal force of mutual gravi-

ne natural philosopher next proceeds to point all the particular facts which are compresed under this general fact, and whose peculics characterise the different movements of solar system. That is, in the language of phiphy, he gives a theory or explanation of the minate phenomena; the elliptical motions of planets and comets, their mutual disturban; the lunar irregularities; the oblate figure of planets; the nutation of the earth's axis; the

precession of the equinoxes; and the phenomena of the tides and trade winds: and he concludes with the theory of the parabolic motion of bodies projected on the surface of this globe, and the motion of pendulums.

He also takes notice of the applications which may be made to the arts of life of the various doctrines which are successively established; such as chronology, astronomical calculation, dialting, navigation, gunnery, and the measuring of time.

If a square parcel of sand be lying on the table, and the singer be applied to any part of it to push it along the table, that part is removed where you will, but the rest remains in its place; but if it is a piece of sand stone of the same materials and shape, and the singer is applied as before, the whole is moved; the other parts accompany the part impelied by the singer in all its motions.

From the moon's accompanying the earth in all its motions round the fun, we infer a moving force which connects the moon and earth. In like manner, we must conclude that a moving force connects the particles of the stone; for we give the name force to every thing which produces motion: We call it the force of COHESION; a term which, like gravitation, expresses merely a fact. This seems to be the next phenomenon of the universe in point of extent.

Having, from the general phenomenon, established the existence of this force, the philosopher proceeds to ascertain the laws by which its exertions are regulated; which is the ascertaining its distinctive nature and properties. This he does in the same way that he ascertained the nature of planetary gravitation, viz. by observing more

particularly the various phenomena.

Here is opened a most extensive and varied field of observation, in which it must be acknowledged. that very little regular and marked progress has been made. The variety in the phenomena, and the consequent variety in the nature of the connecting forces, appear as yet inconceivably great; and there feems little probability of our being able to detect in them all any fameness, combined with the other diftinguishing circumstances, as we have done in the case of gravity. Yet Boscovich has shown clearly, that although we should suppose every atom of matter to be endued with a perfectly fimilar force, acting in a certain determined ratio of the imperceptible diffances at which the particles of matter are arranged with respect to each other, the external appearances may, and must, have all that variety which we observe. He also shows how, from the operation of this force, must arise some of the most general and important phenomena which characterise the different forms of tangible bodies.

The chief varieties of the action of this COR-PUSCULAR force are observed on the bodies which we call bard, fost, solid, stuid, vaporous, brittle, dustile, elastic. We see instances where the parts of bodies avoid each other, and require external force to keep them together, or at a retain small distances from each other. This is samilar in air, vapours, and all compressible and elastic

bodies.

This is evidently a most interesting subject of inquiry. On the nature and action of these corpuscular

puscular forces depends the strength or simmes of solids, their elasticity, their power of communicating motion, the pressure, and motion, and impulse of sluids; nay, on the same actions depend all the chemical and physiological phenomena of expansion, fusion, congelation, vaporifation, condensation, solution, precipitation, absorption, secretion, fermentation, and animal and vegetable concoction and assimilation. Out of this immense store of phenomena, we select those which lead directly to the production or modification of sensible motion.

1. The communication of motion among detached and free bodies, establishing the laws of impulse or collision. This has always been condidered as the elementary doctrine of mechanical philosophy, and as the most familiar fact observed in the material world; and in all ages philo-Jophers have been anxious to reduce all actions of bodies on each other to impulse, and have never thought a phenomenon completely explained or accounted for, till it has been shown to be a case of impulse. This it is which has given rise to a great variety of ridiculous and untenable hypotheses. (See Optics, § 153—156.) But the philosopher who has begun the mechanical study of nature by the abstract doctrines of dynamics, and who has attended carefully to the many analogies between the phenomena of gravitation and cohefion, will entertain very different notions of this matter. He will be so far from thinking that the production of motion by impulse is the most familiar fact in nature, that he will acknowledge at to be comparatively very rare, if indeed it has ever been observed. (See Optics, § 154, 155.) And he will be disposed to think that the production of motion in this case is precisely similar to what we observe when we gently push one sloating magnet towards another, with their fimilar poles fronting each other. There will be the fame production of motion in the one and diminution of it in the other, and the same uniform motion of the common centre of gravity: and, in this case of the magnets, he sees completely the necessity of a law of motion, which is not an axiom, but is observed through the whole of nature, and which receives no explanation from any hypothefis of an intervening fluid, but is even totally inconfiftent with them: viz. "that every action of one body on another is accompanied by an equal and opposite action of that other on the sirst." This is usually called the emulite of asien and readion: it is univerfal; and it is a necessary consequence of the pertect fimilarity of the corpuscular forces of the same kinds of matter. This general fact, unaccountable on the hypothesis of impelling fluids, is confidered in the planetary motions as the unequivocal indication of the sameness of that gravity which regulates them all. We should draw the same conclusion here, that the particles of tangible matter are connected by equal and mutual forces, which are the immediate eauses of all their sensible actions, and that these forces, like gravitation, vary with every change of distance and situation.

The laws of collision and impulsion being thus established, either as original facts, or as consequences of the agency of equal and mutual for-

ces which connect the particles of matter; the philosopher confiders,

2. The production of motion by the intervention of folid bodies, where, by reason of them helion of matter, some of the motions are need farily confined to certain determinate paths or directions. This is the case in all motions round fixed points or axes, or along planes or curre which are oblique to the action of the forced This part of the fludy contains the theory of machines, pointing out the principles on which the energy depends, and confequently funishing maxims for their conftruction and improvement (See MECHANICS.) But these observations d not complete the discussion of the mechaning folid bodies: they are not only folid and me but they are also heavy; therefore the admir gravity must be combined with the confequent of folidity. This will lead to discussion the the centre of gravity, the theory and confirm of arches and roofs, the principles of flability equilibrium, the attitudes of animals, and man particulars of this kind.

3. The philosopher will now turn his attent to another form, in which tangible matter di bits many interesting phenomena, viz. Fill Sir Isaac Newton says, " a fluid is a le subofe particles yield to the finallest impression by so yielding are easily moved among themselve But this definition is not thought fufficienty cife, as the words, smallest impression, and i moving, convey no determinate idea. Euler fers fome very plaulible reasons for doubt whether it will account for the horizontal face, and the complete propagation of prothrough the fluid in every direction; and the fore prefers felecting this last phenomenen, them pagation of preffure quiqua-verfum, as the chall teriftic of fluidity, because a body having t constitution will have every other observed; perty of a fluid. But this definition is perspicuous, and the objections against No more intelligible definition are not unanimal Bescovich defines a fluid to be, a had who ticles exert the same mutual forces in all dire and flows, that fuch particles must be indifferent as to any polition, with respect to each other. no external force act on them, they will have tendency to arrange themselves in one porather than another; differing in this tele from the particles of folid, or foft, or viled dies; which require fome force to change respective positions, and which recover thek! fitions again when but gently disturbed. It lustrates this distinction very beautifully, by on paring a parcel of balls thrown on quickfiver. attracting each other, with a parcel of magno the same situation. The balls will stick torre but in any position; whereas the magnets w ways affect a particular arrangement.

When the characteristic phenomenon of state has been selected, the philosopher proceed combine this property with gravity, and chapses the doctrines of hypostatics, or of pressure and equilibrium of heavy suids, the pagation of this pressure in every direction; a demonstrates the horizontality of surface allowed by all perfect sluids. These doctrines and meaning the surface and meaning t

iples enable us to determine feveral very inteelling circumstances respecting the mutual presure of foilds and fluids on each other; the prefures exerted on the bottoms and fides of veffels; he support and whole mechanism of floating boles, &c.

He ther confiders how fluids will move when her equilibrium of preffure is deftroyed; and eablifies the doctrines of HYDRAULICS, containgall the modifications of this motion, arising on the form of the vertels, or from the intenfior direction of the pressure which occasions it. Ithis subject is completed by the consideranof the refiftance which fluids oppose to the kion of folid bodies through them, and their pulle on bodies opposed to their action. These **x** very important matters, being the foundams of many mechanical arts, and furnishing us ith force of our most convenient and efficacious wets for impelling machines. They are also very difficult discussion, and are by no means impletely investigated. Much remains to be me both for perfecting the theories, and for imwing the arts which depend on them. On He doctrines depend the knowledge of the mo-Profrivers and of waves; the buoyancy, equivium, and Rability of thips; the motion of thips pugh the waters; the action of the winds on fuls; and the whole arts of marine construcand scamanship.

nother general form of tangible matter exvery different phenomena, which are also mely interesting; viz. VAPOUR. All the va-known are heavy fluids: they are there-subject to all the laws of pressure and im-HYDROSTATICS and HYDRAULICS. But are fusceptible of great compression by the of external forces, and expand again when forces are removed. In confequence of this preffion and expansion, the general phenoof fluidity receive great and important mo-tions; and this class of fluids requires a parr confideration. As air is a familiar instance, ranch of mechanical philosophy has been executatives. Under this head we confihe pressure of the Atmosphere, and its efboth on folid and fluid bodies. It produces tof waters or other flitids in pumps and ons, and gives us the theory of their conthin: it explains many curious phenomena Mure, fuch as the motions in the atmosphere, their connection with the pressure of the air, the effect on the barometer or weather glass. in motion, is called wind; and it may be ged to impel bodies. The theory of its acand of its refiftance to moving bodies, are to be confidered, the their motions of progression, &c. such

observe in winds, compressible or elastic pare susceptible of what may be termed inwation; a kind of undulation, where the tions parts are thrown into tremulous vi-ons, in which they are alternately condensed meffed; and these undulations are propaalong the mass of elastic sluid, much in the way in which we observe waves to spread

TOL. XVII. PART IL.

on the furface of water. These undulations are also the more ordinary causes of sound. A trembling chord, or fpring, or bell, agitates the air adjoining to it: these agitations are propagated along the air, and by its intervention agitate the organ of hearing. The mechanism of these undulations has been much studied, and furnishes a very beautiful theory of mufical harmony.

The philosopher examines the law of compression bility of air and other elastic fluids; and thus gets the knowledge of the conflitution of the atmofphere, and of the action of those sluids when employed to impel folid bodies. Gunpowder contains an immense quantity of permanently elastic air, which may be fet at liberty by inflammation. When this is done at the bottom of a piece of ordnance, it will impel a bail along the barrel, and discharge it from the muzzle, in the same way that an arrow is impelled by a bow. Having thus discovered in what degree this air presses in proportion to its expansion, we discover its action on the ball through the whoie length of the piece, and the velocity which it will finally communicate to it. Hence the theory of artillery and of mines. Chemistry teaches us, that most bodies' can be converted by fire into elaftic fluids, which can be employed to act on other bodies in the way of preflure or impulse. They have become interesting by being employed as moving forces in some very powerful machines. See Projec-

The magnetical phenomena between magneta, and from have long attracted attention; and the the to which the polarity of the loadstone has been applied, in directing the course of a ship through the pathless ocean, has rendered these phenomena extremely interefting. (See MAGNE-TISM.) Confiderable progress has been made in the arrangement and generalization of them; but the attention of philosophers was, as usual, misplaced by attempting to discover the ultimate cause of magnetism. Dr GILBERT of Golchester was the first who considered the magnetical phenomena in a truly philosophical manner; and his treatise De Magnete, published in 1580, may be confidered as one of the most perfect specimens of the Baconian or inductive logic. ÆPINUS'S Tentamen Tueoria Magnetifnii is also a most valuable work.

Another class of mechanical phenomena have a confiderable affinity with the magnetical; viz. those of ELECTRICITY. Certain bodies, when rubbed or otherwise treated, attract and repel other bodies, and occasion a great variety of sensible motions in the neighbouring hodies. Philosophers have paid much attention to these appearances of late years, but have not been more fuccessful in establishing a complete theory of them, than in the case of magnetism. Franklin and Æpinus have been most successful in this respect. Dr FRANK-LIN has acquired great celebrity by his most judicious comparison of the phenomena; which has enabled him to establish a few general laws, almost as precise as those of Kepler, and of equally extensive influence. His discovery too of the identity of thunder and electricity has given importance to the whole subject. There are many phenomena

phenomena of electricity which cannot be called mechanical, yet are curious and interefling, and continue to engage much of the public attention.

The appearances prefented by our fense of secing form another branch of natural philosophy in ali feminaries of learning. See OPTICS. are not however properly mechanical phenomena. The nature of LIGHT is still a secret. The general laws of optics, however, are fo few, fo fimple, and so precise, that our theories are more perfect in this science, than in any other branch of phyfics; though as yet far removed from the rank of primary facts. Many unknown events happen before the phenomenon comes under the hands of the ordinary optician, fo as to become the fubjects of the simple laws of reflection and refraction. Apparition or visibility may be a quality of a body, depending on the proximity and position of another body, without any thing between them, just as weight is; and this quality may be cognizable by our faculty of feeing alone, just as the pressure of a heavy body is by our feeling alone.

Mr ROEMER first made it probable, that mechanical philosophy had fomething to do with the phenomena of optics, by his discovery "that apparition was not inftantaneous; that fome time elapsed between the illumination of a body and its being feen at a distance. He discovered, that it was not till 40 minutes after the fun illuminated, one of Jupiter's fatellites that it was feen by an' inhabitant of this globe. If therefore a fun were just created, it would be 40 minutes before Jupiter would be illuminated by him, and 200 before the Georgian planet would be illuminated. Here then is motion. It is therefore juilly supposed, and indeed is highly probable, that there is something moved; but it is still doubted whether this fomething, which we call LIGHT, is a matter emitted from the flining body, and moving with great velocity, and acting on and affected by other bodies, in the various phenomena of optics; or whether it is a certain flate of a medium which is thus propagated, as we fee that waves are propagated along the furface of water, or fonorous undulations through the mass of air, while the water or air itself is hardly moved out of its place. See Light, \$ 4, &c.

There are, however, many chemical facts, and facts in the vegetable economy, which give strong and almost undeniable indications of light being a body capable of chemical union with the other ingredients of fublinary bodies, and of being afterwards fet at liberty under its own form, as the cause or medium of vision. But these are questions similar to those about the cause of gravity, and totally unneceffary for establishing a complete theory of the optical phenomena, the nature of vifion, the cause of colours, the phenomena of the rainbow, halos and periheliums, &c. &c. Such is the field of inquiry to the mechanical philosopher of the prefent day. We may hope to extend it; but we must, in the first place, perfect our knowledge of the fenfible motions and actions of bodies. Those of FLUIDS still demand much investigation; and till thefe are thoroughly understood, it is too foon to attempt penetrating further into the receives of nature.

as this study, it is found that every change

which can be observed in the state of a body, with respect to motion by the action of another body, is accompanied by an equal and opposite change in the state of that body. Thus, in the phenomena of gravitation, it is observed that the deflections of the sun and planets are mutual. The same thing is observed in the actions of magnets on each other and on iron; it is also oblerved in the attractions and repulsions of electrical bodies; and it obtains in all the phenomera of impulse and of corporeal pressure. It is therefore an univerfal law of motion, that allien is always equal and opposite to reaction: but this must be confidered merely as a matter of fact, a contingent law of nature, like that of gravitation. Much falle reasoning has been introduced into mechancal philosophy, and particularly into the theory of impulsion or the communication of moties by impulse. In considering this subject, a term be been introduced which has occasioned man wrangling and misconception; we mean the term INERTIA. It serves indeed to abbreviate language but it has often milled the judgment; and the doctrine of the vis INERTIZ of matter is now pe nerally exploded. (See MECHANIES, Part III. Sed. 11.)

If the word ine-tia be taken as expressing, as a quality of matter, but a law of human parment respecting matter, as expressing our rest ty of inferring the agency of a moving force where we observe a change of motion, all distinctions will vanish, and the equality of actionals action will be inferred, as it should be from rephenomena of collision. There will be inferred vis insta corpori impellents, not qua moved, to qua corpori; and this inference will camp through all the mysteries of corporeal action, it conducted Sir Isaac Newton in his grand to

fearches.

To illustrate this, let A and B be two magnets fastened on the ends of two long wooden laths AE, BF, which turn horizontally on pivots C, D, like compass needles, with their north poles fronting each other, 12 inches apart; and let A be puthed towards B, fo that it would move uniformly with the velocity of two inches in a fecond. The phenomena which bave been observed are as follow: A will gradually diminish its velocity; and when it has advanced about nine inches, will ftop completely. B, in the mean time, will gradually acquire motion; and when it has

a lyanced about nine inches, have 2 velocity about two inches per second, with which will continue to move uniformly. Because motion of A is gradually retarded, we infer that a retarding force, that is, a force in the direct BA has acted on it. And fince this would have happened if B had not been there, and ways happens when B is there, we infer that B either its cause or the occasion of its action. To vulgar say that B repels A; so say the dynamus

The abettors of invisible fluids say, that a stream of fluid alluing from B impels A in the opposite brection. All naturalists agree in faying, that an after force connected with B has deftroyed the aution of A, and confider this curious phenomewe as the indication and characteristic of a disxvery. The same inference is made from the moun produced in B: it is confidered by ail as affeced by a force exerted or occasioned by the presence AA; and the dynamifts and the vulgar fay that A mus B. And both parts conclude, from the equal thinges made on both bodies, that the changing becare equal: here acknowledging, that they obire an equality of action and reaction; and they this to the other inflances of the extent of this iw of motion. All this while nobody thinks of be inertia or inactivity of B, but, on the contra-7, conclude this to be a curious instance of its droity; and must people conclude that both boici carry about with them a vis infita both when trest and when in motion.

But if other phenomena give unquestionable edece that, in ordinary collisions, there are the one changes of motion, produced without mamatical contact, the same inferences must be saws; and a scrupulous naturalist will doubt bether contact should make any change in our assonings on the subject, and whether actual marks ever has been or can be observed. See house, it was the

prices, § 153, 154. the classes of natural phenomena. We find maffes or the particles of matter endued in with qualities, which affect the state of other ticks or masses, at smaller or at greater disaces from each other according to certain gene-Irules or laws. This ultimate step in the conlution of things is inscrutable by us. It is arpance to fay, that because we do not compread how there is inherent in a body any quality which another body may be affected at any hace from it, therefore no such quality is pgf-Le it is no less so to say, that matter has no be property but that of moving other matby impuife; and that because it may be so ored, and also by the agency of our own minds, refore, when it is not moved by impulse, is moved by minds. The same almighty FIAT hich brought a particle of matter into existence ald bring those qualities equally into existence; if the how in both is equally beyond our com-

Yet we must guard against resting on this conteration as a Rop to further inquiry. There be species of matter possessed of the mechapowers, which is not cognitable by our fen-All the properties of matter are not known persons who are deaf and blind; and many knomena may really be produced by the action intervening matter, which we, from indolence thifte, ascribe to inherent forces. Philosophers be already discovered intermedia in some cases. is certain that AIR is the conveyer of found, hit is equally certain that there is such a ing as LIGHT. Let us therefore indulge conjecwer, but let us examine these by the received we of motion, and reject them when we find asuconfiltency; always keeping in mind, that even the most coincident with the phenomena is still but a possibility.

These questions about the activity or inactivity of matter are not physical, but metaphysical. Natural philosophy, commonly takes it for granted that matter is wholly inactive; but it is not of any moment in physics whether this opinion is true or false; whether matter is acted on according to certain laws, or whether it acts of itself according to certain laws, makes no difference to the natural philosopher. It is his business to discover the laws which really obtain, and to apply these to the solution of subordinate phenomena; but whether these laws arise from the nature of some agent external to matter, or whether matter itself is the agent, are questions which may be above his comprehension, and do not imme-

diately concern his proper business.

The account now given of natural philosophy points out the way, in which the study must be profecuted. The causes, powers, or forces, which produce the mechanical phenomena of the universe, are known only in the phenomena themfelves. Our knowledge of the mechanical powers of nature must therefore keep pace with our knowledge of the motions. To discover the forces by which the moon is retained in her orbit round the earth, we must know her motions. To a terrestrial spectator she appears to describe an ellipse, having the earth in one focus; but, in the mean time, the earth is carried round the fun, and the moon's real path, in absolute space, is a much more complicated figure. Till we know this figure, and the variations in the velocity with which it is described, we know nothing of the forces which actuate the moon in her orbit. When Newton says, that the forces by which she is retained in this elliptical orbit are directed to the earth, he means only, that the deflection from that uniform rectilineal motion, which she would otherwise have performed, are always in this direction. In like manner, when he fays that these forces are inverfely proportionate to the squares of her diffances from the earth, he only means that the deflections made in equal times in different parts of her motion are in this proportion, These deflections are considered as the characteriftics and measures of the forces. We imagine that we have made all plain, when we call this indicated cause a tendency to the earth; but we have no notion of this tendency to the earth different from the approach itself. This word tendency, fo fashionable among the followers of Sir Isaac Newton, is perverted from its original sense. Tendere versus solem, is, in the language of Rome, and also of Newton, to go towards the sun; but we now vie the words tend, tendency, to fignify, not the approach, but the cause of this approach. When thele expressions have become familiar, the original lense of the word is forgotten, and this metaphor becomes a fruitful fource of misconception and mistake. To secure ourselves against fuch miftakes from myftical notions, we muft confider the way in which we acquire the knowledge of these fancied powers; and then we see that their names are only names for phenomena, and that universal gravitation is only an universal mutual approach among the parts of the folar fystem.

In a word it is only in those parts of natural philosophy which have been mathematically treated, that the investigations have been carried on with certainty, success, and untility. Without this guide, we must expect nothing but a school-

boy's knowledge.

MOTIONS, are the real and only objects of our observation, the only subjects of our disussion. In motion is included no ideas but those of SPACE and TIME, the subjects of pure mathematical difquisition. As soon therefore, as we have discowered the fact, the motion, all our future reasonings about this motion are purely mathematical, depending only on the affections of figure, number, and proportion, and must carry along with them that demonstration and irreliable evidence which is the boast of that science. To this are we indebted for that accuracy which is attained, and the progress which has been made in some branches of mechanical philosophy; for when the motions are diftinctly and minutely understood, and then confidered only as mathematical quantities, independent of all physical considerations, and we proceed according to the just rules of mathematical reasoning, we need not sear any intricacy of combination or multiplicity of steps; we are certain that truth will accompany us, and will emerge in our final proposition, in the same manner as we see happen in a long and intricate algebraic analysis.

Mechanical philosophy, therefore, thus cultiwated is not a fystem of probable opinions, but a demonstrative science. To possess it, however, in this form, requires confiderable preparation. The mere elements of geometry and algebra are by no means sufficient. Newton could not have pro-ceeded fine " sua mathesi sacem preferente;" and, in creating a new science of physics, he was obliged to fearch for and discover a new source of mathematical knowledge. It is to be regretted that the tafte for the mathematical sciences has declined in this country of late years; and that Britain, which formerly took the lead in natural philosophy, should now be the country where they are least cultivated. It is to foreign writers that we have recourse in our seminaries, even for elementary treatiles; and while the continent has supplied us with the most elaborate and useful treatifes on various articles in physical aftronomomy, practical mechanics, hydraulics, and optics, there has not appeared in Britain half a dozen treatifes worth confulting for thefe last 50 years; notwithstanding the unparallelled munisicence of our fovereign, who has given more liberal patronage to the cultivators of mathematical philosophy, and indeed of science in general, than any prince in Europe. The magnificent establishments of Lewis XIV. orignated from his infatiable ambition, directed by the fagacious Colbert. And his patronage being exerted according to a regular plan of pensioned academics, and in procuring the combined efforts of the most eminent men of all countries, all Europe was filled with his culogifts. But all this was done without the smallest retrenchment of his pleafures, the expences being furnished out of the public revenues of a great and oppressed nation; whereas the voyages of dif-

covery, the expensive observations and geothest operations in Britain, and the numerous pensions given to men of science and activity, were all tensified out of the private effact of our excellent solverign, who seems to delight in repaying, by every service in his power, the attachment of a loyal and happy nation. It is therefore to be wished, that his patriotic efforts were properly conded, and that the taste for the mathematic sciences may again turn the eyes of Europe this country for instruction and improvement the present seems a most savourable era for the purpose.

On the whole mechanical philosophy is a entirely a mathematical study, and is to be cessfully prosecuted only under this form: to our endcavours to initiate the young stude will often require more steadiness of should can generally be expected in such abstract lations. It is usual therefore to employ a ments to assist the young student; and most ses of natural philosophy are accompanied by ries of such experiments, connected by a train of argumentative discourse. Such arrusular courses which so by the name of argumental philosophy; althor such a courses are little than illustrations of known doctrines by a ments.

SECT. XI. Of Experimental Philosop

EXPERIMENTAL PHILOSOPHY is the inve tion of general laws, by experiment; and a ferved, under the article PHILOSOPHY, it most infallible, if not the only way of and the knowedge of them. This is the New ganum Scientiarum, so strongly recommen Lord Verulam. It was new in his time, thou without example; for there was even in his a very beautiful example of this method, Treatife of the Loadstone, by Dr Gilbert chefter; a work which has hardly been by any, and which, when we confider 1580, is really a wonderful performance. most perfect model of this method is & Newton's Opticks. Dr Black's Effar on M. is another. Dr Franklin's Theory of Elicit another example of great merit. That the vestigation is not complete, is not an obje The method is without fault; and a part rection is given for the experiments full a co for establishing the general laws.

But although many beautiful and furze examples have been given as particular for es of inquiry, there are many inflances of inaccurate and inconclusive investigations, periments made at random, aimost with view, serve but little to advance our known Every little series of experiments by Margaminates in a general law, while hardly any ral conclusion can be drawn from Pott's rous experiments. Lord Verulam has much on this subject, and with great judy but he has in this satigued his reader by the merous rules; which are rather obscure, to this valuable part of his writings is little reader.

A formidable objection has been made to method of inquiry. Since a physical law is one expression of a general tact, and is chablished

yin consequence of our having observed a similariyin a great number of particular facts; and since regreat rule of inductive logic is, to give the law a greater extent than the induction on which it tounded, why should a few experiments be recreed as the foundation of a general inference? his has been partly answered in the article Phinsurhy. But it may be of use to consider the abiget more particularly; in doing which we hall quote some observations from the differtaaction of evidence by Dr Campbell in his Philosophy of Rictaric.

from an attentive confideration of the objects round us, we find that they are generally of a emplicated nature, not only as confifting of a emplication of those qualities, called accidents, ath as gravity, mobility, colour, figure, folidity, thich are common to all bodies; but also as confing of a mixture of a variety of fubstances, difrent in their nature and properties; each of hich is perhaps compounded of ingredients more mpie. "The farther we advance in the knowdge of nature, the more her constancy in all her perations appears. Like causes always produce te effects, and like effects are always preceded t like causes. Inconstancy sometimes appears Nature's works at first fight; but a more refined perience shows us that this is but an appearance, d that there is no inconstancy; and we explain thus: Most objects being of a complicated nawe find, on an accurate ferutiny, that the alcribed to them ought often to be folely bed to fome of their component parts; and variety of nature is fo great, that hardly any bindividuals of the same species are in every remalike. On these accounts we expect dislimiles in the phenomena accompanying perfectly mar treatment of different subjects of the same it; but we find, that whenever we can be afted that the two substances are perfectly alike, phenomena arifing from fimilar treatment are fime: and extensive observation teaches us, it there are certain circumftances which infure the perfect fimilarity of constitution of some matural agent on one of these, we expect that k fame will be produced on any other.

If a botanist should meet with a new plant, and bleve that it has 7 monopetalous flowers, he ill conclude that every plant of this species will are monopetalous flowers; but he will not suppose that it will have only seven flowers.

Thus we learn, that perfect uniformity is not to expected in any inftance whatever, because in inftance is the timplicity of conflitution sufficiently great to give us affurance of perfect uniformity mevery circumstance of the case. The near-lowever, that our investigations carry us to knowledge of elementary natures, the more are consinced by general experience of the unimity of the operations of real elements; and almough it may perhaps be impossible for us ever arive at the knowledge of the simplest elements of any body, (See Chemistry, Index.) It when any thing appears simple, or rather to hadiy uniform, as that we have invariably observed it to produce similar effects on discovering

any new effect of this sub stance, we conclude, from a general experience of the efficient, a like constancy in the energy as to the rest. Fire consumes wood, melts metals, and hardens clay. In these instances it acts uniformly. If therefore a trial be made for the first time of its influence on any particular substance, he who makes it is warranted to conclude that the effect will be the same.

This general conclusion, therefore, drawn from one experiment, is by no means in opposition to the great rule of inductive logic, but, on the contrary, it is the most refined application of it. A law still more general, viz. that nature is constant in all its operations, is the inference which is here applied as a principle of explanation of a phenomenon which is itself a general law, viz. that nature is constant in this operation. The foundation of this general inference from one experiment being established, experiments must be an infallible method of attaining to the knowledge of nature; and we need only take care to proceed in a way agreeable to the great rule of inductive logic; that is, the fubject must be cleared of every accidental and unknown circumstance, and put into a situation that will reduce the interesting c-roumstance to a state of the greatest possible simplicity. Thus we may be certain that the event will be a faithful representative of every similar case; and unless this be done in the preparation, nothing can refult from the most numerous experiments but uncertainty and mistakes.

The account given above of MECHANICAL PHI-LOSOPHY would feem to indicate, that experiment was not of much use in the farther prosecution of The two laws of motion, with the affiftance of mathematics, feem fully adequate to the explanation of every phenomenon; and so they are to a certain degree. But this degree is as yet very limited. Our mathematical knowledge, great as it is in comparison with that of former times, is still inadequate to give accurate folutions even of very simple questions. We can tell, with the utmost precision, what will be the motions of two particles of matter, or two bodies, which act on each other with forces proportioned to the fquares of the distances inversely; but if we add a third particle, or a third body, acting by the same law, the united science of all Europe can only give an approximation to the folution. What is to be done then in the cases which often occur, where millions of particles are acting at once on each other in every variety of fituation and distance? How shall we determine the motion of water through a pipe or fluice when urged by a pifton or by its own weight? what will be its velocity and direction? It is impossible, in the present state of mathematical knowledge, to tell with any precition or certainty. We must have recourse to experiment. But if this be the case, must the experiment be made in every possible variety of situation, depth, figure, preffure? or is it possible to find out any general rules, founded on the general laws of motion, and rationally deduced from them? Or, if this cannot be accomplished, will experiments furnish any general coincidences which flow fuch mutual dependences, that we may confider them as indications of general principles, though

though fubordinate, complicated, and perhaps inferutable? This can be discovered by experi-

ment alone.

Philosophers have turned their attention to each of these three chances, and considerable progress has been made in them all. Numerous experiments have been made, almost sufficient to direct the practice in many important cases, without the help of any rule or principle whatever. But there are many eases, and these of by far the greatest importance, such as the nuction of a ship impelled by the winds, resisted by the water, and tossed by the waves, where distinct experiments cannot be made.

NEW FOR, Bernoulli, D'Alembert, and others, have laboured hard to deduce from the laws of motion rules for determining, what may be called the average motion of water in these circumstances, without attempting to define the path or motion of any individual particle; and they have actually deduced many rules which have a great degree of probability. But the premisses are on-ly suppositions, assumed to simplify the circumstances, and to give room for mathematical reasoning; therefore these rules and deductions must be exarnined by experiment. Some of the suppositions are fuch as can hardly be refuted, and the rules deduced from them are found to tally precifely with the phenomena. Such is this, " that the velocities of iffuing water in fimilar circumflances are in the fub-diplicate ratio of the preffures." And this rule gives a most important and extensive information to the engineer. Other suppositions are more gratuitous, and the rules lefs coincident with phenomena. 'The figacious Newton repeatedly failed in his attempts to determine what is the ab olute relocity of water isluing from a hole in the bottom of a veifel when urged by its weight alone, and the attempts of others have fucceeded no better. Experiment is therefore still necessary

Those who have aimed at the discovery of rules, purely experimental, have been pratty fuccefsful. Chevalier Buat has, from a comparison of an immenfe variety of experiments, deduced an empirical rule, which will not be found to deviate from truth above one part in ten, in any case which has yet come to our knowledge. This infrance may show the use of experiments in mechanical philofophy. It is proper in all cases by way of illustration; and it is abfulutely necessary in most, either as the foundation of a characteristic of a particular class of phenomena, or as argument in support of a particular doctrine. Hydrostatics, hydraulies, pneumatics, magnetisin, electricity, and optics, can hardly be studied in any other way; and they are at prefent in an imperfect flate, and receiving continual improvement by the labours of experimental philosophers in all quarters of the world.

Having thus given a pretty full enumeration of the different subjects to be considered in the study of natural philosophy, it is needless to spend time in a detail of the advantages which may be expected from a presecution of this study. Its intimate connection with the arts gives it a sufficient recomnectation to the atternion of every person. It is it is foundation of many arts, and gives liberal assistance to all. To this science the navigator must

have recourse for that astronomical knowledge which enables him to find his place in the trick less ocean; and although very small scraps of the knowledge are sufficient for the mere pilot, the fludy must be prosecuted to the utmost by persons, that the unlearned pilot may get the degree of it which must direct his routine. The tables of the fun's declination, which he ules find his latitude, require the fuccessive and unlike labours of all the aftronomers of Europe to min them tolerably exact: and to afcertain his lone tude with precision, it required all the genies a Newton to detect the lunar irregularities, bring them within the power of the calculate Tili this was done, the respective position of ! different parts of the earth could not be afcertain Vain would have been the attempt to do this geodætical furveys independent of astronomic observation. It is only from the most refined chanics, that we can hope for fure principles! direct us in the construction and management a flip, the great means of communication the different quarters of the globe.

'A knowledge of mechanics little inferior to the is necessary to enable the architect to execute it his greatest works, such as domes and assorbition. Without this he cannot unite example the firength; and his works must either bear from the firength; and his works must either bear from the understood or fecured without falls knowledge. The whole employment of the eighner, civil or military, is a continual applicate of almost every branch of mechanical knowledge and while the promises of a Smeaton, a Wallselidor, may be consided in, the numbers lures and disappointments in the most important costly projects show us daily the ignorance.

the crowd of engineers. The microscope, the steam-engine, the rod, are prefents which the world has no from the natural philosopher; and although compais and telescope were the productions chance, they would have been of little ferrice, they not been improved by Gilbert, Halley, Dollond. But it is not in the arts alone that influence of natural philosophy is perceived: lends its aid to every science, and in every steer It is often necessary to have recourse to the phila fopher in difputes at law concerning properly and many examples might be given where proinjustice has been the consequence of the rance of the judges. Knowledge of nature have prevented many diffraceful condemna for forcery. The hiftorian who is ignorant of tural philosophy easily admits the miraculous his narrations, accompanies these with his retions, draws confequences from them, and his pages with prodigies, fables, and abfurdity

It is almost unnecessary to mention the advatages which accrue to the physician from this lady. So close is the connection between it admedicine, that our language has given but on name (Physiologist,) to the naturalist and the medical philosopher. Indeed, the whole his study is a close observation of the laws of material nature, to draw from them precepts to disconnections.

ct his practice in the art of healing. A know-Ige, therefore, of the mechanical laws of the marial world is not only a convenient, but a necesw, accomplishment to the physician. We are tified in this opinion, by observing medical auors introducing into medicine theories borrowed an mechanical philosophy, which they do not derstand, and which they therefore misapply. But there is no class of men to whom this scice is of more service, than to the teachers of reinn. Their knowledge in their own science, Atheir public utility, are much hurt by ignorance the general constitution of nature; and it is to regretted that this science is generally neglecinplishment: nay, it is too frequently shunned a dangerous attainment, as likely to unhinge own faith, and taint the minds of their hear-We hope, however, that few are so feebly med in the belief of the great doctrines of reion as to fear this. But many have a fort of mor at all attempts to account for the events of ture by the intervention of general causes, and ak this procedure derogatory to the Divine nae, and inconfiftent with the doctrine of his paralar providence. Their limited conceptions mot perceive, that, in forming the general law, : Great Artist did at one glance see it in its reand most minute consequences, and adjust reaft affemblage so as completely to answer epurpose of his providence. There never was re eager inquirer into the laws of nature, or. fame time a more ardent admirer of its glo-Author, than the Hon. Robert Boyle. Greattaken therefore are they who think that we fede the existence of MIND and of providence we trace things to their causes. A physical deing an unvaried fact, is an indication, and Arongest possible indication, of an unerring who is incapable of change. The operainvariable. Physical laws, therefore, or seary causes, are the best proofs of unerring confidered as indications of wildom among And what aftonishing evidences of wisdom re not observe in the general laws of the maworld? They will ever be confidered by the elligent philosopher as the most glorious dism minconceivable wisdom, which has been k, by means to few and to functe, to produce eth which by their grandeur aftonish our feeble derstandings, and by their inexhaustible variety ide all possibility of enumeration.

While the teachers of religion remain ignorant the beautiful laws of nature, the great characters of the wissom and goodness of the Alasty Creator, their heavers are deprived of the fublime pleasure; the Deity is deprived of the praise which he would receive from an entened people; and the only worship he reter is tainted with mean notions of his attrictes, and groundless sears of his power.

Let none be afraid of the pernicious effects of billosophy, in consequence of the dreadful extension which the vanity of man has lately made a France. The rustians who lately ruled in that whappy country, still groaning under despotism,

continually imputed to the illumination of philofophy the ardour which animated them in the cause of liberty; and they pretended that justice and morality were the order of the day. But their whole professions of liberty and philanthropy were contradicted by their practice. The facred name of philosophy was as unfit for their faithless and bloody mouths as the names of liberty or virtue, and was equally misapplied. No wonder that religion fled from the torch of their philosophy: for their philosophy confisted expressly in the confounding the most distinct classes of phenomena and of beings, in affimilating the heavenly animating spark within us to a piece of rude matter, and in degrading man to the level of the brutes, and thus thutting out his fairest prospects. This they did in the face of the world, when they passed an act of the convention, to put an inscription on all church-yard doors, that " Death is only eternal fleep." But it is not by the ordinary exertions of the divine, that fuch facrilegious confusion can be rectified: this requires an intimate acquaintance with what is characteristic of mind and what is characteristic of matter, and a comprehenfive view of the general laws which regulate the appearances in both classes of objects. Thus, and thus alone, will the divine be able to confute the detetlable fophisms of Mirabeau, Diderot, and the other foi-difunt sages of France. Besides these advantages which arise to different classes of men from this study, there are some effects which are general, and are too important to be passed over. That spirit of dispassionate experimental inquiry, which has so greatly promoted this fludy, will carry with it, into every subject of inquiry, that constant appeal to fact and experience which characterife it. And the superior method which distinguish some of the later productions in other sciences, have been in a great measure owing to this mathematical spirit, the fuccess of which in natural philosophy has gained it credit, and thus given it an unperceived influence even over those who have not made it their study. The truths also which the naturalist discovers are fuch as do not in general affect the passions of men, and have therefore a good chance of meeting with a candid reception. Those, whose interest it is to keep men in political or religious ignorance, cannot easily suspect had consequences from improvements in this science; and if they did, have hardly any pretext for checking its progress. And discoveries accustom the mind to novelty; and it will no longer be startled by any consequences, however contrary to common opinion. Thus the way is paved for a rational scepticisin, and a free inquiry on other subjects. Experiment, not authority, will be confidered as the test of truth; and under the guidance of experience we need fear no ill.

Finally, as it is the business of philosophy to deferibe the phenomena of nature, to discover their causes, to trace the connection and subordination of these causes, and thus obtain a view of the whole constitution of nature; it is plain that it affords the surest path for arriving at the knowledge of the great cause of all, of God himself, and for forming proper conceptions of him and of our relations to him: notions infinitely more just than

car

can ever be entertained by the careless spectator of his works. Such a contemplation is in the highest degree pleasant and cheering, and cannot fail of impressing us with the wish to co-operate in the giorious plan, by acting worthy of the place we hold among the works of God, and with the hopes of one day enjoying all the satisfaction that

can arise from conscious worth and consumate knowledge; and this is the worthin which the will approve. "This universe (fays Boyle) in magnificent temple of its great Author; and it is ordained, by his powers and qualifications, it high prieft of nature, to celebrate divine service this temple of the universe." Enc. Brit.

Dryden.—Let the physiognomists examine his tures. Arb. and Pope.

(1.)\* PHYSIOGNOMONICK. Physic MICK. adj. [\$10010710401075; from physics]. Drawn from the contemplation of the lact versant in contemplation of the face.

(2.) Physiognomonics, n. f. among phydenote fuch figns as, being taken from the tenance, ferve to indicate the flate, disposit both of the body and mind; and hence the reducing these tigns to practice is termed a nomy.

# PHYSIOGNOMY.

PHYSIOGNOMY is thus defined by Dr Johnfon:

\* Physiognomy. n. f. [for physiognomony; overinforma; physiognomie, French.] r. The act of discovering the temper, and foreknowing the fortune by the features of the face.—In all physiognomy, the lineaments of the body will discover those matural inclinations of the mind which diffimulation will conceal. Bacon's Nat. Hift. 2. The face; the cast of the look.—

The astrologer, who spells the stars,
Mistakes his globes, and in her brighter eye
Interprets heaven's physiognomy.

Cleaveland.
They'll find i' th' physiognomies

O' th' planets all men's definies. Hudibras.

The end of portraits confifts in expressing the true temper of persons, and to make known their physiognomy. Dryden.—The peculiar physiognomy of the mind is most discernible in children. Locke.

Physiognomy is formed from the Greek quest, nature, and yourse, I know. It is a feience which occupied much of the attention of ancient philo-fophers, and which, fince the revival of learning,

has been much difregarded.

"Till of late," (fays the ingenious WILLIAM MAXWELL MORISON, Efq. whose account we thall use the fredom to quote,) " it has seldom in modern times been mentioned, except in conjunction with the exploded arts of magic, alchemy, and judicial aftrology. It does not appear that the ancients extended the compals of phyliognomy beyond man, or at least animated nature: But the study of that art was revived in the middle ages, when, mifled probably by the comprehensiveness of the etymological meaning of the word, or incited by the prevalent tafte for the marvellous, those who treated of the subject stretched the range of their speculation far beyond the ancient limits, The extention of the fignification of the term was adopted univerfally by those naturalists who admitted the theory of fignatures (fee SigNATURE); and physiognomy came thus in the knowledge of the internal propertial corporeal existence from the external appearance of the physiognomist and philosopher of couldening nence, wrote a treatise on the physiognomist and physiognomical, in which he physiognomy as the generic term. The treatise likewise De Physiognomia Aviva, by the same person. In the Magia Physiognomia Schottus, physiognomia kumant a studierion of the science.

"BOYLE too adopts the extensive figures bove mentioned, which indeed feens to at one time the usual acceptation of the At present physiognomy seems to mean than "a knowledge of the moral charader tent of intellectual powers of human being their external appearance and manners."

" Phyliognomy was much cultivated in and India; and from these countries Pyth probably introduced the rudiments of this as he did those of many others, into Greece the time of Socrates it appears even to have adopted as a profession. Physiognomy, An observes, had been treated of in three ways: philosophers classed animals into genera, scribed to each genus a certain mental disp corresponding to their corporeal appearance thers made a farther diffinction by dividing nera into species. Among men, for instance distinguished the Thracians, the Scythians, gyptians, and whatever nations were ful different in manners and habits, to whom a ingly they affigned the diffinctive physiogracharacteristics. A third fet of phyhoge judged of the actions and manners of the al, and prefumed that certain manners proces But the method from certain dispositions. treating the subject adopted by Aristotle bit was this: A peculiar form of body is invaria companied by a peculiar disposition of mind; a man intellect is never found in the corporeal rm of a beaft. The mind and body reciprocally ed each other: thus in intoxication and mania e mind exhibits the affections of the body; and fear, joy, &c. the body displays the affections the mind.

" From fuch facts he argues, that when in man particular bodity character appears, which by or experience and observation has been found iformly accompanied by a certain mental difpom, with which therefore it must have been ne-brily connected; we are entitled in all such to infer the disposition from the appearance. observations, he conceives, may be drawn ther animals as well as from men: for as a possesses one bodily form and mental characa hare another, the corporeal characteristics to lion, such as strong hair, deep voice, large smities, discernible in a human creature, dethe frength and courage of that noble animal: he the flender extremities, foft down, and other ares of the hare, visible in a man, betray the stal character of that pufillanimous creature. Upon this principle ARISTOTLE treats of the

poreal features of man, and the correspondent ofitions, fo far as observed: he illustrates them to analogy just mentioned, and in some inpattempts to account for them by physiolo-

reasoning.

Confidering the early period in which Aristotle his theory which is plaufible, and even prodisplays his usual penetration and a consie degree of knowledge. He distinctly nodividual phyliognomy, national phyliognoad comparative physiognomy. The state of tedge in his time did not admit of a com-ducidation of his general principles; on that n his enumeration of particular observations precepts is by no means fo well founded or bunte, as his method of fludy. Even his concile and energetic, was inimical to the which, to be made clearly comprehenmust require frequent paraphrases. Aristoperformance, however, fuch as it is, has been as the ground-work and model of every paromical treatife that has fince appeared. The imitators of this great man in the 16th

37th centuries have even copied his language manner, which are fententious, indifcriminate, obscure. His comparative physiognomy of with beafts has been frequently though not.

rially adopted.

Next after Aristotle, his disciple and successor PHRATUS deserves to be particularly men-as a writer on this subject.

TOLEMON of Athens, ADAMANTIUS the foand several others, wrote on the subject athe same period. Lately there was publishcollection of all the Greek authors on physiy: the book is entitled, Physiognomia veteriptores Graci. Gr. & Lut. a Franzio Altenb. 8vo. From the number of these authors, it was that the science was much cultivated in with it fomething of the marvellous. c; but the professors seem soon to have con-

From that period to the close of the Roman blic, nothing worthy of remark occurs in the

VOL. XVII. PART II.

literary history of physiognomy. About the lastmentioned era, however, and from thence to the decline of the empire under the later emperors, the science appears to have been cultivated as an important branch of erudition, and affumed as a profession by persons who had acquired a superior knowledge in it.

"The science of physiognomy shared the same fate with all others, when the Roman empire was overthrown by the northern barbarians. About the beginning of the 16th century it began again to be noticed.-From that time till the close of the 17th it was one of the most fashionable studies Within that space have appeared almost all the approved modern authors on the subject. They are, Bartholom. Cocles, Baptista Porta, Honoratus Nuquetius, Jacobus de Indagine, Alstedius, Michael Schottus, Gaspar Schottus, Cardan, Taisnicrus, Fludd, Behmen, Barclay, Claromontius, Conringius, the commentaries of Augustin Niphus, and Camillus Balbus on the Physiognomica of Aritotle,-Spontanus, Andreas Henricus, Joannes Die gander, Rud. Goclenius, Alex. Achillinus, Jon. Prætorius, Jo. Belot, Guliel. Gratalorus, &c. They are noticed in the Polyhistor, of Morhossi, vol. i. lib. 1. cap. 15. § 4. and vol. ii. lib. 3. cap.

About the commencement of the 18th centurity the occult sciences, as they are termed, had declined very confiderably in the estimation of the learned; and those who treated of physiognomy torbore to diffrace it by a connection with those branches of ideal learning, with which formerly it had been invariably conjoined. In Britain, Dr Gwyther noticed it with approbation.—His remarks are published in the Philef. Tranf. vol. xviii.; and Dr Parfons choic it for the subject of the Croonean lectures, published at first in the 3d supplement to the 44th vol. of the Philos. Transactions, and afterwards (1747) in a separate treatise, entitled Human Physiognomy ex-

plained.

" The observations, however, of these writers, as well as of Lancifius, Haller, and Buffon, relate rather to the transient expression of the patitions than to the permanent features of the face and body. The well-known characters of Le Brun likewife are illustrative of the transient physiognomy, or (as it is termed) pathognomy."—See his description of the Passions, under Drawing, Sea, X. and XI; and his figures on Plates CXIN, and CXX.

" During the 18th century, (continues Mr Mo-RISON,) although physiognomy has been now and then attended to, nothing of importance appeared on the subject till the publication of the great work of M. LAVATER, dean of Zurich, which has excited no inconfiderable portion of attention in the literary world. The author professes not to give a complete synthetical trentife on physiognomy, but, aware that the science is yet in its infancy, he exhibits fragments only illustrative of its different parts. His performance is no doubt defultory and unconnected. It contains, however, many particulars much superior to any thing that had ever before appeared on the subject. From this work we shall conclude our short article, by quotingpart of the author's defence of his favourite leience.

"No fludy, fags, he, excepting mathematics. mu.e more juftly deserves to be termed a science than physiognomy. It is a department of physics, including theology and beiles lettres, and in the same manner with these sciences may be reduced to rule. It may acquire a fixed and appropriate character; it may be communicated and taught.

"Truth or knowledge, explained by fixed principles, becomes science. Words, lines, rules, definitions, are the medium of communication. The question, then, with respect to physiognomy, will thus be fairly stated. Can the firiking and marked differences which are visible between one human face, one human form, and another, be explained, not by obscure and confused conceptions, but by certain characters, signs, and expressions? Are these signs capable of communicating the vigour or imbecility, the siekness or health, of the body; the wisdom, the folly, the magnanimity, the meanness, the virtue, or the vice, of the mind?

"It is only to a certain extent, that even the experimental philosopher can partue his refearches. The active and vigorous mind, employed in such studies, will often form conceptions which he shall be incapable of expressing in words, so as to communicate his ideas to the seebler mind, which was itself unable to make the discovery; but the lofty, the exalted mind, which foars beyond all written rule, which possesses feelings and energies reducible to no law, must be pronounced sciencistic.

"It will be admitted, then, that to a certain degree physiognomical truth may as a science be defined and communicated. Of the truth of the science there cannot exist a doubt. Every countenance, every form, every created existence, is individually diffinct, as well as different, in respect of class, race, and kind. No one being in nature is precifely fimilar to another. This proposition, in fo far as regards man, is the foundation stone of physiognomy. There may exist an intimate analogy, a striking similarity, between two men, yet being brought together, and accurately compared, they will appear to be remarkably different. No two minds perfectly refemble each other. Now, is it possible to doubt that there must be a certain native analogy between the external varieties of countenance and form, and the internal varieties of the mind? By anger the muscles are rendered protuberant; Are not, then, the angry mind, and the protuberant muscles, as cause and effect? The man of acute wit has frequently a quick and lively eye. Is it possible to refift the conclusion, that between such a mind and such a countenance there is a determinate relation?

"Every thing in nature is estimated by its phyfiognomy; that is, its external appearance. The trader judges by the colour, the fineness, the exterior, the *physiognomy* of every article of traffic: and he at once decides that the buyer "has an honest look," or "a pleasing or forbidding countenance."

"That knowledge and science are detrimental to man, that a state of rudeness and ignorance are preserable and productive of more happiness, are tenets now deservedly exploded. They do not ment serious opposition. The extension and increase of knowledge, then, is an object of impor-

tance to man; and what object can be so important as the knowledge of man himself? If knowledge can influence his happiness, the knowledge can influence it the most. The me ful knowledge is the peculiar province of the sence of physiognomy. To conceive a just idea of the advantages of physiognomy, let us for a ment suppose that all physiognomical knowledge were totally forgotten, among men; what consistent, what numberless mistain would be the consequence? Men defined to in society must hold mutual intercours. To knowledge of man imparts to this intercours spirit, its pleasures, its advantages.

"PHYSIOGNOMY is a fource of pure and en ed mental gratification. It affords a new view the perfection of Deity; it displays a new le of harmony and beauty in his works; it rest internal motives, which without it would a have been discovered in the world to come. phyliognomist distinguishes accurately the per nent from the habitual, the habitual from the cidental, in character. Difficulties, no doubt. tend the study of this science. The most mis fliades, fearcely difcernible to the unexperior eye, denote often total opposition of characteristics A fmall inflexion, diminution, lengthening or pening, even though but of a hair's breadth, alter in an aftonishing degree the expression countenance and character. How difficult how impossible indeed, must this variety di fame countenance render precision? The less character is often so hidden, so maked, that can only be detected in certain, perhaps un mon, politions of countenance. These point may be so quickly changed, the figns may stantaneously disappear, and their impress the mind of the observer may be so slight, or u diffinguithing traits themselves so difficult to that it shall be impossible to paint them a feribe them in language. Innumerable great fmall accidents, whether physical or mora ous incidents and passions, the divertity of of position, of light or shade, tend to display countenance often in fo difadvantageous a P of view, that the physiognomial is betrayed an erroneous judgment of the true qualities of countenance and character. Such causes occasion him to overlook the effential traits character, and to form a decision on what isp ly accidental. - How furprifingly, for inflance, the imalipox disfigure the countenance, and ffroy or confound, or render imperceptible, to otherwise the most decifive?"

That there is, upon the whole, some true physiognomy cannot be denied. Every more feeling's direct him in a manner to practic it least tacitly, in a certain degree, upon the sight of a stranger, especially if there be any teither strikingly agreeable or the opposite in features.—But should we attempt to ach by rules of this science, in our general interest with mankind, we would be often grossly dered; and still more were we to decide on a maintellectual powers by the rules of this science. In this last respect, it is affirmed, that Leval himself has fallen into very great mistakes, withstanding his long practice in the art.

FRA their physiology. Bentley.

"PHYSIOLOGY," (fays the ingenious Dr John Baclay, lecturer on anatomy at Edinburgh,) is a Greek word, which, in strict etymology, pufies that which discourses of natures but in common use, it is restricted to that branch physical science, which treats of the different actions and properties of living bodies; while faring bodies are meant those which are by a than organized structure enabled to grow, and agate their kind.

By this definition, physiology must necessahave for its object the explanation of that in-lorganical economy in plants and animals, in sature has devised for the preservation of findividual, and for the continuance and pro-

his naturally divided into two kinds, partiand general. The former treats of the prothe and functions of the individual or species, may be feen in the article Anatomy; the latthe subject of our present article, and treats note functions and properties, which are geneler common to all living bodies.

But of all the branches of physical science, fology certainly makes the nearest approach the region of metaphysics; but yet there is a ference between, though it may not be very If to point out the precise line of termination. lyfology, as already defined, is that science hich has for its object the organical economy living bodies. But, wherever the economy of ing bodies indicates defign, and cannot refult any combination or structure of organs, it be supposed the effect of something different matter, and whose explanation belongs to which is called metophyfics, or which we Aft term the philosophy of mind.

#### INTRODUCTION.

Paysiology was long disfigured by whimfical heries, and numerous hypotheles were formed whout any data. Bellini of Florence disgusted The these absurdations first applied mathematics to k fludy of the science: Borelli, Boerhaave, od Pitcaran adopted fimilar methods. The forher confidered the muscies as ropes, and the specs as levera, and explained the interior motions of the animal economy on the principles of mechanism; while the latter held geometrical demonstration to be the only species of evidence, excepting the fenses, that could be relied on. The mechanic physiology has now funk into such contempt, that the most illuterate affect to imile at the mention of its name; but let it not be forgotten, that it explained the structure of the eye, the movement of the bone, and force of the mulcle, and that it may yet perhaps be the means of many interesting discoveries in the living body. Chemistry now, in physiological investigations, holds that place which was formerly possessed by geometry and mechanics. Nor is CHEMISTRY undeferving of this rank. By the knowledge Chemists have acquired of salts and of gases, by their more ingenious modes of analysis, and by some discoveries made concerning the nature of heat and of light, chemistry is now able to account for many phenomena, that before were inexplicable.

It is more than a century fince it was observed, that plants were nourithed by pure water and atmospheric air; that from these alone they derived their extracts, their mucilage, their oil, their coal, their acids, their alkalis, and aroma: But fince the discovery of different kinds of elastic fluids, it has been farther remarked, that they grow rapidly in hydrogenous gas, and in air mixed with carbonic acid; that affilted by light their leaves absorb hydrogen from water, carbon from the acid of which they are so fond; and, thus decomposing the one and the other, difengage from both the oxigenous principle, or vital air, and restore to the atmosphere salubrity and bealth.

Leaving vegetables, which, by analyfis in close vessels and in red bot pipes, it has reduced to hydrogen, oxygen, azot, and charcoal, it has made discoveries no less important in the animal kingdom. It has found that the food of the nobler animals, which immediately or remotely is prepared by vegetables, is generally acted upon by a folvent: it has proved by experiment, that the animal organs can fix agot; can decompole atmospheric air; can form time, iron, and carbonic acid, as well as vegetables, produce a number of faline substances, which no art could detect in their food. Nor is it here that such discoveries are meant to terminate; these seemingly creative powers of vegetation and of animalization, with other phenomena in the ftructure and economy of living bodies, chemistry imagines that it will yet be able to explain. We may safely venture, however, to predict, that something more than its present knowledge of the vark ous effects of heat and of mixture will in this Rrr 2 cafe

cale be found necessary to ensure success. The discovery of classic fluids and their fingular properties affords the strongest reason to sufpect that we yet may be ignorant of many agents which nature employs in the functions of bodies. But whatever be the truth, we are almost certain that these agents discovered by the chemist are not alone concerned. Electricity, magnetism, and animal electricity, must not be excluded from acting fome part. growth of plants, it is well known, is confiderably affected by the electrical state of the atmosphere; it is fensibly promoted by a proper use of the vegeto-electrometer, (or electro-vegetometer; see ELECTRICITY, Index,) and has been faid to indicate a difference between the negative and positive electricities whether these be kinds or flates of the fluid. Such too is our present knowledge, that electricity as yet feems the only cause to which we can ascribe the seeming chemical affinities of the dew; its constant practice in avoiding fome bodies, its predilection for others, and particularly its attachment to the living points of plants and of leaves: nor is this electricity wholly unconnected with the animal kingdom; when we think of its fingular fondness for points, it occurs that one intention of our hairs may probably have been to collect and diffuse it. It is plainly excited in cross rubbing the hair of some animals; and when we wear filk, it is frequently accummulated upon the furtace of our own bodies.

The iron found in plants and in animals is certainly fomewhat of a firiking circumftance, and cannot be denied to be one reason why magnetism should not be wholly overlooked.

As for animal flectricity, or what has been called fo, it is now, we believe, generally allowed to hold an important place in the fystem. It is very perceptible in all those nerves which are subscrivent to voluntary motions; nor is it limited to these alone. In several instances where metals were applied to the nerves of the heart, which nature has destined to spontaneous motions they were feen to awaken the dormant powers in the mufcular fibres of that vifcus. We here speak only of the nerves; but the Torpedo, the Gymnotus electricus, and Silurus electricus, poffefs a particular structure of organs for collecting this flind, for discharging it at pleasure, and for giving a shock. If those who are accustomed to the common kind of electrical experiments may at first be surprised that this electric stuid in the animal is not discharged from the nerves by water, or any other metallic conductor that is pure and unmixed, another fact, which is fully as ftriking, though it has not been hitherto mentioned by any observer known to us, appears to menit equal attention; Cut away the leg of a frog, uncover a part of the crural nerve, place the limb how on a table on which an electrifying machine is working, you will fee the muscles strongly conbulled at every spark which you draw from the conductor, but remaining motionless upon the discharge of the Leyden phial." Sec Plate CXXXIV, Fig. 16 and 17.

Here it may be expected that we should take

notice of Animal Magnetism, as address in physiology nearly allied to Animal Electurity; but this pretended discovery having has decided to have been a deliberate impossion spot mankind, we need only refer the reader for account of its history and detection, (to the interconfusion of its author Mesmer, and hispapil Deslon,) to our article, Magnetism, and MAL.

"The aid, (continues our ingenious author which anatomy affords to physiology, is now be confidered. Physiology in general and Rudy of anatomy are so closely connected, that HALLER imagined, they can hardly be trated even in idea.

" The anatomist has observed, that all proceeds immediately from the mulcular that the muscular fibre again derives its from the nerve, which terminates in the that fibre and perve, and the whole system, nourished by the blood which comes from heart; and that the waste of blood is suppl by the lacteals, which abforb nptritions as from the food, as it paffes along the intercanal. He has also observed, that the bi which is in continual motion, has a circ courfe; that other veffels along with the teals are employed to abforb; and by mea injection has shown the route of the of fluids as clearly in the dead as they could been feer in the living subject. Aided by microscope, he has discovered the red pla of the blood, animaiculæ in the semen a anaftomoses of the arteries and veins; and the microscope could lead him no further had recourse to chemical analysis, and ma coveries equally important, in demonstrating bodies which compose the several stude folids.

A TABLE of the Functions or Profest Living Bodies; altered from M. D'Al

1. DIGESTION. 2. NUTRITION. 3. SECRET 6. OSSIFICATION. 7. GENERATION. 2. TABILITY. 9. SENSIBILITY.

TABILITY. 9. SENSIBILITY.
Every body, in which one or more of functions are observed, is to be considered.

sessing organization and life.

1. DIGESTION. 1. Living bodies have one or more fromachs easily diffingulation the colophagus and inteffinal canal:—Quadrupeds. Cétaceous animals. Birds. taceous animals. 2. Living bodies which fromach diftinguishable only by certain of tions from the colophagus and inteffinal cast Oviparous quadrupeds. Serpents. Cartier fishes. Fishes properly so called. 3. Living dies which have an alimentary canal, not guilhable into cosphagus, fromach and times:—Insects. Worms. Zoophites. 4 ing bodies which have neither fromach sor times:—Piants.

11. NUTRITION. 2. Living bodies on nutritions juices are absorbed by vessels begind from internal cavities:—Man. Quadrupeds. taceous animais. Birds. Ovipaious quadrupeds.

pents. Cartilaginous fishes. Fishes properly hiled. Infects. Crustaceous animals. Worms. Living bodies whose nutritions juices are abed by ressels opening upon the external sur-:-Plants.

II. CIRCULATION. 1. Living bodies with d, having a heart with a ventricles and a au-Man. Quadrupeds. Cetaceous animals. ls. 2. Living hodies with blood, with one vicle divided into several cavities, and 2 auri--Oviparous quadrupeds. Serpents. g bodies with blood, with one ventricle and uricle :- Cartilaginous fishes. Fishes propercalled. ii. Living bodies with a whitish fluid; e beart is formed of one longitudinal, vessel, ous and contractile, in which there is a whithid infead of blood:—Cruftaceous animals. its. Worms. In some crustaceous animals is observed fomething resembling a heart. lying bodies with juices, in which no heart kt been observed, but only vessels filled with of a nature different from that of blood.

hytes. Plants. RESPIRATION. i. Living bodies which k, 1. By lungs free from all adhesion and y:-Min. Quadrupede. Cetaceous ani-2. By lungs free from all adhefion, veficud muscular: -Oviparous quadrupeds. Ser-3. By lungs adnering to the most and led with appendages:—Birds. 4. By gills 3. By lungs adhering to the ribs, and trent forms:—Cartilaginous fishes. Fishes ly so called. Crustaceous animals. c. By ta or holes in different rings:-Infects. worms. 6. By an opening called trachea, external fringes:—Aquatic worms. 7. By :-Plants. ii. Living bodies in which have been discovered neither stigmata nor

z:-Polypes. BECRETION. Living bodies. lies in which fecretions are not carried on. OSSIPICATION. i. Living bodies, whose n is, v. Internal and offeous:-Man. Quads. Cetaceous animals. Birds. Oviparous peds. Serpents. Pithes properly fo call-Internal and cartilaginous:-Cartilaginous 3. External and corneous: - Perfect in-Lithophytes. 4. External and cretace-Crustaceous animals. Shell fish. Madre-The greatest part of zoophytes. 5. Exand ligneous: Plants. ii. Living bodies bave no skeleton:-Infects in their first Worms. Polypes.

GENERATION. i. Living bodies, which Vivioarous: - Man. Quadrupeds. Cetaranimals. 2. Oviparous, whether the evoof the eggs takes place within or without male: —Birds. Oviparous quadrupeds. Ser-Cartilaginous fishes. Fishes properly so Infects. Crustaceous animals. Worms. ii. Laving bodies which propagate by -Worms. Polypes. Plants.

I. IRRITABILITY. 1. Living bodies which le a body muscular or contractile: - Greatest t of infects in the first state of their transfortion. Worms. Polypes. 2. Living bodies ach have muscles covering the skeleton:m. Quadrupeds. Cetaceous animals. Birds. "parous quadruped). Serpents. Cartilaginous fishes. Fishes properly so called. 3. Living bodies which have a skeleton covering the muscles: -Perfect infects. Crustaceous animals. 4. Living bodies, which have no mufcular power; no spontaneous movements:-Plants.

IX. SENSIBILITY. 1. Living bodies, which have nerves and brain eafily diftinguishable from the fpinal marrow:—Man. Quadrupeds. Ceta-ceous animals. Birds. Oviparous quadrupeds. Serpents. Cartilaginous fiftes. Fiftes properly fo called. 2. Living hodies, which have nerves and brain fcarcely diftinguishable from the spinal marrow: - Infects. Crustaceous animals. Worms 3. Living bodies, in which there have not yet been discovered nerves or brain, or spinal marrow: - Zoophytes. Plants.

The above table, which has its divisions marked by the functions, and their kinds and varieties by the kinds and varieties of those organs by which they are performed, differs confiderably from a zoological. Borrowing its feveral marks of diffinction from internal characters, it more clearly demonstrates the difference between the mineral, vegetable, and animal, than any fystem that attempts to arrange by outward appearan-

No minerals, whatever be their forms, or the regularity and beauty of their figures, were ever faid to possels any thing like organs of nutrition; and however frequently some may recover their loft thapes, they are never supposed either to produce, or affift in producing, their own kind by generative powers. And no plants, however much may be faid of animals that want a nervous fythem and a heart, and are fixed, without the power of loco-motion, to one place; we fay, no plants, though fome may reprefent a few of the fimpler effects of fensation, and others may be free to float through the ocean, were ever faid to discover any signs of voracity, to possels any thing retembling a stomach, to distend their body by swallowing their food, to apply their food to the mouths of abforbents opening internally; and, when the nutritious juices were extracted, to eject it in cumulo. It has been faid that zoophytes prefent fimilar phenomena. One half of their name would imply that they are animals, and another half would infigurate that they are plants. D'-Aubenton reasons with clearness on this subject. True, fays he, the greatest part of them are branched like plants, and like plants are compofed of concentric circles. Some have a foft exterior substance which is called bark, and a hard interior which is called wood. Along their branches, and at their extremities, they put forth velicles which refemble buds; and when a part falls from the whole, it is sufficient, like a vegetable flip, to produce a zoophyte; but do these appearances prove that they are plants?

After thus endeavouring to point out the houndaries between the mineral, the plant, and the animal, we now venture on a rude fk-tch of the order and manner in which these properties may be explained, and in which the facts in general

physiology may be afterwards arranged.

Without blaming the arrangement of D'Azyr, whole genius and labours we respect, we have been induced to adopt the following, from those

realons

reasons with which the reader is now to be acquainted.

Attending minutely to a living body, which already has escaped from the seed, the egg, or membranes of the parent, which is wholly disengaged from the placenta, and depends for the future on the operations of its own organs, we may observe, that in order to live, it must be allowed the free use of air, as applied by the organs of—Respiration.

That, in order to grow, it must have likewise a supply of food, which is a substance somehow adapted to its constitution; and which, on being received into the system, is Prepared by—Disgestion, Taken up by—Absorption, Distributed by—Circulation, Assimilated by—Nutrition, And the whole carried on by means of—Secretion.

We next may observe, that to enjoy the free exercise of these functions, it must be secured from the more common and external injuries of its situation; and that this is done by certain integuments originally produced, and, when it is necessary, afterwards renewed by that function; which, till we receive a new nomenclature, we shall renture to call by what may be rather an uncouth word—Integumation.

We again perceive, that these functions are all dependent on a general principle—Irritability: By which the system is rendered by stimulants susceptible of—Motion; Accommodates itself to different circumstances by means of—Habit; Alters its shape by successive—Transformation; Produces the species by—Generation;

And when the business of life is finished, is, after many a languid affection from the influence of—Sleep, At last subjected to the general sate of all living bodies—Death.

These we imagine are the general properties of living bodies; and such is the order in which we are now to take a short and cursory view of them.

#### SECT. L. Of RESPIRATION.

RESPIRATION is that function by which air is brought into the fystem, and by which it is prepared in particular organs, that in some respect succeed the placenta in the general economy. For, as any interruption of the usual intercourse between the placenta and soctus in ovo proves soon fatal; so, when that communication naturally ceases, and the new one succeeds between the lungs and external air, it is likewise found, that any preternatural interruption of this last is in all living bodies presently attended with various symptoms of increasing languor, and in many with an almost instantaneous death.

So effential is respiration to the system, that snails, chameleons, and some other animals, can live for years upon air alone. We have seen a chameleon that lived and was vigorous for 22 months without any food, and which might have continued to live much longer but for an unfortunate bruise by a fall.

Other phenomena equally demonstrate the importance of air to the living body. The frog leaps away wanting its heart; it survives the loss of the greatest part of its spinal marrow. Without its head, it lives for some days, and its heart

continues to circulate its blood. Spallanzani took one from the back of a female, cut off his head, and, after performing this whimfical experiment, faw the gallant return to his miftress, grasp ber in his arms, and finish the task which he had begue. And Borelli found, that eels and ferpents though their bodies be opened, and the whole of their vilcera be taken out, are able to move for a day after; and yet, notwithstanding, in all these ar mals, the life is observed to be suddenly exist guilhed when the all-vivifying air is exclude Even the smallest insect has died, and the pia loft its vegetative power, when retained for while in a vacuum. The fish itself, when place under the exhausted receiver, has started asset ly to the furface of the water in quest of in air; and, finding none, has funk to the bot and expired in convultions.

To this general dependence of life upon a ration there occur but few things like an exection; these are, some serpents and worms, a crustaceous animals found alive in the hearts stones, some infects that were found in word, a number of toads which in different piaces habeen taken from the hearts of trees and of red where they lest an impression, and where the were supposed in some cases to have lived for turies without air. These sacks, real or pressed, have been the cause of much specular ed, have been the cause of much specular ceiving the facts as sufficiently, authences have studied how to account for them, by an hypotheses.

Experiments must tell what are the which nature has here prescribed to berself. I eggs, when covered with varnish, or placed der the exhausted receiver, are secured u the attacks of corruption. Bomare, in his tionary, has mentioned three, which, prote from air, were found fresh in the wall of a ch after a period of 300 years. And if it be true a fnake found in a block of marble died as as exposed to the air, or if the parts in con with air be the only ones which in torpid and appear to be changed, it would feem pro that a total exclusion of this varying and a element would tend more to the preservation torpid animals, in certain inftances, than a admission, which, in those cases where all functions have ceased, is regularly found a prin pal agent in their disfolution.

M. Herissant, of the French Academy, was first philosopher who, by means of experim thought of interrogating Mature herfeif upon subject. On the 21st of February 1771, he great accuracy that up three toads from the two of which were taken out alive on the 8th April 1774. D'Aubenton fays, after a penoc 18 months; but in this inflance we depend a on the friend of Fontana, who has mentioned The two toads were again inclosed, a dates. Herissant died before there was a second in p tion. D'Aubenton says, that when taken their bodies were hard and shrivelled, and the whole moisture totally obsorbed. A fourth to that had been inclosed was heard to croak when ever the box in which it was confined happened to be shaken. Since that period the practice it COMM 34

Digitized by Google

common of confining finalls in a fealed phial, where

her exift in torpor for years.

These phenomena still excite wonder; but to roader less, and examine more, would sooner procure us that information which we are want-

Leaving, therefore, the torpid state as one of huse subjects with which we at present are little equainted, and of which we therefore cannot reak with certainty in the general abstract lanpage of science; it will naturally be asked, In that respect is air so necessary to all living bo-Les in their active state, and how contributes it whe regular performance of the different funcinos ?

The moderns, who, after all their refearches, ave been unable to discover this vital spark of le ancients, are more puzzled to assign an adesate cause for the heat than for any cold which

bry discover. Of animal heat, the most rational theory, we bink, properly belongs to the last century; it is infirmed by modern discoveries, and has ascribd this heat to respiration. Many had observed, at those animals which respire most, have the wraeft blood. Lower demonstrated, that this pod received a new and a brighter colour in thing through the lungs. Verheyen and Borelli th proved, that the air loft fomething by comin contact with that organ. Mayow showed, this fomething which the air lofes is containm nitre. Experience taught the workers in t, that this something was absorbed from the and Verheyen remarked, that it is also abhed by the lungs, and is probably that which hat in combustion; which qualifies the air for ing support to animal life, and imparts to the d the vermilion colour.

Now well the whole of this reasoning was meded, is proved by the late discoveries of healey and other chemists. There is now obined, in a separate state, an aerial fluid, which lintains both life and combustion, and gives a milion colour to the blood. It is extracted in key large quantity from nitre; is one of the sponent parts of the atmosphere, and the viprinciple of that element; without which, in animals, life is extinguished. It was called phiogisticated air by Priestley, the first disco-For; as the great acidifying cause in nature, the much nomenciature has given it the name of ngenous gas; and, as one of the causes on which memstence both of fire and of life depends, it samed empyreal or vital air.

Late discoveries have shown farther, how this may in respiration produce heat. From the accurate investigations, it appears, that cafric, or the primaiple of heat, is a distinct subince in nature; that it combines with different odies in different degrees; that it is the cause of bidity in all; and that, in proportion to that specity which they have for it, and to that difince at which they are removed from the fluid inte, the more or less caloric they contain. Acform bodies being all, therefore, exceedingly it must be evident, that when they are fixnd or condensed in the blood, and made to apwosch nearer folidity, a quantity of heat must

be evolved. A part of this is very plainly evolved in the lungs where the air is absorbed, as appears by the breath; and a part evolved by the action of veilels, as appears from nearly an equal heat over the system, from the partial heat of a morbid part, and the sudden transition from heat to cold, and from cold to heat, over the furface, when the veffels are affected by either internal or external stimuli. When the heat, thus evolved by the gradual fixation of that body with which it was combined, has been fuccessful in making its escape by the lungs and integuments, the blood returns in a dark and a fluggish stream by the veins, and mingles again with the genial fluid, which before gave it spring, activity, and life.

Of that oxygen which remains in the lystem, part is employed in forming different faline combinations and supplying the waste occasioned by that constant reabsorption; which, from many experiments that have been made with folutions of matter, is known to take place in the folid bones. The use of that oxygenous gas which returns with the breath, is best understood after knowing its affinities. Its basis oxygen, combining with hydrogen, which is the balls of inflammable air, forms water; and, combining with carbon, the carbonic acid. It carries, therefore, back with the breath a part of the carbon, produced by the flight combustion of the blood, and a quantity of hydrogen arifing from the watery fluid decomposed.

But oxygenous gas does not alone enter the lungs. Of 100 parts of the atmosphere, but 18 are oxygenous gas, who is carbonic acid, and 72 are azotic gas. Thefe last, though intended chiefly for other beings different from man, which are in immense numbers on the globe, but which, like him and the nobler animals, are not formed to breathe the empyreal air, must notwithstanding be of some important and essential use to all living bodies. It has accordingly been found by experiment, that pure and unmixed oxygenous gas cannot be breathed for any very confiderable time without danger; that some azot is contained in the blood, and has been extracted from the muscular fibre, when properly treated with the nitric acid. According to Bertholiet, five of its parts with one of hydrogen form ammonia or volatile alkali; which difpels the glandular tumours of the body, and prevents the coagulation of blood, and the thickening of mucus which arrie from acids. The azotic gas may therefore in part unite with hydrogen, may prevent the coagulation of ferum, the catarrhous formation of viscid mucus, and many combinations that oxygen might form, injurious to the system. The carbonic acid, which is ros of carbon, and ros of oxygen, may also be necessary in regulating the effects of the other two. In aerated water, its uses are very generally known: it allays the pain of the urinary bladder when excited by calculus; it has been employed in the cure of wounds, and been thought useful in the pulmonary phthins. It is generated in the lungs of those animals which respire oxygen. In small proportions it favours the growth of the vegetable tribes. These readily decompound it; and, with the addition of o-

ther

ther prepared oxygen from water, restore what is pure to the general mass of the vital fluid, that plants and animals may thus live, by the mutual

performance of kind offices,

Every theory that pretends to account for A-NIMAL HEAT, ought also to account for that fingular equality of heat which the fystem preserves, or endeavours to preferve, in different tempera-The ingenious Dr Barclay explains it fimply in the following manner, from the above

theory:

"Venous blood, if exposed to the air, is known to absorb a portion of oxygen, and assume that colour which it has in the puimonary veins and aorta. Suppose an absorption of a similar kind taking place in the lungs, a fact which may be proved by decifive experiments; it is plain that the oxygen by this absorption must recede from its galeous or fluid state; that a quantity of heat must be therefore evolved, which, along with the heat of the refluent blood, is carried away by that vapour which issues from the lungs. In the courfe of circulation, the oxygen will naturally incline with the hydrogen to form water; it will tend likewise to the formation of many other compounds; and, as it enters into new states, and is farther removed from gaseous sluidity, it must still be giving out a portion of heat. If the furrounding temperature be cold, this separation will be easily effected. The caloric will, in that case, be greedily absorbed from the interior surface of the lungs and exterior furface of the whole body. The oxygen, meeting with the necessary temperature, will readily pass into new forms; and the venous blood, returning to the lungs, will demand a supply which will be either greater or less according as the cold, by favouring the escape of the caloric, and promoting new combinations with oxygen, had removed it from the point of usual saturation.

"The gradual evolution of heat-is a proof that the temperature must be sometimes reduced, before the oxygen can properly enter into all the usual combinations of the system. Suppose the body then to be placed within a hot circumambient atmosphere. This atmosphere, if warmer than the animal, will be more apt to part with heat than to receive it; and the oxygen absorbed, being thus unable to dispose of its caloric, will be prevented from passing into those combinations and forms where heat is evolved. The venous blood will therefore conduct it back to the lungs, and make a demand for a new fupply; but proportionally less according as the hot circumambient air, by preventing the escape of the caloric, and the usual facility of new combinations, has confined its removal to a smaller distance from the point of faturation.

"In this last case the time principally entitled to notice, is a very curious effort of nature to refift the growing increase of heat. In the warm atmosphere, as during violent muscular exertion, the exhaling vapour is commonly discharged in a greater quantity from the furface of the body; and confequently the heat furnished with an excellent temporary conductor, that in some meafure counteracts the dangerous effects from with-

But all living bodies are not supported by the fame kind of aerial food. Oxygenous gas has indeed been honoured with the flattering appellstion of vital air; and nitrogenous gas been ufaally distinguished by that degrading epithet are tic; a word which fignifies destructive of life. But though man, and all the warm-blooded ammair that have yet been examined, may die in reforing the nitrogenous gas, this gas however, which constitutes more than two thirds of the whole mosphere, may in general be called the ntal of the vegetable tribes, and of not a few of the orders of infects which thrive and live in it. In while man, and others which respire as he deemit both the hydrogen and carbon, and me the nitrogen not fentibly diminished; most we tables and many infects eagerly inhale them, emit oxygen as noxious or ufelefs. Thefe are the indications of a radical difference in flitution. Even the fibres of those living which exhale oxygen, will, after death, attne so powerfully, as to decompose the nitric and but those bodies which inhale nitrogen, but very weak an affinity to oxygen, and fo from one to some of the bodies with which it is to bined, that they can easily decompose water

carbonated air. What fithes respire is not ascertained. No the change of the air, nor of the water they occasion when in close vesiels, have, to as we know, been fully examined. Chapter affured, that, like other animals, they are followed of the action of all gales. Foureroy lays they do not generate the carbonic acid, and that air which Priestley and he found in the air wall of carp was nitrogene gas. Their thermone heat is fo low, that in D'Aubenton's table are reckoned among the cold blooded The temperature of plants is still lower. heat of a tree which the very ingenious Dri examined, though feveral degrees above the atmosphere when below the soth division Fabrenheit, was always feveral degrees when the weather was warm. When take the fap was observed to treeze at 32°, while tree it would not freeze below 47°. The profule peripiration of vegetables greatly rates the heat in their furface; and as air abforbs moisture expands, and becomes the

ipecincally lighter, there is a regular conve duced, and evaporation rapidly promoted by

denie air displacing the rarefied. The heat which is developed in all living

dies, is proportioned to the quantity of ma which is by means of the vital powers reduce a flate more nearly approaching folidity; to kinds of the fubstances which are reduced, # the degrees and kinds of the reduction. In all it bodies there are certain degrees of heat, pecul fitted for carrying on their various economic perations. What these are, in the different k of plants and animals, is not known. The h the hedge-hog, the dormouse, and the bat, probably not digeft when reduced to 70°, 750 80°. The frog, however, will digett at 60°; the birch before it arrives at 473. Respiration befides imparting aerial food, feems intended regulate those different degrees of heat. It is ne heat after a meal; it fuffers it to fall in the one of fleep; it withdraws the supply when the tmosphere is warm, and increases it again when Therefore heat merely is not the obet foldly aimed at in respiration. All living boies have their congenial degrees of heat. gulation of these is important; on the one side, prevents the diffipation, on the other, the coaplation, of their fluids; it preferves the living ower of their organs; and, by a natural and proer temperature, affilts their action in mixing, perpofing, decompoling, and preparing the difthat parts for fecretion, excretion, abforption; Murption, and affimilation. But the whole of heat is not evolved in the lungs, nor the whole k is evolved disengaged from air. And the bole of the air does not enter by the lungs; neh is contained in the liquid and foold parts of re food. It is extricated often in the process of ireftion; and, when the organs are vigorous and paithy, is made subservient to the general econog. If the organs, however, should happen to be senid, it feorus their authority, which cannot be forced; from being friendly, it foon becomes inical to the fystem, and threatening danger, acimplates not only in the flomach and inteffines, st in other cavities. It has been found in the ular membrane; in certain velicles formed for ; in the uterus, in an abscets; and in gunwounds: it has fometimes burit from the vawith a fort of norfe. And in a nephritic, plaint of a horfe, it has been found flowing in am from what the farners call the fhrath.

SECT. R

te have now to inquire, what are the kinds of ratory organs, and in what manner their dious are performed? The preceding table in some measure made us acquainted with this ect. Some animals breathe by a trachea and ; inlects, by either Algmata, or trachez, thing into air veffcis; plauts, by air-veffcls and es; tithes, and numbers of the watery element, of do not breathe, at least receive air by their It the foetus in ovo, the polypus tribe, and more organized bodies, by the same organs ch convey their food. The absorbents appear be the first and most general way by which libodies are supplied with air: the mouths of the vessels are like small tubercies; scattered owthe body of the infect while wrapt in its memane. In the horse and the bird they are bloodfels foreading on a membrane, and deriving marithment from the uterus or egg, that had en itself nourished by absorbents. In a cow, by are vessels which, spreading on a membrane, minate in glands; thefe glands being opposite thers which adhere to the uterus; and the mbranous and uterine glands, when in cona, inclofing a third gland like a kernel. In man, ley are veffeis (preading on a membrane, and enrring a large glandular body called the *placenta*, the moufe and the hare, they are hkewife vefs branching on a membrane and entering a lacenta; this placenta, when fixed, receives large eins from the parent, and which may be either mated or injected from the cavity of the ute-

What are properly respiratory organs exercise sot their function till circulation and nutrition are Vol. XVII. PART II.

begun. Not only are the respiratory organs thus late in exercifing their functions; in many vegetables a great part of them is annually renewed, and laid aside in the torpid state. In those insects which undergo the most remarkable kinds of transformation they fuffer a change; and in all those animals which spend their earlier days in the water, and afterwards come to live in the air, they are altered in kind. In all living bodies the proper function of one part of the respiratory organs is, to fecrete from the water or air that particular aeriform fluid which mingles with their juices, and which is necessary to life and nutrition. In many cases these organs are placed externally, and are always in contact with the air or water from which they secrete. In other cases they are lodged internally; and air or water are then alternately admitted and expelled by varieties of organs which ferve as auxiliaries.

Vegetables fecrete their aeriform fluid from water and air. They receive air along with the liquids of their absorbents, which open on the roots, the trunk, and the branches, and upon the inferior furfaces of leaves; or, if nature has plunged thefe leaves under water, the absorbents open and imbibe their fluids on both fides. In many, however, the upper furface of the leaf is intended to inhale air. As it is proved by Ingenbousz and others, that the respiration of many leaves is asfitted by light, we fee a reason why plants growing in a dark room turn to the place where light is admitted; why the flowers and the leaves of many plants follow the diurnal course of the fun: why the branches of trees, which require much fight, die when placed in a thick shade; why moonthine in autumn contributes fo much to the ripening of grain; and, why leaves and branches are arranged in such a manner as least to intercept that quantity of light which nature has allotted to the genus of each.

The air-vessels in the body of plants are those vessels which contain juices but at certain times, and which during the greatest part of the season are filled with air. This air is collected from the dap of the roots as it puffes along the diametral infertions, and from those vessels which open upon the trunk and upon the leaves. Like pulmonary tubes, which are feen branching through the bodies of infects, they perform an office fimilar to that of the traches and bronchia; and are those general receptacles of air from which the neighbouring parts of the plant secrete what is needed. The air vessels are surrounded by those which contain a liquid during the whole time of the growth. They are the largest vessels of the wood, as diffinguished from the bark; and in the leaves they may foractimes be feen even without the affiftance of glaffes. Their cavity is formed by certain fibres which wind spirally like a cork-screw. In the leaf they generally approach and recede like the filaments of nerves; but they never inofculate from one end of the plaint to the other, except at the extremities.

The respiratory organs, which are similar either to the gills of tishes or the lungs of man, can hardly here claim a description, as their nature and forms are so generally known. There is one circumstance, however, in birds which we must notice:

the cells of their bones, and the numerous veficles of their foft parts which communicate with the lungs, have been deservedly a matter of surprise to most physiologists. In accounting for their use, the ingenious HUNTER supposed that they lessened the specific gravity and affisted flying; that being the circumstance which he thought most peculiar to birds. Learning afterwards that they were in the oftrich and not in the bat, he suppo-fed that they were appendages to the lungs. In amphibious animals, in the fnake, viper, and many others, he observed, that "the lungs are continued down through the whole belly in the form of two bags, of which the upper part only can perform the office of respiration with any degree of effect, the lower having comparatively but few air-veffels." In these animals, the use of such a conformation of the lungs was to him evident. "It is in confequence of this fructure," faid he, "that they require to breathe lefs frequently than others." From this reasoning he inserred, that the motion of flying might render the frequency of respiration inconvenient; and that a reservoir for air might therefore become fingularly ufeful. The bat and the offrich, however, are here as formidable objections as before. The bird respires frequently when at rest, and when it slies to our bosom from the hawk; that frequency seems to have been increased by what is a general and a common cause, an increased degree of muscular exertion. This great physiologist was not aware that the circumstance most peculiar to birds was not their act of flying, but their feathers, which conrain a large quantity of air, and which require a regular fupply, whether they foar on the wings of the eagle, or remain on the ground attending the offrich. Both in amphibious animals and birds, the air of the veficles has paffed the respiratory furface of the lungs. In the trachex of plants, and the pulmonary tubes and veficles of infects, it is only proceeding on its way to be respired.

From the general diffusion of air through the birds, and the fituation of their veficles beyond the lungs; it would appear that the pulmonary viscus in these animals does not respire or secrete air for the whole fystem; and we are certain that in piants and infects, most parts respire the air for themselves, and that there is no particular part appointed to fecrete air for the whole. We here freak of respiratory organs, as those which secrete an aeriform fluid from water and air; but our Linguage probably had been more accurate had we called them the organs in which an aeriform fluid is absorbed by their liquid contents, as these Now by, either wholly or in part, in their courfe tarough the fystem. It was long denied that any abforption of the air took place from the pulmonary furface. Borelli, however, endeavoured to thow air in the lungs might mingle with the blood, and how some always disappeared in respiration. , duce expiration. Phere are few doubts now entertained on this subject. Venous blood inclosed in a bladder by the celebrated Priettley discovered such an attraction for oxygen, that it absorbed the aeriform fond through all the coats of the refifting medium, exhil iting an instance and beautiful illustration of the chemical affinities which take place in this function.

There are two kinds of respirators organs, which, though formetimes included in the general expresfion, should always be considered as perfectly dis-The first kind comprehends those in which the water and the air are decomposed; the second, those by which these sluids are properly applied to the respiring surfaces of the former. We observe these last in the fluttering motion of the leaf itself, or in that tendril which turns the face of the leaf to the fun. We feethem prote cing these oscillatory motions in the branching of the pulcx arborescens. When the breathin surface is within the body, we discover them gain in the tracheæ of plants, whole cavity formed by a spiral fibre that is seemingly istu ed for fome kind of peristaltic motion. We tect them likewise in the pulmonary tuben the spiral rings, and in the abdominal moves of infects. We fee them in fifthes swallowing water and propelling it onward through the es of the gills. In the frog, we note them by motions of the pouch between the stemum the lower jaw. After this animal is divided to verfely behind the fore legs, this pouch a nues to fill and to empty it felf downwards by tracheæ where the lungs were. When the wa integuments and fome of the muscles between jaw-bone and sternum are removed, we see the pouch was dilated and contracted by a cartilage connected with the trachea, and ed by mufcles to the indfie of the fternum and neighbouring parts. When the pouch is en ed, the air rushes in through the two noting that time expanded; and when it is contral the glottis starts up with an open mouth w middle of the pouch, and the air is prefled through the trachez to the lungs. fight will fometimes continue for a whole! In man and all the warm-blooded quadrupeds thorax or cavity where the lungs are placed lated and contracted by the diaphragm and cles attached to the ribs. In the time of tion the glottis opens, as we fee in birds air rushes in, supports the incubent weight atmosphere, and enables the thorax to wider. The expanding powers having man last their usual effort, their antagonists successive

exert their force, and the air is expelled.

The heat of the lungs expands the air as as is enters. The air rapidly abforbs most and though not usually remarked by Phygists, yet the sudden expansion, which is at the consequence of that absorption, is a verneral phenomenon in nature. By this her absorption, the air would occasion greater tation, were it not for the lungs, which coult cartilages of the sternum, which recoult the stretched-out muscles, which either specualty, or directed by the will, contract and

Having thus feen how the air rushes in a pening the glottis, we may conceive how shutting of the glottis will result the force of nal expansion; and support a weight laid upon breast. The confined air will expand equals all sides, and the pressure must be great before space which falls to the glottis can exceed its muscular force and the weight of the atmosphere.

is this diffused preffure of fluids that produces sch firking wonders in hydraulics; and which splains how the droppings of the ureters should spend the bladder even to a palfy, and overtom the abdominal muscles.

Various hypotheses have been invented, to acisat for the action of those organs which serve hundred in respiration, but all derived from the limited views of the subject, that no dere theory can be drawn from them. But it is mate for man that these assisting respiratory has are in some measure subject to his will, this subjection he produces vocal sound when place, divides it into parts, varies it by tones, in it into words, and enjoys all the distinguishand innumerable advantages derived from lange, oratory, music, and in a word science in eral.

### SECT. II. Of DIGESTION.

Tas function of digertion succeeds respiration by er continuing or supporting the growth of the body. It depends on respiration for a porof heat, and is that function by which the liand folid food undergoes its first preparation r lystem. Though galeous fluids, including principles of heat and light, may nourish and pose the substances of all living bodies, yet a ionly can enter the lystem in a gaseous state. part is changed by the lungs, or by those which they contain. The organs of dibefore they can act on aerial bodies, must them reduced to some new forms. For the of vegetables, this form requires to be water, t 100 parts confift of 84# of oxygene and of hydrogene. See WATER. When the have passed through both the watery and vele states, they, as juices or folids, become the of many animals.

profession and by preparation the gafes become the food of open which are called carnivorous; and then the vivorous and all living bodies, when the vivirorous and all living bodies, when then the vivirorous and all living bodies, and when the food of the kinds on which they are turn the food of the kinds on which they

has long been observed, that those animals Ith are not carnivorous feed upon plants; and, he the days of Van Helmont and Boyle, it has inspected that plants live upon water and This suspicion has now been confirmed by distilled water without earth, and, instead quiring a vegetable mould, have spread their h in moss, in paper, in cotton, in pieces of th, in pounded gials, and powder of quartz. om these sacts, the ingenious CHAPTAL suphes that soils act, but as so many sponges, afinding water in different proportions, and in diftent ways, and that all that the plant wants in the foil is a firm support, a permission to exid its roots where it chooses, and that propormed supply of humidity which will secure it ainfi the alternatives of being inundated or dried The late Dr John Brown was of the fame opinion, 25 years ago. To answer, however' these several conditions M. Chaptal says it is ne' cessary in many cases "to make a proper mixture of the primitive earth, as no one in particular possesses them." On these accounts a single earth cannot constitute manure, and the character of the earth intended to be mediorated ought to be studied before the choice of any addition is decided on. The best proportions of a sertile earth for corn are three 8ths of clay, two 8ths of sand, and three of the fragments of hard stone. "The advantages of labour consist in dividing the earth, and converting them into manure by facilitating their decomposition."

" Before we had acquired a knowledge of the conflituent principles of water," refumes Chaptal, " it was impossible to explain or even to conceive the growth of plants by this fingle aliment. In fact, if the water were an element, or indecomposable principle, it would afford nothing but water in entering into the nutrition of the plant, and the vegetable would of course exhibit that fluid only; but when we confider water as formed by the combination of the oxygenous and hydrogenous gales, it is easily understood that this compound is reduced to its principles, and that the hydrogenous gas becomes a principle of the vegetable, while the oxygen is thrown off by the vital forces. Accordingly we see the vegetable almost entirely formed of hydrogen. Oils, refins, and mucilages, confift of scarcely any thing but this substance; and we perceive the oxygenous gas escape by the pores where the action of light causes its disengagement."

The leech and the tadpole are also nourished by water, and many animals have no other food. "RONDELET cites a great number of examples of marine animals which cannot subsit but by means of water, by the very constitution of their organs. He kept during three years a sish in a vessel constantly maintained full of very pure water. It grew to such a size, that at the end of that time the vessel could not contain it. The red sishes which are kept in glass vessels are also nourished, and grow, without any other assistance than that of water properly renewed."

As all plants are fed on nothing groffer than liquids, we fee the reason why they are all nourished by abforbents, and why, instead of one common alimentary canal, they are furnished with a number of capillary veffels, which by their action affift the living power in moving the fluids along the trunk, the branches, and the leaves. These fluids move between the different ligneous circles, and the more copioully as the wood is younger or the nearer the circles are to the bark. In the circles themselves, it has been remarked that the sap-vessels, from being empty during a great part of the growing season, have been cal-led air-vessels; that they are formed of spiral fibres, adapted to some peristaltic motion: and it is plain, that by this structure they are well fitted to propel their contents, whether water or air, upwards or downwards, backwards, or forwards, according to the different politions of the plant, Befides the particular action of the veilels, a ge. neral concustion is received from the movement Ssca

Digitized by Google

of the waters or winds, which ferves as an exercife; a general dilatation is occasioned by both mostlure and heat; and a general contraction by dryness and cold, which produce a motion some-

thing fimilar to that of the thorax.

In spring the sap ascends through the empty veficle before the leaves appear. When the veffels are filled through their whole extent, the huds swell, the leaves spread, and the flowers blow; the evaporation from the furface is increa-Led; the cap is diminished by the absorption; the succiferous vessels now cease to bleed; and the poots being unable to fupply the wafte, the rains and the dews enter by the trunk, the branches, the leaves, and the petals of the flowers. When the evacuations are immoderately increased by excessive heat, or preternaturally obstructed by the plucking of the leaves, by too much humidity, or other causes which prevent perspiration, the plant foon either fickens or dies. The chyle, which is formed in the fap veffels, has generally iomething of a faccharine tafte.

Most Animals have, like vegetables, both inhaling and exhaling veffels, by which some of their fluids are absorbed, and evacuations regularly carried on. Except, however in those animals which fublish by liquids, these wessels are of little importance in receiving food or ejecting what is facal from the fystem. In these animals the absorbents terminate in a hollow viscus, which is called the alimentary canal, where the fluids undergo a preparatory change, and are partly reabforbed for affimilation. In all others the food enters by a probofcis, or by an aperture called the mouth: this mouth is properly the entrance of the alimentary duct. It is very generally furnished with a tongue, which is usually affilting in deglutition ! and if the food be of that nature to require curting, tearing, or grinding, it is likewise furnished with the proper instruments for these operations. When the food is tellaceous or some hard wegetable substance, and these instruments are not in the mouth, fomething fimilan is generally found in a more remote part of the canal. The crab and the lobster have accordingly grinding teeth in their stomachs, and granivorous fowls have a powerful gizzard lined with a thick corneous fubtrance. It possesses the compressing force of the jaws; and small pebbles which the animals swal-tow, serve it for teeth.

\* Besides grinding, the solid food often requires to be mixed with some additional liquid. In those carnivorous animals which chew, this liquid during the time of martication flows into the mouth from certain glands in the neighbourhood. In Some species of fimia a previous dilution takes place in two pouches fituated on the fides of the lower jaw. In granivorous birds this dilution is tifually performed in a fac, which is a dilatation of the canal; and the food being macerated there by the glands or exhaling vessels, gradually pas-Le down, as is needed, to be triturated and further prepared in the stomach. In the ruminating kind the dilution is performed in a fimilar manner; but these having no muscular stomach fitted for grinding, inftead of descending, the food is brought up again into the mouth, and is then, after the proper maffication, lent to the flomach.

If the food require no mastication, it is fest dired. ly that way at first: a circumstance which shows a curious differnment with respect to foods, and proves that this asimentary canal is subject to the action of voluntary mufcles as far as the flomen Some of those birds which have a diluting fair a ingluvies feem likewife to rumluate. This in parrot was observed by the gentlemen of French academy. It has fince been observed! rooks; micaws, cockatoos, and others; and Munter discovered, that the male and the fer pigeon fecrete in their incluvies a certain it for feeding their young; and that the mon! of what have been thought ruminating bird very often in expressing their fondness regun their food. Yet both this and another speci regurgitation; which is very common with animals that fwallow indigeftible fubftances their food, should be carefully distinguished rumination.

To the ruminating kinds the diluting facno means peculiar. The porpoise has though it does not ruminate; and many of animais which have none, as the rat, the hope the horse, have a part of the stomach with a cuticle, and which must therefore pally serve as a reservoir. The guilets of fishes, and serpents are facs of this kind. of their prey projects often from the while another part fills up the gullet and ga descends, to be reduced in the solvent bele very dilatigle are the stomachs and the gul fome ani: is, that serpents have been one to swallow whole animals, which prior gorging, were larger than themselves; a ny polypes, and even some of the louse kind by fwallowing food, more than double the bulk

All animals which ruminate have two or at least two divisions in one; some have as the gazella; and fome 4, as the cow, medary, and the sheep: but the number mache is no proof of a ruminating power. porpoise has two; the porcupine has the fions in one; and the cassowar, although four fromachs, does not ruminate; nor, granivorous, is any one of the four a passione what different from these expansions first part of the alimentary canal, is a f pouch which hangs from the neck and the mandible of feveral birds, and which, like th pouches of apes, may be used either to man the food or to carry provisions from a diffe their young. The pelican, a native of countries, employs this pouch fometimes to a quantity of water....

Besides the suids which mingle with the in the mouth, the gullet, or macerating sact is one denominated the gastric juce, which is one denominated the gastric juce, which a series glands at the entrance of the gizzard, resists or glands in the coats of the storage perhaps most plentifully near the pylorus: it effully resists the putrefactive fermentation; agulates misk and the white of an egg; it sind food even when inclosed in metallic tubes. When life ceases, it acts frequently on the ward mach from which it was secreted. Its take

in, and solvent powers, are different in different fles of animals. It seems to be modified acting to the age, the health, the habit, and the brent aliments on which they live. But what most surprising in the gastric juice is, that it resall living bodies; as those worms which exist the stomach, and the stomach itself while it is c; and it has an affimilating power, and recessall substances, whether animal or vegetable, which it ass, to a certain fluid of determinate serties, called CHYLE.

perties, called CHYLE. the food, after passing through the stomach, is gkd with a greenish saponaceous liquor, call-BILE, which flows either immediately from the r, or from a veficle into which it had regurgid as into a blind gut: at the fame time nearly s mingled with another refembling the faliva n the pancreas or sweet-bread; a gland or ids whose place is supplied in many fithes by a nber of vermicular appendages to the stomach. bort, from one extremity of the alimentary cato the other, fluids are perpetually flowing ina cavity from glands, veffels, or organic porest the membranes confiantly fecreting a mucus noted themselves from the acrimony of their This acrimony must often be considermear to that end of the canal where the faces dicharged; for, as the first part of the canal has mally one or more dilatations called *flomachs*, keretes at least one fluid which is strongly an-Ric, so the last part has generally appendages d caca, where the food always remains for time, and where, from the quantity of animatter that happens to be mixed with it, it mes putrescent. The office of the coca is times supplied by the largeness and convoluwof the colon, as in the bear whose integines so feet long, but have no cacum. The cocca of various forms and capacities; they are often p than the stomach itself; are often composed reportionally thin and transparent membraness from their contents have often a colour fomeresembling that of the gall-bladder. ther is different in different animals. Some tbut one. The birds which have them have rally two; the buffard has three; and Swam-Ham has diffected infects which had four. The mm of both the rabbit and the hare is curioufly med. It is large and beautiful; is rolled up like mau ammonis; and has a fold running spirally hin. The animals which live on vegetable food t usually the greatest length of the canal, and greatest number of stomachs and of cocca: yet raffowar, which has no gizzard, has no co-); and the polype, which is faid to be all stois, properly speaking, rather all eccum. breating of the process of digestion, we must everlook that general organic action which through the whole alimentary canal. per of mastication exerted in the mouth is obm. But the force of some stomachs has till y lately been known to few. Abbé Spallan-In divided stomache into 3 forts; the muscular, membranous, and intermediate. BORELLI d the force of the muscular stomachs by throwmto them nuts of filberds, hollow spheres of hollow cubes of lead, small pyramids of 04, and several other very hard substances, sup-

posing that the power exerted by the stomach of the Indian cock was equal to 1350 lb. weight. The force of an intermediate stomach cannot be so great, and that of a membranous one must be still lefs. Each seems to have more of the solvent as it has less of the muscular power. The most membranous are affisted by the action of the neighbouring parts, and expel their contents as readily as the strongest. The muscular fort is either wholly or principally confined to certain hinds of birds and of sisses. This comminution

takes place in their flomachs. The direction of hairs found in the stomachs, and the balls of hair which are thrown up, indicate a circular motion in the alimentary canal. The intestinal part has a motion similar to that of a worm, and is called the vermicular or perificaltie. Every portion retains its own motion, tho' separated from the rest by ligatures. The stomach of the polype, the gullets of the ruminating kinds, and the cocca, have this motion in different directions at different times; and that observed in the alimentary canal of a loufe is, when viewed through a microscope in the time of action, amazingly rapid; the ftimulating causes employed are the food, the different liquors with which it is mixed, the air, the nerves where they exist, and a portion of heat. Some degree of heat is necessary to every process of digestion both in the animal and vegetable kingdom: what that degree is depends on the nature of the living body; and is various according to its age, health, employments, and habits. The ingenious Hunter has mentioned the digestive and generative heats; and gardeners versant in the operations of hot-houses, have on their thermometers the swelling, flowering, and the ripening heats, with a great-many others, for the plants which they raile. Among the other causes of digestion some authors have ranked FERMENTA-TION: and it must be allowed, that something similar to the putrefactive fermentation takes place in the cocca and the lower extremity of the inteftine, and that the vinous and acetous fermentations but too frequently occur in our stomachs when that viscus is morbidly affected.

Living bodies are much regulated by the different degrees of heat, the varieties of foil, and the kinds of food concerned in digeftion. The plants grow where the foil and beat are congenial to their nature; and those which admit of the great, eft variety with respect to soil, and the largest range on the scale of heat, are the farthest disperfed over the globe. As every foil has usually some regular supply of moisture, the plants that can live upon that supply extend their roots under the furface, where their liquid food is the least exposed to evaporation. If their trunks need a support, they creep on the ground, they climb the face of a neighbouring rock, or cling to the body of some of the statelier children of the forest. Their range for food is chiefly confined to the small space occupied by their roots and branches; yet if any uncommon exertion be necessary, the branches will bend, and the leaves turn to drink of the water that is passing by. If the roots be laid bare, they will again plunge into the earth; if a stone or a ditch be thrown in the way, they will move round or will dip downwards, and spread into the foil on the other side: if there they arrive at one that is unfriendly, they will not enter; but if a favourite earth should be near, though not in their direction, they will twist about, advance as they grow, and at last meet it. In all these cases the prop, the water, and soil, must be necessary; they must also be within a very small distance, otherwise the plants cannot perceive them, or will fail in their languid attempts to approach them.

It may be considered as a general fact, that wherever food is liberally supplied for a whole lifetime in one place, the creatures which use it have feldom much locomotive power, or much inclination to exercise it in a long continued and progressive line. The curious infect is therefore observed to deposit its offspring in those places where the prospect of genial warmth and of plenty feems to preclude the future necessity of wandering or refearch; and when this offspring is about to pass into a new state, and the organs foretel that a change or perhaps a variety of food will foon be required, the appearance either of wings or of legs does likewife foreshow that the power of locomotion is to be increased. The nobler animals, when the organs of digeftion are strong and the appetite inclines to variety of aliment, wander in fearch of it, and move at intervals, from place to place. Such are often endued with a large alimentary canal, with stomachs, convolutions, and cœca, where they may lay up provisions for a journey.

This variety of food, and the manner in which it is affected by climate, are the cause of the many and singular migrations from spot to spot, from country to country, and from sea to sea: they are the cause of a state of torpor in the hedge hog and the bear, and they partly explain the provident foresight of the ant and of the bee. Animals of great locomotive power, to provide for themselves and their offspring, remove to a distant country or climate. Those of less locomotive power, and who are incapable of migrating far, lay up a store for the scarcity to come; or, should their food be of that kind as not to be easily preserved, their system becomes susceptible of torpor, and they are enabled to sleep through the period of want.

## SECT. III. Of ABSORPTION.

When the food has undergone the first preparation, by digestion, and the chyle is formed in the alimentary canal or sap-vessels, it is thence taken up by means of absorption for the use of the system. From the vessels it passes into the whole cellular tissue, composed of vessels, and closely interwoven with all the vascular part of the plant. From the vessels or utricles of the cellular tissue it enters the vasa propria and glands, which contain and prepare the sluids and secretions peculiar to the species.

It was supposed that the chyle was absorbed by the ramifications of the red veins spreading on the gut, till 1622, when Asellius an Italian discovered the lacteals running on the mesentery of a living dog, and printed his account of them in 1627. As he had not traced their course very far, he thought that they went to the liver. This opinion continued to be general till 1651, when Pecquet in France published his account of the thoracic duck.

He owned that he had been led to make the discovery by observing a whitish fluid mixed with the blood in the right auricle of the heart of a dor. The lymphatics were first discovered by Rudber, a young Swedish anatomist; and Thomas Batholine, a Danish anatomist, first published upon them. His book came out in 1653, GLISSON, who was in 1654, has ascribed to these vessels the office carrying the lubricating lymph from the seven carrying the lubricating lymph from the seven cavities back into the blood; and Frederic Heman affirmed they were absorbents very explicitly. On the 19th June 1664, SWAMMERDAN decovered the valves of these vessels; and Ruyson who had seen them, perhaps very nearly aboth that time, first gave an account of them in a matise published at the Hague in 1665.

The most decisive mode of demonstrating lymphatics we owe to the celebrated Nuck, wh as a specimen of that complete System of Ly phography which he meant to publish, printed 1691 his Adenography, or Description of the Gir In this treatife he not only tells us how he brea them into view, but in his plates represents a of them as filled with his new mercurial injection a happy invention, fince followed by others method by which he inflated thefe veffels led to suppose that they took their origin from or arteries, either immediately or through the tervention of fome follicles. The celebrity name procured credit to this mistake; and withstanding the founder opinion of Gliffon, I man, and others, the old notion that the performed the office of absorbents came is down as Haller and Meckel. The argume however, by which it was supported are now to have been erroneous; while the be affertion that birds and fishes were without als or lymphatics, has been disproved by the tunate discoveries of Mr HEWSON and Dr M Ro. Excepting, therefore, in the penis and centa, and in those animals whose veins injected from the gravid uterus, the lymp perform the whole business of absorption. contain a fluid that is coagulable like the ly of the blood, and are called valvular to diffus them from the arteries that do not admit the globules. They derive their origin from the luiar membrane, from the different cavities from the surface. They both run into the view but most of the lymphatics in the human sub and all the lacteals, first unite in the thoracie de which near the heart leads into the course of circulation.

## SECT. IV. Of CIRCULATION.

AFTER part of the food is converted into chand this chyle is abforbed by the lacteals; brought into the course of the circulation, a distributed to all the different parts of the space On this account HIPPOCRATES speaks of the mand constant motion of the blood, of the veins arteries as the fountains of human nature, as rivers that water, the whole body. When an his time anatomy came to be more studied, inctions of the ancients respecting the blood better defined; and, however chimerical they make the motions of the ancients respecting the blood better defined; and, however chimerical they make the motion and experiment. To opening deal botter defined and experiment.

ky found that the arteries were almost empty, it that very nearly the whole of the blood was illected in the veins, and in the right auricle and attrice of the heart. They therefore concludithat the right ventricle was a fort of laborary; that it attracted the blood from the cavæ; fome operation rendered it fit for the purpose nutrition, and then returned it by the way that came. From the almost empty state of the artes, they were led to suppose that the right strick prepared air, and that this air was conged by the arteries to temper the heat of the pull parts to which the branches of the veins feditributed.

rediffributed. This last notion was entertained by Erasistratus, hen added an important discovery. By certain periments he proved that the arteries contained od as well as the veins. But this discovery the occasion of some embarrassment. How the blood to get from the right to the left tricle? To folve the difficulty in which his r discovery had involved him, he supposed that branches of the veins and arteries anaftomofthat when the blood was carried to the lungs the pulmonary vein, it was partly prevented be valves from returning; that therefore duthe contraction of the thorax it passed through mall inofculating branches to the pulmonary and was thence conveyed along with the air he left ventricle to flow in the horta. This ion, tho' agreeable to fact, foon gave place to er that was the result of mere speculation. was, that the left ventricle received air by ulmonary vein, and that all its blood was dethrough pures in the feptum of the heart. e passage through the septum being once afied, it was generally supposed the only one number of centuries; and fupported likeby Galen's authority, it was deemed blasphein medicine to talk of another. In 1543, ever, VESALIUS having published his immorwk upon the structure of the human body, given his reasons for diffenting from Galen, ked it was impossible that the blood could pass igh the leptum of the heart. His reasoning routhe attention of anatomists; and every one reager to discover the real passage which the d must take in going from the right to the left ricle. The discovery of this fell first to the if Michael Servede, or Servetus, a Spanish leian, who published his opinion, and revived ald doctrine of Galen, in 1553. But his opidid not spread; the book in which it made ppearance contained herefy, and was deftroyy public authority. Fortunately, the same very was again made by Realdus Columbus, iffor of anatomy at Padua and Rome, who ted his account of it in 1559. Many others, ged in the same research were equally successand Andrew Cæfalpinus was fingularly lucky. pears by his Peripatetic Questions printed at ce in 1571, and reprinted in 1593, that he not only the leffer circulation, but had obed that there were times when the blood flowrom the branches of the veins towards their ks, and that veins swelled between their ligaand the extremities, and not between the lire and the heart. From these observations he

inferred that the veins and arteries anaftomofed; and he ventured to affert that the blood could not return by the arteries to the left ventricle. Yet he did not discover the true circulation. Being a zealous peripatetic, he thought himself bound to maintain with Aristotle, that the blood slowed like the tides of Euripus backwards and forwards in the same channel; and therefore supposed that it flowed from the arteries into the veins in the time of sleep, and from the veins back into the arteries in the time of waking. The greater circulation, so far as we can learn, was not even dreamed of by this writer. A farther step was yet to be made towards its discovery; and this was reserved for another profession of the Paduan school.

In 3574, Hieronymus Pabricius ab Aquapendente, while feeking for the cause of the varicose swellings of some veins, which had arisen from friction and ligature, he to his great joy dif-covered their valves in one of his diffections: and thus again the true theory of circulation secmed almost unavoidable. Yet whoever reads the small treatise De Venarum Ofliolis, first printed by Hieronymus Fabricius ab Aquapondente in 1603, will fee that he was as far from entertaining a just notion of the circulation as his predecessors. Notwithstanding all that he saw, he still was of opinion that the blood flowed from the heart to the extremities even in the veins. He calls them an instance of admirable wisdom, and mistakes his own awkward conjecture for one of the defigns of infinite intelligence. Yet he bore no inconsiderable share in promoting the discovery of the circulation. By writing on the valves, the formation of the fostus, and the chick in ovo, he directed the attention of his pupil Harvey to those subjects, where it was likely that the motion of the blood would frequently occur.

HARVEY was born at Folkstone in Kent, in 1578, completed his studies at Cambridge, went to Padna, and was there admitted to the degree of M.D. with unusual marks of applause, in 1602. He examined the valves with more accuracy than his master Fabricius; and explained their use in a treatise which he published some time after. About 1616 he first taught his celebrated doctrine of the circulation, and printed it in 1628. He was the first author who spoke consistently of the motion of the blood, and drew rational conclusions from his experiments and observations. His books prefent us with many indications of a great mind, acute discernment, unwearied application, original remark, bold inquiry, and a clear, forcible, and manly reasoning; and every one who considers the furprise which his doctrine occasioned among the anatomists of those days, the strong opposition that it met with from some, and those numerous and powerful prejudices, which it had to encounter from the fauction of time and of great names, must allow that the author has a title to rank in the first class of eminent discoverers. discoveries showed, that in most animals the blood circulates in arteries and veins, and through the medium of one, two, or more hearts: that in arteries it moves from the trunk to the branches; and that, meeting there with the branches of veins, it returns in a languid stream to the heart; that the heart communicates a new impulse; that it

drives.

drives it on to the trunk of the arteries; and that the arteries, by the thickness of their coats, exerting a force, push it onwards again into the veins.

In every part of this circulating course, there are valves situated where it is necessary; they are meant to prevent the return of the blood; they are at the beginnings of the great arteries, and are found in different places of the veins where their feeble action requires to be affished. The veins, before they enter the heart, generally expand into a thin museum fac, which is called the auricle. It receives the blood while the heart is contracting; and, when the heart admits of dilatation, contracts itself, and throws the blood into the ventricle.

We have here called the ventricle a heart: though what is usually meant by the heart be a ventricle and auricle; or fometimes a ventricle and two auricles, where the veins approach in different directions, and, without bending to meet one another expand at two different places. hearts are fometimes united, fo as in appearance to form but one. Hence the modes of circula-tion are various. In some animals the heart throws its blood to the remotest parts of the system; in others it throws its blood only into the respiratory organs; from these it is collected by the branches of veins; and thefe branches, uniting in a trunk, convey it to an artery, which renews the impulse, and acts as a heart. In a third fet of animals, the blood from the respiratory organs is carried by the veins to another heart; and this fecond heart, united in the same capfule with the first, distributes the blood by the channel of its arteries to the feveral parts. In the human foctus, and the foctules of those animals which have two hearts, a part of the blood, without taking the passage through the lungs, proceeds directly from auricle to auricle. In amphibious animals, the auricular pattage continues open during their life, and is employed, when the breathing ceafes un-der the water. In many infects, a number of hearts, or expansions, which answer the purpose of hearts, are placed at intervals on the circulating courfe; and each renews the impulse of the former where the momentum of the blood fails, In the Sepia Loligo the two separate parts of the gills are each supplied by a heart of its own: the blood from both is collected into one; which, by two arteries opening at two different parts, fend it at once to the opposite extremities. In numbers of animals, the heart, like the stomach, is in the extremity opposite to the head.

After the discovery of the circulation, the most interesting object with anatomists was to demon-Irrate it in a clear, fatisfactory, and eafy manner. Harvey, to show it with every advantage, was obfiged to open animals alive: but whether the animais were dead or alive, the larger branches of the veins and arteries were only to be feen, and even these but in certain cases, when they happened occasionally to be full of blood. That admirable method, which is now observed in demonstrating the course of the circulation, we owe to the great anatomists of Holland who flourished in the 17th century. Alout 1664, Regnier de Graaf invented the fyringe, and accompanied with a print, published an account of it in 1669. His injection was usually a thin fluid of a blue, green or forne

other colour; this injection transluded through the veffels, allowed them to collapse by its good ral diffusion, and broke out through the first pening that happened in its way. A fluid which hardened after being injected, and which profes ved the vellels diftended, was a happier control ance. This at first was either melted tallow wax, of a colour fuiting the tafte of the anatom So early as 1667, Swammerdam injected the re fels running on the uterus with wax; and tra mitted preparations with plates, and a fell a count of his method, to the Royal Society of Lo don in 1672. Soon after, his friend Ruysch : quired fuch skill in the art of injecting, that he not been furpaffed by any fince his time. discovered vessels in many parts where they we not supposed to have had an existence; and, or trary to the great Malpighi, showed that e many of the glands were entirely valcular. As ther discovery was made, for demonstrating to finall capillary branches running, through a pr by the very ingenious Dr. NICHOLLS of Lond who invented the method of corroding the parts with a menfiruum, and leaving the war, it was moulded by the veffels, entire.

In the vegetable kingdom, the chyle is different to all the parts from the numerous rewhich convey the fap; and the fe veffels, but feel by their firudure to carry the fap elected by their firudure to carry the fap elected to the branches to roots, or from the roots from the branches to roots, or from the roots to the branches, it reason why plants inverted in the ground fend forth roots from the place of their branches and fend forth branches from the place of the roots. Even a fimilar distribution of the polypes, the chyle, without a circulating finess conveyed directly to the different parts in

the alimentary canal.

Another circumstance respecting the which sometimes has engaged the thousing physiologists, is the colour which it has in animals. The late Mr Hewson was of opithat the lymphatics, with the spleen and be mus, contributed greatly to the formation of red globules. (See Bloop, § 7.) His realization of the discountry of the second of the celebrated Nuck, who had often observed the celebrated Nuck, who had often observed the discountry of the second of the discountry of the second of

The blood receives its vermilion colour in fing through the lungs; animals with lungs the blood redder than those which are feen without that organ; and the colour, as well the heat, is in proportion to the extent and fection of the lungs. Oxygenous gas is about in respiration; and it has been proved by sment, that the red globules of the blood, and red only, contain iron, and that the colour ing to iron calcined by the pure air, and reduct to the state of red oxyd. From this manner conceiving the phenomena, says Chaptal, we apperceive why animal substances are so advantoous in affisting and facilitating the red dre.

Digitized by Google

Various experiments have proved how much e colour and confiftence of the blood is altered the action of the veffels; and this discovery u enabled us to conjecture, why in infants and legmatic persons the blood is paler, in the chohe more yellow, and; in the fanguine, of verfion red; why the blood varies in the same inidual, not only with regard to the state of bith, but likewise at the same instant; why the hed which circulates through the veins has not fame intenfity of colour, nor the same consistas that of the arteries; why the blood which through the organs of the breast differs from which passes languidly through the viscera; the veffels vary in the denfity of their coats, in their diameters; why they are fometimes coluted in a gland; why they fometimes determs of a spiral form; why the branches to at various angles; why they are various maltomofed; why they fometimes carry the od with dispatch, and sometimes slowly, thro bouland windings. By these means their acth varied, and the blood prepared to answer purpoles of nutrition and fecretion.

#### SECT. V. Of NUTRITION.

INUTRITION (fays the ingenious Dr Barcis the function which affimilates the food fereral parts, and which finithes the proegun in the ftomach, lungs, and vafeular In perfect animals some of the stages of tels are distinctly marked. The chyle, as some resemblance to milk, is the work alimentary canal: it undergoes fome new by the action of the lacteais, and of their then they exist. In the course of circupasses along the respiratory organs, and d with oxygen or fome other gas: by this to the confequent heat, and the action of fiels, it is turned into blood. The blood, examined, fpontaneoully separates into three an albuminous part or a ferum, a coagu-mph, and red globules. The two first are mus to the white parts of an egg, by which ick in ovo is nourished; the globules have remblance to the yolk, which ferves afteras food to the chick in the more advanced of life. The three parts contain in each a of principles which are originally composed these principles, conveyed through vessels rous forms, of various diagonals, and with degrees of motion and of heat, and all ararying as they pass, arrive at last on the of the parts which are wrapt up in a tiffue or some other membrane. The tiffue or some other membrane. membrane gives a new change; the parts ed perform the office of fecreting organs; the action of the veffels is varied according place to which they are tending and the which they enter, we partly fee the manner di bone, muscle, cartilage, and nerve, are

tition is carried on in worms and polypes, feetion, almost entirely by the cellular tifadd in plants by a tissue cellular and vesicuin all living bodies the cellular tissue, besides for XVII. PART II.

giving a form to the parts, and preventing friction and cohesion, certainly performs some important office. Many have thought it the organ of nutrition; and it certainly is one of the organs employed in affifting to affimilate the nutritious fluid. But in fact all the parts of the living body. are affimilating organs; each part affimilates for ftfelf; and the stomach; the respiratory organa; the veffels, and nerves where they exist, are affiftant to the whole, and to one another. It is furprifing that any should have imagined that the nerves are peculiarly the organs of nutrition, or that growth should be owing to the addition of some organic and vivifying particles pre-existing in the food. These physiologists have not demonftrated the existence of nerves in all living bodies; and these organic and vivisying particles have as yet been discovered but in their fancy. Dr Monro has proved, that the limb of a frog can live and be nourished, and its wounds heal, without any nerves: and Mr Hunter has given many instances of a living and nutritious power in the blood.

- " In plants and animals, the affimilating power has always certain limits: its influence is very generally confined to the fort of food congenial to the species; and its strength is varied according to circumstances, as the age, the habits, and the state of health. Young animals and plants affimilate fafter than old; and one species will affimilate much faster than another. Certain worms that feed on animal and vegetable substances will, in 24 hours after their escape from the egg, become not only double their former fize, but will weigh, according to Redi, from 155 to 210 times. more than before. Most oils are of very difficult affimilation; effential oils will often refult the long continued and the varied action of the living organs; will mingle with the parts, and undecompounded, communicate their flavour. In living bodies nutrition is only a species of secretion."

# SECT. VI. Of SECRETION.

SECRETION is a function by which a part is feparated from the whole, and generally with fome. change of its qualities. In the case of nutrition it was observed, that all parts secrete for themfelves; and that fome few, as the lungs, the stomach, the veffels, and the nerves, officiate befides for the general use of the whole system. all the ingesta were to remain and to be affimilated, the body would continually increase. But living bodies are confiantly in a frate of waste and repair. In most animals part of the ingesta is carried off by evacuation, without having entered the mouths of the abforbents; part, which enters the abforbents and veins, is thrown off by exhaling atteries or the urmary pallage: and experiments with madder prove that the lymphatics, belides originating from all the cavities and carrying back the lubricating fluids, do enter the substance of the hardest bones, and convey particles that had been affimilated back into the blood.

The faces, the urine; and perspirable matter, are remarkably distinguished by two kinds of odour; the one peculiar to the whole species, the other peculiar to the individual. By the perspirable matter which adheres to the ground, and Tre

of which the odour is diffused by moisture, the dog not only distinguishes a man from any other animal, but is able to trace his master through a crowd. The natural evacuations of plants, and of some few animals which feed by absorbents, are all by perspiration or exhaling vessels. The urine in quadrupeds is before emission collected in a vessels, and thence carried off by the genital organ. In birds, and in a number of sishes, the ureters empty themselves into the rectum, and their contents are evacuated with the seces.

The word feeretion is fornetimes employed for the matters secreted. In this sense there are various fecretions. Besides the faces, the urine, the fweat, and the vapour from the lungs, which are excrementitious, there are fecretions which answer useful purposes in the system. Of these the most important and general are the bile, the faliva, the gastric juice, and the pancreatic, which affift in digestion; the lymph and the fat, which lubricate the parts; the mucus, which protects them from acrid substances; the nervous stuid, which forms a very confpicuous link between body and mind; the feminal fluid, employed to propagate the species; and the lacteal, intended for some while to support the young after they emerge from the feetal state.

The saliva is a fluid that mixes with the food in maftication. In man it is fecreted from theparotid, the fublingual, and fubmaxillary glands; it is watery and fomewhat vifcid; it retards and moderates fermentation: it has fometimes a tendency to form calculi. By these concretions it incrusts the teeth and sometimes obstructs the falivary ducts. It is the seat of the rabies canina.

The GASTRIC LIQUOR possesses a solvent power upon animal and vegetable substances, with little preference of affinity, as it varies according to the nature of the aliment; "it is sometimes acid, (says Chaptal) sometimes insipid. Brugnatelli has found in the gastric juice of carnivorous birds and some others a disengaged acid, a resin, and an animal substance, united with a small quantity of common salt. The gastric juice of ruminating animals contains ammoniac, an extractive animal substance, and common salt. In our time the phosphoric acid has been found disengaged in the vastric juice" of the graminivorous kinds.

the gaffric juice" of the graminivorous kinds.
"The BILE feereted by the liver is glutinous or imperfectly fluid like oil, of a very bitter tafte, a green colour inclining to yellow, and froths by agitation like the folution of foap. Its constituent principles are water, a fpiritus rector, a coagulable lymph, a refinous oil, and foda. The refinous part differs from vegetable refins, because these do not form a soap with fixed alkalis, because they are more acrid and inflammable, and because the animal refin melts at the temperature of 40°, and acquires a fluidity fimilar to that of fat. From fat it differs in not being foluble in cold alcohol, in which respect it approaches to fpermaceti, which alcohol cannot diffolve with-out heat. Bile, like other foaps, removes fpots of oil from clothes; when its passages are obstructed, the motion of the intestines becomes languid. It is neither alkaline nor highly putrescent. In putrefaction it yields fomething of a musky odour; the fossil alkali precipitates from it a green sedi-

ment; and with distilled vinegar it produces a mixture neither acrid nor fweet. Like faliva m urine, it has a tendency to form concretions called biliary calculi or gall-flones. They are sometime found of an irregular texture, of a brown, black yellowish, or greenish colour. They sometime confift of transparent crystalline laminz, la mica or tale, and are sometimes radiated in the centre to the circumference. They are always inflammable, of a more folid confiltence than generality of animal oils, and refemble spermant both in their folidity and crystallization, they foluble in ardent spirit when assisted by a not rate heat: the warm folution, when filtered, a posits by cooling a number of Jaminated the brilliant crystals, which have been compared the falt of benzoin, the concrete acid diam and to spermaceti. Many of their characters cate that they are a substance of the same with the last. Fourcroy found that the felling of which these crystals are composed const only in the crystallized gall-stones or bile; be ferved it to a very confiderable degree inahin liver which had been exposed to the air for kes years, and bad loft its volatile parts by pand tion. He detected it also in a saponaceous tom bodies which had been many years baried ground; and lately Dr Pearson of London ball tificially converted the muscular fibre into a stance of a similar kind, highly inflammable, refembling spermaceti.

The PANCREATIC JUICE refembles the and was examined in the 17th century, in Graaf and Swammerdam. It has often been ferved forming stony concretions.

The LYMPH confifts chiefly of water; the ferous part of the blood, contains a which is coagulable by heat, by acids foirit of wine. It is found in the cellulur brane, in the ventricles of the brain, in the cardium, on the furface of the pleura, in domen, in the bursa mucosa, and in the under the name of SYNOVIA, where it has than an ordinary degree of viscidity, and lubricating quality. It is secreted chiefly by

Animal FAT is a substance of a nature the fat oils in the vegetable kingdom. Itscall usually white, sometimes yellow, and its taken Its confistence is various in different animals. taceous animals and fifthes it is nearly fluid: in a vorous animals more fluid than in the frugivor birds, finer, fweeter, more unctuous, and rally less folid than in quadrupeds. In the animal it is more folid near the kidneys and the tkin than in the vicinity of the moveable ra. As the animal grows old it becomes pe and more folid; and in most animals is me pious in winter than in fummer. In man and other animals, it is collected in particular of the cellular membrane, accumulated quantities in the groin, in the axida, in ploon around the kidneys and blood-veffeld likewise secreted on the surface of the this it protects from acrid substances. In all animals and fifthes it is generally disposed tain refervoirs such as the cavity of the and the vertebræ; in some it is chiefly confin the liver; in ferpents, infects and worms,

era of the lower belly, where it is disposed in ill lumps, and only a small quantity found on muscles and under the skin: in frogs it is coled in certain bags which diverge from a computrunk, and seem like appendages to the ovaled testes. In many places it seems to be seed by organic pores, and under the surface of this by glands. It is accumulated from a distinct of perspiration, from the nature of the ents, from morbid affection, and from idiosynfit it is of the same nature as the fixed oil of

lisa bad conductor of heat, and preferves the with of thole regions where it is lituated. It ire adhefive and less apt to evaporate than er, and is therefore, a better lubricating fluid. en reabforbed, it counteracts the faline immation if too copious; and its nutritive power three to one when compared to that of the tular fibre. These properties explain its uses and the several branches of the blood-vessels in e parts which require warmth, and which are sed to motion. They likewife account for king more copious in winter than in fummer; for its being found in great quantities in those als which are confirmined to a long abitinence. man fometimes steatomatous tumours, and bins the sebacic acid, which acts readily on copper, and iron.

The WEGETABLE FAT is contained chiefly in the part of the part of

Removes is more viscid than the lymph, and coagulable by fire or alcohol. It is mild, sposed to corruption, nor soluble in water. Exerction is performed by glands. Mucus and in the noie, through the whole length of simentary canal from the mouth to the anus, he aspera arteria, in the bronchia, in the kidh, weters, bladder, and most of all in the una. It forms hard sony concretions somewhite the lungs.

he SEMINAL FLUID has feldom been analyzlt is heavier than water, foluble in urine, detices in air and with heat; it hardens with fited alkali, and is not coagulable by alcoholbitains a number of animalculæ; and in the min which it is fecreted, it affects the paffithe manners, the voice, the tafte of the les, the fecretion of fat, and the growth of lair. In many fifthes this fluid is contained in it of bags. In most animals it is fecreted by fla, called teffer, and is accumulated in the vaficentia, or where they exist in the seminal res. Mr Hunter shows that they secrete a bcular shuid in all animals.

We are so little acquainted with the NERVOUS 11D, that some have doubted of its existence. I discovery, however, of Galvani and the krous experiments that have since been makon animal electricity, lead us to hope that bothing yet may be known of its properties, it will greatly illustrate the phenomena of the mail economy.

the LACTEAL SECRETION is generally confinto une fea, and is peculiar to the class of mammalia, though fomething fimilar may perhaps be fecreted in the crops of pigeons.

We cannot enumerate all the different fecretions in living bodies, without running into a tedious detail. The effential OLLS, the CAMPHOR, GUMS, the BALSAMS, the RESINS, &c. are various fecretions of the vegetable kingdom. (See these articles in their order.) Each species of plant and animal has generally some peculiar secretion; and this secretion in the individual has often some diftinguishing quality, discoverable by taste, colour, or smell. These secretions have likewise each their particular uses.

The difference among the various fecretions of the same tystem seem principally owing to a difference of stimulants, and to the various action, form, and irritable powers of the secretory organ. The passions often affect the secretory organ and passion and medicine often affect one secretory organ and not another. It is therefore probable, that the organs of secretion, (and the smalless sibre is an organ of this kind) like the eye, the ear, and all the different organs of sense, are each affected in some measure by peculiar stimulants; at the stomach by hunger, the sauces by thirst, and the genital organs by venereal organsus. But however much the various sluids of living bodies may differ in appearance, chemical analysis has generally reduced them all to a water, a gluten, a salt, and an oil.

### SECT. VII. Of INTEGUMATION.

ALL living bodies have one, two, or more integuments, prepared by fecretory organs, as a defence against those injuries to which their situation is exposed. Of these integuments, some prevent the diffipation of the fluids, some refult acrid and corrofive substances, some are indigestible in the stomach, and some are seemingly incorruptible in the earth. By these properties they preserve feeds and the ova of infects for a number of years, waiting the change of foil or of feafon. They protect both from the action of weak membranous stomachs, and make those animals who swallow them contribute likewise to their propagation. The gelatinous substance ejected by birds, and called the tremella nostoc, or starfall, is found, by numerous experiments, to be a substance of this kind. (See Nostoc and TREMEL-LA, No 3.) Several integuments are unful by their strength and hardness. The shells of the beetle are an expellent defence for the membranous wings which the creature folds up when it creeps into the earth. The shell of the shall lodges the intestines when the animal comes forth to fearch for its food, and furnishes a safe retreat for the body when any danger is threatened. Some animals, confined to their fields, can open and close them by a muscular power; and some shells, like the scales on fishes and insects, are disposed into plates, so as to be no hindrance to motion. Several infects which live partly in the water always compole a shell for themselves where it is needful. The usual materials are fand, straws, or mud, which they cement by a viscid secretion, The shells of most insects are corneous. Swammerdam found that cretaceous shells are compofed of layers of indurated membranes, and that they are fumetimes covered with a nuticle.

JL DLury

Many integuments are covered with feathers; others with hair or a thick down. Befides many other obvious uses of these coverings, they serve in general to repel infects; and, being bad conductors of heat, preserve a genial and necessary warmth. When the integuments are covered with prickles, they repel attacks by the strength of their points, or by the venom which they infuse, as the stings of nettles and the downs of some infects and plants. When moistened with a viscid secretion, they preserve the softness of the parts, prevent evaporation, resist acrimony, enable plants to destroy their enemies, and assist the small in performing its motions.

Both plants and animals, but particularly the former, are often protected by efficial from their integuments. This is the finer part of their volatile oil, always inflammable, and so subtile, that the continual emission of it from wood or flowers does not fenfibly diminish their weight. To this odour it is owing, that the deadly nightshade, the henbane, hounds tongue, and many others, are feen on almost every high road untouched by ani-The mancinelle tree of the West Indies emits to very dangerous vapours, that those have died who have flept under its shade. The lobelia longiflora of America produces a fuffocating oppression in the breast of those who respire near it. The return of a periodical diforder has been attributed to the exhalation of the rhus toxicodendron. (See Rhus, No 7.) Every one knows, fays Chaptal, the effects of muck and oriental faffron on certain persons. lagenhousz mentions a young lady whose death was occasioned by the smell of lillies and Triller tells of another who died by the finell of violets. The selection of graffes by different animals feems owing to the volatile aroma. But of all the vegetable exhalations known, those emitted by the bohun-upas, or poison-tree of Java, are the most remarkable. For many miles round no animal can breathe the air, no plant dares peep from the foil, the fillies die in the poisoned stream, and the birds that fly through its atmosphere with despairing shrieks sink down liteless.

The various colours of the integuments, are also a species of defence. "Caterpillars which feed on leaves (fays DARWIN) are generally green; and earth-worms the colour of the earth. But, terflies which frequent flowers are coloured like them. Small birds which frequent hedges have greenish backs like the leaves, and light-coloured bellies like the sky, and are hence less visible to the hawk who passes under them or over them. Those birds which are much among slowers, as the goldfinch, are furnished with vivid colours. The lark, partridge, and hare, are of the colour of dry vegetables, or earth on which they reft; fregs vary their colour with the mud of the fireams which they frequent; and birds which live on trees are green. Fift which are generally suspended in the water, and swallows which frequent the air, have their backs the colour of the distant ground, and their bellies of the fky." The fphinx convolvuli refembles in colour the flower on which it refts; and among plants, the nectary and petals of the ophrys, and of forne kinds of the delphinium, refemble both in form and colour the inficts which plunder them, and

thus fometimes escape from their enemies by having the appearance of being pre-occupied. Mar animals vary their colours with the featons, at those which are of various colours in summer, a winter assume the colour of the slow.

SECT. VIII.

But a change of colour is not the only chanced the integuments. The tree annually cate in bank, the lobifter his finell, the quad uped his har and fometimes his horns, the ferpent his fike, at man himfelf renews the feales of the epidema Tinele changes usually take place once awar, of ten twice with respect to ferpents, and offene it toads, who devour the skins they throw of. But the integuments of ova and feeds, being the poduction of parental organs, neither are nor or changed.

## SECT. VIII. Of IRRITABILITY.

"IRRIГАВІLІТУ (fays the ingenious Dr Ваа) is that property of the living fibre by which man confequence of stimulants. Being one of the grad causes of motion in living bodies, no proper to excited more wonder, been the cause of more ror, or exhibits fuch a number of firiking plents na to the fenses. These effects, however, have risen rather from the nature of the stimularism from any thing mysterious in irritability. In of the stimulants by which this property in both is displayed are often invisible, unknown, an thought of; and men being confeious that and her of their motions proceed from a flimilime is under the direction of a mental pour, is readily conclude from a fort of analogy, that on motion in plant and infect that seems to we a useful purpose, and is caused by some man stimulant, is the consequence of mind dive from within: That irritability is in all cake the confequence of nerves, which are those of which nature has employed in the animal king. to convey frimuli between body and mind. The fingular conclusions have led to others that all admiffible."

The learned Dr HALLER, however, to who made use of this term, gives a very dilo account of irritability, which he represent property, not of the nerves, but of the mice fibres, totally distinct from and independent Jenfibility. See his account of it under the and ANATOMY, \$ 190, and IRRITABILITY; WILL Monko's remarks upon it, and experiments in position to it, under Anatomy, y 513-525. Abraham Girtanner gives a disserent acc of irritability from both these great physiciahorrowing the late Dr Brown's account principle of Excitability, and adopt very words; though he does not do him the so quote his Elementa Medicina, but f. the term irritability for excitability, throughwhole description of this principle, although Brown's Excitability and Haller's Icritability toto calo different.

But the ingenious Dr Barclay, after ricking the many abfurd hypotheles, advanced by followings on this and other branches of the total makes the following, among many other, it is observations, on Interactive, which he is dere as an effect of frimulants.

.. " Befides the other propentities which open

stimulants in the fystem itself, the naturalist has ound that light, heat and moisture, in various denes from abiolitte darkness, coldness, and dryness, it as flimulants upon living bodies: he has expeiroced that ELECTRICITY is a general agent, that everal plants emit flashes, and that some animals ven give thocks resembling the electric. He has ask it probable that it produces all the wonders crystallization; and that the cause of chemical anily, and of all the phenomena displayed by the super, if not fimply a modification, is at least m wit. In the male parts of plant and animal has feen both the fluid and the pollen that gave kimulus in generation, and are accompanied the fo extraordinary changes in the fystem. He as found that much of the vegetable economy, id even the function of generation itself, as the tvelopment of the fecundating powder, and its plication to the female organ, is partly carried by wind, heat, and other fuch agents. He has ason to conjecture that many general agents in ture are yet unknown. By the help of chemistry, thas found out lately a confiderable number, the gafes which are of the very highest imporace in both the animal and vegetable economy, nd which, like the aromas of plants, or the cauof contagion, produce their effects without bevisible. It is only, too, of a late date that the hebrated professor Galvani of Bologna has exlo much curiofity through Europe, by the wery of a certain filmulus that relides in the that palles along electric conductors, and by a certain application of metals occasions and fiath in the eye, convulses the body of a frog, and rouses the detached limbs into ac-The change of colour in the integuments anding to different feafons and circumstances, it answer a rational and useful purpose, beeds from a cause that does not seem to be n well known. Even many agents which are tinvilible, nor yet unknown, exert their influm in a fecret manner, not obvious to the fenses. a generally known, that many fingular moveints of plants are owing to heat, many to light, feveral to moisture. The barley-corn is often kreed to creep on the ground by means of its which dilates or contracts according to the erent degrees of moisture. The wild oat, emytd as an hygrometer, moves through the barn, rels through the fields, nor ceases to be changits lituation till its beard fall off, or till it meet th a full where it conveniently may strike root. mits, whether invifible, unknown, or unthought directed by regular and uniform laws under preat Author of nature, produce effects that cate prescience, wisdom, and design, and, caus, la transient or permanent propensity in the thnite minds that refide in matter. Fds, in a living body, have generally been found companied with some system of nerves."

Our author, after some other remarks, says that, half animals the vigour of mind has some related to the quantity of brain, and to the perfect of its organization; and that the acuteness of different senses is generally proportioned to quantity of nerve bestowed on their organs an has a greater proportion of brain than any o-

ther animal; but many an animal has a much greater proportion of nerves bestowed on different organs of sense. Many animals have therefore acuter senses than man; but man has a greater vigour of mind than any other animal on this globe.

"The brain of quadrupeds is fomewhat fimilar to that of man, but proportionally fimaller, and not fo well organized. WILLIS has observed, that among animals the structure of the cerebrum is more variable than that of the cerebelium; that the former generally furnishes nerves to the voluntary muscles, and the latter with the medulin oblongata to the involuntary.

"The brain of birds is seemingly the reverse of the human brain; the cortical substance is the interior, and the ventricles are situated in the white part on the outside. In the brain of the bird there are no orcumvolutions like the intestines, no formix, corrous callosium, nor corpora striata.

nix, corpus calloium, nor corpora striata.

"The brain of sishes is in many respects similar in its structure to the brain of birds. It is very small in proportion to their body, and is generally surrounded with an oily matter. In one genus of sides, the gadus, Dr Monro sound spheroidal bodies between the dura and pia mater, and covering the greater part of the nerves like a coat of mail. The two senses, seeing and hearing, in many sides are often acute. By laying one ear on the water, and striking the surface at some distance, this element is sound to be a better conductor of sound than even the air.

" The reptile tribes have very little brain, and like the fishes have no ganglions upon their nerves. Most insects have no brain at all, but a nervous cord that is full of ganglions, that runs from one extremity to the other, and is denominated the spinal marrow. This knotty cord, however, is not marrow; the infect has nothing refembling a spine; and the situation of the cord in the animal is often not along the back but the breaft. In the filk-worm, and most other insects, this cord is in contact with the alimentary canal: and the first ganglion, which is sometimes called the brain, though not in the head, divides, in order to give a passage to the stomach, and again unites in a fecond ganglion. Swammerdam found in a species of snail a brain with two lobes, in contact with the stomach, moveable by muscles, and without a fixed place in the body.

"The polypes exhibit no appearance of brain or of nerve, as in other animals. Their skin, however, is full of a number of small granulary bodies, connected by a glareous matter that resembles a thread. Like rows of beadfrings, they extend from one extremity to the other, and along the arms. Some nerves (adds our author) by frequent service and habit become so obedient as to convey their stimuli to the muscles almost without the consciousness of mind. The motions excited by the stimuli of nerves are in many cases exceedingly rapid. These may be seen in the wings of most insects, but are most noticed in dancers, tumblers, and apes, and all those animals that are exhibited for feats of agility.

"The motions excited in the body by the stimuli of nerves have often been so vigorous and prompt, as to have torn the muscle from the bone, and to have broken the bone itself. They

often affect the organs of fecretion, have often unhinged the fabric of the fystem, occasioned death, and accounted for the miracles that have been ascribed to the power of fancy. The prompt motions of what have been named fensitive plants feem owing to a different species of stimulants

acting on extremely irritable fibres.

"In the animal kingdom, all muscles in the time of action are observed to discharge a quantity of their blood; and those muscles which are naturally white are the most irritable. In all living bodies, the irritable power will cease to obey the action of a stimulant, if either long or violently applied. After exercise, therefore, the irritable fibre requires rest, after heat cold, after waking sleep, before it again becomes submissive to the action of the stimulant that overwhelmed it. This is the reason that in plants and animals there are certain exertions and sunctions of the system that can only be continued at intervals and seasons. The natural stimuli of involuntary muscles continue to act, and the muscles to obey through life."

On the whole, the difference of irritability "arriles from the firucture of the organ itself, and from the manner in which the nerve is distributed through it. Other parts of the animal body, as the stomach, the fauces, and the genital organs, are thus affected by particular stimulants; and many animals, and even vegetables, may be affected in various manners, and by various stimulants, of which neither our feelings nor our senses can give intimation of any thing analogous."

## SECT. IX. Of MOTION.

" IRRITABILITY, (continues Dr Barclay,) is one of the great fources of motion in all living bodies; and this power is brought into action immediately by nerves or fome other stimulants. Locomotion here is principally confidered; for although the kinds of internal motion employed in fecretion and the other functions be as remarkable, in the eye of the philosopher, they have not fo generally attracted attention. Most animals are capable by nature of changing the place which their body occupies; for this reason, the irritable fibres, being formed into bundles, called Mus-CLES, are in most animals attached to bones, cartilages, or hard integuments, which they move as levers: the levers, with their muscles attached, are in most cases formed into wings, fins, or legs of various kinds, and are employed in performing the motions of flying, swimming, walking, leaping, and creeping. So very necessary, in the opinion of fome of the ancients, was one or other of these instruments to progressive motion, that the movement of the serpent was often afcribed to a preternatural cause, was supposed to resemble the incessus deorum, and procured to the animal one of the highest ranks among the emblematic kinds of divinities. Notwithstanding, however, the furprife that has been occasioned by its fingular movement, the motion of fnails, though not so rapid, is in many respects as extraordinary: they adhere by a certain vifeid fecretion; on dry ground this fecretion forms a pavement over which they glide; and they proceed by the ac-tion of muscles, without bone, cartilage, or shell, to which the muicles can be attached.

"No animal walks without legs, or flies without wings; but there are many that fwim without fins, and that leap and creep without kg. The rapidity of movement is not proportioned to the number of inftruments that are employed; if the spout-fish be observed to move showly without legs, the sea-urchin moves still flower with many thousands; the oyster moves by squirtie cu water; the scallop by the jerk of its flut and when in the water it rises to the surface as fails before the wind.

"Many animals are formed by nature to it, walk, leap, and swim: the fate of those is rate uncommon whose shuseles or feet are by nate attached to their integuments; the lobser is bliged to throw off its shell, and the caterial all its feet with the skin, and in that situation remain stationary till it receive new instrumers of motion. Besides the organs here mentioned the form, the structure, and even the specific gravity of the body, as depending on the nature the bones and muscles, or as varied by air, to sie its property of the circumstances, are necessary to explain the decircumstances, are necessary to explain the

ferent phenomena of locomotion.

"As to vegetable motions, they evidently pend on external agents. The motion of them out has been mentioned; the wings of them to be carried by the wind, their special vity to float in the water, and their legs or cula to adhere to bodies that are in motions ingular motions which have been ascribed fleeping, waking, fenfation, and volition, in the getable kingdom, seem only the consequence light, heat, moisture, and such stimulants, an invisibly or with secret influence: the consequence of the meteoric flowers are and closing of the meteoric flowers are and the opening and closing of the equation and tropic flowers, to the light, the length shortness of the day.

"The principal intentions of locomotes to get food, to fhun danger, to promote course, and disperse the species."

#### SECT. X. Of HABIT.

HARTT in physiology differs a little from a gual meaning. Dr Barclay uses it "to figt that principle in living bodies by which they commodate themselves to circumstances, as it were a different nature, and in many response undergo a species of transformation."

So greatly do some vegetables accommode themselves to different situations, to soil, to mate, and the state of cultivation, that an ralists, not accustomed to nice and accurate criminations, have often mistaken the variation the same plant for so many species. These variations the same plant for some process. These variations the same plant for some process. These variations are being some or in the sields; or by bringing it may rude uncultivated state, when it sometimes as asset is formidable prickles, and changes the colour and structure of its slowers.

Both in plants and animals the delicacy and gour of the constitution are oftener the effects habit and circumstance than original conformation. The varying colour of the integument

nentioned. We may add, that animals cotered with a down or hair have it thick or thin, ong or short, according to the exigencies of cli-

SECT. XI.

These changes on their bodies are accompanied rith others, which are the causes of new tastes, ew propensaties, and new manners. At the Cape Good Hope the offrich fits on her eggs day al night like other birds; but in Senegal, where k beat is greater, the leaves them to the fun duthe day. In those countries where provisions be found during the greatest part of the year, thee gradually lofes the propentity of laying flores for winter; and in those countries ined with monkeys, many birds, which in other nates build in bushes and the clefts of trees, and their nests upon sender twigs, and by this mous device clude the rapacity of their ene-Man, from imitation, has a great number statits peculiar to himfelf; and physical causes we ingeniously been assigned for the variety of features and complexion. Few experiments to yet been made to show how far this accomthating principle may be extended in the differ-

species of plants and animals. often happens among living bodies, that fecharacteristic distinctions, as the colour, the es, and a number of diseases that are origithe effects of circumstance, at last become so the system, that they become hereditary some generations. With regard to anithe facts are well known; and as to vegeit has been observed, that the apple trees we kent from Britain to New England bloffift too early for the climate, and bear it; and that it is only after some years that consorm to their situation. The perma-The permaof these effects has often been the cause of confusion and error in philosophy: for the th, mistaking the lasting, though temporary of habit for the real and essential qualities cies, has often drawn conclusions from his exinto that have been contradicted by fimilar ments in other circumstances. This is one e obvious reasons why experiments exhibit y inconfiftencies, and why we are amused ch a multitude of vifionary theories about roperties of living bodies. From not attendthe numerous circumftances that induce and to that general accommodating prinin living bodies, many medical prescriptions pt only useless but mischievous.

eccommodating principle is one of the mences of invitability. Its various effects a-In the actions of different stimulants on the fibre; and the after duration of thefe effrom the modifications of irritable fibres, behabitual from the frequent repeated action minulants. The design of this accommoprinciple is to fit both the plant and the for a more extensive and a more varied of existence.

SECT. XI. Of TRANSFORMATION.

changes which plants and animals undermetamorphofis or transformation are more hably firiking, than any of those to which

and its changing with the scasons have been they are exposed, from the variations of habit or the change of integuments. It has indeed been afferted, that these alterations consist in throwing off certain temporary coverings or envelopes; but there is here a want of precision in the ideas, and consequently a want of accuracy in the expres-The same persons who make this affertion inform us, that caterpillars change their skin, and many of them even several times, previous to the period of their transformation. Transformation, therefore, and a change of integuments, by their own concessions, are different things. The truth is, transformation frequently takes place independent of any change of integuments; and there is often a change of the integuments without transformation or any appearance of a new form a but a new form or change of appearance is always implied in metamorphofis or transformation. This new form is fometimes occasioned by a change of shape, consistency, and colour; as when the lobes of a feed are converted into seminal leaves. It is fometimes occasioned by a change of proportions among the parts. It is fometimes occasioned by the addition of new organs; as when the emmet receives wings, and the plume of the feed is fed by new roots striking into the ground; or it is occasioned by a change of both the form and the organs, and their mode of operation, as happens remarkably in some insects: for, though ail living bodies, plants, and animals, undergo partial or general transformation, yet these changes are chiefly observable among infects. Many infects appear to confift of two diftinct animal bodies, one within the other: the exterior, a creature of an ugly form, reliding in the water or under the earth, breathing by gills, or sometimes by trachez projecting from the tail, possessing a voracious and grovelling appetite. and having a system of sanguiferous vessels that circulates the blood towards the head. When all its parts decay and fall off, the creature inclosed succeeds in its stead: this often is an animal of a different form, generally lives in a different element, feeds on a different species of food, has different instruments of motion, different organs of fense, and different organs of respiration, and differently fituated; and, being endowed with the parts of generation, inclines to gratify the fexual propentity, and produces an embryo which becomes like the first, and from which afterwards in process of time a creature is evolved fimilar to itself.

" If the embryo or egg be deposited on a leaf, the leaf is frequently observed to bend, to wrap it in folds intended for the purpose, and to pro-tech it from injuries and danger. If deposited in the body of an animal or plant, they accommodate themselves to its wants and necessities, and furnish a tumour which serves it for a nidus, and besides, like an uterus, supplies it with nourishment; and if deposited in the body of an insect, the creature provides for the future destination of its young charge with all the tender care of a parent, and then dies."

These circumstances, added to the great variety of forms which insects assume, render it sometimes difficult to know who is the parent. cannot, for inflance, pronounce with certainty \$20

who is the true parent of the Gordius, known by the name of the feta equina, or hair eel. A fet of experiments, which Dr Barchay once began with a view to throw fome light on the fubject, were interrupted unfortunately by an accident, and he has not fince had leifure to refume them. He learned only, from a number of observations, that certain black beetles about the end of the summer months have the strongest propensity to run into the water, where they foon die; and that one or two, and sometimes three or more, of those eels gradually drop from the beetle by the anus.

If the reader wish to be much acquainted with the manners and transformations of infects, he will derive information and pleasure from confulting the plates and memoirs of REAUMUR. If he wish to know their intimate structure, the laborious Swammerdam can introduce him to a new and amufing species of anatomy. This last author had, before Reaumur, defined and described the kinds of transmutations among infects and some other animals. He has shown similar transmutations in plants; and in plate 46 of his Book of Nature, has compared the frog and the clove Julyflower under their fix different forms. In all living bodies possessed of mind, the changes of form, as well as the change of habit and of age, are usually accompanied with new propensities, appetites, and passions.

Microscopic observations having demonstrated, that all the forms of the plant and animal existed previously in the seed or embryo, transformation must be owing entirely to the evolution of the different parts by means of nutrition. By means of transformation different elements are peopled, the different seasons variously adorned, and animated nature wonderfully diversified without a multipli-

cation of beings.

# SECT. XII. Of GENERATION.

Many of the causes which contribute to the formation of a living body have hitherto eluded human research; and perhaps are beyond human comprehension. Some philosophers, considering the extreme divisibility of matter, and learning from the microscope that transformation is but the development of certain parts that previously existed, have imagined that generation is somewhat analogous; that all regularly organised bodies received their form at the beginning; that the first of every genus and species contained by involution the numerous millions of succeeding generations; and that the union of the two sexes gives only a stimulus, and brings into view forms that had existed fince the world began.

The abfurdity of this hypothetis, which attempted to explain a thing that is unknown, by what must for ever remain incomprehensible to the human mind in its present state, is self-evident. Several other theories of generation are mentioned under ANATOMY. See also MIDWIFERY, Sea. II.

"But for a long time past (fays Dr Barelay,) the most rational physiologists have generally agreed, that the embryo is formed gradually and slowly in one or other of the two sexes, not by chemical combination and mixture, but by a system of organs, directed by laws and prompted by stimuli,

with many of which we are yet unacquained From the great Hippocrates downwards to A :: A pendens and Harvey, the credit of fumiling the feetal embryo was almost universally given to the females of oviparous animals. Among the vivipirous, appearances were fuch, that the female wa left to contest it with the male. At last the edd of LEUWEPHOER's difcoveries feemed to put n end to all doubts entertained upon the fubici-He very plainly faw, through his microfcroze that very great profusion of particles, that move to and fro with arriazing rapidity in the male lensa (See Animalcule, § 6.) Upon this he colored the doctrine of Hamme, who had her used before, and supposed from their motions that particles were not only animalcules, but the ciples or rudiments of that animal in when the were formed, and that they were deposited: uterus of the female only to be nourified augmented in fize.

What raised suspicions against this story were the numerous animalcules discoverable by the microscope in other fluids, and that it me fulion of you g embryos in those cases, where ver more than one or two arrive at maturin. was an objection to it, that fome females had bet impregnated where the hymen remained while and where the vulva had been that to close # leave only a passage for the urine. The men in these instances could have reached the mouth of the uterus. It was another, the all birds which have no intrant penis the mice men is never fent farther than the mouth of vulva, and that a fingle act of the male in nates the whole eggs of the ovarium. Attit jection is the pollen of flowers, which is not plied immediately to the feed, but often to tant part of the veffel in which it is contains 4th may be taken from frogs and fiftes. those animals whose eggs are impregnated emission. And last y, Haller had observed let completely formed in those eggs that we fecundated.

"It is now pretty generally known, the embryo does not commence its existence is cavity of the uterus. De Graaf observed her passage down the Fallopian tube; he saw place where it first began in the testice of the male; and cases have occurred where it has all the Fallopian tube, where it has fallen into abdomen, where the placenta has been farm and the foctus has grown among the viscers of lower belly. See Midwifery, Part I. See. I

"From these facts it has been concluded, withstanding some feeble objections, that the male testicles are real ovaries containing eggs, these eggs are brought into action by the mating power of the male semen, which is some thrown into the cavity of the uterus, sometime plied only to its mouth, and sometimes sprover the egg after emission. The principal rence, therefore that occurs between our and viviparous animals, considered as such pears to be this: the former are accustomed eject their embryo before it escapes from membranes of the egg; the latter retain it is in the uterus until it acquires a considerable suntil the membranes can hold it an longer.

hen eject it when the membranes are burft. A dant is oviparous when it yields feed; viviparous then it produces a gem, a bud, a bulb, or an red root. The membranes of the feed being reloved, an incipient embryo is feen through the ricrofcope.

"Some animals, according to the feafon, eject le embryo inclosed in its membranes, or retain it the uterus till the membranes are broken. hele are the animals which are faid to be ovirous at one period and viviparous at another. some animals the fexual union is almost intancous. It constitutes nearly the business of in the last stage of the ephemeron; and the the both of the frog and toad often continues the back of the female not for hours and for only but for some weeks. Upon examition it has been found, that with his fore feet taffilts the female to protrude her eggs through e windings of the oviduct; and when they at arrive at the anus, a species of the toad has en observed to draw them out with his hind These animals were probably the first of t masculine gender who practised this art." me Dr Barclay adds fome humorous remarks, dencludes that " due nonour has not been afbed to the obstetrical toad for his discovery," by mitators and fuccessors the Men-midwives.

Among all living bodies the two fexes are gey fimilar; and the male fex is generally diftinby superior strength, beauty, and courage. w, however, does not hold universally. males of some carnivorous animals, who by the male to provide for their offspring, ger, stronger, and more ferocious than he. fome infects the male and female have no into even in form. The male of the glow-is a beetle, which flies in the dark, and is sed not by the form, but the brilliancy of his is. The female gall infect is a large mass 4 regetable excrescence, without locomotion; male a small fly full of activity. The one is as to the other as a Harpy to a Venus, and as roportioned in point of bulk as a horse to an

In many animals the distinctions of sex are tealed in the body. When any of their parts placed externally, or protruded occasionally, imale parts are usually prominent, and the fehollow, in order to receive them. In the ais however, in many flies, and a few hornets, teale is reverled; the female parts suffer erecand the male parts are open and hollow for

treception.
The external fituation of these parts is very h varied in different animals. In many worms near to the head. It is often upon the fide of fail; near to the breast in the female of the on-fly. It is at the extremity of the antennæ male spider. The vulva enters from the in birds. Its common fituation in most ais well known. The male penis, where t is one, is fornetimes found to enter the vulva, metimes not: it is sometimes imperforated, etimes forked, sometimes double, sometimes thy, sometimes bony, sometimes straight, somehes winding spirally like a screw, sometimes with VOL. XVIL PART IL

a knob, and fometimes with a point at its extremi-

ty, according to the kinds and varieties of animals.

"Few individuals have more than one fex... Many Inails, however, are androgynous, and have two. In copulation they perform the office of two fexes, and are mutually impregnated. This circumstance has often led the sensualist to wish that he were a fnail. With equal reason the epicure might wish to be one of those worms that imbibe by abforbents, and fuck in nourishment by a thoufand mouths. The organs employed may be more in number, the continuance of their function may be much longer, and yet the gratification may be lefs. The discreet beauty can afford a million of pleafures to her lover, which no fuail or fenfualist enjoys, and which profitution can never

yield. "The male and female parts of the vegetable are fometimes both on the fame flower, fometimes on separate flowers, and sometimes even on different plants of the same species. Besides the flower, another organ of generation is found in vegetables. This is the corona, from which the buds and branches proceed. It is a fubitance between the pith and the ligneous circles, and from which the diametral infertments diverge. See BOTANY, Ind

"The corona is most conspicuous at the time when the feed is to be formed; and the testicles and ovaries of those animals which procreate only at stated periods are diminished in size, and some-

times disappear till the genial season."

With regard to the decision of the fex of the feetus, our learned author thinks that, " wherever a male or female is produced, the stimulus of that particular fex, whatever was the cause, had during the time of coition and conception acquired the ascendency over the parts that were to become fexual in the embryo. We cannot fo readily answer the question, Why the offspring should possess the form and dispositions or one parent, and the fex of the other? In this case, the different stimuli may have acted differently on different parts; in the case of hermaphrodites, which are very common in the horse, the ass, the cow, and the sheep, the two parents seem to divide the form, the fex, and the dispositions, equally between them.

"The particular cause which excites the orgasine in the female organs is not afcertained. (See Or-GASM.) That viscous fluid which young laseivie ous females eject when fond of the male, is chiefly a fecretion from the glands of the vagina, the mouth of the uterus, and the neighbouring parts. In some respects it appears to be similar to those periodical discharges of semales which frequently assume the erect posture; and these discharges being usually discontinued during the times of pregnancy and fuckling, we must suppose that it is a portion of that fluid which nature has prepared for the use of the fœtus. These discharges are aiways a proof that the female has arrived at the age of puberty; that her ovary is now performing its office; and that the is disposed to propagate her kind. Whatever be the cause of the semale orgalmus, it is often to ftrong as to counteract the natural effects of the seminal fluid, and prevent impregnation. For this reason, few young Uua

and lascivious females conceive immediately after their marriage; and after contion, therefore, in cattle, it is sometimes a practice to beat the semale, to plunge her in water, to weary her with running, and to use other means to prevent the

return of the fexual defire.

" In man, and some of the nobler animals, the influence of fancy over the organs of generation is unquestionably great; but the extent and mode of its agency is not defined. Those who allow it fo much power in impressing marks, and altering the form and colour of the fœtus, support their opinion rather by the number than the strength of their arguments. Many of the stories which they adduce as proofs are fabulous, and have brought the truth of the whole into question. The reports, however, of the French commissioners who were appointed to examine the nature of ANIMAL MAG-NETISM, ought to deter the candid inquirer from drawing very hafty conclusions. + 'The queries of Fienus, in his small work entitled De Viribus Imaginationis Tradatus, concerning the powers of this mental faculty are important and curious, and might be of use in directing our researches; but they ought to be answered by accurate experiments, and not by acute metaphyfical reasoning, and historical anecdotes that are ill authenticated.

"To prevent a confusion of genera and species, animals are generally restricted by propensity to their own kind; and the seminal sluids, besides, being various in various animals, cannot indiscrim nately act as a stimulus on all semale organs of generation. The changes of form induced by habit, which is owing itself to the influence of stimuly, will partly explain the manner in which the progeny is made to resemble the male. As the irritability of different parts is of different kinds, the stimulus will have a different effect on different organs; and in these cases, where either genera or species are mixed, the parts which are most and least affected by the stimulus of the male will be obvious in the shape and form of the offspring.

"We have hitherto spoken of generation as being performed by the temporary intercourse of two fexes; but the puceron is an inftance where fexual diffinctions are not always necessary." (See PUCERON.) "Even where they exist, they are daily dispensed with in the vegetable kingdom. Plants grow from the gem, the bulb, the leaf, or the root. They propagate by flips, by fuckers, and by layers; and fome of them, as the house leek and some grasses, multiply by spontaneous feparation. In fome animals the distinctions of fex are totally unknown. Infusory animalcules multiply their species by continual divisions and subdivitions of their own body; some polypes, by spontaneous separation, split transversely, some longitudinally, and some even send off shoots. When experiments have been made upon these animals, it has been discovered that the numerous and artificial divisions of their body or their head produce entire animals. Trembley learned that they might be engrafted upon one another, and produce monsters as wild and extravagant as poet or fabulist has ever dreamed of.

"The alimentary canal of some animals diffibutes nourishment thro' the whole body without the intervention of circulating veffels, and the visit organs of vegetables are generally diffuled through the whole fystem. The case is the same in polygia as in plants. Every part is a miniature of the whole. It is found to have fimilar organs of & gestion, of respiration, of circulation, and of a neration. In perfect animals all the parts are not dependent on one another; the vital organs has diffinct fituations, and their powers are concerts ted in diffinct places. The arm of a man has heart, lungs, ftomach, or organs of generalized but the branch of a tree has as complete a fite of organs as the trunk itself, and is as independent of that body from which it grew as the graftish dependent of the stock. The several parts of the fect animals all contribute to make one white the feveral parts of a plant or polype, when with together, form only a congeries of living heat These facts contribute to explain the pract phenomena in this mode of propagation.

### SECT. XIII. Of SLEEP.

" SLEEP (says Dr BARCLAY,) is rather at 150 tion of mind than a property of body, and subm fore more naturally a fubject of metaphyliou of physiology. This affection is often income fatigue and exercise; and several persons they are weary and no longer able to met limbs, fay they are exhaufted. Though the exhaufted, in this expression, has seldomany meaning, it feems, however, to have been means of fuggefting a theory with regard to This theory supposes that sleep is occasional the exhaustion of irritability in the living for but it feems to be founded on very limited! partial observations, or rather has been im like many others, prior to any observations # and afterwards tortured to account for the dical returns of fleep, for the almost more drowfiness of infants, and for that liftless to inaction fo often attendant on old age. When exhaustion of irritability can well be supposed have taken place, the propenfity to fleep our occasions becomes irresistible, from the dict monotonous speaking, from stillness, darkness, from the fameness of scenery around us; and al one stimulus, after long application, can rough more (a plain proof that the irritable principle by no means exhausted,) another stimulus that less powerful in ordinary cases is accompani with excitement.

In all living bodies there is a continual war and repair, or to speak with more precine a accuracy, one process of affimilation and and of diffolution constantly taking place in all the ferent parts of the system. This assimilates when the body is healthy, predominates in you dissolution prevails in old age; and the two nearly on a par during the vigour and meridalise. A gentle and moderate exertion of middle body will promote both. And lastly, immode exertion in either respect, or any exertion that not suited to our strength, habits, or period.

<sup>+</sup> From this passage, as well as from some others, which we have not quoted, Dr BARCHAY for put more faith in the doctrine of Animal Magnetism, than most other modern British Physican. Se that article.

fe, prevents affinilation, haftens diffolution; and he means which nature employs to reftore the alance is usually by inducing a state of sleep.

"When the balance is restored, and all the parts e again repaired for discharging their office, man wakes; but his waking period is of short duraon, if appetite or passion do not engage him in me purfult, if his mind be not occupied with me object, or if no ftimuli be applied from withnt. This period feems chiefly intended for colfing food, and for being employed in those extons which promote respiration, digestion, abtion, circulation, and fecretion; while fleep, the food is collected, affilts nutrition, and motes affimilation throughout the fystem he is the natural food of the species cannot be heded by the plant or animal in a short time, period of fleep is proportionally restricted. If food received be difficultly affimilated, the fod of sleep is proportionally extended. If the dbe not prepared for affimilation, the fleep is arbed. If it be difficultly prepared by the ors, the active exertions are more vigorous; if ly prepared, they are more feeble. If it be eded during the day, the fleep is in the night; the collected during the night, the fleep takes \*during the day; and all living bodies are di-# by nature to felect that time and species of which is most suited to their nature, their their circumftances, and age.

favour nutrition, not only the body, but e mind, must be allowed to indulge in rest. raint, that those functions employed in numay not be disturbed. The mental faculfill feeble in a more advanced period of the moderate exertions of mind and boich are natural to youth are chiefly fuch as The preparatory organs of the system, and of manhood, confidered with respect to to body, foon cause dissolution to prerate in the scale, and old age becomes littless, and drowfy, and the mind returns to nod or dotage, because living bodies accomthemselves to circumstances, and the predisolution is retarded by the frequent reof rea and of fleep, which favour the affimispower, counteract re-absorption, and oppose

for the best of reasons, the mind is not allowrindge for itself when it is proper to eat, to to fleep, to wake, and to propagate the spe-These and the like are offices too important to folly intrusted with a being of so very limited by certain propenfities refulting from the consequence of stimuli or organic struc-Being often amused with thoughts and ideas e objects which are purely intellectual, as the of memory, the forms of fancy, and its sperations in the way of reasoning; being inwith some little power in rousing, calming regulating the passions, the desires, and appeand having the command of all the voluntary ements of the body; it sometimes neglects its of the fystem, destroys it sometimes by exceffive indulgence, and fometimes employs it in accomplishing ends peculiarly its own.

"The natural returns of waking and fleeping may be altered by the presence or absence of stimuli, and are curiously affected by the influence of habit. Although the commencement of one of these periods be changed, the commencement of the other will continue as before. If a person be accustomed to sleep percifely at 9 P. M. and to rife again at 6 A. M. though his fleep in the evening may now and then be kept off till 12 he will waken at fix; and though continued by darkness, quietness, or such-like causes, till the day be advanced, it will recommence in the evening at o. The state of physiology is such at present, that we cannot affign any precise physical cause for the natural kinds of fleeping and waking, or for their regular periods of return.

" Plants too have been said to sleep. At the approach of night, many of them are observed to change their appearances very confiderably, and fometimes even to fuch a degree as fearcely to be known for what they were before. During the night, many leaves, according to the nature of the plant, rife up, hang down, or fold themselves in various ways for the protection of the flowers, the buds, the fruits, or young flems; and many flowers, to escape a super-abundance of mosture, hang down their mouths towards the earth, or wrap themselves up in their calyxes. These phenomena are owing to stimuli acting from without: most of the motions are performed at the joints where the leaves and petals articulate with the ftem. A period of reft is as necessary to plants as fleep is to animals: the rapid growth, observable in plants during the night, is a strong proof that the organs employed in assimilation had been difturbed in discharging their functions during the day, when exposed to the actions of heat and light and of other ftimulants."

Such is the ingenious Dr Barelay's theory of Sleep in animals and plants. Without objecting to the former branch of it, or entering at all upon the latter, we shall quote, by way of contrast, the theory of the late eminent Dr John Brown, respecting the sleep of animals, which appears fully as plausible and consistent, as any we have met with. To prevent any mitunderstanding of the terms, we refer the reader to the articles, Brunonian System, § 4; Excitability, § 1—3; Excitability, § 2. Stimulus, &c.

"As Death" (says the Doctor) "closes all the

labours of life, so Sleep closes those of every day; and, as the former is the confequence of a perfect extinction of the excitement, either from a complete exhauftion or extreme abundance of excitability; fo the latter fucceeds a diminution of excitement, during which the excitability is either, z. only so far diminished, that it can be accumulated again; or, 2. fo abundant, that the excess can be wasted; and, in each case, the excitement restored. Such is the nature of the excitability of animals, that it can reither be deficient nor over-abundant, without detriment; a deficiency producing indirect, and a super-abundance direct debility. And, as any exciting power, carried beyond its boundary, produces the former, Uµu2

ind the with boilding of any gives occasion to the latter; the same proposition holds good of the exeeffive or too sparing use of any of them, or of all. Sleep, then, is the effect of our actions duging the day, at first giving always more and more excitement, afterwards less and less, in proportion to the continuance of their operation, but so as always to afford some excitement, till the per-Ion arrives at that state, where the degree of exsitement, necessary to the waking state, no longer exifts. Of this we have the most certain proof, in every day's experience, and in the common effect of all the exciting powers to produce fleep. Thus a certain degree of heat, food, drink, labour of body or mind, and passion or emotion, when their stimulus neither stops short of the proper point, nor goes beyond it, all give a difposition to slesp. This is the most falutary sleep. Premature, unseasonable, or morbid sleep, is produced by either indirect or direct debility, With respect to the sormer, an excessive operation of any one or more of the filmuli produces it, by acting in excess and wasting the excitability, fuch as hurried drinking, &c. Of the directly debilitating powers, which produce the same effect, the want, or sparing application, of the powers, which, by a due degree of flimulus, induce fleep, will induce a bad kind of it." Eiem. Med. Voi. 1. p. 266-270.

### SECT. XIV. Of DEATH.

"DEATH is the cellation and total absence of the living principle in organized bodies. It is sometimes imitated by fleep and swoons; and a flate of torpor in many inftances on hardly be diftinguished from it. Several mosses and a few animals, as the ears of blighted wheat, the feta equina, the wheel polype, and fome fnails, may be fafely preferved as dried preparations, not for months only but for years; and after irritability and fenfation have been totally fulpended, will return to life upon the proper application of moisture. A wheel polype was put by Fontana upon a bit of glass, and exposed during the whole summer to the noonday fun; another was exposed in a similar manner for a year and a half; and, after they were like a piece of hardened glue, were restored to the use of all their functions by a few drops of water. Wherever there is death, there must therefore be likewife a partial or general decomposition of one or more of the vital organs. This decomp I tion takes place naturally in some living bodies after a few hours, in some after a few days; the life of others is extended to weeks; some are vigorous for months or a leafon. Man has often feen more than fourfcore; and the hardy oak furvives the shock of two or three centuries. These observations conspire to show that there is a certain period of existence allotted by nature to every species of living bodies. In the individual this period is sometimes abridged, and may be sometimes extended by circumstances; yet there is a bound which it cannot pass, when the vital organs thus be decomposed, and the system moulder with the dust. The time of incubation and the time of gestation are pretty much defined in every species, because the circumstances of the indivalual in these cases are generally timilar; but,

after emerging from the fortal flate, the individuals are partly entrufted to their own organs at the chances of life, which are much varied; at hence the difference of their age.

"Life in general feems to be proportioned to the space occupied by that series of functions who the species is evidently destined to perform: al here sometimes the accommodating principles fingularly remarkable. As the period of decays never feen to commence in the species till that propagation be nearly elapsed, and as propagate in the lower tribes of plants and of animals is a ten the immediate harbinger of death; to may a nimals which have not propagated, indulted propenfity, nor become uneafy from the interof defire, continue vigorous longer than on as if waiting for an opportunity to multiply is And in the vegetable kingdom, when the kind. individual is ever the victim of defire or win annuals, if prevented from flowering and fed in their proper featon, will live double, and in times triple, the usual time, till these fundions fomehow performed, and then die. But wie ! the organs are fully evolved, and have diffuse or have continued for the usual time capable discharging, those offices for which they in in tended; diffolution commences, the affine organs begin gradually to lofe their tong re-absorbents carry off more from the parts than what they receive in the nutrition: the irritable fibre then beet gid; the membranes and cartilages offify; the bones grow harder; the smaller collapse and disappear; the parts no loopse bedient, as before, to the action of fine and death enfues.

"With regard to the period by which the functions, and difeases of living bedom frequently regulated, and which period sometimes he varied but not evaded, the prudent language that, perhaps, can be in the present state of physiological withis of the Divine, That the God who hath numbered our days, determined our and prescribed the limits of our existence.

The ingenious Dr Barclay concludes. Treatife on Physiology, with a Table grassian asummary view of the whole fystem, by of supplement to that of M. D'Azyr aborqued, Introd. p. 500. The following Table exhibit in the substance of the Doctor's Summary in compressed within smaller bounds, and in all more intelligible by ordinary readers:

1. Perspiration. Some living books respiratory organs, x. Dissused through the tem: 2. Confined to one place: 3. Situated ternally: 4. Situated internally: 5. In the cost of circulation: 6. Not in the course of circulation at pleasure: 8. Without trached with trached ramified thro' the system, the respiratory organs are generally disself. With trached not ramified through the system that trached through the system that trached through the system tra

sterew: 14. With trachese admitting air by one marance: 13. With ditto admitting it by several strances: 16. With trachese whosly concealed a the body: 17. With ditto partly projecting momit: 18. With trachese opening at the head: 9. With ditto opening at the opposite extremis: 20. With trachese opening on one side: 21. With ditto opening on both sides.

II. DIGESTION. i. Some living bodies have an Imentary canal, 1. Without teeth: 2, With eth in the mouth: 3. With teeth in the flomach: With Rones or artificial teeth in the stomach: With glands in the mouth for fecreting a liquor be mixed with the food: 6. With pouches in the buth, where the food is kept and nourished: 7. tha fac or bag, where the food is kept and moifred: 8. With a membranous stomach: 9. With a skular stomach: 10. With an intermediate mach: 11. Without a cocum or blind gut: . With a cœcum: 13. With two cœca: 14. ith 3 cosca: 15. With 4 cosca; all of which # laft, as well as ruminating stomachs and ir oelophagus, have anti-perifialtic motions: With one entrance or mouth: 17. With magairances by absorbents.

i. Digestion. 1. Plants have many alimengrands: 2. Some polypes have alimentary also that branch thro' the body: 3. The alimany casals of plants, of some polypes, and ten, diffribute the flu ds without the aid of imilating system.

ABSORPTION. Performed, 1. By vessels from the alimentary canal: 2. By vessels from the cavities: 3. By vessels from the surface: 4. By veins in the penis piacenta: 5. By re-absorbents originating all parts of the system.

CIRCULATION. 1. Some living bodies have strengthing fystem: 2. Some have a circulating m with one heart: 3. Some have a circulatspeem, with a heart for distributing the blood the respiratory organs, and an artery for fibuting it thro' the system: 4. Some have a stating system with one heart for the respiralorgans, and one for the fyslem, both in one. lie: 5. Some have a circulating system two bearts for the respiratory organs, and har the fystem: 6. A circulating system with mimonary heart, for the respiratory organs the course of circulation: 7. A circulating m, with a pulmonary heart within or without course of circulation: 8. A circulating system ha heart fituated in the breast: 9. A circuof freem with a heart near the head: 10. Ditrith a heart in the opolite extremity.

NUTRITION. The food is prepared, r. lie Alimentary Canal: 2. By the Lacteals: 3: the respiratory organs: 4. By the circulating m: 5. By the cellular membrane: 6. By the mes: and, 7. By the several parts in which it mes finally assimilated".

L. SECRETION. Performed, 1. By veffels: 2. txhaling veffels: 3. By excretory organs: 4. organic porcs: 5. By glands: And, 6. By all parts of which the system is composed.

II. INTEGUMATION. Some living bodies c integuments, which are, 1. Scaly: 2. Shel-3- Membranous: 4. Corneous: 5. Cretaceous:

6. Ligneous ? 7. Covered with down: 8. Covered with hair: 9. Covered with prickles: 10. Covered with eathers: 11. Covered with a viscid matter: 12. Which change their colour: 13. Which change their covering: 14. Which are changed themselves.

VIII. IRRITABILITY. The irritable principle affected, 1. By stimulants invisible: 2. By stimulants unthought of: 4. By the nervous influence: 5. By Light: 6. By heat: 7. By mossure: 8. By Electricity: 9. By Salts: 10. By Gases: 11. By bodies that act mechanically.

IX. MOTION. Locomotion performed, z. By legs: 2. By wings: 3. By fins: 4. By the tail: 5. By organs which fall not properly under these descriptions: 6. By the springiness of the body, or of some part of it. 7. By contrivances which sit living bodies for being moved by foreign agents.

X. Habit Accomodates with respect to, r. Respiration: 2. Digestion: 3. Absorption: 4. circulation: 5. Nutrition: 6. Secretion: 7. Integumation: 8. Irritability: 9. Motion: 10. Transformation: 11. Generation: 12. Sleep: 13. Death: 14. Form: 15. Size: 16. Climate: 17. Propensity: 18. The Healing of parts that are morbid: 19. The renewal of those that are broken off.

XI. TRANSFORMATION takes place, 1. By a change of proportion among the parts: 2. By a change of their form: 3. By throwing off old parts: 4. By an addition of new ones of a different use, ftructure; and form: 5. By a change of the whole form together: 6. By a change of qua-

lities, propenfities, and manners.

XII. GENERATION. Performed, 1. By the temporay union of two fexes: 2. By the spontaneous separation of parts: 3. By organs situated in the breaft: 4. By organs in the fider 5. By organs, near the head: 6. By organs in the opposite extremity: 7. By an intrant organ of the male, and a recipient organ of the female: 8. By an intrant organ of the female, and a recipient organ of the male: 9. By the stamina and pistils of flowers: 10. By the seminal secretion of the male thrown into the organs of the female: 11. By ditto fprinkled at the entrance of the female organs: 12. By ditto thrown upon them from a diffence: 13. By ditto transported to them by the winds: 14. By d tto fprinkled on the embryo after emission: 15. By ditto dissolved in a fluid secreted by the semale, before it can rightly perform its office: 16. By ditto dissolved in water: 17. By ditto dissolveed fometimes in air, as an the directious plants, where it probably acts like an aroma. All living bodies are exhausted after performing the act of generation; and many of the inferior plants and animals begin immediately to ficken and decay.

XIII. SLEEP. Natural Sleep is occasioned, 1. By quietness: 2. By the absence of simuli: 3. By the fameness of stimuli when long continued: 4. By desciont assimilation: 5. By desciont irritability, which is owing sometimes to the weakness, inattention, or confined powers of the mental principle.

XIV. DEATH happens naturally to fome foecies of living bodies, 1. After hours: 2. After days: 3. After weeks: 4. After months: 5. After feafons: 6. After years: 7. Not till after centuries PHYSY. n. f. I suppose the same with fusee. See Fusee.—Some watches have strings and

phyfies, and others none. Locke.

PHYTEUMA, in botany, HORNED RAMPTONS, a genus of the monogynia order, belonging to the pentandria class of piants; and in the natural method ranking under the 29th order, Gampanacce.

\* PHYTIVOROUS. adj. [polor and woro, Lat.] That eats grafs or any vegetable.—Hairy animals, with only two large foreteeth, are all phytivorous.

Kay.

\* PHYTOGRAPHY. n. f. [bolow and yearw.] A

description of plants.

PHYTOLACCA, POREWEED, OF AMERICAN NIGHTSHADE, in betany, a genus of the decagynia order, belonging to the decandria class of plants; and in the natural method, ranking in the 54th order, Miscellanea. It grows naturally in Virginia. It hath a thick, fleshy, perennial root, divided into feveral parts as large as midding parfneps. From this rife many purplish, herbaceous stalks, about an inch thick, and 6 or 7 feet long, which break into many branches, irregularly fet with large, oval, sharp-pointed leaves, supported on short foot stalks. These at first are of a fresh green colour, but as they grow old they turn reddith. At the joints and divitions of the branches come forth long bunches of fmall bluish-coloured flowers, confifting of 5 concave petals each, furrounding to stamina and to styles. These are succeeded by round depressed berries, having 10 celis, each containing a fingle finooth feed. In Virginia and other parts of America the inhabitants boil the leaves, and eat them in the manner of spinach. They are said to have an anodyne quality, and the juice of the root is violently eathar-The stems when boiled are as good as asparagus. The Portuguese had formerly a trick of mixing the juice of the berries with their red wines, to give them a deeper colour; but as it was found to debafe the flavour and to make the wine deleterious, the king of Portugal ordered ail the ftems to be cut down yearly before they produced flowers, to prevent any further adulteration. The same practice was common in France till it was prohibited by an edict of Lewis XV. and Lewis XVI. under pain of death. This plant has been faid to cure cancers.

(1.) \* PHYTOLOGY. n. s. [quin and higw.] The

doctrine of plants; botanical discourse.

(2.) PHYTOLOGY. See BOTANY, and MATE-

RIA MEDICA.

PHYFON, a general of the people of Rhegium, against Dionysius, the tyrant of Sicily. He was taken by the enemy, and tortured, and his fon was thrown into the sea; A.A.C. 387. See SYRACUSE.

PHYXIUM, an ancient town of Elis.

PI, a town of China, in Se-tehuen, of 3d rank. PIA, or PIALIA, festivals instituted in honour of Adrian, by the emperor Antoninus Pius. They were celebrated at Puteoli on the 2d year of the Olympiads.

PIABA, in ichthyology, is a fmall fresh water fish, caught in all the rivers and brooks in the Brazils, and in some other parts of America. It is about the bigness of the common minnow; is well tasted, and much esteemed by the natives.

PIABUCU, in ichthyology, an America fa eaten in many places by the natives. It is recous and so greedy of blood, that if a person gos into the water with a wound in any part of b body, the piabucu will make up to it to such the brood. It seldom exceeds a inches in length.

PIACENZA. See PLACENTIA.

\* PIACLE. n. f. [piaculum, Lat.] An enorge crime. A word not used.—To tear the pethat gave them suck, can there be a greater pagainst nature? Howel's Engl. Tears.

\* PIACULAR. \ adj. | procularis, from the PIACULOUS. \ lum, Lat. \] 7. Explatory, wing the power to atone. 2. Such as require a piation.—It was piaculous unto the Roman pair their nails upon the nunding. Browninnal; attrocionfly bad.—While we thin fo piaculous to go beyond the ancients, we man necessarily come short of genuine antiquity truth.

PIADELLA, a town of the Italian republic, the dep. of the Lario, diffrict of Como, and be duchy of Milan; 20 miles N. of Como, and s

of Gravedona.

PIASTER. n. f. [piastra, Italian.] An in com, about five thillings sterling in value.

Plaster, or See Money, 9 9; under Plastre, Spain.

ASTUS, or PIAST, a native of Poland, the f Cossisco, or Kossiusko, a citizen of Cruswho, from the station of a wheel-wright, was to the throne of the duchy or kingdom of 14, about A. D. 830, on the death of Popiel Different fabulous legends are told, by the 1 of Cracow, Guagnini, and other historians it age, of the cause of this promotion; such the midst of a famine, he had entertainnangels, or at least two pilgrims, very hofy; who, in return, enabled him miraculousfupply the wants of the people; from all we may gather, that Piast had become poby his liberality in a time of scarcity. All ians agree, that he governed with so much and clemency, that the Poles had no rearegret their choice. He died at Gnefna, er he had removed the court from Cruswitz, us succeeded by his fon, Ziemovitus.

ITEK, a town of Poland, in Lenczicz. iTTA, a town of Naples, in Calabria Ultra;

3 SW. of Girace.

TIGER, a town of Russia, in Viatka. TNITZKA, a town of Russia, in Tobolsk, ks NNW. of Einiseisk.

(2, 3.) PIAZINSKOI, OLD and New, two towns of Russia, in Tobolsk, near the mouth of the Piazida. Lon. 105. o. E. Ferro. Lat. 73. 30. N.

(1.) \* PIAZZA. n. f. [Italian.] A waik under a roof imported by piliars.—He stood under the piazza. Arb. and Pope's Seriblerus.

(2.) PIAZZA, in building, popularly called piache, an Italian name for a portico, or covered walk. The word literally fignifies a broad open place or square; whence it also became applied

to the walks or porticoes around them. (3.) PIAZZA, Jerome Bartholomew, an Italian, originally a Roman Catholic, a Dominican Friar, and a judge in the Inquifition, but turning Protestant, he came to England, and taught Italian and French at Cambridge. He published An Account of the Inquisition, and its proceedings as practifed in Italy: With an Extract out of an Authentic Book of the Roman Legends: Lond. 1712. He married a French Protestant, by whom he had 3 children; and died at Cambridge in 1745; with a good character.

(4.) PIAZZA, in geography, a town of Naples, in Principato Citra, 13 miles ENE. of Salerno.

(5.) PIAZZA, a town of Sicily, in Noto, nearly in the centre of the island, containing 18,000 inhabitants, 15 miles NW. of Calata Gironne, and 16 S. of Castro Giovanni.

PIAZZOLA, a town of the French republic. in the island and dep. of Corsica; 3 miles ESE. of Porta.

PIBERSTAIN, a town of Germany, in Austria; 10 miles W. of Freystatt.

PIBRAC, a town of France, in the dep. of Up-

per Garonne; o miles W. of Toulouse.
PIBROCH, says the late Dr James Beattie, is a species of tune peculiar to the Highlands and Western Isles of Scotland. It is performed on a bagpipe, and differs totally from all other mufic. Its rythm is so irregular, and its notes, especially in the quick movement, fo mixed and huddled together, that a stranger finds it almost impossible to reconcile his ear to it, so as to perceive its modulation. Some of these pibrochs, being intended to represent a battle, begin with a grave motion refembling a march, then gradually quicken into the onfet; run off with noify confusion and turbulent rapidity, to imitate the conflict and pursuit; then swell into a few flourishes of triumphant joy; and perhaps close with the wild and flow waitings of a funeral procession. See Muşic, § 15.

(1.) PIC, a navigable river of N. America, which runs into Lake Superior; in Lon. 89°. 41'. 6'. W. and Lat. 48°. 36'. 11'. N. The chief

portage is in Lat. 48. 41.

(2.) Pic

(2.) PIC DEL ALVERDI, or a high island in (3.) PIC DE L'ETOIL, the form of a sugar loaf, lying N. of Aurora Island, discovered by

Bougainville in May 1768.

(1.) PICA, or PYE, in ecclefiaftical matters, had formerly the same sense as ordinal, meaning a table or directory, pointing out the order in which the devotional fervices appointed for different occasions were to be performed. It is derived from it, a contraction of work, a table; or from litera picata, a great or black letter at the beginning of a new order in the prayers. It was used in a similar sense by officers of civil courts, who called their catalogues or indexes of things contained in the rolls of their courts, the

(2.) PICA. n. f. Among printers, a particular fize of their types or letters. It is probably so called from having been first used among us in printing the pye, an old book of liturgy.

(3.) Pica, in medicine, a depravation of appetite, which makes the patient long for what is unfit for food, or incapable of nourifhing; as chalk, ashes, coals, platter, lime, &c. See MEDI-CINE, Index.

(4.) Pica, in ornithology. See Corvus, No

(5.) Pica, in geography, a sea port of Peru, on a high land, 36 miles N. of the Lora, and 15 S. of Carapoucha.

(6.) PICA DE REGALADOS, a town of Portugal, in Entre-Duero-e-Minho; 41 miles NNR. of Braga.

(7, 8.) PICA MARINA, in ornithology. See AL-CA, N 5; and HAMATOPUS.

PICÆ, Pies, in ornithology, the 2d order of birds in the Linnaan System. They are thus characterised by Mr Kerr:—" The bill is sharp and convex on its upper surface. The legs are short, strongish, and of different kinds, some climbers, and some fitted for walking, i. e. having no back toe. The body is firmly confiructed. The birds of this order live on various kinds of food, and are mostly unfit for food. They pair, build their nests on trees, and the male feeds the female during incubation." (Animal Kingd. vol. I. p. 418.) There are 30 genera. See ORNITHO-LOGY, Sea. IV.

PICARA, a large province of South America, in New Granada, bounded on the E. by the

(1.) PICARD, a native of the Netherlands, who founded the Sect, called Picards. See Pi-

CARDS.

(2.) PICARD, John, an able mathematician, one of the most learned astronomers of the 17th century, born at Fleche. He became priest and prior of Rillie, in Anjou. Going to Paris, he was, in 1666, appointed astronomer to the Academy of Sciences. In 1671, he was fent, by order of the king, to the castie of Uraniburg, built by Tycho Brahe in Denmark, to make aftronomical observations there; and from thence he brought the original MSS, written by Tycho Brahe, which are the more valuable, as they differ in many places from the printed copies, and contain a book more than has yet appeared. He made important discoveries in astronomy; and was the fi who travelled through France, to measure a d gree of the meridian. His works are, 1. A tre tife on levelling. 2. Fragments of dioptrics. Experimenta circa aquos efficientes. 4. De mensa 5. De mensura liquidorum & aridorum. 6. An age to Uraniburg, or astronomical observation made in Denmark. 7. Aftronomical observation made in feveral parts of France, &c. Thek, fome other of his works, which are much end ed, are in the Memoirs of the Academy of \$ ences; vols. 6. and 7.

PICARDS, a religious fed which arole is hemia in the 15th century. Picard, the mi of this fect, drew after him a number of mes women, pretending he would reftore that the primitive state of innocence wherein and created; and accordingly he affumed the Under this pretence ki the New Adam. dulged his followers in all kinds of import faying that therein confifted the liberty of fons of God; and that all those not of the were in bondage. He first published his op a in Germany and the Netherlands, and pulsa many people to go naked, whom he and DAMITES. After this, he seized on as ified the river Lausnecz, some leagues from Time the head quarters of Zisca, where head felf and his followers. His women we mon, but none were allowed to enjoy bea out his permission: so that when any mas dea particular woman, he carried her to hard! gave him leave in these words, Go, incrept tiply, and replenish the earth. At length, we Zitca, general of the Huffites, (famous victories over the emperor Sigismund | their abominations, marched against them, himself master of their island, and put then death except two; whom he spared, that ke learn their doctrine. Such is the account various writers, relying on the authorited neas Sylvius and Variilas, have given of cards, who appear to have been a party VAUDOIS, that fled from perfecution in the country, and fought refuge in Bobenia is highly probable that the whole is a call invented to difgrace the Picards, because the ferted the communion of the church of h Lasitius informs us, that Picard, with 42 persons, besides women and children, feet Bohemia in 1418. Balbinus the Jeful, Epitome Rerum Bobemicarum, lib. ii. got 1 lar account; and charges on the Picards ru the crimes afcribed to them by Sylmus, S. fecretary of Ladiflaus, Ling of Bohemia, letters to Erasmus, gives a particular accord the Picards, wherein he represents their ples as no other than those of the Vaudon M. de Beaufobre has shown that they well of the same sect, though under different nations. The Vaudois were fettled in Ed in 1178, where fome of them adopted the the Greek, and others those of the Latin ch On the commencement of the national was in Bohemia, on account of the opposition ! papal power (fee Moravians), the Picards licly avowed their religious opinions; and da confiderable body in an island by the river ausnecz, in the district of Bechin, and recurring

rms, were defeated by Zilca.

PICARDY, a ci-devant province of France, bunded on the N. by Hainault, Artois, and the usits of Calais; on the E. by Champaigne; on ie S. by the Ille of France; and on the W. by ormandy and the English Channel. The name not more ancient than the rath century. It is ng and narrow, being usually compared to a nt um; and in this figure is nearly 150 miles ng, but not above 40 broad, and in many plaa not above 20. It is generally level, and proices wine, fruit of all kinds, plenty of corn, and ent quantities of hay; but wood being scarce, oft of the inhabitants burn turf. They have, weset, some pit coal. It was united to the own of France in the year 1643; and contains out 533,000 citizens. Its principal rivers are e Simme, Oife, Canche, Lauthie, Lys, Aa, ape, and the Deule. Its fituation on the feaall, its many navigable rivers and canals, with eindustry of the inhabitants, render it the feat a flourishing trade. In it are made beautiful thuffs, woolien stuffs, coarfe linen, lawn, and 申: It aifo carries on a large trade in com and coal. The fisheries on this coast are also veadvantageous. This province was divided in-Upper, Middle, and Lower Picardy; but now ms the department of the Somme, and part those of the Arsne, and the STRAITS OF CAm. Amiens is the capital.

PICAROON. n. f. [from picare, Italian.] A ber; a plunderer.—Corfica and Majorca in all have been the nefts of picaroons. Temple's

fellanies.

PICART, Bernard, a celebrated engraver, fon Stephen Picart, also a famous engraver, was in at Paris in 1673. He learned the elements his art from his father, and studied architec-2 and perspective under Sebassian le Cierc. As embraced the reformed teligion, he settled in sland, where his genius produced those masterces which made him esteemed the most ingeus artist of his age. A multitude of books are belished with plates of his egraving. He di-

in 1733. MCAUVILLE, a town of France, in the dep. the Channel; 9 miles NW. of Carentan.

PicAWEE, an Indian town of the United ites, in the North Western Territory, on the rat Miami, 75 miles above its mouth; where 3 only 30 yards broad, though navigable by sed batteaux 50 miles higher up.

PICCAGE. n. f. [piccagium, low Lat.] Mo-

favors's.

ficcino, a town of the Italian republic, in dep. of the Serio, district and late prov. of samo, seated in the valley of Taleggio, of ich it is the capital.

1.) PICCOLOMINI, Æneas Sylvius. See Pi-

2.) PICCOLOMINI, Alexander, Abp. of Patras, abom at Sienna, about 1508, of an illustrious 1 ancient family, originally from Rome. He pposed for the theatre, and was equally differ. XVII. PART II.

ringuished for genius and virtue. His charity was very great, and was much exerted in favour of men of letters. He wrote many works in Italian. The principal are, 1. Various Dramatic Precés. 2. A Treatise on the Sphere. 3. A Theory of the Planets. 4. A Translation of Arrifotle's Art of Rhetoric and Poetry, in 4to. 5. A System of Morality; Venice, 1575, in 4to; translated into French by Peter de Larivey, in 4to; Paris, 1581. He was the first who wrote in the Itaiian language upon philosophical subjects. He died at Sienna, 12th March, 1578, aged 70. A catalogue of his works may be seen in the Typographical Dictionary.

(3.) PICCOLOMINI, Francis, of the fame family, was born in 1520, and taught philosophy with success, for 22 years, in the most celebrated universities of Italy, and afterwards retired to Sienna, where he died, in 1604, aged 84. His works are, 1. Commentaries upon Aristotle; Mentz, 1608, 4to. 2. Universa Philosophia de Moribus; Venice, 1583, fol. He laboured to revive the doctrine of Plato, and imitated his manners. He had for his rival the famous James Zabarella, whom he excelled in facility of expression and elegance of language; but to whom he was much

inferior in point of argument.

(4.) Piccolomini, James, whose proper name was Ammanati, took that of Piccolomini, in honour of his patron Pius II. He was born near Lucca, in 1422. He became Bp. of Massa, afterwards of Frescasi; a cardinal in 1464, under the title of de Pavie; and died in 1479, aged 57, of an indigestion of sigs. He left 8000 pistoles in the bankers hands, which Pope Sixtus IV. claimed; and of which he gave a part to the Hospital of the Holy Ghost. His works, which consist of some Letters, and a History of his own time, were printed at Milan, in 1521, in folio. His history, entitled Commentaries, commences the 18th June, 1464, and ends the 6th Dec. 1469. They are a Sequel of Pope Pitts II.'s Commentaries, which end with 1463.

(5.) Piccolomini, Octavius, of Arragon, duke of Amalfi, prince of the Empire, an imperial general, and knight of the Golden Fleece, was born in 1995. He first bore arms among the Spanish troops in Italy. He afterwards served under Ferdinand II. who sent him to the relief of Bohemia, and gave him the command of the imperial troops in 1634. He signalized himself at the battle of Northingur, and made Marsin, de Chatillon raise the slege of St Omer. He deseated the Marquis Fenquieres in 1639: nor did the loss of the battle of Wolfenbuttel, in 1651, impair his glory. He died on the 10th Aug. 1656, aged 57, with the character of an active general. The celebrated

Caprara was his nephew.

PICENI, or the ancient inhabitants of Prce-PICENTES, Num, (Cicero, Liny,) who were originally a colony of Sabines. They were different from the Picentini, on the Tufcan feathough called so by the Greeks; but Piolemy calls them Piceni, as does also Piiny. Their territory at this day is supposed to form the greatest part of the March of Ancona. Cluverius.

PICENTIA, the capital of the Picentini, who X x x inhabited

inhabited the AGER PICENTINUS. (Strabo, Pli-

PICENTINI, an ancient people of Italy, who inhabited the AGER PICENTINUS. The Greeks commonly confound the Picentini and Picentes, but the Romans distinguish them. The former had only two towns, named Silermon and Picentia; the fituation of both uncertain: only Pliny fays the latter flood within land, at some distance from the fea: Now thought to be Bicenza, (Holflenius), in the Principato Citra of Naples.

PICENTINUS AGER, an ancient diffrict of Italy, on the Tuscan Sea, extending from the Promontorium Minervæ, the S. boundary of Campania on the coast, to the Silarus, the N. boundary of Lucania, reaching within land as far as the

Samnites and Hirpini.

PICENTIUM AGER, ) a territory of Italy, ly-PICENUM, or ing to the E. of Um-PICENUS AGER, ) bria, from the Apennine to the Adriatic; on the coast, extending from the river Actis on the N. as far as the Pratutioni to the S. In the upper or N. part of their territory, the Umbri excluded them from the Apennine, as far as Camerinum; but in the lower or fouthern part, they extended from the Adriatic to the Apennine. It was very fertile, and very populous. Caf. Plin. Florus, Cie. Sall. Liv. Tac. Varro. See AGER PICENUS.

PICHERIE, a town of France, in the dep. of

Aude; 9 miles E. of Carcassone.

PICHFORD, or PITCHFORD, a town of Salop, on the SE. fide of Shrewsbury, near Condover. It is noted for a spring of pitchy water (whence its name), on the top of which there always flows a fort of liquid bitumen. Over most of the coal pits hereabouts, there lies a stratum of blackish rock; of which, by boiling and grinding, they make pitch and tar, and also distil an

oil from it.

PICHINCHA, a mountain of Peru in Quito, in the prov. of Truxillo, famous for its great height, which is estimated at 2432 toises above the level of the sea. It is, however, 1278 yards lower than the perpendicular height of Cotopaxi, and was formerly a volcano, but the crater on one of its fides is now covered with fand and caleined matter; fo that at present neither smoke nor fire issue from it. When Don George Juan and Don Antonio de Ulloa were stationed on it for the purpose of making astronomical observations, they found the cold on the top of this mountain extremely, intenfe, the wind violent, and they were frequently involved in so thick a fog, or cloud, that an object at 6 or 8 paces diftance was scarcely discernible. The air grew clear, by the clouds moving nearer to the earth, and on all fides furrounding the mountain to a vast distance, representing the sea with the mountain fanding like an ifland in the centre. When this happened, they heard the dreadful noise of the tempelts that discharged themselves on Quito and the neighbouring country. They faw the lightning iffue from the clouds, and heard the thunder roll far beneath them. While the lower parts were involved in tempefts of thunder and rain, they enjoyed a delightful ferenity; the wind was abated, the fky clear, and the enliven-

ing rays of the fun moderated the feverity of the cold. But when the clouds rose, their thickness rendered respiration difficult: snow and hail fell continually, and the wind returned with ail its violence; fo that it was impossible entirely to o vercome the fear of being, together with their hut, blown down the precipice on whose edge st was built, or of being buried in it by the conflar accumulations of ice and fnow. Their fears were likewise increased by the fail of enormous from ments of rocks. Though the smallest crevier sible in their but was stopped, the wind was piercing that it penetrated through; and though the hut was small, crowded with inhabitants, and had feveral lamps constantly burning, the co was fo great, that each individual was obliged have a chafing difh of coals, and feveral men we conftantly employed every morning to mon the fnow which fell in the night. By the level ties of fuch a climate, their feet were fwelled, fo tender, that walking was attended with a treme pain, their hands covered with childs and their lips fo fwelled and chopt, that eve motion in speaking drew blood.

PICHMANSKOI, a town of Ruffia in O netz, on lake Latcha; 32 miles SSW. of Lug

pol.

PICIERNO, a town of Naples, in Banicul

miles WNW. of Potenza.

PICIGITHONE. See PIZZIGHITONI PICIOTTI, a river of Naples, which rus the fea, 15 miles SE. of Reggio, in Calaba

\* PICK. n. f. [pique, French.] A fnarp [ ed iron tool .- What the miners call then whern, the stone-cutters nicomia, is so hard, !! the picks will not touch it. Woodward.

(1.) \* To Pick. v. a. [ picken, Dutch.] 1. cull; to chuse; to select; to glean; to gl. It has commonly out a ter here and there. when it implies felection, and up when it me cafual occurrence.-

This fellow picks up wit as pigeons per

He hath pick'd out an act. Under whose heavy sense your brother's like Falls into forfeit.

Out of this filence yet I pick'd a welcom

-When men are ingenious in picking out circ stances of contempt, they do kindle their and Bucon .- He should out of these his enemies treffes pick some fit occasion of advantage. les's Hiftory .-

They must pick me out with shackles tirl To make them sport with blind activity.

What made thee pick and chuse her out

-Men that have been picked up and relieved of starving necessities, afterwards conspire as their patrons. L'Estrange.-He'd make a his pick it up. L'Estrange. A painter would not much commended, who should pick out this vern from the whole Æneids. Drydes.-In the bees, who pick from every flower that w they find most proper to make honey. Drying He that is nourished by the acorns he picked ander an oak in the wood, has appropriated them in himself. Locke.—He asked his friends about im, where they had picked up such a blockhead. Seed.—The will may pick and chuse among these tipels. Cheyre.—

Deep thro' a miry lane she pick'd her way.

-Thus much he may be able to pick out, and rilling to transfer into his new history. Swift.—
Heav'n, when it strives to polish all it can-

Heav'n, when it strives to polish all it can, Its last, best work, but forms a softer man, Picks from each sex, to make the sav'rite blest, Your love of picasure, our desire of rest. Pope. To take up; to gather; to find industriously. You owe me money, Sir John, and now you it a quarrel to beguile me of it. Shak.—The ug did this, to pick a quarrel to put him to 2th. Bacon.—There's not one circumstance in ture, but they shall find matters to pick a quarlat. L'Estrange.—Pick the very resuse of those west sieds. Thomson.—She has educated sevel poor children, that were picked up in the test. Lasv. 3. To separate from any thing has or noxious, by gleaning out either part; skan by picking away silth.—

He could not stay to pick them in a pile

Of musty chaff. Shak. hath been noted by the ancients, that it is gerous to pick one's ears whilst he yawneth. He picks and culls his thoughts for contion. Addison. 4. To clean, by gathering adually any thing adhering.—A dog expects, mafter has done picking a bone, More. master has done picking a boile, and are not to wash your hands, till you have your sallad. Swift. 5. [Piquer, Fr.] To be; to strike with a sharp instrument.—Pick ppie with a pin full of holes not deep, and it with spirits. Bacon.—In the face, a wart my pustule, heated by scratching or picking hails, will terminate corrosive. Wiseman. 6. This with bill or beak; to peck.—The eye mocketh at his father, the ravens of the valhall pick out. Prov. xxx. 19. 7. [Picare, Itas, and had my pocket pickt; the house is yd bawdy-house, they pick pockets. Sbak. ty have a defign upon your pocket, and the a conscience is used only as an instrument to IL South. 8. To open a lock by a pointed Parent.

Did you ever find
that any art could pick the lock? Denbam.
To Pick a bole in one's coat. A proverbial exfion for finding fault with another.
L) \* To Pick. v. n. 1. To eat flowly, and

mall morfels.—
Why fland'st thou picking?

Dryden.

why stand it thou picking?

Dryden.

To do any thing nicely and leifurely.—

He was too warm on picking work to dwell.

PICKAPACK. adv. [from pack, by a redupline very common in our language.] In manual pack.—In a hurry she whips up her darunder her arms, and carries the other a pickal upon her shoulders. L'Estrange.

PICEANE. n. f. [pick and axe.] An axe not to cut, but pierce; an axe with a sharp

under an oak in the wood, has appropriated them point.—Their tools are a pickaxe of iron, 17 inbimself. Lacke-He asked his friends about ches long. Carew.—

I'll hide my master from the slies, as deep As these poor pickaxes can dig. Sha.

Pioneers, with fpade and pickaxe arm'd, Forerun the royal camp, to trench a field.

Milton.

PICKBACK. adj. [corrupted perhaps from pickpack.] On the back.—

Mounted a pickback on the old.

\* PICKED. adj. [pique, Fr.] Sharp; finart.

Let the stake be made picked at the top. Morti-

mer's Husbandry.

"To PICKEER. v. a. [piccare, Italian.] 1.
To pirate; to pillage; to rob. Ainsworth. 2.

No fooner could a hint appear,

To make a flying skirmish.-

But up he started to ficker.

\* PICKER. n. f. [from pick.]

\* Pickers or culls.—The pickers pick the hops into the hair-cioth. Mortiner.

2. A pickare; an infirmment to pick with.—With an iron picker clear the earth out of the hills. Mortiner.

\* PICKEREL. n. f. [from pike.] A small pike. \* PICKEREL-WEED. n. f. [from pike.] A water plant, from which pikes are fabled to be generated.—The pikes are bred, some by generation, and some not; as of a weed called pickerel-weed. Walton.

(1.) PICKERING, a pretty large town in the N. Riding of Yorkshire, 13 miles from Scarborough, and 225 from London; but belonging to the duchy of Lancaster, on a hill among the wild mountains of Blakemore; between the forest of Pickering on the N. and Pickering Common on the S. It is said to have been built 270 years before Christ, by Peridurus, a king of the Britons, who was buried here. It had once a castle, the ruins of which are still to be seen; to whose jurisdiction many of the neighbouring villages were subject: and the adjacent territory, commonly cailed Pickering-Lath, or the liberty or forest of Pickering, was given by Henry III. to his son Edmund, earl of Lancaster. A court is kept here for all actions under 40s. arising within the honour of Pickering. It is 26 miles NE. of York. Lon. 0. 38. W. Lat. 54. 15. N.

(2-4.) PICKERING FOREST, &c. See last ar-

ticle.

PICKERSGILL, an island in the S. Atlantic Ocean, near Cape Disappointment, in S. Georgia. Lon. 36. 58. W. Lat. 54. 41. S.

PICKERY, n. s. in Scots law, petty theft, or

Realing things of imall value.

(1.) PICKET, n. f. an out-guard posted before an army, to give notice of an enemy approaching.

(2.) PICKET, a punishment, where a foldier flands with one foot upon a sharp-pointed stake; the time of his standing is limited according to the offence.

(3.) PICKETS, in fortification, flakes sharp at one end, and sometimes shod with iron, used in laying out the ground, about 3 feet long; but, when used for pinning the fascines of a battery, they are from 3 to 5 feet long.

(4.) PICKETS, in artillery, are about five or fix

feet long, shool with iron, to pin the park lines, in rifes from Lake Shabamoushwan, and russ into

laying out the boundaries of the park.

(5.) PICKETS, in the camp, are also stakes of about fix or eight inches long, to fasten the tent cords, in pitching the tents; also, of about four or five feet long, driven into the ground near the tents of the horsemen, to tie their horses to.

(6.) Pickers, in geography, a town of Virgi-

nia, 35 miles SSW. of Wallington.

To PICKET, v. a. To torture by the Picket.

See PICKET, No 2.

(1.) \* PICKLE. n. f. [pekel, Dutch.] 1. Any kind of falt liquor, in which flesh or other substance is preserved .-

Thou shall be whipt with wire, and flew'd in

brine,

Smarting in lingring pickle. -- Some fish are gutted, split and kept in pickle. Carew.-He instructs his friends that dine with him in the best fielde for a walnut. Spesiator .- A third fort of antifcorbuticks are called aftringent; as capers, and most of the common pickles prepared with vinegar. Arbuibnot. 2. Thing kept in pickle. 3. Condition; state. A word of contempt and ridicule .-

How cam'ft thou in this pickle? -A physician undertakes a woman with sore eyes; his way was to dawb 'em with ointments, and while the was in that pickle, carry off a spoon.

L'Estrange.

Poor Umbra, left in this abandon'd pickle, E'en fits him down. Swift.

(2.) PICKLE, (\$ 1. def. 1.) OF BRINE, is commonly compoled of fait, vinegar, &c. fometimes with the addition of spices, wherein meat, frult, &c. are feafoned.

(3.) \* PICKLE, or pightel. n. f. A fmail percel of land inclosed with a bedge, which in some countries is called a pingle. Phillips.

\* To PICKLE. 2. a. [from the noun.]

preserve in pickle .-

Autumnal cornels next in order ferv'd, In lees of wine well pickled and preferv'd.

Dryden. Nay, to keep friendship, they shall pickle you. Dryden.

2. To feafon or imbue highly with any thing bad : as, a fickled rogue, or one confummately villa-

rous.

\* PICKLEHERRING. n. f. [pickle and berring.] A jack-pudding; a merry-andrew; a zany; a buffoon.-Another branch of pretenders to this art, without horse or picklegerring, lie fing in a garret. Spellator.—The pickleherring found the way to shake him. Spellator.

\* PICKLOCK. n. f. [pick and lock.] I. An

instrument by which locks are opened without the key .- We have found upon him, Sir, a ftrange picklock. Shak .- Scipio, having fuch a picklock, would spend so many years in battering the gates of Carthage. Brown.—It is the very picklock that opens the way into all cabinets. L'Estrange.—Thou railedst thy voice to describe the powerful Betty, or the artful picklock. Arbuthnot. 2. The perfon who picks locks.

PICKMERE, a river of Cheshire.

FICKOUAGAMS, a river of Canala, which

Lake Si John.

\* Pickpocket. \ n. f. [pick and pocket, or purfe.]
\* Pickpocket. \ A thief who steals, by putting his hand privately into the pocket or purfe.- I think he is not a pick-purfe. Shak.—It is reasonable, when Esquire South is losing his money to thereers and pick; sckets, I should lay out the fruits ci my honest industry in a law fuit. Arbutbact -Pickpockets and highwaymen observe first juffing among themselves. Bentley-

His fellow pickpurfe, watching for a job. Seif Go drench a pickpocket, and join the mob. Por

\* PICKTHANK. n. f. [pick and thank.] At offe ous fellow, who does what he is not defired; whifpering parafite.-

Many tales devisid.

By fmiling pickthanks and base newsmongers.

With pleasing tales his lord's vain ears be fa A slatterer, a pickthank, and a lyer. -The business of a pickthank is the basest of a ces. L'Effr.-If he be great and powerfol, for and pickthanks generally provoke him to tyras over the innocent and the just. South.

\* PICKTOOTH. n. f. [pick and tooth.] An interment by which the teeth are cleaned .- If a see man leaves a picktooth case on the table afin ner, look upon it as part of your vails. See

(1.) PICO, one of the AZORE ISLINDS, DE ed from a very high mountain in it, terman like Tenerifie in a peak, and reputed equal min height. This illand lies about 12 miles 38 of St George, 12 of Tercera, and about 9 \$20 Fayal. The circumference of the island as puted at about 15 leagues; and its most rese able places are Pico, Lagoas, Santa Crass, Sebastian, Pesquin, San Rocke, Playa, and dalena; the inhabitants of which live who the produce of the island, in great plenty and licity. The cattle are various, numerous, and cellent in their feveral kinds: it is the fame the vine; and its juice, prepared into diffe wines, the best in the Azores. Besides cedar ther timber, they have a kind of wood w they call TEIXO, foild and hard as iron; and to ed, when finely polified, like a rich fearlet wh which colour it has in great perfection. T longer it is kept, the more beautiful it grow hence it is, that the teixo tree is felled only the king's use or by his order; and is probable from being exported as a common article of tra-Lon. 28. 21. W. Lat. 38. 29. N.

(2.) Pico, a lofty mountain in the above its which gives name to it, filled with difinal & caverns or volcanoes, which frequently vomit flames, smoke, and ashes, to a great distance, the foot of it, towards the E. is a spring of the water, generally cold, but fometimes to be with fubterraneous fire, as to rush forth in rents with a kind of ebullition like boiling was equalling that in heat, and fending forth a but of fulphureous fetid vapours, liquefied flores nerals, and flakes of earth all on fire, in quantities, and with fuch violence, as to be formed a kind of promontory vulgarly called A terios, on the declivity of the coast, and at the

: account given by Ortelius.

3.) Pico, the capital of the above island.

4.) Pico, a mountain of Spain, on the confines New and Old Castile and Estremadura.

5.) Pico, or Puerro de Pico, a town of Spain. Old Castile, on a mountain, near the source of Tormes.

6.) Pico Marina, a sea fish common at Kongo Mrica, which derives its name from the timilarity ts mouth to the beak c: a wood-pecker. It is a large fize, and prodigious strength, has 4 fins is back, 3 under its belly, and one on each fide its head; its tail is large and forked, by which uts the waves with furprifing force and veloci-

It is at war with every fish that swims, and h every thing it meets in its way, without beintimidated by the largest vessels; a surprising ance of which intrepidity, we are told by some fignaries, whose thip was attacked by one of m, near these coasts, in the dead of night. The ence of the shock which it gave to the vessel ckly awakened the captain and the rest of the ple; who immediately ran to the thip's fide, are they perceived, by moon light, this huge after fastened by its forehead to the vessel, and ting the strongest efforts to disengage itself; n which some of them tried to pierce him with r pikes, but he got off before they could acpolith their aim. On the next morning, upon ting that fide of the veffel, they found, about below the surface of the water, a piece of ony fnout fluck fast into the wood, and two bree inches of it projecting outwards. at presently after to vitit the inside of the ship, discovered about 5 or 6 inches more of the at of the horn which had penetrated though plank.

1.) Pico Sacro, a mountain of Spain in Gali-

; 9 miles S, of St Jago.

3.) Pico Teneriffe, a mountain of Barba
5; 1 mile S, of Cuckold's Point.

TCOLATA, a fort of East Florida, on the St m, 3 miles from Fort Poopoa, and 27 from St

ICOSA, or PISANA, high mountains of Peru, ch serve as land-marks, extending about 21

s on the coast, S, of the equator.

ICQUERING, part. n. f. a flying war, or skirmade by foldiers detached from two armies pillage, or before a main battle begins. ICQUET, OF PICKET. See PIQUET.

ICRA, a lake of Africa, which Alexander the at croffed, when he went to confult the oracle

upiter Ammon. Diod.
ICRAMNIA, in botany, a genus of the pen-Iria order, belonging to the dicecia class of ares; and in the natural method ranking with le that are doubtful. The calyx is tripartite; corolla has 3 petals; the stamina from 3 to 5,
-shaped, and seem to join together at the base; re are two ftyli, which are thort and bent backds; the berry is roundith, and contains two ong feeds, and sometimes one seed only. There ply one species, viz.

PICRAMNIA ANTIDESMA, the murjoe bush. This 36 is frequent in copies and about the skirts of ands in Jamaica, rifing about 8 or 9 feet from

placed alternately along the branches; the flowerspikes are long, pendulous, and slender: the florets finall and white: the berries are numerous; at first red, then of a jet black colour; the pulp is fost, and of a purple complexion. The whole The neplant is bitter, and especially the berry. groes make a decoction of them, and use it in weaknesses of the stomach and in venereal cases.

PICRANIA, in botany, a new genus of plants, of the class pentandria and order monogynia, lately discovered. Only one species is yet known; viz.

PICRANIA AMARA, Or Bitter Wood, a tall and beautiful timber tree, common in the woods of The name is expressive of its sensible Jamaica. qualities. Every part of it is intenfely bitter; and even after the tree has been laid for floors many years, whoever rubs or scrapes the wood, feels a great degree of bitterness in their mouth or throat. Cabinet-work made of this wood is very ufeful, as no infect will live near it. This tree has a great affinity to the Quassia, Amara of Linnaus; in lieu of which it is used as an antiseptic in putrid severs. When used, less of it will do than of the Quaffia Amara of Surinam. See QUASSIA.

PICRIS, in botany, Ox-Tongue; a genus of the polygamia equalis order, belonging to the fyngenelia class of plants; and in the natural methord ranking under the 49th order, Composita. There are 4 species, of which the only remarkable

one is the

Pickis echioides, the common ox-tongue, growing spontaneously in corn fields in Britain. It has undivided leaves embracing the stem, with yellow bloffoms, which fometimes close foon after noon, at other times remain open till nine at night. It is an agreeable pot-herb while young.

juice is milky, but not too acrid.

PICRIUM, in botany, a genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking with those that are doubtful. The calyx is monophyllous and quinquefid; the corolla monopetalous, and its tube is short; the filaments are 4, and hooded at their infertion; the stile long and thick; the stigma bilamellated; the capfule is round, bivaived, and contains a number of small seeds. There are two species;

z. Pickium Ramosa, and

2. PICRIUM SPICATA; both natives of Guiana. Both species are bitter, and employed in dyspepsy. and to promote the menfes: they are also recommended in visceral obstructions.

\* PICT. n. f. [pi@zi, Lat.] A painted person.— Your neighbours would not look on you as

But think the nations all turn'd pits again. Lee. PICTÆ. See Picti, and Picts.

PICTAVI, or PICTONES. See PICTONES.

PICTAVIA, an ancient kingdom of Caledonia, or Scotland, comprehending, at its most flourishing period, all the territories bounded on the N. by the Forth and Clyde, and on the S. by the Tweed and Solway. It was inhabited by the Picts. See Picus.

PICTAVIUM, an ancient town of Gaul, the capital of the Pictones, called also Lemaum, DOW POICTIERS.

(1.) PICTET,

(1.) PICTET, Benedict, a native of Geneva, born in 1655, of a diftinguished family. After having travelled into Holland and England, he taught theology in his own country with extraordinary reputation. The university of Leyden, after the death of Spantreina, invited him to fill his place; but he preferred his own country, for which he received the thanks of the council. He died 9th June, 1724, aged 69. He was remarkable for charity and affability. He published a great number of works in Latin and French, which are much etteemed in Protestant countries. The principal of these are, I. A System of Christian Theology in Latin, 3 vols in 4to; best edit. 1721. 2. Christian Morality, Geneva, 1710, 8 vols 12mo. 3. The History of the 11th and 12th centuries; a fequel to that of Sueur, 1713, 2 vols 4to. and held in higher estimation. 4. Several Controversial Treatiles. 5. A great number of tracts on morality and piety; particularly the Art of Living and Dring well; Geneva, 1705, 12mo. 6. Letters. 7. Ser-

mons, from 1697 to 1721; 4 vols 8vo.

(2.) PICTET, John-Lewis, a counfellor of Geneva, born in 1739, of the same family. He was member of the Council of Two Hundred; Counfellor of State and Syndic; and died in 1781. He studied astronomy, and made several voyages into France and England. He had a most enlightened understanding. He left in M. S. the "Journal of a Voyage which he made to Russia and Siberia in 1768 and 1769, in order to observe the transit of Venus over the sun's disk:" a work very interesting, from the lively descriptions which it gives

both of men and of nature.

PICTI, or PICTÆ, [Lat. painted.] an ancient people of Scythia, so named, because they painted their bodies with various colours, to make them appear terrible to their enemies. They are also called AGATHYRSI. According to Servius, a colony of them emigrated to the N. parts of Britain, where they settled, and preserved their name and manners, and gave rise to the kingdom of the Picts. But this is disputed. See Picts.

PICTLAND. See PENTLAND.

PICTONES, an ancient people of Gaul, mentioned by Cætar, (De Bell. Gall. vii. c. 4.) who inhabited the country called Poictou in modern

times, till the late revolution of France.

\* PICTORIAL. adj. [from pittor, Latin.] Produced by a painter. A word not adopted by other writers, but elegant and ufeful.—Sea horfes are but grotefoo delineations, which fill up empty fpaces in maps, as many pittorial inventions, not any phytical fhapes. Brown's Vulgar Errowrs.

PICTOU, an island near the N. coast of Nova

PICTOU, an island near the N. coast of Nova Scotia. Lon. 62. 13. W. Lat. 45. 46. N. PICTOWA, a mountain of Siberia, in Barraba,

abounding with rich copper mines, which have also filver and gold in them. See BARRABA.

PICTS, one of those nations who anciently posfessed the north of Britain. It is generally believed that they were so called from their custom of painting their bodies; an opinion which Camdention, Vol. I. p. xci. of the presace.) It is certainly liable, however, to considerable objections; for its this custom prevailed among the other ancient inhabitants of Britain, who used the glajtum of

Pliny and the vitrum of Mela for that purpok may be asked, Why the name of Picti was po fined by the Romans to only one tribe, when was equally applicable to many others? W thould they delign them only by an epithet of out ever annexing their proper name? Or frould they impole a new name on this people ly, when they give their proper name were ther tribe which they have occasion to speat As these questions cannot be answered man tisfactory manner, we must look for some derivation of the name. The Highlanders of a land who fpeak the ancient language of Caleland express the name of this once famous nation the term Pidich; a name familiar to the the most illiterate, who could never have it from the Roman authors. The word means pilferers or plunderers. The appear was probably imposed upon this people by neighbours, or affumed by themselves, some after the reign of Caracalla, when the unstate of the Roman province, on which the of making incursions thither, and committee predations. Accordingly this name feems to been unknown till the end of the 3d centur. menius the panegyrist is the first Roma who mentions this people under their we of Piclich, or, with a Latin termination. When we fay that this name may have keep bably assumed for the reason just now men we must observe, that, in those days of we the character of a robber was attended with difgrace. If he had the address to form schemes well, and to execute them success he was rather praifed than blamed for his and confidered as a bero, providing he me encroachments on the property of his own or any of its allies. This is no peculiar upon the Picts; for other nations of amigan the like rude flate, thought and acted as tique See Thuesdides, lib. 3. p. 3. and Virg. Enter 749. Concerning the origin of the Patthors are much divided. Boethius denves from the Agathyrsi, Pomponius Lætus from Germans, Bede from the Scythians, Camdes Father Innes from the ancient Britons, Stilling. from a people inhabiting the Cimbrica Com fus, and Keating and O'Flaherty, on the auty of the Pialter Cashel, derive them from Thracians. But the most probable opinion is," they were the descendants of the old Calcius Several reasons are urged in support of this nion by Dr Macpherson; and the words of menes, " Caledonum, aliorumque Pictorum vas," &c. plainly imply that the Picts and donians were one and the same people. As has been much dispute about the origin of Picts, so there has been likewise about ther guage. There are many reasons which man plain that their tongue was the Gaelic or Com and these reasons are a further confirmation their having been of Caledonian extract. Through the E. and NE. coafts of Scotland (which possessed by the Picts) we meet with an incumer ble lift of names of places, rivers, mountains, which are manifestly Gaelic. From a very old i gifter of the priory of St Andrew's (Dalrym)

PIC

ledions, p. 122.) it appears, that in the days of ngus, the last Pictish king of that name, St hew's was called Mucrofs; and that the town called Queensferry had the name of Ardebinban. Both these words are plain Gaelic. The fignifies the heath or promontory of boars; and latter, the height or peninfula of Kenneth. In lift of Retish kings published by Father Innes, l of the names are obviously Gaelic, and in y instances the same with the names in the f Scottish or Caledonian kings published by ame author. Had Innes understood any thing is language, he would not have supposed with den that the Picts spoke the British tongue. two words, on which they built their conjec-(Strath and Aber) are as common in the ic as they could have been in the British, and is day make a part of the names of places in the state to which the Pictish empire never exd. The names of Stratbfillan and Lochaber kerve as instances. Bede, as much a stranger te Celtic as either of these antiquaries, is eunhappy in the specimen which he gives of this language in the word penuabel, the bead swall. Allowing the commutation of the iniinto c, this word has still the same meaning Hic which Bede gives it in the Pictish. The if the earliest age, as appears from the joint ay of all writers who have examined the possessed only the E. and NE. coast of d. On one fide, the ancient Drumalbin, ridge of mountains reaching from Lochlo-tear Dumbarton to the frith of Taine, separates the county of Sutherland from a Rois, was the boundary of the Pictish do-Accordingly we find in the life of St ha, that, in travelling to the palace of Bruing of the Picts, he travelled over Drumal-Dersum Britanniæ of Adamnan. On the ide, the territory of the Picts was bounded Roman province. After Britain was relinby the emperor Honorius, they and the s by turns were masters of those countries lie between the frith of Edinburgh and the Tweed. We learn from Bede, that the Saxpre masters of Gailoway when he finished clefishical Hiftory. The Picts, however, a conquest of that country foon after; to before the extinction of their monarchy, all critories bounded on the one fide by the and Clyde, and on the other by the Tweed The history solway, fell into their hands. e Picts, as well as of all the other ancient in-Ints of Britain, is extremely dark. The Irish ians give us a long lift of Pictish kings, who pover Pictavia for 11 or 13 centuries before briftian era. After them Innes, in his Critical gives us a lift of above 50, of whom no less ave held the sceptre, each for a whole centuis probable that these writers had consoundhistory of the Picts with that of their ancesthe old Caledonians. In any other view, accounts of them are highly fabulous; and been long ago confuted by Dr Macpherson bee, an antiquary of much learning and re-The Picts were probably not known by name before the 2d or 3d century. Adamabbot of Iona, is the first author who express-

ly mentions any Pictish king: and the oldest after him is Bede. We are informed by these two writers, that St Columba converted Brudeus king of the Picts to the Christian faith. Columba came into Britain A. D. 565. Before that period we have no general record to afcertain fo much as the name of any Pictish king. The history of Drust or Dreft, who is faid to have reigned over he Picts in the beginning of the 5th century, when St Ninian first preached the gospel to that nation, A. D. 630. has all the appearance of fiction. His having reigned 100 years, and his putting an end to 100 wars, are stories which exceed all the bounds of probability. Brudeus, the contemporary of Columba, is the first Pictish king mentioned by any writer of authority. What figure his ancestors made, or who were his successors on the throne of Pictavia, cannot be afcertained. Bede informs us, that, during the reign of one of them, the Picts killed Egfred king of Northumberland in battle, and destroyed the greatest part of his army. The same author mentions another of their kings called Naitan, to whom Ceolfrid, abbot of Wiremouth, wrote his famous letter concerning Easter and the Tonsure; a letter in which Bede himself is supposed to have had a principal hand. Roger Hoveden and Simon of Durham mention two other Pictish kings Onnust and Kinoth, the first of whom died in 761, and the latter sourished about the 774, and gave an afylum to Alfred of Northumberland, who was about that time expel-The accounts given by the led, his kingdom. Scots historians of several other Piclish kings cannot be depended on; nor are the stories told by the British historians, Geoffroy of Monmouth and the author of the Eulogium Britannia, worthy of greater credit. In the 9th century the Pictish nation was totally subdued by the Scots in the reign of Kenneth II. Since that time their name has been lost in that of the conquerors, with whom they were incorporated after this conquest: however, they seem to have been treated by the Scottish kings with great lenity, so that for some ages after they commanded a great deal of respect. The prior of Hogulstead, an old English historian, relates, that they made a confiderable figure in the army of David L in his disputes with Stephen king of England. In a battle fought in 1136, by the English on one side, and the Scots and Picts on the other, the latter infifted on their hereditary right of leading the van of the Scots army, and were indulged in that request by the king. principal feat of the Pictish kings was at Aberne-Brudeus, however, as appears from the accounts given by Adamnan, in his life of Columba, had a palace at Inverness, which was probably near the extremity of his territory in that quarter. With respect to the manners and customs of the Picts, there is no reason to suppose they were any other than those of the old Caledonians and Scots, of which many particulars are related in the Greek and Roman writers. Upon the decline or the Roman empire, cohorts of barbarians were railed, and Picts were invited into the service, by Honorius, when peace was every where restored. and were named Honoriaci. Those under Corstantine opened the passes of the Pyrenean mountains, and let the barbarous nations into Spain. From

From this period we date the civilization of their manners, which happened after they had by themselves, and then with the Scots, ravaged this Ro-

man province.

PICTS WALL, in antiquity, a wall begun by the emperor Adrian, on the northern bounds of England, to prevent the incursions of the Picts and Scott. It was first made only of turf strengthened with palifadoes, till the emperor Severus, coming into Britain in person, built it with solid ftone. This wall, part of which still remains, began at the entrance of the Solway Frith in Cumberland, and running NE. extended to the Ger-

man Ocean. See Adrian and Severus.
(1.) \* PICTURE. n. f. [pi&ura, Latin.] refemblance of persons or things in colours.

Vouchsafe me yet your pidure for my love, The picture that is hanging in your chamber.

Shak. -Piaures and shapes are but secondary objects.

Bacon's Nat. Hift .-

He with an empty pillure fed his mind. Dryden. -As many pidures of animals should be got him as can be found with the printed names to them. Locke.—She often shews them her own pidure. Law. 2. The science of painting. 3. The works of painters.—Quintilian, when he faw any wellexpressed image of grief either in picture or sculpture, would usually weep. Wotton .- I had no defign to ruin the company of picture drawers, Stilling fleet. 4. Any resemblance or representation.

Vouchsafe this pitture of thy foul to see. Dryd. -It fuffices to the unity of any idea, that it be confidered as one representation or sicture. Locke.

(2.) PICTURE. See DRAWING and PAINTING. \* To PICTURE. v. a. [from the noun.] 1. To

paint; to represent by painting.

I have not feen him to pictur'd. \ Shak. Cymb. -He who caused the spring to be pictured, added this rhyme for an expolition. Carew's Survey .-Mary Magdalen is pictured before our Saviour wathing his feet on her knees. Brown's Vulg. Err. -Love is like the painter, who, being to draw the picture of a friend having a biemish in one eye, would pitture only the other lide of his face. South. 2. To represent -I, that do but hear it from you, and do picture it in my mind, do greatly pity it. Spenfer.

See here thy pidur'd life. Thomfon's Winter. (1.) PICTURESQUE, [ pictoresque, Fr.] adj. Of or belonging to painting: ftrikingly beautiful, or

romantic, fo as meriting to be painted.

(2.) PICTURESQUE BEAUTY refers to " fuch beautiful objects as are fuited to the pencil." This epithet is chiefly applied to the works of nature, though it will often apply to the works of Those objects are most properly denominated picturesque which are disposed by the hand of nature with a mixture of varied rudeness, finplicity, and grandeur. A plain neat gardens with little variation in its plan, and no striking grandeut in its polition, displays too much of art, defign, and uniformity, to be called picturefque. "The ideas of neat and smooth (fays Mr Gilpin), inflead of being picturefque, in fact difqualify the object in which they relide from any pretentions to picturesque beauty. Nay, farther, we do not

fertiple to affert, that roughnels forms the mile effential point of difference between the beautiand the picturesque; as it seems to be that pur cular quality which makes objects chiefly plea in painting. I use the general term responsibilities properly speaking roughness relates only to furfaces of bodies: when we speak of their is neation, we use the word raggedness. Both however, equally enter into the picturesque both are observable in the smaller as well as larger parts of nature; in the outline and had a tree, as in the rude fummit and craggy fide mountain. On the whole, picturesque com tion confifts in uniting in one whole, a vari parts, and these parts can only be obtained rough objects. It is possible therefore to had turesque objects among works of art, and the fible to make objects so; but the grand for picturesque beauty is nature in all its organ riety, and in all its irregular grandeur.

PICUIPINIMA, in crnithology, is the me a species of pigeon in Brasil. It is so very limit scarce to exceed the lark in fize. Its head, an and wings, are of a pale lead colour, with a semilunar mark at the extremity of each but its long wing-feathers, which are feethe wings are expanded in flying, are of an brown on one fide, and blackish on the with black ends or tips; the tail is long, variegated with black, white, and brown belly is covered with white feathers, ever which has a brown mark of the shape of \$1.

moon at the end.

PICUMNUS and PILUMNUS, were two at Rome, who prefided over the aufpices to before the celebration of nuptials. Pilum supposed to patronize children, as his name in some manner to indicate quod pellat male tie. The manuring of land was first invite Picumnus, for which reason he is called \$ Pilumnus is also invoked as the linius. bakers and millers, as he is faid to have for

vented the art of grinding cosn.
(I.) PICUS, in fabulous history, a king tium, fon of Saturn. He married VENULL CANENS, by whom he had Faunus. He loved by the goddess Pomona, and returned affection. As he was one day hunting in the war he was met by Circe, who became deeply enan ed of him, and who changed him into 2 47 pecker, called by the mome of picus among Latins. His wife Venilia was fo disconsolate the was informed of his ceath, that the pine way. Some fay that Picus was the fon of Pin NUS, and that he gave out prophecies to hall jects by means of a favourite woodpecker; which originated the fable of his being me phofed into that bird.

(II.) Picus, John, earl of Mirandola, a prof parts and learning, was the youngest ch John Francis Picus earl of Mirandola and Co dia; and was born in 1463. The progres he made in letters was extremely rapid. He the scholar of R. Jochanan, a German Jew. confirmed his natural fondness for the call writings. After visiting the most famous uran ties of France and Italy, he went to Rome; in 1486, before he was 24 years of age, be

537

thed deo propositions in logic, mathematics, phyes, divinity, cabaliftic learning, and magic, drawn n only from Greek and Latin, but even from with and Arabian writers: fubjoining to his adstikment, that, " it any philosopher or divine ould come to Rome to dispute with him upon is or all of them, he would defray the expences his journey from the remotest corners of Italy. at some of his propositions being charged with rely, he was forbid to dispute upon them. At e age of 28, he confined himfelt wholly to the ndy of the scriptures; and undertook to combat in lews and Mahometans, as well as to confound mical attrology. He died in 1494, in his 32d per. He was called the phanix of his age, and by aliger Monfirum fine Vitio. He compoled a great unber of works, which have often been printed. (IIL) Picus, John Francis, prince of Mirando-, rephew of John Picus mentioned above, was an about the year 1469. He cultivated learning id the sciences after the example of his uncle; # he had a principality and dominions to supertend, which involved him in great troubles, and hat coft him his life. - He was twice driven from sprincipality, and twice reftored; and at laft, 1533, was, together with his eldelt fon Albert, lutinated in his own cattle by his nephew Galeis He was a great lover of lefters; and fach of sworks as were then composed were inferted in & Strafburgh edition of his uncle's in 1504, and mand in future impressions, betides some o**mw**hich were never collected.

(IV.) Picus, the Woodencker, in ornitholo-Bagenus belonging to the order of piece. The ks ftraight, and confifts of many tides, and he a wedge at the point: the nostrils are coverwith britisy feathers; the tongue is round like form, very long, and sharp at the point, which with riftic, fays Latham, of these birds is the have (which in no bird is fimilar, the wryneck kepted, whose other characters, however, differ widely to give it place in this class;) the mus-# necessary to the motions of which are fingufand worthy of notice; affording the animal the of darting it forwards the whole length, trawing it within the mouth at will. See Ray the Creation, p. 143. Derham's Physico-Theol. p. 4. Note c. Will. Orn. p. 136. t. 21. Mr Lathnenumerates no less than 50 species of woodeters, and g varieties. The most remarkable

1. Picus Auratus, the gold-win . I woodpecker; about 11 inches long, and weighs about 5 oz. bill is an inch and a half long, and is somehat bent, and is not square but roundilli, ridged by on the top, the point being fliarp; the upper Ms of the head and neck are ath-coloured; the the head is red; the fides of the head, throat, th fore part of the neck, are pale yellow; on ich fide of the head is a ftripe of black, from the He of the lower jaw to the nick; the back, scaelars, and wing coverts, are of a grey brown com, transverfely firiated with black lines; the imp is whitish; the breast, belly, and fides, are thitish yellow, and each feather is marked with found black spot at the tip; on the middle of be break there is a large crefeent of black; the Vol. XVII. PART II.

thighs, upper and under tail coverts, are black and white mixed; the quills are brown, with yellow shafts spotted with brown on the outer edge; the tail is blackish, being outwardly edged with grey; the outer feather is dotted with whitish on the margins; the shafts of all but the two middle feathers are yellow half way from the bafe; and the legs and claws are brown. The female differs in having the crown and neck behind grey brown the hind head of a less vivid red; and the greater quills not spotted on the edges. She also wants the black lift on the throat, but otherwise is like the male. This species inhabits Virginia, Carolina, and Canada, and abounds in New Jerfey and about New York, where it is called by fome bittock or pint, and by others high-hole. Both the first names have some relation to its note; and perhaps the latter, from the fituation of the neft. It is almost continually on the ground, and is not observed to climb on the trees, like others of the genus. It lives chiefly on infects, and is commonly very fat, so as to be thought very palatable for the table. It flays all the year. In its form and fome of its qualities it refembles the cuckow. It flies to the tops of trees, and fits occasionally on the branches. Forfter, in the Philof. Tranf. favs, it is a bird of pallage in the northern parts of America, vitting the neighbourhood of Albany Fort in April, and leaving it in September: that it leys from four to fix eggs, in hollow trees, and feeds on worms and other infects.

2. Picus Erythrocfphalus, the red-keaded aunod pecker, is about 84 inches long, and weighs 2 oz. The bill is an inch and a quarter in length, of a lead colour, with a black tip; the irides are dusky; the head and the neck are of a most beautiful crimson; the back and wings are black; the rump, breaft, and belly, are white; the ten first quills are black, the 11th black and white, and the others are white with black shafts; the tail is black and cuneiform; the legs and claws are of a lead colour. The cock and hen are very nearly alike. This species inhabits Virginia, Carolina, Canada, and most of the parts of North America; but at the approach of winter it migrates more or less to the 8, according to the severity of the seafon; and upon this circumstance the people of North America foretel the rigour or elemency of the enfuing winter. Kalin observes that it is a very common bird, and is very destructive to the maize fields and orchards, pecking through the ears of maize, and dellroying great quantities of apples. In force years they are more numerous than in others, when they attack the orchards where the sweet apples grow, which they eat so far that nothing remains but the mere pills. Some years ago there was a premium of twopence per head paid from the public fund, to extirpate thefe They are likewise very fond of pernicious birás. acorns. In Virginia and Carolina they flay the whole year, but are not feen in fach numbers in winter as in fummer. During the winter they are very tame, and often come it to the houses as the redbreaft does in England. This species is found chiefly in old trees; and the noise they make with their bills may be heard above a mile diffant. It builds the earliest of all the woodpeckers, and ge-Yyy

nerally pretty high from the ground. It is ac-

counted very good eating.

3. Picus Flavus, the yellow woodpecker is about 9 inches long. The bill is of a yellowith white, and more than an inch long; the hind head is crested; the head itself, the neck, and whole body, are covered with dirty white feathers; from the lower jaw to the ears, on each fide, there is a red stripe; the wing coverts are brown and edged with yellowish, and some of the greater ones are mixed with rufous on the inner web; the quills are brown or rufous; the tail is black; the legs and claws are grey. This species is common at Cayenne, and is called there charpentier jaune. makes its nest in old trees which are rotten within; making with its bill a hole from without, at first horizontal, but declining down-wards as soon as it has pierced through the found part, till it is at last a foot and a half below the first opening. The female lays three white and nearly round eggs, and the young are hatched about the beginning of The male bears his share in the work with April. the female, and in her absence keeps centinel at the entrance of the hole. The note of this bird is a kind of whittle fix times repeated, of which the two or three last are in a graver accent than the others. The female wants the red band on the fide of the head which the male has. Specimens vary; fome are of that dirty white, as Britton defcribes it, others of a light yellow; which last is the case in a specimen in the Leverian museum: this is 13 inches in length.

4. Picus Major, the great spotted woodpecker, weighs 23 oz. the length is 9 inches; the breadth The bill is one and a quarter long, of a black horn colour. The irides are red. The forehead is of a pale buff colour; the crown of the head a gloffy black; the hind part marked with a rich deep crimfon spot. The cheeks are white; bounded beneath by a black line, that palles from the corner of the mouth and furrounds the hind part of the head. The neck is encircled with a black colour. The throat and breaft are of a yellowith white; the vent feathers of a fine light crimfon. The back, rump, and coverts of the tail, and leffer coverts of the wings, are black; the feapular reathers and coverts adjoining to them are white. The quill feathers are black, elegantly marked on each web with round white fpots. The 4 middle feathers of the tail are black, the next tipped with dirry yellow; the bottoms of the two outmost black; the upper parts a dirty white. The exterior feathers marked on each web with two black foots; the next with two on the inner web, and only one on the other. The legs are of a lead colour. The female wants that beautiful crimson spot on the head; in other respects the colours of both agree. This species is much more uncommon than the VIRIDIS, (No 10.) and keeps altogether in the woods. They are pretty common in England, France, Germany, and other parts of Europe, frequenting the woods, and are likewife met with in America. They are very conning, and hide themselves when observed. The extreme facility with which there birds defound and afcend the trees is furprifing.

c. Picus martius, the greatest black avoidtecher, is about the fixe of a jackdaw, being a-

bout 17 inches long; the bill is nearly 24 inches in length, of a dark afh colour, and whitih or the fides; the irides are pale yellow, and the qu lids are naked, according to Scopoli; the wh bird is black, except the crown of the head, which is vermilion; the first quill feather is the short and the two middle tail feathers, which are ger than the others, make it appear a little to ed; the legs are of a lead colour, covered feathers on the fore part for half their length. female differs from the male in having the h head only red, and not the whole crown of a head; and the general colour of the plumage to a strong cast of brown in it. Sometimes the release the hind head is wholly wanting; and in both male and female vary in different subjects their proportion of red on the head. This fee is found on the continent of Europe, but is merous only in Germany. It is not an inhibited of Italy, or France, but it is found in Swell Switzerland, and Denmark, though not in w It builds in oid ash and poplar trees, making and deep nefts; and Frisch observes, that they ten fo excavate a tree, that it is foon after har down with the wind; and that under the had this bird may often be found a bushel of dishin bits of wood. The female lays two or the white eggs, the colour of which is peculized whole of the genus.

6. Picus medius, the middle-fized evaluation agrees with the MAJOR, (N° 4.) in colours and excepting that the crown of the head of this use rich crimfon; the crown of the head is the of the former black; and the crimfon is in for a bar on the hind part. Birds thus see have been shot in Lancashire and other passed England; but Mr Pennant is doubtful when they are varieties, or distinct species.

7. Picus MINOR, the least spotted was fcarce weighs an ounce: the length is fix its the breadth 11. The forehead is a dirty w the crown of the head, in the male, of a bear crimfon: the cheeks and fides of the next white, bounded by a bed of black beneath The hind part of the head and former. and the coverts of the wings, are black; the thers varied with black and white: the break! belly are of a dirty white: the crown of the in the female, is white; the feet are of a leader lour. It has all the characters and actions of greater kind, but is not fo often met with. fon affirms that it inhabits most parts of Fre It approaches near habitations in winter, and be feen in orchards adjoining to houses. Ith in an hole of a tree, and often disputes the of possession with the little colemouse. Will by fays it is called in England by the name of avall. It is said to inhabit the higher parts uf

8. Picus principalis, the subite-billed pecker, is fomewhat bigger than the Marn (N°5.) and equal in fize to acrow. It is 16 ms long, and weighs about 20 ounces. The billing as ivory, three inches long, and channelled; irides are yellow, and on the hind head is aempointed creft, of a fine red colour, fome of feathers of which are two inches long; the itfelf, and the body in general, are black; the lower part of the back, rump, and upper

verts, are white; from the eye there arises a ipe of white, which passes on each side of the th down to the back; 3 or 4 of the prime quills black, but the rest are white; the tail is cuform, and of the fame colour as the body; the and claws are also black. This species inha-Carolina, Virginia, New Spain, and Brafil, is called by the Spaniards carpenter, and not hout reason, as this as well as the other spesmake a great noise with the bill against the in the woods, where they may be heard at pat distance, as if carpenters were at work, ing, according to Catefby, in an hour or two thel of chips. He adds, that the Canadian ans make use of the bills of these birds for cothe setting them round in a wreath with the th outwards; and that the northern Indians thate them of the fouthern at the rate of two three buck-fkins per bill. Kalm fays they are in New Jersey, though very seldom, and

Int certain feafons. Picus Pubescens, the little awoodpecker, acing to Catefby, weighs only about an ounce an half. Briffon fays it is larger than the left of our European species, being about 54 e long. The bill is about eight lines long, of a horn colour; the top of the head is black, on each fide above the eye is a white line; the head is red; the hind parts of the neck, the and rump, are black, which is divided into its by a line of white passing down the the rump; the scapulars, upper wing coverts, are black; the greater wing co-ad quills are spotted with white; the units of the body are pale grey; the tail is the four middle feathers are plain, the barred with white and black; and the and claws are black. The female has no red hind head. Linnaus fays, that the outfeather is white, marked with four black According to Kalm, it abounds in New Jer-This species inhabits Virginia and Caroliwhere it is the most daring and dangerous to ds. As foon as it has pecked one hole in a makes another close to the first, in an ho-al direction, proceeding till it has made a of holes quite round the tree; and the apsees in the orchards have often feveral rings des round the stem, insomuch that the tree kntly dries up and decays.

Picus vinidis, the green avoodpecker, weighs t; its length is 13 inches, the breadth 201; Mi is dusky, triangular, and near two inches s the crown of the head is crimson, spotted black, and the males have a rich crimion t beneath the blackness; the back, neck, and f coverts of the wings, are green; the rump pale yellow; the whole of the under part of body is of a very pale green, and the thighs vent are marked with dusky lines; the legs eet are of a cinereous green; the tail confifts Riff feathers, whose ends are generally broas the bird refts on them in climbing; their are black; the rest of each is alternately barwith dusky and deep green. These birds seed rely on infects; and their principal action is of climbing up and down the bodies or the of trees: for the first purpose they are provided with a long slender tongue, armed with a sharp bony end barbed on each side, which by the means of a curious apparatus of muscles they can exert at pleasure, darting it to a great length into the clifts of the bark, transfixing and drawing out the infects that lurk there. They make their nefts in the hollows of trees: in order therefore to force their way into these cavities, their bills are formed strong, very hard, and wedge-like at the end; Dr Derham observes, that a neat ridge runs along the top, as if an artift had defigned it for ftrength and beauty. Yet it has not power to penetrate a found tree; their perforation of any tree is a warning to the owner to throw it down. Their legs are short, but strong; their thighs very muscular; their toes disposed two backward, two forward; the feathers of the tail very stiff, sharp pointed, and beading down-The three first circumstances admirably concur to enable them to run up and down the fides of trees with great security; and the strength of the tail supports them firmly when they continue long in one place, either where they find plenty of food, or while they are forming an access to the interior part of the timber. This form of the tail makes their flight very aukward, as it inclines their body down, and forces them to fly with short and frequent jerks when they would ascend, or even keep in a line. This species feeds oftener on the ground than any other of the genus; all of them make their nefts in the hollows of trees; and lay five or fix eggs, of a These birds beautiful semi-transparent white. fometimes build in a hollow asp or other tree, 15 or 20 feet from the ground. The male and female take it by turns to bore through the living part of the wood, till they come to the rotten part, wherein, after being hollowed out to a proper depth, they lay their eggs, which are generally greenish, with small black spots. These holes are fo deep, that a man may thrust his whole arm down one of them, till he reach the eggs. The young ones climb up and down the trees before they can fly. The holes of the woodpecker are as perfeetly round as if made by a pair of compasses. Nuthatches, starlings, and bats, frequently build in these holes when deserted. Both Frisch and Klein mistake in saying that the semales have not the red crown, for even the young ones in the nest have the appearance of it; but they do not become of a full red till after the first moult. They are fond of bees, and make great havock among them. Salerne fays they are found in the markets of Italy. In Sir A. Lever's muleum there is a variety of this bird of a straw colour, except

the crown, which is faintly marked with red. PIDAURA, a town of European Turkey, in the Morea, anciently called Epidaurus; feated on the W. coast of the Gulf of Engia, 25 miles E. of Napoli di Romania. Lon. 41. 8. E. of Ferro. Lat. 37. 40. N.

PIDDLE, a river of Dorfetshire, called also TRENT, which runs into the sea at Pool, a little below Wareham. Along its banks are situated—

PIDDLE-HINTON, PIDDLE-MUSTERTON, PIDDLE PARVA, PIDDLE-TOWN, PIDDLE-TRENT-HIDE, and fome other villages.

\* To PIDDLE. v. n. [This word is obscure in its Y y y 2 etymology,

etymology. Skinner derives it from picciolo, Italian; or petit, Fr. little. Mr Lie thinks it the diminutive of the Welft bregta, to eat; perhaps it comes from peddle, for Skinner gives for its primitive fignification, to deal in intite things.] I. To pick at table; to feed squeamishly, and without appetite.—

To piddle like a lady breeding. Swift.

3. To trifle; to attend to final parts rather than

to the main. Ainf.

\* PIDDLER. n. f. [from piddle.] 1. One that eats fque mishly, and without appetite. 2. One

who is budy about minute things.

\*PIE. n. f. [This word is derived by Skinner from beizan, to build, that is to build of patte; by Junius derived by contraction from pafy; if paties, doubled together without walls, were the first pies, the derivation is easy from pie, a foot; as in some provinces, an apple patty is still called an apple foot.] 1. Any crast baked with spmething in it.—

No man's pic is freed
From his ambitious finger.

Mineing of meat in pics faveth the grinding of the teeth. Bacon.—They have bought more editions of his works, than would lay under all their

fies at a lord mayor's Christmas. Dryden.—
From thence of course the figure will arise,
And elegance adoru the surface of your pies.

Eat berfor pie-crust, if you'd serious be. King. 2. [Pica, Latin.] A magpie; a parti-coloured bird.—

The pie will discharge thee for pulling the rest.

Chattering pies in difinal differed fung. Shirk. Who taught the parrot human notes to try, Or with a voice endu'd the chatt'ring pie?

3. The old popish service book, so called, as is supposed, stom the different colours of the text and rubrick. 4. Cock and pie was a slight expression in Shakespeare's time, of which I know not the meaning.

Mr Slender, come; we flay for you.—
-I'll eat nothing, I thank you, Sir.—

-By cock and pie, you flall not chuse, Sir; come, come. Shak. Merry Wives.

\*Prebald. adj. [from pie.] Of various colours; diversified in colour.—

It was a particoloured dress,

Of patch'd and *ficbald* languages. Hudibras.—They would think themselves miserable in a patched coat, and yet contentedly suffer their minds to appear abroad in a *fiebald* livery of coasse patches and borrowed shreds. Locke.—They are pleased to hear of a *fiebald* horse, that is strayed out of a field near Islington. Spellator.—

Peel'd, patch'd, and piebald, linfey-woolfey brothers,

Grave nummers! Pope.

(1.) \* PIECE. n. f. [piece, Pr.] 1. A patch. clinf.
2. A part of the whole; a fragment.—Bring it out piece by piece. Exekiel, xxiv. 26.—The chief captain, fearing left Paul should have been pulled in pieces of them, commanded to take him by force. Ads.—Are they not manifest fragments and pieces of these greater masses? Burnet.—A man

that is in Rome can scarce see an object, that does not call to mind a piece of a Latin poet of historian. Addison, 3. A part.—It is accounted a piece of excellent knowledge, to know the law the land. Tillosson. 4. A picture.—If unnauna, the siness colours are but dawbing, and the per is a beautiful monster at the best. Dryda.—

Each heavenly piece unweary'd we compine

5. A composition; performance.—He wrette veral pieces. Addison. 6. A single great gun.—A piece of ordinance 'gainst it I have plack.

— Many of the ships have brass pieces, wherease very piece at least requires four gunners to and it. Raleigh.—Pyrthus, with continual hattend great pieces, did batter the mount. Knolles. A hand gun.—When he is put to a piece or a phe maketh as worthy a soldier as any nation in meeteth with. Spenfer.—The ball goes on in direction of the stick, or of the body of the pout of which it is shot. Gheyne. 8. A coin; and gle piece of money.—

Boileau, for eight hundred pices

Makes Lewis take the wall of Jove. Fra 9. In ridicule or contempt: as, a piece of a weyer or a smatterer. 10. A-PIECE. To takedemand, concerning all those creatures that is eyes and ears, whether they might not have to only one eye, and one ear a piece. More gainst Atheism. 11. Of a PIECE with Like 6 the same tort; united; the same with the ride

All feems uniform and of a piece. Reference. When Jupiter granted petitions, a cocker request that his house and his body might as a f a piece. L'Estrange.— My own is of a period his. Dryden.—I appeal to my enemies, it is nother man could have invented one while been more of a piece. Dryden.—

Now flie is gone, the world is of a pink

-Nothing but madness can please madness a poet must be of a piece south the special gain a reputation. Desden.

(2.) PIECE, in matters of money, fignifies to times the fame thing with species; and someon by adding the value of the pieces, it is used express such as have no other particular more.

(3.) PIECE is also a kind of money of access or rather a manner of accounting used among in negroes on the coast of Angola in Africa. S
MONEY.

(4.) PIECE, in heraldry, denotes an ordinary charge. The honourable pieces of the thirest the chief, fefs, bend, pate, bar, cross, had chevron, and in general all those which the ore third of the field, when alone, and in a manner soever it be. See Heraldry.

(5.) PIECE OF EIGHT. See DOLLAR, I

(6.) Pieces, in the military art, include forts of great guns and mortars. Batteringped are the larger fort of guns used at sieges for a king the breaches; such are the 24 pouncers culverine, the one carrying a 24 and the other 18 pound ball. Field-pieces are 12 pounders, miculverines, 6 pounders, suckers, minions, 3 pounders, which march with the army, and

camp always behind the second line, but in day of battle are in the front. A foldier's firelock is likewife called his piece.

(1.) \* To PIECE. v. s. [from the noun.] I. To

mlarge by the addition of a piece.—
I fpeak too long, but 'tis to pare the time,

To draw it out in length. If aught within that little feeming substance,

Or all of it with our displeasure piec'd, And nothing more may fitly like your grace,

She is yours. Shak. Let him, that was the cause of this, have power

To take off so much grief from you, as he Wili piece up in himfelf.

-Plant it with women as well as men, that it may spread into generations, and not be pieced from without. Bacon. 2. To join; to unite. 3. To PIECE out. To increase by addition.-He piem out his wife's inclination. Shak .- Whether the niering out of an old man's life is worth the pains, l cannot tell. Temple.

(2) To PIECE. v. n. [from the moun.] To join; to coalesce; to be compacted.—He was more in the present speech of the people, and it beard better and followed more close upon the bruit of Plantagenet's escape. Bacon.

PIECELESS. adj. Ifrom piece.) Whole; com-

pad: not made of leparate pieces.-

Religion's types the pieceless centers flow, And are in all the lines which all ways go.

Denne. (1.) \* PIECEMEAL. adv. [pice and mel; a word he faxon of the fame import.] In pieces; in frag-

He ftrooke his helme, full where his plume did fland,

On which it piece-meale brake.

Chapman. Why did I not his carcals piecemeal tear, And cast it in the sea. Denbam.

I'll be torn piecemeal by a horfe,

Ere I'll take you for better or worfe. Hudibras. -Nother was the body then subject to distem-Per, to die by piecemeal. South .-

Piecemeal they win this acre first, then that.

Pope. (2.) \* PIECEMEAL. adj. Single; separate; divihd.—This by a more compendious impiety, shoots at his very being, and as if it scorned these promeal guilts, sets up a single monster big e-Rough to devour them all. Gov. of the Tonque.-Stage editors printed from the common piecemeal written parts in the playhoufe. Pope.

PIECER. n. f. [from piece.] One that pieces. PIED. adj. [from pie.] Variegated; particoloured.—Such as have their feathers of pied, orient

and various colours. Abbot .--

All the yearlings, which were streak'd and pied.

Sbak.

Should fall as Jacob's hire.

-Fiel cattle are spotted in their tongues. Bacon. The wing of a pied butterfly. Dravion.

Meadows trim with dailies pied. Milton. PIEDE, or PIETE, a town of Mexico.

PIEDICORTE, a town of the French repubic, in the island and dep. of Corsica, 12 miles ESE. of Corte.

PIEDI-OREZZA, a town of Corlica; 12 miles ENE. of Corte.

PIEDMONT, a country of Italy, with the cidevant title of a principality; which before the late revolutionary war, belonged to the king of Sardinia, but is now annexed to the imperial Prench republic, and divided into 6 departments. It was bounded on the N. by Savoy and Italy; on the W. by France; on the S. by the Mediterranean and the Ligurian republic; and on the E. by the late duchies of Montferrat and Milan: extending about 150 miles from N. to S. but much less from E. to W. It is called Piedmont, in Latili Pedemontium, from its fituation at the foot of the mountains, or Alps, which separate France from Italy. It is in some parts mountainous, but is everywhere very fruitful. The plains produce fine corn, Turkey wheat, which serves for bread, and with which people of the middle rank mix rye; the pods are used for fuel, and the stalks being thick, ferve to mend the roads. The hills 2bound with vines, which afford plenty of wine, very lufcious when new, especially the white. There is also a tartish red wine called vino brusco, faid to be very wholesome for fat people. fweet wine is recommended as a stomachic. The neighbourhood of Turm is famous for fine fruits, and many long walks of chefuut and mulberry trees. Truffles or subterraneous mushrooms grow here in great abundance. Some are black, others white marbled with red. Their price is rated according to their fize. Sometimes they are found of 12 or 14 pounds weight; and many country people earn from 60 to 70 dollars a-year merely by digging for them. The trade in cattle is faid to bring into Piedmont no lefs than three millions of livres per annum. The cultivation of filk is also a profitable article, the Piedmontese filk being, on account of its finenels and strength, esteemed the best in Italy. The Piedmontese gentry breed vast numbers of filk worms, under the care of their tenants, who have the eggs and muiberry leaves delivered to them, and in return they give haif the filk to their mafters. Piedmont was formerly divided into 11 fmall provinces: Piedmont proper, the valleys between France and Italy, the valley of Saluzzo, the county of Nice, the marquifate of Sufa, the duchy of Aoft, the Canavefe, the lordship of Verceili, the county of Afti, and the Langes. It was formerly confidered as a part of Lombardy, as it lies at the foot of the Aips, which separate France from Italy. It contains many high mountains, among which there are rich and fruitful valleys, as pleasant and populous as any part of Italy. In the mountains are mines of several kinds, and the forests afford a great deal of curious game, among which the number is an uteful animal. "The mules (days Mr Watkins) are very fine in this country; but the inhabitants have other beads, or rather monsters, which they find very ferviceable, though vicious and oblinate. Thele are produced by a cow and an als, or mare and buil, and called jumurres, or gimeiri." The chief trade of this country confifts in hemp and filk. The filk worm thrives fo well, that many peafants make above 100 lb. of filk annually; and it is not only abundant, but univer-

fally known to be stronger and finer than any in Italy. They also trade in corn, rice, wine, fruits, flax, and cattle. The chief river of Piedmont is the Po, which flows out of Mount Viso. The river Sefia, the Doria, Baltea, the ancient Stura, the Tanaro, and feveral others, run into The language of the Piedmontese is a mixture of French and Italian. In this principality there were before the revolution about 50 earldoms, 15 marquifates, many lordships, and 20 abbeys. Turin is the chief city. See Turin. The number of inhabitants, Mr Watkins fays, in Piedmont and Savoy, (now the department of MONT BLANC,) aniounts to 2,695,727 fouls, of which Turin contains about 77,000. During the late war, this country was repeatedly over-run by the troops of the belligerent powers. In Nov. 1798, the king of Sardinia left Turin, and took refuge in the island of Sardinia; foon after which his whole territories in Piedmont, MONTFERRAT, &c. were taken possession of by the French; and erected into a republic. (See PIEDMONTESE, N° 3.) This form of government, however, was foon overthrown by the Austrians, who reduced the whole country, except a few forts, in fummer 1799; but after the battle of Marengo, in June 1800, the whole of these territories again submitted to the French. It was not, however, till the 11th Sept. 1802, that their fate was finally determined, by a decree of the French Confervative Senate; whereby they were irrevocably annexed to the French republic, and divided into fix departments, named the Po, MARENGO, Doria, SE-LIA, STURA, and TANARO; the capitals of which are Turin, Alexandria, Ivica, Vercelli, Coni, and Affi. Of these, the department of the Po sends 4 deputies, Marengo 3, Doria 2, Sefia 2, Stura 3, and Tanaro 3, to the Legislative Assembly.

(1.) PIEDMONTESE, adj. Of or belonging to

Piedmont.

(2.) PIEDMONTESE, n. f. The inhabitants of Piedmont. The Piedmontese have more sense than the Savoyards, but are not fo fincere. Some authors reprefent them as lively, artful, and witty, the inhabitants of the mountain of Aosta excepted, who are farther diftinguished by large wens, as well as their horses, dogs, and other animals.

(3.) PIEDMONTESE REPUBLIC, a short-lived democratic state erected by the French, after the model of their own government then prevailing, on the 10th Dec. 1798, out of the king of Sardinia's ci-devant Italian dominions. It was divided into four departments, called Eridan, Sefia, Stura, and Bormida. But in summer 1799, it was overthrown by the Austrians, and the old government and geography restored for a period equally short.

\* PIEDNESS. n. f. [from pied.] Variegation; di-

verfity of colour.

There is an art, which in their picdness shares With great creating nature.

PIEDRO, ST, a town of Maritime Austria, in Istria; 6 miles SSW. of Capo of Istria.

\* PIELED. adj. Perhaps for peeled, or bald; or piled, or having thort hair.

Piel'd priest dost thou command me be faut out ?

-- I io.

Shall.

PIEMONTE, a town of Maritime Auftria, is Istria, 11 miles S. of Capo of Istria.

PIENES, a small island of Japan, over against the harbour of Saccai, famed not only for the heauty of its walks, to which crowds of people refort from the city, but for a deity worshippel there, to which vast numbers of persons devote themselves. They go from his temple to the sa fide, where they enter into a boat provided for the purpose; then, launching into the deep, the throw themselves overboard, loaded with stores and fink to the bottom. The temple of that doty, which is called Canon, is very large and lots, and fo are many others in the city itself; one in particular, dedicated to the gods of other constries, is thought the finest in the whole empire.

PIENIN, a town of Poland, in Cracow. PIENO, a flourishing town of the Italian republic, in the dep. of the Lario, diffrict and las county of Como, on the E. bank of lake Como.

PIENZA, a populous town of Etruria, in the Siennese, with a bishop's see, 25 miles SE. of Sena, and 56 S. of Florence. Lon. 11. 42. E LE 43. o. N.

(1.) \* PIEPOWDER COURT. n. f. [from pin foot, and pouldre, dufty.] A court held in fair in redrefs of all disorders committed therein.

(2.) PIEPOWDER COURT, or PIEPOUDRE COM. the lowest, and at the same time the most end tious, court of justice known to the law of lip land. It is called PIEPOUDRE, (curia win reverizati,) from the dufty feet of the fuitors; ", according to Sir Edward Coke, because justice there done as speedily as dust can fall from foot: upon the same principle that justice and the Jews was administered in the gate of the dip that the proceedings might be the more special as well as public. But the etymology given by learned modern writer is much more ingeniou and fatisfactory; it being derived according to him, from pied puldreaux, a pedlar, in old Free and therefore tignifying the court of fuch pour chapmen as refort to fairs or markets. It is court of record incident to every fair and market of which the steward of him who has the toll of the market is the judge. It was inflituted to alminister justice for all commercial injuries done that fair or market, and not in any preceding one So that the injury must be done, complained al, heard, and determined, within the compais of one and the same day, unless the fair continues The court hath cognizance of all mallonger. ters of contract that can possibly arise within the precinct of that fair or market; and the plantif must make oath that the cause of an action arose there. From this court a writ of error lies, in the nature of an appeal, to the courts at Web minfter.

(1.) \* PIER. n. f. [pierre, Fr.] The columns of which the arch of a bridge is raifed. For fometimes wet, fometimes dry, take elm. Basse The English took the galley, and drew it to shore, and used the stones to reinforce the per-Hayward .- The bridge, confisting of four arches, is the length of 622 English feet and an haif: the dimensions of the arches are as follows, in Est lith measure; the height of the first arch 109 hers the diffance between the piers 72; feet; in the

I 543

ed arch, the diftance of the pier is 130 feet; in the 3d the diftance is roo feet; in the 4th the listance is 138 feet. Arbuthnot.

(2.) PIER, in building denotes a mass of stone, ke opposed by way of fortress to the force of he sea, or a great river for the security of ships hat lie at harbour in any haven.

(3.) Piers of a Bridge. See Bridge, § I, 3. (1.) PIERA, in ancient geography, a fountain f Peloponnesus, between Elis and Olympus.

ex/. v. c. 16.

(2.) PIERA, in modern geography, a town of pain, in Catalonia, 16 miles NW. of Barcelona PIERBACH, a town of Austria, 16 m. NNW. f Grein.

PIERCE, James. See Peirce.

(i.) \* To PIERCE. v. a. [percer, Fr.] 1. To tactrate; to enter; to force a way into-

Steed threatens fleed in high and boaftful

neighs,

Piercing the nights dull ear. Shak. They have pierced themselves through with any forrows. I Tim. vi. 10.-

With this fatal fword, on which I dy'd, I pierce her open'd back or tender fide. Dryden.

The glorious temple shall arise,

And with new luftre pierce the neighb'ring skies. Prior.

To touch the passions: to affect .-Did your letters pierce the queen? Sbak. (1) \* To Pierce. v.n. 1. To make way by

zinto, or through any thing. Mer tears will pierce into a marble heart. Shak. Here is that speaketh like the piercings of a d.-Prov. xii. 18.—Short arrows, called this, were discharged out of muskets, and ald pierce through the sides of ships, where a Let would not pierce. Bacon. 2. To ftrike; to

Me; to affect.-Then I'll commend her volubility;

and say the uttereth piercing eloquence. Shak. To enter; to dive as into a fecret.—She would Pierce further into his meaning, than himfelf old declare. Sidney.—All men knew Nathaniel can Israelite; but our Saviour piercing deepgiveth further testimony of him. Hooker. 4. lotes daily to chain up the poor. Shak.

PIERCEA. See RIVINA.

PIERCER. n. f. [from pierce.] 1. An inftru-It that bores or penetrates.

Cart, ladder and wimble, with pierfer and pod.

The part with which insects perforate bodies. The hollow instrument, terebra, we may Engpiercer, wherewith many flies are provided. 3. One who perforates.

PIERCE's ISLAND, an island of New Hamp-

te in the Piscataqua.

PIERCINGLY. adv. [from pierce.] Sharply. PIERCINGNESS. n.f. [from piercing.] Power percing.—We contemplate the vast reach and pass of our understanding, the prodigious kinels and piercingness of its thought. Derham. PIERFOND, a town of France in the dep. of 4, 71 miles N. of Crespy, and 71 SE. of Com-

(1.) PIERIA, in ancient geography, a district of

Macedonia, contained between the mouths of the rivers Ludias and Peneus; extended by Strabo beyond the Ludias, to the Axios on the N. and on the S. no farther than the Aliacmon, along the W. fide of the Sinus Thermaicus.

(2.) PIERIA of Syria, the N. part of Seleucia, or the Antiochena, fituated on the Sinus Isficus,

and lying next Cilicia on the NW.

(1.) PIERIDES, in fabulous history, the daughters of Pierus, a Macedonian prince, who prefuming to dispute with the Muses for the prize of poetry, were turned into magpies. They were also called PEONIDES.

(2.) Pierides, a name of the Muses, from mount Pieris in Thessaly, which was consecrated to them; or according to others, from Pierus, a Thesfalian poet, who was the first who facrificed to them. See Pieris.

PIERINO DEL VAGA, an eminent Italian painter, born of poor parents in Tuscany about the year 1500. He was placed apprentice with a grocer in Florence; but a painter named Vaga taking him to Rome, he was called Del Vaga, from living with him, his real name being Buonacorfi. After Eaphael's death, he joined with Julio Romano and Francis Penni to finish the works in the Vatican, which were left imperfect by their common master; and to confirm their friendship married Penni's fifter. He gained the highest reputation by his performances in the palace of prince Doria at Genoa: but the multiplicity of his bufiness drained his spirits in the flower of his age; for he died in 1547. Of all Raphael's disciples, Pierino kept the character of his master longest, i. e. his exterior character and manner of deligning; for he fell very thort of the finences of Raphael's thinking.

PIERIS, in ancient geography, a mountain which is thought to have given name to Pieria of Macedonia; taking its name from Pierus a poet, who was the first that sacrificed to the Muses, thence called Pierides.

PIERMONT, a township of New Hampshire in Grafton county, on the E. bank of the Connecticut, 6 miles S. of Haverhill; containing 426

citizens, in 1795.
PIEROUAGAMIS, a nation of N. American Indians, who inhabit the NW. bank of Lake St John, in Lower Canada.

(1.) PIERRE, a town of France in the dep. of

Saone and Loire, 15 miles N. of Louhans.
(2.) PIERRE D'AUTOMNE, a French name, translated from the Chinese, of a medicinal stone, celebrated in the east for curing all disorders of the lungs. Many think it had its name of the autumn flone from its being only to be made at that season of the year; but it certainly may be made at all times. The Chinele chemists refer the various parts of the body to the feveral feafons of the year, and thus they refer the lungs to autumn. This is evident in their writings, and thus the stone for difeases of the lungs came to be called autumn flone. It is prepared as follows: They put 30 pints of the urine of a strong and healthy young man into large iron pot, and fet it over a gentle fire When it begins to boil, they add to it, drop by drop, about a large tea-cup fuil of rape oil. They then leave in on the fire till the whole is evaporat-

ed to a thick substance like black mud. It is then taken out of the pot, and laid on a flat iron to dry, so that it may be powdered very fine. This powder is moistened with fresh oil, and the mass is put into a double crucible, furrounded with coals, where it stands till it be thoroughly dried again. This is again powdered, and put into a china vessel, which being covered with silk cloth and a double paper, they pour on it boiling water, which makes its way, drop by drop, through these coverings, till so much is got in as is sufficient to reduce it to a paste. This paste is well mixed together in the veffel it is kept in, and this is put into a veffel of water, and the whole fet over the fire. The matter thus becomes again dried in balneo marie, and is then finished. Observ. fur les Cout. de l' Afie, p. 25%.

(3.) PIEERE, ST, Enflace DF, a brave French patriot, who devoted his life to fave his country.

See CALAIS, No 1.

(4.) PIERRE, ST, a large river in North America, scarcely inferior to the Rhine or the Danuhe, and navigable to its fource. It falls into the Mif-

fiflippi.

(5.) PIERRE, ST, or ST PETER's, the capital of Martinico, was built in 1665, to overawe the mutincers of the island who rebelled against its proprietors, the fecond West India company, who were at the same time the proprietors of all the French Antil'es. It is fituated on the W. fide of the island. The town extends along the shore, and a battery that commands the road is erected on the W. fide, which is washed by the river Royolan, or St Peter. The town is divided, into three wards; the middle, which is properly St Peter's begins at the fort, and runs W. to the battery of St Nicholas. Under the walls of the 2d ward ships at anchor ride more securely than under the fort, on which account this ward is called the Auchorage. The 3d ward, called the Gallery, extends along the fea fide from Fort St Peter to the Jesuits' River, and is the most populous part of the city. The houses of St Peter's ward are neat, commodious, and elegant, particularly those of the governor, and the other offi-cers. The parish church of St Peter is a magnificent stone building which belonged to the Jesuits, with a noble front of the Doric order. The church of the Anchorage, which belongs to the Jacobine mars, is likewife of stone. It is a place of confiderable trade, and is built with tolerable regularity. The houses are mostly constructed of a grey pumice-flone or lava, which is found on the ftrand; and the high firect is, according to Dr liert, above an English mile in length. It is fupposed to contain about 2000 houses, and 30,000 mhabitants, including negroes. St Pierre, with the whole of the ifland, was taken from the French in March 1794, by the British land and sea forces under Sir Charles Grey and Sir John Jervis: 125 wellels loaded with the produce of the illand, and of great value, were captured, 71 of which were in the harbour of St Pierre. But the island was restored by the treaty of peace in 1801.

(6.) PIERRE, ST, a town of France, in the dep. of the Straits of Calais; 3 miles SE. of Calais.

(7.) PIERRE, ST, a town of France, in the dep. of Tarn; 6 miles NW. of Caune.

(8.) PIERRE, Sr, an island near the 3. coal = Newfoundland; ceded to the French, by it treaty of peace in 1763, but taken by the Bris in 1793. Lon. 56. 17. W. Lat. 46. 46. N, (9.) Pierre, St. A. Oisbau, an island near the

coast of France, the largest of the Seven Island (10.) PIERRE, ST, DE BOBUP, allown of France

in the dep. of the Rhone and Loire; 12 miles W of St Etienne.

(II.) PIERRE, ST, DE CHEMIN, a town of France in the dep. of the Vendee; 3 miles N. of Chr. neraye.

(12.) Pierre, St, DE CHIGNAC, a town France, in the dep. of the Dordogne; 7 m. II of Perigueux.

(13.) PIERRE, ST, D'ESTRIFIERS, a town France, in the dep. of Lozere; 71 miles NW.

Meyrveis.

(5.) PIETRO, ST, CAMPO, a district of Maritime Austria, in Paduano, containing one town, 32 villages, and 218,000 inhabitants who chiefly cultivate corn and wine.

(6.) PIETRO, ST, CAMPO, the capital of the above district, is a west built town, containing 3,100 inhabitants in 1797.

(7.) PIETRO, ST, GALATINA, a town of Naples

in Otranto; 6 miles E. of Nardo.

(1.) \* PIETY. n. f. [pietas, Lat. pieté, Fr.] 1 Discharge of duty to Goil.—What piets, pity, fortitude did Æneas possess beyond his companions? Peacham on Foetry.—

'Till future infancy, baptiz'd by thee,

Grow ripe in years, and old in piets. Prior.
There be who faith prefer and piets to God.
Milton.

—Praying for them would make them as giad to fee their fervants eminent in pirty as themselves, Law. 2. Duty to parents or those in superior relation.—

Pope's filial piets excels,

Whatever Grecian story tells. (2.) PIETY is a virtue which denotes veneration for the Deity, and love and tenderness to our This diftinguished virtue, like many others, received among the Romans divine honours, and was one of their deities. Acilius Glabrio first erected a temple to this divinity, which he did upon the spot on which a woman had fed with her own milk her aged father, who had been imprifoned by order of the fenate, and deprived of all aliments. The story is well known, and is given at length in books which are in the hands of every school-boy. (See FILIAL PIETY, also Cicero de div. 1. and Valerius Maximus, 5. c. 4.) If piety was, thus practifed and thus honoured, in Heathen antiquity, it ought not to be less so among Christians, to whom its nature is better defined, and to the practice of which they have motives of greater cogency.

(3.) PIETY, FILIAL. The following example of filial piety is taken from Du Halde's description of China: " In the commencement of the dynasty of the Tang, Loutao-tiong, who was disaffected to the government, being accused of a fault, which touched his life, obtained leave from those who had him in custody, to perform the duties of the Tao to one of his deceased friends. He managed matters so well, that giving his keepers the flip, he fled to the house of Lou Nan-kin, with whom he had a friendship, and there hid himself. Lou Nan-kin, notwithstanding the strict search that was made, and the severity of the court against those who conceal prisoners that have escaped, would not betray his friend. However, the matter being discovered, Lou Nan-kin was imprisoned; and they were just on the point of proceeding against him, when his younger brother prefenting himself before the judge, said, It is I, Sir, aubo bave bidden the pri oner; it is I who ought to - die, and not my elder brother. The eldest maintain. die, and pot my elder brother. Z z z

ed, that his younger brother had accused himself wrongfully, and was not at all cuipable. The judge who was a person of great sagacity, fifted both parties to effectually, that he not only difcovered that the younger brother was innocent, but even made him confess it himself: It is true, Sir, said the younger all in tears, I have accused myself falsely; but I have very strong reasons for so doing. My mother has been dead for some time, and her corps is not yet buried; I have a fifter also who is marriageable, but is not yet disposed of : these things which my brother is capable of managing, I am not, and therefore defire to die in his stead. Vouchsafe to admit my testimony. The commissioner gave an account of the whole affair to the court, and the emperor pardoned the criminal."

(1.) PIEVE, a town of the Italian republic, in the dep. of the Mincio, and diffrict, late duchy, of Verona, feated in the valley of Lumezzano;

containing about 2000 citizens.

(2.) PIEVE, a rich town of the Italian republic, in the dep. of the Upper Po, diffrict and late terterritory of Cremona, seated on the Delmona.

(3.) Pieve, a town of the Ligurian republic, 9

miles W. of Albenga.

(4.) Pieve, a town of Maritime Austria, in Friuli; the birth-place of TITIAN.

(5.) Pieve Di Savo, a town of Maritime Auf-

tria, in the Paduano; 7 miles ESE of Padua. PIEUX, a town of France, in the dep. of the Channel; 10 miles SW. of Cherburg, and 13 W. of Valognes.

(1.) Pigeon-House, n. f. a house creded holes within for the keeping, breeding, &c. of geons, otherwise called a Dove-core. lord of a manor may build a pigeon-bouled land, but a tenant cannot do it without the licence. When perfons shoot at or kill get within a certain diffance of the pigeon hour, arel lablet o pay a forfeiture. For a pigecall no lituation is more proper than the middle fpacious court-yard, because pigeons are not ly of a timorous disposition, and the least of ey hear frightens them. As to its form, the und should be preserved to the square ones; beule rats cannot to eatily come at them in the mer as in the latter. It is also much more comidious; because you may, by means of a ladder roing upon an axis, visit all the nests in-: house, without the least difficulty; which mot so easily be done in a square house. To ider rats from climbing up the outlide of the geon-house, the wall should be covered with. plates to a certain beight; about a foot and a will be sufficient; but they should project 13 or 4 inches at the top, to prevent their mbering any higher. The pigeon-house should placed near water, that the pigeons may carit to their young ones; and their carrying it in ir bills will warm it, and render it more wholese in cold weather. The boards that cover pigeon-house should be well joined together, t no rain may penetrate through it: and the ole building should be covered with hard plas-, and white-washed within and without, white ng the most pleasing colour to pigeons. ft be no window, or other opening in the pis-house to the E. these should always face the m pigeons are very fond of the fun, especialn winter. The nefts or covers in a pigeonthe should consist of square holes made in the. of a fize sufficient to admit the cock and hen and in them. The first range of these nests pot be less than four feet from the ground, k wall underneath being smooth, the rate to be able to reach them. These nests be placed in quincunx order, and not ditover one another. Nor must they be condany higher than within three feet of the of the wall, and the upper row should be cowith a board projecting a confiderable diffrom the wail, for fear the rats should find to climb the outfide of the houle.

\* PIGNORATION. n. f. [pignora, Lat.] The

act of pledging.

PIGNORIUS, Lawrence, a learned Italian, borsh at Padua, in 1571, and bred an ecclefiaftic. He made deep refearches into antiquity, and published several curious works in Italian and Latin, particularly Mensa Islaca, on the antiquities of Egypt. The great Galico procured him the offer of a professoriship at Pisa, but he declined it. In 1630, he was made a canon in Trevisio, but died of the plague in 1631.

(1.) \* PIGNUT. n. f. [pig and nut.] An earth

Dut.

I with my long nails will dig thee pignets.

Sbak.

(2.) PIG NUT. See BUNIUM.

• PIGSNEY. n. f. [piga, Sax. a girl.] A word of endearment to a girl. It is used by Butler for the eye of a woman, I believe, improperly.—

Shine upon me but benignly

With that one, and that other pigsacy. Hudib. PIGUS, in ichthyology, a species of leathermouthed fish, very much resembling the common carp; being of the same shape and fize, and its eyes, fins, and fleshy palate, exactly the same; from the gills to the tail there is a crooked dotted line; the back and fides are bluish, and the belly reddish. It is covered with large scales from the middle of each of which there rifes a fine peliucid prickle, which is very tharp. It is an excellent fish for the table, being perhaps preferable to the carp: and it is in feafon in the months of March and April. It is caught in lakes in forme parts of Italy, and is mentioned by Piny, tho without a name. Artedi fays it is a species of cyprinus, and he fliles it the cyprinus, called piclo and pigus.

(1.) PIGWAKKET, a town of the United States, in Main, 27 miles NW. of Portland.

(2.) PIGWARKET, a river of the United States, which runs into the Saco, 5 miles S. of the above

town, No 1.

\* PIGWIDGEON. n. f. This word is used by Drayton as the name of a fairy, and is a kind of cant word for any thing petty or small.—

By Scotch invafion to be made a prey To fuch pigwidgeon myrmidous as they.

PI-HAHIROTH, a mouth or narrow pass between two mountains, called Chiroth or Eiroth, and lying not far from the bottom of the W. coast of the Arabian gulf; before which mouth the children of Israel encamped, just before their

entering the Red Sea. (Wells.)

PIHIERN, a town of Austria, 3 m. SW. Steyr. PIISSKER, in ichthyology, is a 5th of the Mustella Kind, commonly called the fossil mustela, or fossil ssp. Tella kind, commonly called the fossil mustela, or fossil ssp. They are generally found as long as a man's hand is broad, and as thick as one's tinger; but they sometimes grow much longer: the back is grey with a number of spots and traverse streaks, partly black and partly blue; the belly is yellow, and spotted with red, white, and black; the white are the larger, the others look as if they were made with the point of a needle; and there is oneach side a longitudinal black and white line. There are some sleshly excressences at the mouth, which are expanded in swimming, but contracted

when out of the water. These fishes run into caverns of the earth, in the sides of rivers, in marky places, and penetrate a great way, and are often dug up at a distance from waters. Often, when the waters of brooks and rivers swell beyond the banks, and again cover them, they make the way out of the earth into the water; and wait deserts them, they are often left in valt number upon the ground, and become a prey to far It is thought to be much of the same kind with the figum fith; and it is indeed possible that it precilia of Schonefeldt is the same.

(1.) \* PIKE. n. f. [pieque, Fr. his front her thanp. Skinner and Junius.] 1. The luce of is the tyrant of the fresh waters: Sir Francis con observes the pike to be the longest lived dans freth water fish, and yet he computes it to be utually above forty years; and others think be not above ten years: he is a folitary, meland and bold fish; he breeds but once a year, and time of breeding or spawning is usually about end of February, or somewhat later, in Man as the weather proves colder or warmer: atd manner of breeding is thus; a he and a fleg will usually go together out of a river into ditch or creek, and the spawner casts her me and the melter hovers over her all the time cafting her spawn, but touches her not. Was Angler. - In a pond into which were put to fish and two pikes, upon drawing it some year terwards there were left no fift, but the grown to a prodigious fize, having devoured other fish and their numerous spawn. Hak-

The pike the tyrant of the floods.

2. [Pique, Fr.] A long lance used by the for diers, to keep off the horse to which beyond

have succeeded .-

Beat you the drum that it speak mountain Trail your steel pikes.

He wanted pikes to fet before his arche

Their pikes they strained in both hands, therewith their buckler in the left, the one of the pike against the right foot, the other high against the enemy. Hayward.

A lance he bore with iron pike. Holds 3. A fork used in husbandry; a pitch-fork.

A pike to pike them up handfome to dre

—Let us revenge this with our pikes. Shak. Among turners, two iron fprigs between whany thing to be turned is faltened.—Hard we prepared for the lathe with rasping, they p

between the pikes. Moxon.

(2.) Pike, in ichthyology. See Esox. Ipike never swims in shoals as most other sishes but always lies alone; and is so bold and mous, that he will seize upon almost any thin than himself. Instances of the voracity of the sare so numerous and well known, that unnecessary to quote them. They breed once a year, in March. They are found in all all fresh waters; but very different in good according to the nature of the places whey live. The finest pikes are sound in clear vers; those in ponds and meres are inserted, the worst are those of the fen ditches. They very plentiful in these last places, where the way

r is foul and coloured; and their food, fuch as ogs and the like, plentiful but coarte; fo that ky grow large, but are yellowish and high belid, and differ greatly from those which live in it clearer waters. The fishermen have two nincipal ways of catching pikes, by the ledger, id the walking bait. The ledger bait is fixed in se certain place, and may continue while the sker is absent. This must be a live bait, a fish frog: and among fish, the dace, roach, and gudnon, are the best; of frogs, the only caution is choose the largest and yellowest that can be et with. If the bait be a fish, the hook is to be ack through the upper lip, and the line must be grands at least in length; the other end of this to be tied to a bough of a tree, or to a shelt iren into the ground near the pike's haunt, and the line wound round a forked flick, except ant half a yard. The bait will by these means xp playing so much under water, that the pike ill foon lay hold of it. If the hait be a frog, en the arming wire of the hook should be put at the mouth, and out at the fide; and with a edie and fome ftrong filk, the hind leg of one he is to be faftened by one flitch to the wire ming of the hook. The pike will foon feize is, and must have line enough to give him leave aget to his haunt and poach the bait. The trol-I for pike is a pleafant method also of taking in this a dead bait ferves, and none is fo thewater till the pike seizes it; and then he is Thre line enough, and time to swallow it: the k is small for this sport, and has a smooth her of lead fixed at its end to fink the bait; and Fine is very long, and runs through a ring at kend of the rod, which must not be too slender top. The art of feeding pikes, to make them That is by giving them cels; otherwise perches, we imall, and their prickly fins tender, are the food for them. Breams put into a pike-pond a very proper food: they will breed freely, It their young ones make excellent food for in the numerous shoals of voaches and th, which are continually changing place, and in Boods get into the pike's quarters, afford and for them for a long time. Pikes, when used be fed by hand, will come up to the very shore, Make the food that is given them out of the agers of the feeder. It is wonderful to see with hat courage they will do this, after a while pracling; and it is very diverting, when there are femal of them nearly of the fame fize, to fee what riving and fighting there will be for the best bits are thrown in. The most convenient place thear the month of the pond, and where there about half a yard depth of water; for, thus, toffal of the feedings will all lie in one place, and the deep water will ferve for a place to reire into and reft is, and will be always clean and A order.

(3.) Pixz, in war, an offensive weapon, conling of a wooden shaft, zz or za feet long, with that steel head, pointed, called the *Spear*. This reapon was long in use among the infantry; but low the bayonet, which is fixed on the muzzle of the firelock, is substituted in its stead.

(1.) To Fixe, v. a. To murder with a pike.

This verb owes its origin and use in this sense, to the horrors of the French revolution, when so many unfortunate prisoners were piked to death by Septembrisers at Paris, without trial by judge or jury in Sept. 1792. It is also used as an active verb, in husbandry, by Tuffer, in the passage above anyted by Dr. Johnson, under Pure 6 v. def 2

quoted by Dr Johnson, under Pine, § 1, def. 3.
(3.) To Pine. v. n. To peep. Chaucer. This fense is obsolete, as is also the active kense in which that poet also uses it,—To pick out, to

pitch upon.

PIKED. adj. [piqué, Fr.] Sharp; accuminated; ending in a point. In Shakefpeare, it is used of a pointed beard.—

Why then I suck my teeth, and catechife My pited man of countries. Shake PIKELAND, a town of Pennsylvania, in Chester county.

\*PIKEMAN. n. f. [pike and man.] A foldier armed with a pike.—Three great squadrons of pikemen were placed against the enemy. Knolles.

PIKESTAFF. n. f. [pike and flaff.] The wooden pole of a pike.—To me it is as plain as a pikeflaff, from what mixture it is, that this daughter filently lowers, t'other fleals a kind look. Tatler.

(1.) PILA, in antiquity, was a ball variously made according to the different games in which it was to be used. Playing at ball was very common amongst the Romans of the first distinction, and was looked upon as a manly exercise, which contributed both to amusement and health. The pilawas of four sorts: 1st, Follis or balloon; 2al, Pila Prigonalis; 3d, Pila Paganica; 4th, Harpasum. All these come under the general name of pila-For the manner of playing with each of them see the articles Follis, and Trigonalis.

2.) PILA MARINA, OF the SEA BALL, in natural biftory, a substance very common on the shores of the Mediterranean, and elsewhere. It is generally found in the form of a ball about the fize of the balls of horse-dung, and composed of a variety of fibrillæ irregularly complicated. Various conjectures have been given of its origin by different authors. John Bauhine tells us, that it confifts of fmall hairy fibres and ftraws, fuch as are found about the sea plant called alga vitriariorum; but he does not afcertain what plant it owes its origin to. Imperatus imagined it consisted of the exuvize both of vegetable and animal bodies. Mercatus is doubtful whether it be a congeries of the fibrillæ of plants, wound up into a ball by the motion of the sea-water, or whether it be not the workmanship of some fort of beetle living about the sea fhore, and analogous to our common dung beetle's ball, which it elaborates from duag for the reception of its progeny. Schreckius fays it is compofed of the filaments of some plant of the reed kind: and Welchius supposes it is composed of the pappous part of the flowers of the reed. Maurice Hoffman thinks it the excrement of the Hippopotamus; and others think it that of the fea calf. Klein, who had thoroughly and minutely examined the bodies themselves, and also what authors had conjectured concerning them, thinks that they are wholly owing to, and entirely composed or, the capillaments which the leaves, growing to the woody stalk of the alga vitriariorum, have when they wither and decay. These leaves, in their

natural state, are as thick as a wheat straw, and they are placed fo thick about the tops and extremities of the stalks, that they enfold, embrace, and lie over one another; and from the middle of these clusters of leaves, and indeed from the woody substance of the plant itself, there arise several other very long, flat, smooth, and brittle leaves. These are usually four from each tust of the other leaves; and they have ever a common vagina, which is membranaceous and very thin. This is the style of the plant, and the pila marina appears to be a cluster of the fibres of the leaves of this plant, which cover the whole stalk, divided into their constituent fibres; and by the motion of the waves first broken and worn into short shreds, and afterwards wound up together into a roundish or

(1.)\* PILASTER. n. f. [pilastre, Fr. pilastro, Ital.] A fquare column fometimes infulated, but oftener fet within a wall, and only shewing a fourth or a fifth part of its thickness. Dist.—Pilasters must not

be too tall and slender. Wotton .-

Built like a temple, where pilasters round Were set.

Milton.

The curtain rises, and a new frontispiece is seen, joined to the great pilasters on each side of the stage.

Dredon.—

Clap four flices of pilasters on't. Pope. (2.) PILASTER. See ARCHITECTURE, Index. PILATE, PONTIUS, was governor of Judea when our Lord was crucified. Of his family or country we know but little, though it is believed that he was of Rome, or at least of Italy. He was fent to govern Judea in the room of Gratus, A. D. 26 or 27, and governed this province for ten years, from the 12th or 13th year of Tiberius to the 22d or 23d. He is represented both by Philo and Josephus as a man of an impetuous and obstinate temper, as a judge who used to sell justice, and to pronounce any sentence that was defired, provided he was paid for it. They likewife speak of his rapines, murders, oppressions, and the torments that he inflicted upon the innocent, and the perfons he put to death without any form of process. Philo, in particular, deferibes him as having exercised an excessive cruelty during his whole government, diffurbed the repose of Judea, and given occasion to the troubles and revolt that followed. St Luke records his maffacre of the Galileans in the temple. (xiii. 1, 2, &c.) His fruitless endeavours to deliver our Saviour from the hands of his enemies; his wife's alarming dream and meffage to him; his repeated declarations of our Saviour's innocence; his vain endeavour to gratify the malice of the Jews by whipping him; his equally fruitless attempt to get rid of pronouncing fentence by fending him to Herod; his declaration of his utter aversion to condemn the innocent by washing his hands; with the consequent imprecation of the Jews upon themselves and their posterity; his want of resolution to acquit him; his infcription upon the cross in different languages; with his reply to the Jews, when they challenged it; and his delivery of the body to Joseph and Nicodemus, are recorded by the Evangelists .- Justin Martyr, Tertullian, Eusebius, and after them several others both ancient and modern, affure us, that it was formerly

the custom for Roman magistrates to prepare pies of all verbal processes and judicial acts which they passed in their several provinces, and to seni them to the emperor. And Pilate, having accordingly fent word to Tiberius of what had passal relating to Jefus Christ, the emperor wrote an a count of it to the fenate, in a manner that reason to judge that he thought favourably of the religion of Jejus Chrift, and showed that he should be willing they would decree divine honours up him. But fortunately the senate was not of the fame opinion, and so the matter was dropped; therwise modern infidels would have ascribed in fubfequent rapid and univertal fuccess of Chills nity to the imperial power and influence of The rius. It appears by what Justin says of theken that the miracles of Jesus Christ were mention there, and that the foldiers had divided his ments among them. Eusebius infinuates that to spoke of his resurrection and ascension. Ten lian and Justin refer to these acts with so confidence as would make one believe ther be them in their hands. However, neither Euclo nor St Jerome, who were both inquifitive, water flanding persons, nor any other author that afterwards, feem to have feen them, at leaf me the true and original acts; for as to what we now in great numbers, they are not authentice ing neither ancient nor uniform. There are fome pretended letters of Pilate to Tiberius, a history of our Saviour, but they are unwall-allowed to be spurious. Pilate having, by his ceflive cruelties and rapine, disturbed the peace Judea during the whole time of his govern was at length deposed by Vitellius, the prod of Syria, A. D. 36. and fent to Rome to gin a account of his conduct to the emperor. The having died before Pilate arrived at Rome, hish ceffor Caligula hanished him to Vienne in Gal where he was reduced to fuch extremity that killed himfelf. He was only procurator of Le though the evangelifts call him governor, becar in effect acted as one, by taking upon him wine in criminal matters. See Calmet's Dia. Echoc Eccl. Hift. and Beaufobre's Annot. With rega to Pilate's wife, the general tradition is, the was named Claudia Procula or Projeula; and her dream, fome think that as the had intellige of our Lord's apprehenfign, and knew by him racter that he was a righteous person, her is " nation, firuck with these ideas, naturally produthe dream we read of; but others think that " dream was fent miraculously, for the clearer festation of our Lord's innocence.

PILATRE DU ROSIER, Francis, was bor Metz the 30th of March, 1756. He was find prentice to an apothecary there, and afterweight of Paris in quest, of improvement. He plied himself to the study of natural history of natural philotophy, and had already acque some reputation, when the discovery of M. Megolfier had just associated the learned world, the 25th Oct. 1783, he attempted an aerial age with the Marquis of Arlande. He perfected exeral other exemptions in this way with buildingers, in the presence of the royal samy france, of the king of Swedyn, and of France, of the king of Swedyn, and of France, of Prusilia. He then resolved to pass in

ngland by means of his aerial vehicle, and for at purpose he repaired to Boulogne, whence he se about 7 o'clock in the morning of the 15th me, 1785; but in half an hour after he fet out, e balloon took fire, and the acronaut, with his mpanion M. Romaine, were crushed to death the fall of that machine, which was more ingeous, perhaps, than ufeful. (See Aerostation, dex.) Pilatre's focial virtues and courage, which he very diffinguished, heightened the regret of thiends for his loss. His merit as a chemist, this experiments as an aeronaut, procured him pecuniary reward, and some public appoint.

He had a pension from the King, was inant of Monficur's cabinets of natural philosochemistry, and natural history, professor of mai philosophy, a member of several academies, principal director of Monfieur's museum. LAYO and PASPAYA, a province or jurifdicfor S. America in the government of Buenos ks, and archbishopric of La Plata. LCHARD, or \n. f. in ichthyology, a fish t.) PILCHER, which has a general likeness be herring, but differs in fome particulars very mally. The body is less compressed than that the herring, being thicker and rounder: the horter in proportion, and turns up; the riaw is shorter. The back is more elevated; the left sharp. The dorfal fin of the pilchard ced exactly in the centre of gravity, fo that. taken up by it, the body preferves an equin, whereas that of the herring dips at the The scales of the pilchard adhere very whereas those of the herring very easily of. The pilchard is in general less than the but it is fatter, or more full of oil. Pilappear in vaft shoals off the Cornish coasts the middle of July, disappearing the begin-winter, yet sometimes a few return after mas. Their winter retreat is the same with If the herring, and their motives for migrame same. See CLUPEA. They affect, duummer, a warmer latitude; for they are not in any quantities on any of our coasts exhole of Cornwall, that is to fay, from Fowey ir to the Scilly ifles, between which places bals keep shifting for some weeks. The apof pilchards is known by the fame figns as that indicate the arrival of the herrings. called in Cornwall buers, are placed on Infis, to point to the boats stationed off the the course of the fish. By the 1st of James .23, fishermen are empowered to go on the hads of others to line, without being liable to ms of trespass, which before occasioned fre-I law fuits. Dr W. Borlafe, in his Account Pil.bard Pifbery, fays, "It employs a great er of men on the fea; and men, women, and ten, at land, in falting, preffing, washing, and ng, in making boats, nets, ropes, calks, the trades depending on their construction He. The usual number of hogsheads of fish and each year, for ten years, from 1747 to inclusive, from the four ports of Fowey, Falh, Penzance, and St Ives, in all amounted to 14; Fowey has exported yearly 1732 hogf-th; Falmouth, 14,6317 hogfheads; Penzance Mounts-Bay, 12,149; hogtheads; St Ives,

1283 hogheads. Every hoghead for ten years last past, together with the bounty allowed for each when exported, and the oil made out of each, has amounted, one year with another at an average, to the price of L. 1: 13: 3; so that the eash paid for pilchards exported has, at a medium, annually amounted to the sum of L. 49,532: 10." The numbers that are taken at one shooting out of the nets is amazingly great. Mr Pennant says, that Dr Borlase assured him, that on the 5th of October 1767, there were at one time inclosed in St Ives Bay 7000 hogheads, each hoghead containing 35,000 fish, in all 245,000,000.

taining 35,000 fish, in all 245,000,000.

(2.) \*PILCHER. n. f. [Warburton says we should read pilete, which signifies a cloke or coat of skins, meaning the scabbard: this is confirmed by funius, who renders pilly, a garment of skins; pplece, Sax. pellice, Fr. pelliccia, Ital, pellis, Lat.] 1. A furred gown or case; any thing fined with fur. Hanmer.

Pluck your fword out of his pileber by the ears.

Shak

4. A fish like a herring much caught in Cornwal. PILCHOWITZ, a town of Silefia, in Oppeln; 6 miles SSW. of Gleiwitz, and 28 ESE. of Upper Glogau.

(1.) PILE. n. f. [pile, Fr. pyle, Dutch.] r. A ftrong piece of wood driven into the ground to make a firm foundation.—The bridge the Turks before broke, by plucking up of certain piles, and taking away of the planks. Knolles.—If the ground be hollow or weak, he ftrengthens it by driving in piles. Movon.—The foundation of the church of Harlem is supported by wooden piles, as the houfes in Amsterdam are. Locke. 2. A heap; an accumulation.—

Bury all which yet diffinelly ranges
In heaps and piles of ruin.

Shak.

What piles of wealth hath he accumulated

To his own portion! Sbak.

—By the water passing through the stone to its perpendicular intervals, was brought thither all the metallic matter now lodged therein, as well as that which lies only in an undigested and confused pile. Woodward. 3. Any thing heaped together to be burned.—

I'll bear your logs the while; pray give me it,
I'll carry't to the pile Shak. Tempest.
—Woe to the bloody city, I will even make the
pile for fire great. Exekiel xxiv. 9.—In Alexander's
time, the Indian philosophers, when weary of living, lay down upon their funeral pile without any
visible concern. Collier.—

The wife, and counfellor or prieft,
Prepare and light his fun'ral fire,
And cheerful on the pile expire.

Prior.

4. An edifice; a building.—

Th' afcending pile flood fixed.

Milton.

Not to look back fo far, to whom this ifle

Owes the first glory of so brave a pile. Denbam.

The pile o'erlook'd the town. Dryden's Fancy brings the vanish'd piles to view. Pope. A pile shall from its ashes rise,

Fit to invade or prop the skies. Swift.
5. A hair. [pilus, Lat.] His left-cheek is a cheekof two pile and a half, but his right cheek is worn
bare. Shuk. Ail's well. 6. Hairy surface; nap.—
Many other forts of stones are regularly figured;
the amianthus of parallel threads, as in the pile of

selvet. Green 7. [Pilum, Lat.] The head of an arrow.-

There stucke the steele pile, making way Quite through his skull. Chapman.

The pile was of a horse fly's tongue,

Whose sharpness nought revers'd. Dragton.

18. [Pile, Pr. pila, Italian.] One side of a coin; the reverse of cross.—A man may more justisfiably throw up cross and pile for his opinions, than take them up so. Locke. 9. [In the plural, piles.] The hamorrhoides.—Solicit the humours towards that part, to procure the piles, which soldom miss to relieve the head. Arkathnot.

(2.) PILE, in heraldry, an ordinary in form of a wedge, contracting from the chief, and terminating in a point towards the bottom of the shield.

(3.) Pile, among the Greeks and Romans, was a pyramid built of wood, whereon were laid the bodies of the deceased to be burnt. It was partly in the form of an altar, and differed in height according to the quality of the person to be consumed. Probably it might originally be considered as an altar, on which the dead were consumed as a burnt-offering to the infernal deities. The trees made use of in the erection of a suneral pile were such as abounded in pitch or rosin, as being most combustible; if they used any other wood, it was split that it might the more easily catch fire. Round the pile were placed cypress boughs to hinder the nosione smell. See Funeral.

(4.) Pile, in coinage, denotes a kind of puncheon, which, in the old way of coining with the hammer, contained the arms or other figure and infeription to be firuck on the coin. See Coinage. Accordingly we fill call the arms fide of a piece of money the pile, and the head the creft; because in ancient coin, a crofs usually took the

place of the head in ours.

To Pile. a. a. 1. To heap; to coacervate
The fabrick of his folly, whose foundation
Is pild upon his faith. Shak. What. Tale.
Pile ten hills on the Tarpeian rock. Shak.
Hills pild on hills, on mountains mountains lic,
To make their mad approaches to the sky. Digd.
Men pild on men, with active leaps arise.

Addison.

—In all that heap of quotations which he has piled up, nothing is aimed at. Atterbury.—Those heaps of comments, which are piled so high upon authors, that it is difficult sometimes to clear the text from the rubbish. Felton. 2. To fill with something heaped.—Attabalipa had a great house piled upon the sides with great wedges of gold. Abby's Descript. of the World.

\* PILEATED. adj. [pileus, Lat.] Having the form of a cover or hat.—A pileated echinus taken up with different shells of several kinds. Wood-

ward on Fossils.

PILE-ENGINE, n. f. a very curious machine invented by Mr Vauloue for driving the piles of Westminster-bridge; but of which we need not give any description; as a new machine for driving piles has been invented lately by Mr S. Bunce of London which will drive a greater number of piles in a given time than any other; and can be constructed more simply to work by horses than Mr Vauloue's engine. Fig. 1 & 2, Plate CCLXXIV. sepresent a side and front section of the machine.

The chief parts are A, fig. 1. which are two meless ropes, or chains connected by cross pieces of iron B (see fig. 2.) corresponding with two congrooves cut diametrically opposite in the whell (fig. 1.), into which they are received; and by which means the rope or chain A is carried non-FIIK is a fide view of a firong wooden fram moveable on the axis H. D is a wheel, or which the chain passes and turns within at these of the frame. It moves occasionally from I to upon the centre H, and is kept in the political by the weight I fixed to the end K. Fig.; I the iron ram, which is connected with the or pieces by the hook M. N is a cylindrical pe of wood fuspended at the hook at O, which fliding freely upon the bar that connects the to the ram, always brings the hook upright the chain when at the bottom of the machine the position of GP. See fig. 1 .- When the at S turns the usual crane-work, the ram to connected to the chain, and passing between guides, is drawn up in a perpendicular drawn and when it is near the top of the machine, the projecting bar Q of the book strikes against a piece of wood at R (fig. 1.); and confequent discharges the ram, whilst the weight I d moveable frame instantly draws the appearing into the polition shown at F, and keeps the free of the ram in its descent. The hook, descending, is prevented from catching the by the wooden piece N. For that piece b specifically lighter than the iron weight below, moving with a lefs degree of velocity cannot to in contact with the iron till it is at the better the rum stops. It then falls, and again com the hook with the chain, which draws of ram, as before. Mr Bunce has made a model this machine, which performs perfectly well; he observes, that, as the motion of the wheel uninterrupted, there appears to be the less ble time loft in the operation.

\* PILER. n. f. [from pile.] He who are

lates.

(1.) PILES. See MEDICINE, Index.

(2.) PILES, Roger DE, a learned French ter, born at Clamccy, of a good family, in till He studied at Nevers and Auxerre; then work Paris for philosophy, and studied divinity in a Sorbonne. Meantune, he cultivated painting der Recollet. In 1652, he became preceptor the fon of M. Amelot, whom he accompanied to Italy, and on his return became famous a connoilleur. In 1682, M. Amelot being fent an embassy to Venice, De Piles attended him fecretary; and during his refidence there, he fent by the marquis of Louvois into Germany purchase pictures for Lewis XIV. and live to execute a private commission on state and In 1685, he attended M. Amelot to Lisbon, in 1689 to Switzerland, as fecretary. In he was fent incog. to Holland, as a vinuela in reality to act as a fpy. Being detected, be put in prison, where he continued till the pu of Ryfwick, and where he wrote his Lives of Painters. In 1705, though in his 70th year attended M. Amelot on his embaliy into Main He died in 1709. His other works are, I. Abridgment of Anatomy: 2. A Translation

ney on account of devotion .-

A long and weary pilgrimage.

In latting labour of his pilgrimage.

Shaki

Painting is a long pilgrimage. Dryden. 2. Shakefpeare uses it for time irksomely spent.—

In prison thou hast spent a pilgrimage. Shak. (2.) PILGRIMAGE is a kind of religious discipline, which confifts in taking a journey to some holy place, in order to adore the relics of fome deceafed faint. Pilgrimmes began to be made about the middle ages of the church; but they were most in vogue after the end of the 11th century, when every one was for visiting places of devotion, not excepting kings and princes themfelves; and even bilhops made no difficulty of being ablent from their churches on the same account. The places most visited were Jerusalem, Rome, Compostella, and Tours: In 1428, in the reign of Henry VI. many licences were granted to captains of English ships, for carrying devout persons to the shrine of St James of Compostellas in Spain; provided that those pilgrims strould first swear not to take any thing prejudicial to England, nor to reveal any of its fecrets, nor to carry out with them any more gold or filver, than what would be sufficient for their reasonable expences. In this year there went out thither, the following number of perfors: From London 280; Bristol 200, Weymouth 122, Dartmouth 90, Yarmouth 60, Jersey 60, Psymouth 40, Exeter 30; Liverpoole 24, Ipswich 20; in all 926 pilgrims: The greatest numbers now reserve to Loretto, to visit the chamber of the blessed virgin, in which fhe was born, and brought up her fon Jesus till he was 12 years of age. For the pilgrimages of the followers of Mahomet, fee Mahometanism, II. In every country where popery was eftablithed, pilgrimages were common; and in those countries which are ftill popill, they continue. In England, the thrine of St Thomas & Becket was the chief refort of the pious; and in Scotland, St Andrew's; where, as tradition informs us, was deposited a leg of the holy apostle. In Ireland they still continue; for, from the beginning of May till the middle of August every year, V 5, 5, 5 erowda

crowds of popish penitents from all parts of that country refort to an illand near the centre of Lough fin, or White Lake, in the county of Donnegal, to the amount of 3000 or 4000. These are mostly of the poorer fort, and many of them are proxies for those who are richer; fome of whom, however, with fome of the priefts and bishops on occasion, make their appearance there. When the pilgrim comes within fight of the holy lake, he must uncover his hands and feet, and thus walk to the water fide, and is taken to the island for sixpence. Here there are two chapels and 15 other houses; to which are added confesfionals, fo contrived, that the priest cannot fee the person confessing. The penance varies according to the circumstances of the penitent; during the continuance of which (which is fornetimes, 3, 6, or 9 days) he fubfifts on oat meal, fometimes made into bread. He traveries sharp stones on his bare knees or feet, and goes through a variety of other forms, paying fixpence at every different confession. When all is over, the priest bores a gimblet hole through the pilgrim's staff near the top, in which he fastens a cross peg; gives him as many holy pebbles out of the lake as he cares to carry away, for amulets to be prefented to his friends, and so dismisses him, an object of veneration to all other papias not thus initiated; who no fooner fee the pilgrim's crofs in his hands, than they kneel down to get his bleffing. There are, however, other parts of Ireland facred to extraordinary worthip and pilgrimage; and the number of holy wells, and miraculous cures, &c. produced by them, is very great.

PILIATCHIN, a cape of Ruffia, on the E. coaft of the Penzinskoi Sea; 372 miles ENL. of Ochotsk.

64 miles E. of Konigfberg.

PILKINGTON, Lætitia, a famous poetical genius, daughter of Dr Van Lewin, a phytician of Dublin, where the was born in 1712. She was married very young to the Rev. Matthew Pilkington, a poet aifo of no inconfiderable ment; and these two wits, as is often the case, lived very unhappily together. They were at length totally ieparated, on the husband accidentally discovering a gentleman in her bedchamber at two o'clock in the morning; a circumstance which the accounted for in a very unfatisfactory manner. After this unlucky adventure, Mrs Pikington came to London; and having recourfe to her pen for fublishence, through the means of Cosley Cibber, the lived some time on the contributions of the great. She was, however, thrown into the Marshalfea for debt; and being set at liberty, opened a pampblet shop. She raised at length a handfome subscription for her Memoirs; which are written with great sprightliness and wit, containing leveral entertaining anecdotes of dean Swift, with whom the was intimate, as well as many retty little pieces of her poetry. This ingeni-cus, but unhappy woman, is faid at last to have killed builed with drinking at Dublin, in 1750.

PILKOPEN, a town of Pruffia, in Samlard, on a mountain; 30 miles N. of Konigsberg.

PILLTOWN, a town of Ireland, in Waterford,

Muniter.

PILNIKAW, a town of Bohemia, in Konigin-

gratz; '5 miles SW. of Trantenau.

PILNITZ, a town of Upper Saxony, in the margraviate of Meillen, with a cattle, belonging to the elector of Saxony; memorable for the treaty entered into between the emperor of Germany, the king of Pruffia, and other princes of Europe, against France, in 1792. It lies 4 miles

NW. of Perna, and 7 SE. of Diefden.

PILON, Frederick, an Irish dramatic writer, born at Cork, in 1750. He was fent to Edinburgh to fludy medicine, but the flage foon withdrew his attention from physic. He made his first appearance on the Edinburgh theatre in the character of Oroonoko. But though his conception was good, and his difcrimination beyond common acting, yet he laboured under natural and infuperable defects; his figure wanted grace, and his voice wanted harmony. His friends, however, being offended, he continued to act on the provincial theatres for 4 years, till 1776, when he went to London; where he published a Critical Effay on Hamlet, which procured him the patronage of Mr Colman. In 1776, he wrote the Drama, a poem, in the manner of Churchill's Resciad; and Regutta, a poem on the Fete given on the Thames in 1776, both of which were well received. After various other mifcellaneous pieces, he published in 1778, The Invasion, or a Trip to Brighthelmstone, a Comedy, which was accessed in the plantic at Covent Garden. After this, is wrote various pieces for the managers, but although and drawn considerable houses, his Farmerican, an opera, was refused by the many of Covent Garden; and though acted at Drug Lane, produced a dispute with the manager, much more trouble than profit to the actually make the more trouble than profit to the actual than the manager, which is next Comedy was, He would be a Soldar, to profits of which to him were much infrient what might have been expected, from its great run. After this, being distressed by cated The Ward of Chancery, but had not mished it completely, when he returned to inland, and died at Lambeth, in Jan. 1788.

What port can fuch a pilot find, Who in the night of fate must blindly for

-The Roman fleet, although conducted by without experience, defeated that of the Conducted

ginians. Arbutbnot.

(2.) The PILOT is the officer who superior the navigation, either upon the fea coaft or a main ocean. It is, however, more particular applied by our mariners to the person done with the direction of a ship's course on a the sea coast, and into the roads, bays, havens, &c. within his respective district. I of ships, taking upon them to conduct any from Dover, &c. to any place up the Thur are to be first examined and approved by mafter and wardens of the fociety of Trat House, &c. or shall forseit sol. for the firm fence, 201. for the fecond, and 401. for every all offence; one moiety to the informer, the other the master and wardens; but any master or man of a thip may pilot his own veffel up the mo and if any thip be loft through the negligence any pilot, he fliall be for ever after ditabled act as a pilot. 3 Geo. I. c. 13. The lord wall of the cinque ports may make rules for the vernment of pilots, and order a sufficient num to ply at lea to conduct thips up to the Tham 7 Geo. I. c. 21. No person shail act as a p on the Thames, &c. (except in collier without a licence from the master and wan of Trinity House at Deptford, on pain of fixe ing 201. And priots are to be subject to the pe vernment of that corporation; and pay and dues, not exceeding is, in the pound, out of the ges, for the use of the poor thereof, Stat. 5 Go II. c. 20. By the ci-devant laws of France, person could be received as pilot tid he had make leveral voyages, and paffed a first examination

d after that, on his return in long voyages, he is obliged to lodge a copy of his journal in the miraity; and if a pilot occasioned the loss of a p, he had to pay 100 livres fine, and to be for er deprived of the exercise of pilotage; and if did it defignedly, be punished with death.

\*\* Mercat. 70. 71. The laws of OLERON orm, That if any pilot designedly misguide a p, that it may be cast away, he shall be put to igorous death, and hung in chains: and if the d of a place, where a ship be thus loft, abet th viliains, to have a thare of the wreck, he all be apprehended, and all his goods forfeited rthe fatisfaction of the persons suffering; and sperson shall be fastened to a stake in the midst his own manfion, which, being fired on the is corners, shall be burned to the ground, and with it. Leg. Ol. c. 25. And if the fault of a ot be so notorious, that the ship's crew see an parent wreck, they may lead him to the hatch-, and arike off his head; but the common law nies this hafty execution: an ignorant pilot is stenced to pais thrice under the thip's keel by e laws of Denmark. Lex Mercat. 70. The renations with regard to pilots in the royal navy tasfollow: "The purier of the thip is always have a set of bedding provided on board for epilots; and the captain is to order the boataim to supply them with hammocks, and a consient place to lie in, near their duty, and apart m the common men; which bedding and hamare to be returned when the pilots leave ip. A pilot, when conducting one of his tay's ships in pilot water, shall have the sole large and command of the ship, and may give for feering, fetting, trimming, or furling a fails; tacking the ship; or whatever concerns enavigation: and the captain is to take care # all the officers and crew obey his orders. the captain is diligently to observe the conof the pilot; and if he judges him to behave the as to bring the ship into danger, he may rehe him from the command and charge of the and take such methods for her preservation half be judged necessary; remarking upon the popok, the exact hour and time when the pilot temoved from his office, and affigning the Mons for it. Captains of the king's ships, emloying pilots, whether British or foreigners, are idened to be punctual in their certificates, vouwas and payments, as foon as the service is orvice, &c.

To PILOT. v. a. [from the noun.] To steer;

direct in the course.

PILOTAGE. n. f. [pilotage, French, from unt.] 1. Phot's skill; knowledge of coasts.—Ve must for ever abandon the Indies, and lose all at knowledge and pilotage of that part of the borld. Rakigb. 2. A pilot's hire. Ainfavorth.
PILOT FISH, or Gasterosteus Ductor, in ichthylogs, is a species of the gasterosteus, and is found the Mediterranean and in the Atlantic ocean, herly towards the equator. (See Plate CCI.XXIV; and Gastenosteus.) Catesby, who gives a figure of it in its natural fize, together with a short lamption, calls it perca marina sectoria, or rud-

One of them, which Gronovius deder-fish. scribes, was about 4 inches long, and its greatest breadth little more than an inch: the head is about a third of the body, and covered, excepting the space between the snout and the eye, with feales scarcely perceptible, and covering one annther like tiles; the iris of the eye is a filver grey; the jaws are of equal fize, and furnished as well as the palate with small teeth disposed in groups; there is also a longitudinal row of teeth on the tongue. The trunk of the pilot fish is oblong, a little rounded, but it appears quadrangular towards the tail, because at this place the lines are thicker, and form a kind of membranaceous projection. The back fin is long, and furnished with 7 radii; on the fore part of this fin are three moveable prickles very short; the fins on the breast have each of them 20 radii, forked at their extremity; the abdominal fins have fix; that of the anus has 17 branches, of which the first is longest; this fin is preceded by a small moveable prickle; that of the tail is thick, large, and forked. The pilot fish is of a brownish colour, changing into gold; a transversal black belt crosses the head; the 2d passes over the body at the place of the breast; a 3d near the moveable prickles of the back; 3 others near the region of the anus; and a 7th at the tail. Scafaring people observe, that this fish frequently accompanies their vessels; and as they fee it generally towards the fore part of the ship, they imagined that it was guiding and tracing out the course of the vessel, and hence it received the name of pilot-fifth. Ofbec tells us, that they are shaped like those mackerels which have a transversal line across the body. "Sailors (continues he) give them the name of pilots, because they closely follow the dog-fish, swimming in great shoals round it on all udes. It is thought that they point out some prey to the dog-fish. (See Mem. of the Swed. Acad. for 1755, vol. xvi. p. 71.) It likewife follows the shark, apparently for the remains of its prey. Barbut informs us, that these fishes propagate their species like the shark. He adds, that in the gulph of Guinea they follow thips for the fake of the offals, and hence the Dutch give them the name of dung-fish. Though so small. they can keep pace with ships in their swiftest courfe.

PILOUTAI, a town of Chinese Tartary, near the Hoang-ho, 308 miles W. of Pekin. Lon. 126.

39. E. Perro. Lat. 40. 38. N.

PILPAY, a celebrated Bramin, who flourished about A. A. C. 250. He wrote a book of fables, which has been translated into most of the languages of Europe.

(1.) PILSEN, a circle or province of Bohemia, abounding in theep, and famous for excellent

cbeefe.

(2.) PILSEN, a handsome and strong town of Bohemia, capital of the above circle. In 1422 and 1453, it was besieged by the Hussites, but without success. In 1553, it was taken by George Podiebrad; in 1618 by Count Mansfeld, and in 1621 by Count Tilly. Pilsen is scated at the conflux of the Miza, Radbuza, and Watto; 44 miles SW. of Prague, and 80 S. of Dressen. Lon. 7. 30. E. Lat. 49. 39. N.

into a flame. Zin?

PHESNA, (or Pilzow, a town of Little Po-PHESNO, ) land, in the palatinate of Sandoroiz, feated on the Wilfake; 50 miles E. of Cracow, and 56 SW. of Sandomitz. Lon. 21. 10. E. Lat. 50. O. N.

PHLS FING, a town of Lower Bayaria, 8 miles ENE, of Ding-llingen, and 2 N. of Landau.

- (1.) PILTEN, a divition of Courland, which lies in Courland Proper, and derives its name from the ancient callle or palace of Pitten, built by Valdemar II. king of Denmark, about 1220. when he founded a bithop's fee in this country for the conversion of its Pagan inhabitants. This diffrict afterwards fucceffively belonged to the Germans, the king of Denmark, the duke of Courland, and to Poland; and by virtue of the instrument of regency drawn up for it in 1717, the government was lodged in 7 Polith fenators or counfellors, from whom an appeal lies to the king. The bishop of Samogitia also styles himfeif bishop of Pilten. The most remarkable part of this diffrict is the promontory of Domefinele, which projects northward into the gulf of Livonia. From this cape a fand bank runs 4 German miles farther into the fea, half of which lies under water, and cannot be differred. To the east of this promontory is an unfathomable abyfs, which is never observed to be agitated. For the safety of vellels bound to Livonia, two fquare beacons bave been erected on the coast, near Domesness church, opposite to the fand bank, and facing each other. One of these is 12 fathoms high, and the other 8; and a large fire is kept burning on them from the first of August to the first of Jamuary. When the mariners fee thefe fires appear as one in a direct line, they may conclude that they are clear of the extremity of the fand bank, and confequently out of danger; but if they fee both beacons, they are in danger of running upon it. The diffrict of Pilten contains 7 parifhes, and ieveral villages. The inhabitants are chiefly Lu-
- (2.) PILTEN, or PYLTYN, the capital of the above diffrict, feated on the Windaw, between Golding and Fort Windaw, Lon. 22, 10, E. Lat. 57, 15, N.

PILULÆ, pills. See PHARMACY, Index.

PILULARIA, in botany, Pepper Grass, a genus of plants in the class Cryptogamia, and order of Filices; ranking in the natural method in

the 55th order Filices.

PILUM, a miffire weapon used by the Roman foldiers, and in a charge darted upon the enemy. Its point, we are told by Polybius, was so long and small, that after the first ducharge it was generally so beat as to be rendered usels. The legionary toldiers made use of the pilum, and each man carried two. The pilum underwent many alterations and improvements, infomuch that it is impossible with any precision to describe it. Julius Scanger laboured much to give an accurate

account of it. It appears to have been formetion round, but most commonly square, to have been two cubits long in the staff, and to have had niron point of the same length hooked and it at the end. Marius made a material important in it; for during the Cimbrian war, he is contrived it, that when it stuck in the end hield, it should bend down in an angle in the where the wood was connected with the mand thus become useless to the person who the ed it.

Pimpernel, water. See Veronica. Pimpernel, yellow. See Lysimachia. MPILLO, a species of Cactus.

MPINELLA, BURNET SAXIFRAGE; a genus t digynia order, belonging to the pentandria of plants; and in the untural method, rankader the 45th order, Umbellatæ. There are its; the most remarkable are.

Pinginella Anisum, the common anife, anomal picut, which grows naturally in E; but is cultivated in Malta and Spain, from or the feeds are annually imported into Bri-The lower leaves of this plant are divided bace lobes, which are deeply cut on their; the stalk rifes a foot and a haif high, directly into several stender branches, garnished barrow leaves, cut into three or four narrow nits, terminated by pretty large loose ummonposed of smaller umbels or rays, which on pretty long footstalks. The slowers are and of yellowish white; the seeds are obmit swelling.—The former species requires

no culture; the latter is too tender to be cultivated for profit in this country. However, the feeds will come up if fown in the beginning of April upon a warm border. When they come up, they should be thinned, and kept clear of weeds, which is all the culture they require.

2. PIMPINELLA MAJOR, or greater burnet faxifrage, growing naturally in chalky woods, and on the fides of the banks near hedges, in several parts The lower leaves of this fort are of England. winged; the lobes are deeply fawed on their edges, and fit close to the midrib, of a dark green. The stalks are more than a foot high, dividing in-to four or five branches. The lower part of the stalk is garnished with winged leaves, shaped like those at the bottom, but smaller: those upon the branches are short and trisid; the branches are terminated by fmall umbels of white flowers, which are composed of smaller umbels or rays. The flowers have 5 heart-shaped petals, which turn inward, and are succeeded by two narrow, oblong, channelled feeds. Both these species are used in medicine. The roots of pimpinella have a grateful, warm, very pungent tafte, which is entirely extracted by rectified spirit: in distillation the menstruum arises, leaving all that it had taken up from the root united into a pungent aromatic refin. This root promises, from its sensebie qualities, to be a medicine of considerable utility, though little regarded in common practice: the only officinal composition in which it is an ingredient, is the pulvis ari compositus. Stahl, Hoffman, and other German phylicians, are extremely foud of it; and recommend it as an excellent stomachie, resolvent, detergent, diuretic, diaphoretic, and alexipharmac. They often gave it with success, in scorbutic and cutaneous disorders, foulness of the blood and juices, tumors and obitructions of the glands, and difeases procceding from a deficiency of the fluid fecretions Boerhaave directs the use of it in asthmatic and hydropic cases, where the strongest resolvents are indicated: the form he prefers is a watery infusion; but the spirituous t'ncure posfelles the virtues of the root in much greater perfection. Anifeeds have an aromatic finell, and a pleafant warm tafte, accompanied with a degree of sweetness. Water extracts very little of their flavour; rectified spirit the whole. The seeds are in the number of the four greater hot feeds: their principal use is in cold flatulent disorders, where tenacious phlegm abounds, and in the gripes to which young children are subject. Frederic Hoffman strongly recommends them in weakness of the stomach, diarrhœas, and for firengthening the tone of the vifcera in general: and thinks they well deferve the appellation given them by Helmont, intestinorum solamen. finaller kind of anifeeds brought from Spain are preferred.

\* PIMPING. adj. [pimple mensch, a weak man, Dutch.] Little; petty: as, a pimping thing. Skinner.

PIMPLA, a mount ain of Macedonia, near Olympus, facred to the Mules, hence called Pim-PLE E.

(1.) \* PIMPLE. n. f. [pompette, Fr.] A small

red puffule.—If Rofalinda is unfortunate in her A horny induration of the membranes of the acmole, Nigranilla is as unhappy in a pimple. Spec-

If e'er thy gnome could spill a grace,

Or raife a pimple on a beauteous face. Pope. -The rifing of a pimple in her face will make her

keep her soom two or three days. Law.

(2.) PIMPLES, CURE FOR. By mixing equal quantities of the juice of house-leek, fedum minus, paffed through paper, and of spirit of wine rectitied by itself, a white coagulum of a very volatile nature is formed, which Dr Bughart commends for curing pimples of the face; and fays, that the thin liquor feparated from it with fugareardy is an excellent remedy for thick viscid phlegm in the breaft.

PIMPLEÆ, and and names given to the Muses, PIMPLEADES, from Mount PIMPLA. Hor.

i. Od. 1. 26. Strab. 10.

\* PIMPLED. adj. [from pimple.] Having red puffules; 'ull of pimples: as, his face is pimpled. PIMPRANA, an ancient town of India, on the Indus. Arrian.

PIMSANIM, a town of Chinese Tartary; 35

miles SW. of Ning-Yuen.

(1.) \* PIN. n. f. lespingle, Fr. spina, spinula, Lat. spilla, Italian; rather from pennion, low Latin. Isidore.] I. A thort wire with a sharp point, and round head, used by women to fasten their cloaths .- I'll make thee cat iron like an oftridge, and fwallow my fword like a great pin, ere thou and I part. Shak .-

Whatever foirit, careless of his charge, His post neglects, or leaves the fair at large, Shall feel tharp vengeance foon o'ertake his

fina.

Be stopt in vials, or transfixt with tins. 2. Any thing inconfiderable, or of little value. Soon after comes the cruel Saracen,

And flernly looks at him, who not a pin Does care for look of living creature's eye.

Spenfer. His fetch is to flatter to get what he can; His purpose once gotten, a pin for thee then. Tuffer.

Tut, a pin; this shall be answer'd. Shak. - Tis not a pin matter whether the fact be true or falfe. L'Estrange. 3. Any thing driven to hold things together; a peg; a bolt .-

With pins of adamant And chains, they made all faft. Milton. 4. Any flender thing fixed in another body.-

Bedlam beggars, with roaring voices, Stick in their numb'd and mortified bare arms, Pins, wooden pricks, nails, fprigs of rofemary.

.- These bullets shall rest on the pins; and there must be other pins to keep them. Wilkins. 5. That which locks the wheel to the axle; a linch pin. 6. The central part .- Romeo is dead, the very pin of his heart cleft with the blind hautboy's but haft. Sh k. 7. The pegs by which muficians intend or relax their firings. 8. A note; a strain. In low language.—A fir tree, in a vain spiteful bumour, was mightily upon the pin of commending itself. L'Estrange.-As the woman was upon the peevish pin, a poor body comes, while the floward fit was upon her, to beg. L'Estrange. 9.

Hanmer. Skinner feems likewife to fay the lane I should father think it an inflammation, who causes a pain like that of a pointed body pious the eye .-

Biind with the pin and web. 10. A cylindrical roller made of wood .-

They drew his brownbread face on pres

And made him stalk upon two rolling him

11. A noxious humour in a hawk's foot. Ad (2.) PINS, in commerce, are made of brass ve In 1543, by statute 34 and 35 of Henry VIII. or vi. it was enacted, "That no person shall past fale any pinnes but only fuch as shall be don't headed, and have the heads foldered fait to fhank of the pins, well smoothed, the shank of fhapen, the points well and round filed, com and sharpened." From the above extract it has appear that the art of pin-making was but of l invention, probably introduced from France: that our manufactories fince that period have so derfully improved. Though pins are appa fimple, their manufacture is curious and co The following account of it is given in Elli pagna of London. "When the brass which the pins are formed, is first received manufactory, it is generally too thick for the pose of being cut into pins. The first ox therefore is that of winding it off from one to another with great yelocity, and causage pass between the two, through a circle in a of iron of smaller diameter: the wire bear ! reduced to its proper dimensions, is strated drawing it between iron pins, fixed in a bed a zig-zag manner, but fo as to leave 1 line between them: afterwards it is call lengths of 3 or 4 yds, and then into imile every length being fufficient to make fix pal end of these is ground to a point, which formed when I viewed the manufactor who fat each with two fmall grinding left fore him, turned by a wheel. Taking up 1 ful, he applies the ends to the coarfell of the stones, being careful at the same time to each piece moving round between his firem that the points may not become it; he that them a smoother and sharper point, by app them to the other stone, and by that means a of 12 or 14 years of age is enabled to point a 16,000 pins in an hour. When the wire is pointed, a pin is taken off from each end, this is repeated till it is cut into fix pieces next operation is that of forming the heads, of they term it, bead-frinning; which is done means of a fpinning-wheel, one piece of win ing thus with aftonishing rapidity wound re another, and the interior one being drawn leaves a hollow tube between the circumvolu it is then cut with theers; every two circui tions or turns of the wire forming one head; are foftened by throwing them into iron pass placing them in a furnace till they are red As foon as they are cold, they are diffributed children, who fit with anvils and hammen them, which they work with their feet, by of a lathe, and taking up one of the lengths

rhich lie before them, and catching one at the exremity, they apply them immediately to the anil and hammer, and by a motion or two of the and, the point and the head are fixed together in such less time than it can be described, and with dexterity only to be acquired by practice; the ectator being in continual apprehension for the steey of their singers ends. The pin is now siithed as to its form, but still it is merely brass; is therefore thrown into a copper, containing a slution of tin and the leys of wine. Here it remins for some time; and when taken out assumes white though dull appearance: in order therefore give it a polish, it is put into a tub containing quantity of bran, which is fet in motion by ming a shaft that runs through its centre, and us by means of friction it becomes perfectly right. The pin being complete, nothing remains at to separate it from the bran, which is perfored by a mode exactly fimilar to the winnowing f corn; the bran flying off and leaving the pin thind fit for immediate fale. See NEEDLE,

To Pin. v. a. [from the noun. 1. To fasten ith pins.—Tis only a paper pinn'd upon the reaft. Pope .-

Not Cynthia when her manteau's pinn'd awry, E'er felt fuch rage.

. To fasten; to make fast. -Our gates,

Which yet feem shut, we have but pinn'd with rushes. Shak. Macbetb. To join; to fix; to fallen .- She lifted the meels from the earth, and so locks her in emncing, as if the would pin her to her heart. If removing my confideration from the imretion of the cubes to the cubes themselves, I pin this one notion upon every one of them. By of Bodies .-

I've learn'd how far I'm to believe

Your pinning oaths upon your fleeve. Hudibras. They help to cozen themselves, by chusing to their faith on fuch expolitors. Locke. - It canbe imagined, that so able a man should take hauch pains to pin fo closely on his friend a my which, if he himself thought incredible, he mid not but also think ridiculous. Locke. findun, Sax.] To shut up; to inclose; to conk; as, in pinfold. This written like to pen. all this be willingly granted by us, which are culed to pin the word of God in so narrow um, let the cause of the accused be referred to e accuser's conscience. Hooker.

PINACIA, among the Athenians, were tablets brais inscribed with the names of all those citims in each tribe who were duly qualified and illing to be judges of the court of Areopagus. hele tablets were cast into a vessel provided for c purpose, and the same number of beans, 100 ting white, and all the rest black, were thrown to another. Then the names of the candidates id the beans were drawn out one by one, and ky whose names were drawn out together with k white beans were elected judges or fenators. solon's time there were only four tribes, each f which chose 200 senators; but the number of nbes afterwards increasing, the number of sena-Vol. XVII. Thou shalt be pinch'd

As thick as honey-combs. Shak. Tempest. -He would pinch the children in the dark fo hard, that he left the print in black and blue. Arbutbnot. 4. To press between hard bodies. 5. To gall; to fret.—As they pinch one another by the dispofition, he cries out, no more. Shak. Ant. and Cleop. 6. To gripe; to oppress; to straiten.-Want of room upon the earth's pinebing a whole nation, begets the remediless war. Raleigh's Effays.

She pinch'd her belly with her daughter's too.

Dryden. -Nic. Frog would pinch his belly to fave his pocket. Arbutbnot. 7. To distress; to pain. Avoid the pinching cold and scorelling heat.

The sharp year pinches. Thomfon's Autumn. 8. To press; to drive to difficulties.—The beaver, when he finds himself hard pineb'd, bites 'em off. L'Effr.—The respondent is pinebed with a strong objection, and is at a loss for an answer. Watts, 9. To try thoroughly; to force out what is contained within.—This is the way to pinch the ques-

(2.) \* To Pinch. v. n. 1. To act with force, so as to be felt; to bear hard upon; to be puzzling. -A difficulty pincheth. Glanville.-

But thou

See'st where the reasons pineb, and where they 2. To spare; to be frugal.—There is that waxeth

rich by his wariness and pinching. Ecclus. xi. 18.-The poor that scarce have wherewithal to eat, Will pineb and make the finging boy a treat.

Dryden. The bounteous player outgave the pinching Dryden.

PINCHBECK, n. J. An artificial metal, compounded of COPPER, and ZINC. The proportions, according to Dr Thomfon, are thefe: "When the alloy contains 3 parts of zinc and 4 of copper, it assumes a colour nearly the same with gold, but it is not fo malleable as brass. It is then called pinchbeck, prince's metal, or Prince Rupert's metal."
PINCHFIST. PINCHPENNY. n. f. [pinch, fift,

and penny.] A miser. Ains.

PINCHINA. See Pichincha.

\* Pinchpenny. See Pinchpist.

PINCHUGA, a town of Russia, in Tobolsk. PINCHUN, a town of China, in Chan-si.

(1.) PINCKNEY, an island near the coast of

S. Carolina.

(2.) PINCENEY, a diffrict of S. Carolina, lying W. of Camden and Cheraw districts. It is divided into four counties, named York, Chefter, Union, and Spartanburgh. It contained, in 1795, 25,870 citzens, who fend to the State legislature, 3 fenators and 9 reprefentatives; and in conjunction with Wathington, fend one member to Congrefa.

Pinckneyville, a post town of S. Carolina, in Union county, capital of the above diffrict. It is seated on Broad River, at the mouth of the Pacolet, 75 miles NW. of Columbia.

PINCO, a town of Peru, in Atun-xauxa.

PINCUM, in ancient geography, a town of Mæsia Superior, now called GRADISCA.

PINCUSHION. n. f. [pin and cufbion.] A small bag stuffed with bran or wool on which pins are fluck.—She would ruin me in filks, were not the quantity, that goes to a large pincu/bion, sufficied to make her a gown and petticoat. Guardian.-Thou art a retailer of phrases, and don dea a remnants of remnants, like a maker of pinculous Congreve.

PINCZESTI, a town of European Turkey, a

Moldavia; 28 miles WSW. of Jash.

PINDAR, the prince of lyric poets, was bon at Thebes, about 520 years B. C. He received first mutical instructions from his father, who a flute-player by profession; after which, accord ing to Suidas, he was placed under Myrtis, 2 b dy of distinguished abilities in lyric poetry. Dering this period he became acquainted with poetels Corinna, who was likewise a student under Myrtis, and Paufanias fays, was or: the most beautiful women of her time. Putard tells us, that Pindar profited from the lesses which Corinna, more advanced in her finding The first poetical disgave him at this school. fions of a genius, so full of fire and imaginate as that of Pindar, would be wild and luxurely and Lucian has preferred fix verses, said to be been the exordium of his first essay; in with crowded aimost all the subjects for long, with cient history and mythology then furnished. pon communicating this attempt to Corima told him smiling, that he should sow with the band, and not empty his whole fack at once. I dar, however, foon quitted the leading tring his poetical nurses, and became the disopted Simonides, now in extreme old age: after si he foon surpassed all his masters, and acqu great reputation over all Greece: but, was honoured in his own country than elsewhere; at Thebes he was often faid to be vanquiled the mufical and poetical contests, by card of inferior merit. Indeed at that period fame in these accomplishments was to be an red, otherwise than by entering these life. cordingly we find, that both Myrtis and Cari na publicly disputed the prize with him Thebes. He obtained a victory over Myntis, le was vanquished five different times by Curist But this, fays Paulanias, was because the judget were more fentible to the charms of beauty that to those of mulic and poetry. When he quitted that city, as his judgment was matured, he and ed the errors for which he had been chanded and fuddenly became the wonder and delight all Greece. Every hero, prince, and polentate defirous of lafting fame, courted the mule of Pa dar. He feems to have been often present at the festivals, of the Olympian, Pythian, Nema and Ishmian games, as may be inferred from veral expressions in the odes which he composite for the victors in them all. Those at Oymp who were ambitious of having their atchievements celebrated by Pindar, applied to him for an ode which was first fung in the Prytaneum or tose hall of Olympia, where there was a banqueling room, fet apart for the entertainment of the comquerors. Here the ode was rehearled by a cho

PIN

us, accompanied by inftruments. It was aftervards performed in the same manner at the triimphalentry of the victor into his own country, in rocessions or at the sacrifices that were made with reat pomp and folemnity on the occasion. There s no great poet in antiquity whose moral characer has been less censured than that of Pindar. Pluarch has preferved a fingle verse of his Epicedium r Dirge that was fung at his funeral; which, iort and fimple, as it is, implies, great praise: bu man was pleasing to strangers, and dear to bis illew-citizens. His works abound with precepts the purest morality: and it does not appear at he ever traduced even his enemies, comfortg himself, for their malignity, by a maxim which : inferted in his first Pythic, and which afterwards cam eproverbial, That it is better to be envied than tied. Paufanias fays, Pindar's character as a poet as confecrated by the god of verse himself, who, van express oracle, ordered the people of Del-10s to let apart for Pindar one half of the firstit offerings brought by the religious to his rine, and to allow him a conspicuous place in stemple, where in an iron chair he used to sit d fing his hymns in honour of that god, air was remaining in the time of Pausanias, seral centuries after, and shown to him as a relic nthy of the functity and magnificence of that Fabricius tells us, that Pindar lived to the e of 90; and according to the chronology of Blair, he died 435 years B. C. aged 86. His low citizens erected a monument to him in the podrome at Thebes, which was extant in the e of Paulanias; and his renown was fo great a his death that his posterity derived very contrable honours and privileges from it. When mander the Great attacked the city of Thebes, gave express orders to his foldiers to spare the ate and family of Pindar. The Lacedemonians I done the same before this period; for when Travaged Bozotia and burned the capital, the bwing words were written upon the door of poet: Forbear to burn this bouse, it was the g of Pindar Respect for the memory of peat poet continued so long, that, even in tarch's time, the best part of the sacred vicat the Theoxenian festival was appropriated iis descendants.

INDARIC one, in poetry, an ode formed in ation of the manner of Pindar. See POETRY.

INDASUS, a mountain of Troas.

INDENISSUS, a town of Cilicia, on the borof Syria. Cicero, when proconful of Alia, tit after a fiege of 25 days. Gic. Ep. ii. 10. ) PINDUS, in ancient geography, an extenchain of mountains, in Theffaly, inhabited by tent people of Epirus and Thessaly, separat-Macedonia, Thessaly, and Epirus; having edonia on the N. the Perrhoebi on the W the Dolopes on the S. (Strabo.) It was facred pollo and the Muses

13.) PINDUS, a Doric city of Ætolia, fituatn a cognominal river, which falls into the Ce-

us. Strabo.

PINDUST. n. f. [pin and duft.] Small particles ctal made by pointing pins.—The little parts indust, when mingled with sand, cannot, by mingling, make it lighter. Digby.

(1.) \* PINE. n. f. [pinus, Latin; pin, French.] The pine-tree hath amentaceous flowers or katkins, which are produced at remote diffances from the fruit, on the same tree, the feeds are produced in squamous cones; to which should be added, that the leaves are longer than those of a firtree, and are produced by pairs out of each fheath. Miller .-

You may as well forbid the mountain pines -To wag their high tops.

Thus droops this lofty pine, and hange his fprays. Shak.

(2.) Pine, in botany. See Pinus.
(3.) Pine, Ground. See Teucrium.

(4.) PINE ISLAND, an island in the Guif of Mexico, near the S. coast of W. Florida. Lon. 88. 18. W. Lat. 30, 18, N.

(s.) Pine, Low Heath, a species of Coris. (6.) PINE, STINKING GROUND. See CAM-

PHOROSMA.

(1.) \* To PINE. v. n. [piman, Saxon; pijnen, Dutch.] 1. To languish; to wear away with any kind of mifery.-

My hungry eyes, through greedy covertife, With no contentment can themselves suffice; But having, pine, and having not, complain.

Spenfer,

I burn, I pine, I perish, If I atchieve not this young modest girl. Shak. Since my young lady's going into France, the fool hath much pined away. Sbak.

See, fee the pining malady of France. Shak. -You shall not mourn, but pine away for your

iniquities. Ezekiel, xxiv. 23 .-The wicked with anxiety of mind Shall pine away. Sandys,

To me, who with eternal famine pine, Alike is hell, or paradife or heav'n. Milton.

Welcome the new, whose ev'ry day, Restoring what was snatch'd away By pining fickness from the fair,

That matchless beauty does repair. Waller. The roses wither, and the lilies pine. Tickel.

2. To languish with desire .-We may again

Do faithful homage and receive free honours: All which we pine for.

We stood amaz'd to see your mistress mourn, Unknowing that she pin'd for your return. Dryd. Your new commander need not pine for acr tion. Philips.

(2.) \* To Pine. v.a. 1. To wear out; to make to languish.-

Part us; I towards the north,

Where shivering coid and sickness pines the clime.

Look rather on my pale cheek pin'd: There view your beauties. Carew.

Beroe pin'd with pain,

Her age and auguish from these rites detain.

Thus tender Spencer liv'd, with mean repast Content, depress'd with penury, and pin'd In foreign realm. Philips. 2. To grieve for; to bemoan in filence .-

Virtue in her shape how lovely, saw, and

pin'd His lofe. Milton. Bbbb 2 PINEA

PINEA, or PIGNE, in commerce, is a term used in Peru and Chili, for a kind of light, porous masses, or lumps, formed of a mixture of mercury and filver dust from the mines. The ore, or mineral, of filver, when dug out of the veins of the mine, is first broken and then ground in mills for the purpose, driven by water with iron pesties, each of 200 pounds weight. The mineral, when thus pulverized, is next fifted, and then worked up with water into a paste; which, when half dry, is cut into pieces, called cuerpos, a foot long, weighing each about 2,500lb. Each piece or cuerpo is again kneaded up with fea-falt, which, diffolving, incorporates with it. They then add mercury, from 10 to 201b. for each cuerpo, kneading the paste afresh until the mercury be incorporated therewith. This office, which is exceedin ly dangerous on account of the noxious qualities of the mercury, is always made the lot of the poor Indians. This amalgamation is continued for 8 or 9 days; and foine add lime, lead, or tin ore, &c. to forward it; and, in some mines, they are obliged to use fire. To try if the mixture and amalgamation be sufficient, they wash a piece in water; and if the mercury be white, it is a proof that it has had its effect; if black, it must be ftill farther worked. When finished, it is fent to the lavatories, which are large basons that empty successively into one another. The paste, &c. being laid in the uppermost of these, the earth is then washed from it into the rest by a rivulct turned upon it; an Indian, all the while, flirring it with his feet, and two other Indians doing the like in the other basons. When the water runs quite clear out of the basons, the mercury and filver are found at bottom incorporated. This matter they call pella, and of this they form the pineas, by expressing as much of the mercury as they can; first, by putting it in woollen bags, and prelling and beating it strongly: then, by stamping it in a kind of wooden mould, of an octagonal form, at bottom whereof is a brafs plate pierced full of little holes. The matter, when taken out of the mould, is laid on a trivet, under which is a large veffel full of water; and the whole being covered with an earthen head, a fire is made around. The mercury still remains in the mass and is thus reduced into fames, and, at length condenfing, it is precipitated into the water, leaving behind it a mass of fiver grains of different figures, which only joining or touching at the extremes, render the matter very porons and light. This, therefore, is the pinea, or pigne, which the workmen endeavour to feli feeretly to veffels trading to the South Sea; and from which those, who have ventured to engage in fo dangerous a commerce, have made fuch vaft gains. Indeed the traders herem must be very careful; for the Spanish miners are arrant knaves, and to make the pignes weigh the more, they often fill the middle with fand or iron.

(1.) \* PINEAL. adj. [pineale, Fr.] Resembling a pine apple. An epithet given by Des Cartes from the form, to the gland which he imagined the feat, of the foul .- Courtiers and ipaniers exactly refemble one another in the pineal gland.

Arbuthnot.

(2.) PINEAL GLAND, a gland in the 3d ventricle

of the brain, fo called from its refembling a fine See ANATOMY, Index.

(1.) \* PINE-APPLE. n. f. The Anana named from its resemblance to the cone of pines. - The fine apple hath a flower confilling of one leaf, divided into three parts, and is funnel-shaped: the embryos are produced in the tubercies: thefe become a fleshy fruit full of juice: the feeds, which are lodged in the tubercles, are very fmall and almost kindey-shaped. Miller .- Try if any ward can give the take of a pine-apple. Locke.-It ! child were kept where he never taw but black ad white, he would have no more ideas of forther than he that never tafted a pine-apple, has of the particular relish. Locke.

(2.) PINE-APPLE. See BROMELIA.
(3.) PINE-APPLE, WILD. See RENEALNIA. (1.) PINEAU, Gabriel Dv, an emineut Fred lawyer, born at Augers in 1573. After practical fome time at Angers, he went to Paris, and place with eclat before the parliament and great to cil. Upon his return to Angers, he because counfellor in the prefidial court. He was culd ed by all the neighbouring provinces, and badas active hand in all the great affairs of his tea Mary de Medicis made him mafter of reques and, in her difgrace, wished to support beselve his credit and counfels; but Du Pineag, dutiful to the monarch and his mother source ed to inculcate fentiments of peace. In this Lewis XIII. by way of reward, appointed a mayor and captain-general of the city of August a fituation in which he merited the flattering the of Father of the people. He had no respect de fons; for he was equally accessible to the post the great. This worthy citizen died the Oct. 1644, aged 71. His house was a kind of cademy, where regular conferences were and attended by young officers, advocates, ther literary characters. His writings are, Lt. tin notes, in addition to those of Du Moules the canon law, printed along with the was that eminent lawyer by the care of Francis le 2. Commentaries, observations, and consultations upon feveral important questions respecting laws both of Anjou and of France, with differtations upon different subjects, &c. note in 1725 in, 2 vols. fol. by Livomere, with remain

(2.) PINEAU, OF PINEUS, Severin De, and of Chartres, and first furgeon to the king of Free He was very fkilful in lithotomy; and haven hind hun, 1. . 37. N. PINEG, a town of Russia, in Archangel, on e Pinega; 48 miles E. of Archangel. Lon. 59. . E. Ferro. Lat. 64. 30. N.

PINEGA, a river of Russia, which rises in Usg, and runs into the Dwina; 8 miles E. of solomgori, in Archangel.

PINEL, a town of France, in the department

the liere; 9 miles from Vienne. MNELLI, John Vincent, a learned Italian, mat Naples, son of Count Pinelli, a noble Gede, who had fettled in that city, and had acired a handsome fortune in trade. After rering a liberal education he repaired to Padua, the age of 24. He had an excellent library tifting of a choice collection of books and \$5. which he continued to enrich till the hour his death. His literary correspondence, not 7 in Itay, but through the most of Europe, rured him all the new works worthy of a place m coilection. The authors were often forward my their respects to him. In many cities of ly he had persons employed to search, at least a month, the stalls of those artificers, who ke use of old parchments, such as lute-makers, ewrights, and others; and thus often faved defiruction fome valuable fragments. His on for knowledge embraced all the sciences; bistory, medals, antiquities, natural history, tany, were his favourite studies. He was ed from ail quarters, by the learned world. responded with Justus Lipsius, Joseph Sca-Sigonius, Possevin, Peter Pithou, and many m, who all paid the highest compliments to tendition. Insensible to all the pleasures of hand acquainted only with those of the mind, had a great diffike to plays, entertainments, ms, a devery thing which most excites the cuby of other men. During 43 years that he at Padua, he was never known to be out of but twice; once on occasion of a plague infelled it; and once on a voyage to es, which he made at the earnest solicitation is friends. In short, Pineili was generous, ipathizing, and compassionate, particularly to nof letters, whose wants he often anticipated. \$ zeal for the advancement of science rendered wery communicative of his knowledge and of books. He died in 1601, aged 68, without ing published any work. Paul Gualdo, who written Pinelli's life, fays, that when his rich Fary was transported by sea to Maples, it was exted up in 130 chefts, of which 14 contained SS.; but it did not go whoily to his heirs. le senate of Venice caused their seal to be set on the M.SS. and took away what concerned saffairs of the republic, to the number of 200 res .- "I compare (says De Thou) Pinelli to Pomponius; for, as that illustrious Roman called Attic, Pinclii also bore the title of Venem, on account of the great affection which the public of Yenice had for him.

(1.) PINES, or PINEZ, an island on the SW. sult of Cuba, from which it is divided by a deep rait, 18 miles wide. The island is 25 miles long

and 15 broad, and abounds with pines, and good pasture. Lon. 83. 25. W. Lat. 21. 30. N.

(2.) PINES, BAY OF, a bay on the coast of W.

Florida. Lon. 88. 21. W. Lat. 30. 20. N.

(3.) PINES, CAPE, OF CAPE PINE, a cape on the S. coast of Newfoundland, 24 miles W. of Cape Race. Lon. 53. 20. W. Lat. 46. 42. N.

(4.) PINES, ISLAND OF, an island in the S. Pacific Ocean, near the S, coast of New Caledonia, fo named by Capt. Cook from its abounding with tall pines. It is about 14 miles broad, but remarkably high in the middle, being quite a pointed hill, floping on all fides to the extremities which are low. Lon. 167. 43 E. Lat. 22. 38. S.

(5.) PINES, ISLAND OF, an island of S. America, near the coast of Terra Firma, with a good harbour, formed by two adjacent isles and the main land; 123 miles E. of Porto Bello. Lon. 80. 15. W. Lat. 9. 12. N. or according to Mr Cruttweil, Lon. 77. 36. W. Lat. 8. 35. N.

(6.) PINES, ISLAND OF THE, one of the Samba-

loe isles. See DARIEN, § I, i.

PINET, Antony Du, lord of Noroy, a native of Bifançon, who lived in the 16th century. He was strongly attached to the Protestant religion, and a bitter enemy to the church of Rome. His book, entitled La Conformité des Eglises Resormés de France, de l'Eglife p' imitive, Lyons, 1564, in 8vo; and the notes he added to the French translation of the Fees of the Pope's Chancery, printed at Lyons, in 8vo. 1564, and reprinted at Amsterdam in 1700, in 12mo, plainly discover his sentiments. He published the last mentioned performance under this titre : Taxe des partles cafuelles de la boutique du Pape, in Latin'and French, with some notes taken from decrees, councils, and canona, to ascertain the discipline anciently observed in the church. His translation of Pany's Natural History, with notes, printed at Lyons, in 2 vol. folio, 1566, and at Paris, 1608, was much read. Pinet also publithed Plans of the principal fortresses in the world, at Lyons, 1564, in folio.

PINETZKOI, a town of Russia, in Archangel, on the Dwina; 60 miles SSE. of Archangel.

PINEY, a town of France, in the dep. of the Aude; 12 miles NE. of Troyes, and 134 SE. of

PINEZ. See PINES, No 1.

\* PINFEATHERED. adj. [pin and feather.] Not fledged; having the feathers yet only beginning to shoot.-

We see some raw pinfeather'd thing

Dryden. Attempt to mount. \* PINFOLD. n. f. [pindan, Sax. to shut up, and fold.] A place in which beats are confined. The English, nothing suspecting, are taken at an advantage, like theep in the pinfold. Spenjer on Ireland.-

I care not for thee.--If I had thee in Lipsbury pinfold, I would make thee care for me. Sbak. K. Lear .-

Confin'd and pester'd in this pinfold here. Milton.

Oaths were not purpos'd more than law To keep the good and just in awe, But to confine the bad and finful, Like moral cattle in a pinfuld.

Hudih. (1.) PING.

PINGUEDO. See FAT, § 3.

PINGUICULA, BUTTERWORT, 2 genus of the monogynia order, belonging to the diandria class of plants; and in the natural method, ranking under the 24th order, Corydales. There are four species; of which the most remarkable is

Pinguicula vulgaris, common butterquort, or Yorkshire Sanicle, grows commonly on bogs or low moift grounds in England and Scotland. Its leaves are covered with foft, upright pellucid prickles, fecreting a glutinous liquor. The flowers are pale red, purple, or deep violet colour, and hairy within. If the fresh gathered leaves of

this plant are put into the strainer through with warm milk from the cow is poured, and the mil fet by for a day or two to become accident, it so quires a confishency and tenacity, and new whey now cream separate from it. In this time is an extremely grateful food, and as such well by the inhabitants of the north of Sweden. The is no further occation to have recourse to t leaves; for half a spoonful of this prepared as mixed with fresh warm milk, will convert it is own nature, and this again will change anext quantity of fresh milk, and so on without of The juice of the leaves kills lice; and the mon people use it to cure the cracks or character cows udders. The plant is generally fund injurious to theep, by occationing in the but difease called the rot. But from experient made on purpose, and conducted with account it appears, that neither theep, cows, goals in or twine will feed upon this plant. When this plant is found, it is a certain indication as boggy foil. The Laplanders make an agree food with the milk of the rein-deer by the fel leaves of this plant, like that of the Sweder the milk of cows, and with the fame on

quences. PINGUID. adj. (pinguis, Lat.) Fat; ous. Little ufed .- Some clays are more and others more slippery. Mortimer.

(I.) PINGUIN, in geography, an i the Cape of Good Hope, abounding

(II.) PINGUIN, OF PENGUIN, in orall genus of birds of the order of palmipeds tinguished by Mr Latham by the following racters: The bill is strong, strait, more of bending towards the point, and furrowed at fides; the nostrils are linear, and placed in furrows; the tongue is covered with from pointing backwards; the wings are imal like fins, and covered with no longer is than the rest of the body, and therefore flight; the body is clothed with thick hot! thers, having broad shafts, and placed as of pactly as the scales of fishes; the legs are be thick, and placed very near the vent; the b are 4, all placed forwards, the interior are lod and the rest are webbed; the tail is very fust, co fifting of broad shafts scarcely webbed. Pinger are inhabitants of S. latitudes only; being, as in as is yet known, found only on the coafts of America from Port Defire to the Straits of Mar lan; and Frezier fays they are found on the coast as high as Conception. In Africa they see to be unknown, except on a small isle near !! Cape of Good Hope, which takes its name in them. They are found in vast numbers on in during the breeding feafen; for they feldom on shore but at that time: they form burn under ground like rabbits; and the illes they quent are perfectly undermined by them. The attitude on land is quite erect, and on that count they have been compared by fome to p mics, by others to children with white hibs. The are very tame, and may be driven like a flock fheep. In water they are remarkably active, and fwim with vaft ftrength, affifted by their wirgh which serve instead of fins. Their food in gent,

is fish; not but that they will eat grass like ife. Mr Lathan remarks, that this genus apits to hold the fame place in the fouthern dion of the earth that the awks do in the norm; and that, however authors may differ in nion on this head, they ought not to be con-uded with one another. The pinguin is never s but in the temperate and frigid zones S. of equator, while the awk only appears in the allel latitudes N. of the equator; for neither bese genera have yet been observed within the pics. Forster, in his voyage (vol. i. page 92.), 4 be faw one for the first time in lat. 48. S. are they ever met with nearer than 40° S. (Id. w. Dife. on Pinguins, Comment. Got. vol. 31.) wings of the pinguin are scarcely any thing than mere fins, while the awk has real wings gills, though they be but small. The former four toes on each foot, the latter only three. ile swimming, the pinguin finks wholly above breaft, the head and neck only appearing out tewater, while the awk, like most other birds, is on the surface. There are several other marities which serve to distinguish the two ra, but what we have mentioned are doubtufficient. "The bodies of the pinguin tribe our author) are commonly so well and closemered with feathers that no wet can pene-; and as they are in general excessively fat, cucumstances united secure them from cold. thre often been found above 700 leagues ited; and frequently on the mountains of m which they feem to ascend without diffih as the foles of their feet are very rough hited to the purpose." Mr Latham enumemoe different species of this genus, besides rarieties of the black-footed pinguin or DIO-

PINGUIN, ANTARCTIC, is about 25 inches and weighs about 111 lb. The bill is uprof 22 inches long; the upper parts of the are black, the under are glossy white; bethe chin there is a narrow streak of a blackthur, passing backward towards the hind radittle bent about the region of the ears; igs are much the fame as in the other spethe tail is cuneiform: the feathers, or ranitles, of which it is composed are black number 32; the legs are of a Besh colour, it soles of the feet are black. "This species Latham) inhabits the fouth sea, from 48° to tarctic circle; and is frequently found on on mountains and islands, which it ascends; pretty numerous species. Our last voyagers them in plenty in the Ille of Desolation. In ad they touched at not greatly distant, the were almost covered with the pinguins and the first probably of this fort.

INGUIN, BLACK-FOOTED, Or diomedea de-See Diomedea, No 1.

INGULN, COLLARED, is a very little less to papuan, being 18 inches long. The bill, is black, is fimilar to that of the patagongum; the irides are black: the eye is surd with a bare skin of a blood colour, of an ape, and three times as large as the eye ithe head, throat, hind part of the neck and back, wings, and tail, are all black; the

fore part of the neck, breast, belly, and thighs, are white, extending round the neck, where the white begins like a collar, except that it does not quite meet at the back part; the legs are black. This species inhabits New Guinea. It was also seen by Dr Forster near Kerguelen's Land; and again on two isles adjoining to the island of South Georgia.

4. Pinguin, crested, is a very beautiful species, 23 inches long; the bill is 3 inches long, and of a red colour, with a dask furrow running along on each fide to the tip; the upper mandible is curved at the end, the under is obtuse; the irides are of a dull red; the head, neck, back, and fides are black. Over each eye there is a stripe of pale yellow feathers, which lengthens into a creft behind, nearly four inches long; the feathers on each fide of the head, above this stripe, are longer than the rest, and stand upward, while those of the creft are decumbent, but can be erected on each fide at pleafure; the wings, or rather fins, are black on the outlide, edged with white; on the infide they are white; the breast and all the under parts are also white; the legs are orange, and the claws are dusky. The female has a streak of pale yellow over the eye but it is not prolonged into a creft behind as in the male. species inhabits Falkland Islands, and was likewife met with in Kerguelen's Land, or Isle of Detolation, as well as at Van Diemen's Land, and New Holland, particularly in Adventure Bay. They are called bopping pinguins and jumping jacks, from their action of leaping quite out of the water, on meeting with the least obstacle, for 3 or 4 feet at least: and indeed they often do this, without any seeming cause, unless to advance. This species seems to have a greater air of liveliness in its countenance than others, yet is in fact a very stupid bird, so much so as to suffer itself to be knocked on the head with a flick when on land. Forster says he found them difficult to kill, and when provoked, he adds, they ran at the failors in flocks, and pecked their legs, and spoiled their clothes. When angered too they erect their crests in a beautiful manner. birds make their nefts among those of the pelican tribes, living in tolerable harmony with them; and lay feldom more than one egg, which is white, and larger than that of a duck. They are mostly seen by themselves, seldom mixing with other pinguins. They are often met with in great numbers on the outer shores, where they have been bred. They frequently suffer themselves to be taken by the hand. The semales lay their eggs in burrows, which they eafily form with their bills, throwing out the dirt with their feet. In these holes the eggs are deposited on the bare The time of fitting is in October; but fome of the species, especially in the colder parts. do not fit till December, or even January. How long they fit is not known.

g. PINGUIN, MAGRILLANIC, is about the fize of the antarctic pinguin. They are about 2 fect and fometimes 24 feet long, and weigh 11 pounds. The bill is black, having a transverse band across near its tip; the head and neck are black, except a few markings here and there; the upper parts of the body and wings are of the same colour; the under parts of both are white from the breast, except a narrow band of black paffing at a little diftance within the white on the breaft, and downwards on each fide, beneath the wings quite to the thighs; the legs are of a reddith colour, irregularly spotted on the thighs; and the claws are black. This species, which is very numerous, inhabits the Straits of Magellan, Staten Land, Terra del Fuego, and Falkland iflands. Far from being timid, these birds will often attack a man and peck his legs. As food they are not at ail They often mix with fea wolves unpalatable. among the rushes, burrowing in holes like a fox. They fwim with prodigious swiftness. They lay their eggs in collective bodies, reforting in incredible numbers to certain spots, which their long refidence has freed from grafs, and to which were given the name of tozons .- Penrole observes, that they composed their nests of mud, a foot in height, and placed as near one another as may be. "The eggs (fays he) are rather larger than those of a goose, and laid in pairs. When we took them once, and fometimes twice in a feafon, they were as often replaced by the birds; but prudence would not permit us to plunder too far, left a fupply in the next year's brood might be prevented." They lay some time in November, driving away the albatroffes, which have hatched their young in turn before them. The eggs were palatable food, and were preferved good for 3 or 4 months.

6. PINGUIN, PAPUAN, is about 21 feet long, being a little bigger than the Cape Pinguin. This species inhabits the Isle of Papos, or New Guinea: and has been met with at Faikland Isles and Kerguelen's Land; it is often found among the

Patagonian pinguins.

7. PINGUIN, PATAGONIAN, is fo named, not only because it is found on that coast, but also because it exceeds in bulk the common pinguins as much as the people are faid to do the common race of men. It was first discovered by Captain Macbride, who brought one of them from Farkland Islands off the Straits of Magellan. length of the stuffed skin of this bird measured 4 feet 3 inches, and the bulk of the body feemed to exceed that of a Iwan. The bill was 41 mches long, flender, ftraight, bending on the end of the upper mandible, with no nostills. The tongue half the length of the bill, and fingularly armed with strong sharp spikes pointing backwards. The plumage is most remarkable, the feathers lying over one another with the compactness of the scales of a fish; their texture equally extraordinary; the shafts broad and very thin; the vanes unwebbed; the head, throat, and hind part of the neck, are of a deep brown colour; from each fide of the head to the neck are two lines of bright yellow, broad above, narrow beneath, and uniting haif way down; from thence the fame colour widens towards the breaft; fading away till it is lott in pure white, of which colour is the whole under fide of the body, a dufky line dividing it from the colour of the upper part. The whole back is of a very deep ath colour, almost dulky; but the end of each feather is marked with a blue inot, those about the junction of the wings larger and paler than the other. The wings are in this species, as in all the others, extremely short in spect to the size of the bird; hang down, have the appearance of fins, whose office ! perform; their length is only 14 inches; or outlide they are dufky, and covered with h like feathers, or at beft, with fuch whose hain fo broad and flat as fcarce to be diffinguished scales; those on the ridge of the wings con entirely of shaft; the larger, or quill feat have some very thort webs. The tail confi 30 brown feathers, or rather thin fliafis, rela ling split whale-bone; flat on the upper s concave on the under, and the webs that, connected, and briftiy. From the knees to end of the claws fix inches, covered with the pentangular black scales; the fore toe scale inch long, and the others fo remarkably that to evince the necessity of that strength of the which seems intended as a support to the its erect attitude; in the same manner asther the woodpecker is when it clings to the the trees: between the toes is a frong femile membrane, continued up even part of the da the middle claw is near an inch long, and the ner edge very sharp and thin; the interest fmall, and placed very high. The kan tremely tough and thick; which, with the nels of the feathers, guards it effects as This species, which was first me Falkland Islands, has fince been feen ale len's Land, New Georgia, and New Grins Rougamville caught one, which from hom tame as to follow and know the perlm and care of it: it fed on flesh, fish, and beed; after a time grew lean, pined away, at The chief food, when at large, is thought fifle; the remains of which as well as crabs fith, and molufex, were found in the This species is the fattest of the tribe; fore most so in January when they most are supposed to lay and fit in October are met with in the most deserted place flesh is black, though not very unpalate has been confidered as a folitary species now and then been met with in confideral They are found in the same places as the pinguins, and not unfrequently mixed will but in general show a disposition of assure with their own species.

8. PINGUIN, RED-FOOTED, or phaeton

fus. See PHAETON, 9 III, No 2.

9. PINGUIN, SMALL, Or, as Lathara the little pinguin, is about the five of a los-15 inches long. The bill, which is of a lour, is about 11 long, and shaped like that phaeton demerfus; the upper parts of from the head to the tail appear to be of reous blue colour, of which colour are of the feathers; the base of them, how brown black, and the shafts of each of the colour; the under parts from chin to white; the wings are dusky above and neath; the tail, which is exceedingly then, fitts of 16 stiff feathers, which are scarcely ! tible; the legs are of a dull red colour; the are dufky, and the claws are black. is pretty common among the rocks on the & of New Zealand, but they are most free

Dusky Bay. They make deep burrows on the fides of the hills, in which they lay their eggs: these holes are so thick in some parts, that a perfin is fearcely able to walk 3 or 4 steps without alling into one of them up to the knees. The ininbitants of Queen Charlotte's Sound kill them with sticks, and, after skinning them, esteem the flesh as good food. At New Zealand they ire named korora .- "These birds (fays Latham,) have found to vary both in fize and colour: ome are much finaller than others, quite black awe, and meafure only 13 inches in length; othen are rather larger, and of a plain lead-colour on the upper parts, and the wings black, though Mare white, or nearly fo, beneath. The legs in hele two last are marked with black at the ends fithe toes; and the claws are black."

PINGUS, a river of Myfia, which runs into the Janube. Plin. iii. c. 26.

PING-Y, a town of China, in Yun-nan.

Ping-Yang, a town of China, in Kiang-fi. PING-YUEN, two towns of China: 1. of the drank in Koei-tcheou, 985 miles SSW. of Pekin: . of the 3d rank, in Canton; 82 miles NW. of chao-tcheou.

PINHEIRA, a town of Portugal, in Beira, on

k Mondago; 15 miles SW. of Vifeu.

PINHEL, a fortified town of Portugal, in Beii, feited on a mountain. It has parith churches nd about 1600 inhabitants; 8 miles NE. of Alseids, and 45 SE. of Lamego. Lon. 11. 51. E. tro. Lat. 40. 33. N.

MN-HO, a town of China, in Fo-kien.

PINHOLE. n. f. [pin and bole.] A finall hole, ter as is made by the perforation of a pin.—The wast at first broke in a small pinhole. Wifeman. (1.) PINION. n. f. [pignon, French.] 1. The ant of the wing remotest from the body. bukespeare seems to use it for a scather or quill of be wing.-

He is pluckt, when hither He fends to poor a pinion of his wing. Shak.

How oft do they with golden pinions cleave The flitting thies? Spenser.

The God, who mounts the winged winds, Fast to his feet the golden pinions binds. Tho' fear should lend him pinions like the wind, Yet swifter fate will seize him from behind. Swift. The tooth of a finaller wheel, answering to that a larger. 5. Fetters on bonds for the arms.

injevertb. (2.) Pinion, in mechanics, an arbor, or spindle, the body whereof are feveral notches, which tch the teeth of a wheel that ferves to turn it und, or it is a leffer wheel that plays in the teeth

a larger.

To Pinion. m. a. [from the noun.] 1. To nd the wings.—They become facrifices to the constancy of fortune, whose wings they thought their felf-wisdom to have pinioned. Bacon. o confine by binding the wings; to main by tting off the first joint of the wing. 3. To bind c arm to the body .-

A fecond spear sent with equal force, His right arm pierce'd, and holding ou, bereft His use of both, and pinion'd down his left. Dryd. Vol. XVII. Part II.

4. To confine by binding the elbows to the fides. Swarming at his back the country cry'd,

And feiz'd and pinion'd brought to court the knight.

5. To flackle; to bind.-Know, that I will not wait pinion'd at your master's court. Shak. Ant and Cleop .- You must be pinion'd. Shak .-

That my free foul may use her wing, Which now is pinion'd with mortality. Herbert. He's pinion'd up by formal rules of state.

Norris.

6. To bind to. This is not proper.-

While on fame's triumphant car they ride,

Some flave of mine be pinion'd to their fide. Pope. (1.) \* PINK. n. f. [ pince, Fr. from pink, Dutch, an eye; whence the French word æillet; earyophilhun, Lat.] 1. A fmall fragrant flower of the gilliflower kind.—In May and June come pinks of all forts; especially the blush pink. Bucon's Essays. 2. An eye; commonly a small eye: as, pink-eyed.

Come, thou monarch of the vine,

Plumpy Bacchus, with pink eyne. Shak. 3. Any thing fupremely excellent. I know not whether from the flower or the eye, or a corruption of *pinacle*.-

I am the very pink of courtefy. With patience wait; and be content to reign The pink of puppies in some future strain.

4. A colour used by painters.—Pink is very susceptible of the other colours by the mixture. Dryden's Dufr. 5. [Pinque, Fr.] A kind of heavy narrowfterned ship .-

This pink is one of Cupid's carriers;

Give fire, the is my prize. Shak. Merry Wives. 6. A fish. The minow. Ainsworth.

(2.) PINK, a name given to a ship with a very narrow stern; whence all vessels, however small, whose sterns are fathioned in this manner, are called pink sterned.

3.) PINK, in botany. See DIANTHUS.

(4-6.) PINK, INDIAN, the English name of three fpecies of different genera; viz. DIANTHUS, No 3; IPOMOEA, and LONICERA.

(7.) PINK, SEA, a species of STATICE.

(1.) \* To PINK. v. a. [from pink, Dutch, an eye.] To work in eye-let holes; to pierce in small holes -A haberdafher's wife of fmall wit rail'd upon me, till her pink'd porringer fell off her head. Shak. Henry VIII.—The fea-hedgehog is inclosed in a round shell, handsomely wrought and pink'd. Caread's Survey of Cornavall.

Happy the climate, where the beau Wears the fame fuit for use and show; And at a finall expence your wife,

If once well rink'd is cloath'd for life. (2.) \* To Pink. v. n. [pincken, Dutch; from the noun.] To wink with the eyes.—A hungry for lay winking and pinking, as if he had fore eyes. L'Eftrange

PINKUSELT, a town of Hungary, 10 miles

W. of Steinam Anger.

PINKZOW, a town of Poland, in Sandomirz; 52 miles W. of Sandomirz.

PIN-LI, a town of China, in Chen-fi.

PIN-LON, a town or China, in Chang-fi, on the Hoang, 15 miles SE, of Kai.

\* Pin-

\* PIN-MAKER. n. f. [/in and maker.] He who from the shell at the place where it opens, about makes pins.

PIN-MAKING, n. f. See Pin, § 2.

\* PINMONFY. n. f. [pin and money.] Money allowed to a write for her private expences without account.—The woman must find out formething elfe to mortgage, when her pinmoney is gone. Addif.

(I.) PINNA, in ancient geography, a town of Italy, S. of Picenum, at the mouth of the Matri-

nus. Sil. 8. v. 518.

(II.) PINNA, in zoology; a genus belonging to the order of vermes tettacea. See MYTILUS, No 4. The animal is a flug. The thell is bivatve, fragile, and furnished with a beard; gapes at one end; the valves hinge without a tooth. They inhabit the coasts of Provence, Italy, and the Indian o-

cean. See Plate CCLXXIV.

PINNA MARINA, the largest and most remarkable species, inhabits the Mediterranean. It is blind, as are all of the genus; but furnished with very strong calcareous valves. The feutile-fish (jepia), an inhabitant of the fame fea, is a deadly foe to this animal: as foon as the pinna opens its thell, he ruthes upon her like a lion; and would always levour her, but for another animal of the erab kind, (see Cancer, No 15.) naked like the herm.t, and very quick fighted. This cancer or crab the pinua receives into her covering; and when the opens her valve an quest of food, lets him out to look for prey. During this the fenttle fith approaches; the crab returns with the utmost speed and anxiety to his hofters, who being thus warned of the danger fluits her doors, and keeps out the enemy. Dr Haffelquift, in his voyage towards Palettine, beheld this curious phenomenon, which though well known to the ancients had eleaped the moderns. Aristotle (Hist. lib. 5. c. 15.) and Pliny (lib. 9. 51. and 60.) confirm the facts above fet forth. The pinna marinæ diner less from mutcles in the fize of their fhells than in the finencle and number of certain brown threads which attach them to the rocks, hold them in a fixed fituation, fecure them from the rolling of the waves, efficiently in tempests, and affift them in laying hodo ilime. See My ribus, No4. Thefe thread, M. de Reaurum fays, are nearly as fine and beautidal as filk from the filk worm, and hence calls them the fik-worms of the fee. Stuffs, and feveral kinds of beautiful manufacture, are made of them at Palermo; in many places they are the chief object of fithing, and become a filk proper for many purpotes. It requires a confiderable number of the pinnæ marinte for one pair of flockings. This fingular thread is fo fine, that a pair of Itockings made of it can be eafily contained in a fuuff-box of an ordinary fize. Many manufacturers are employed in manufacturing these threads into various fluffs at Patermo and other places. The men who are employed in tithing up the piona marina, fay, that it is necessary to break the tuft of threads. They are fittled up at Toulon, from the depth of 15, 20, and fometimes more than 30, feet, with an inflrument called a cramp. This is a kind of fork of iron, of which the prongs are perpendicuher with respect to the handle. Each of them is about 8 feet long, and there is a space between them of about fix inches. The turt of filk iffues directly from the body of the animal; it comes

4 or 5 inches from the fummit or point in the lay pinnæ. M. de Reaumur, (Mem. de l'Acel. la Sciences, 1711, p. 216, and 1717, p. 177,) confidenthe pinna as the most proper of all shell-fish to lucidate the formation of pearls. It produces many of them of different colours, as grey or ke coloured, red, and fome of a blackish colour, a in the form of a pear. The animal which lide in the plana marina rarely shows itself, because the valves are feldom opened. Its head is bear its largest extremity opposite; it is kept in the shell by four vigorous muscles, placed at then tremities of the valves; the fiell has no have but a flat and blackith ligament, which is equal length to one-half of the fliell. See Pixxoran and PFARL. M. d'Argenville distinguishes kinds of the pinnæ:

1. PINNA M. ASTURA of the Venetians, is an red within, and has reddift mother-of-peal, lar to the ful flance of the fhell itself. Some

thefe fhelis weigh near 15 lb.

2. PINNA M. PAPYRACEA, is finaller, flender, papyraceous, of the colour of horn, a little land

with pale red.

3. PINNA M. PERNA, is adorned with point a the channels of the shell, but what is singular, and edges of the shell are thicker at the opening at the joining of the valves.

(1.) \* PINNACE. n. f. [ pinnaffe, Fr. fore. talian; pinaça, Span.] A boat belonging to: of war. It feems formerly to have fignifed and a finall floop or bark attending a larger fin-

(2.) PINNACLE, in architecture, the top of an ule, terminating in a point. This kind of roof iong the ancients was appropriated to temples; ir ordinary roofs were all flat, or made in the

itform way.

(i.) PINNACLE, in geography, a cape on the W. aft of the ifle of Jersey; one mile S. of Grones. 4.) PINNACLE ISLAND, an island in the N. Pac Ocean. Lon. 172. 30. W. Lat. 60. 25. N. J.) PINNACLES, one of the FARN ISLANDS, in most distant groupe, so called, from some vast lumnar rocks at the fouth end, even at their e, flat at the tops, and entirely covered with liemots and flags. The fowlers pass from one the other of these columns by means of a board, ich they place from top to top, forming a narr bridge over fuch a dreadful gap that the very it of it ftrikes one with horror.

INNATED LEAVES, in botany. See BOTANY. INNATIFIDUM FOLIUM. See BOTANY, Gloff. INNATIPEDES, [Lat. from pinna, a tin, and a foot.] in ornithology, an order of birds that t pinnated feet, or are fin-footed. It is the 8th er both in the Linnæan fystem, and in Mr Lam's; (see Ornithology, Sea. IV.) but the according to Dr Gmelin's arrangement, which showed by Mr Kerr; who characterises them s:-" The bill, body, and mode of life, in the is of this order, resemble those of the Waders. e thighs are likewise naked for the lower half, the feet are fitted for wading in marshes, all toes being divided; but the toes are edged on a fide with a membrane for their whole length. efe birds mostly live in pairs, while breeding, construct very large nests of various leaves grass in their marshy haunts." See GRALLE, WADERS. There are only three genera, acding to all thefe ornithologists.

INNATUM FOLIUM. See BOTANY, Gloffary. INNAW, a river of Germany, which runs into Elbe, 20 miles below Hamburg, in Holftein. INNE, a town of Poland, in Polnan.

INNEBERG, or PINNENBURG, a town of their, and capital of a county so named, which independent of Holstein. It is scated on the r, 8 miles NW. of Holstein, 19 ESE. of Glucklt, and 13 NW. of Hamburg. Lon. 9. 40. E. · 53. 46. N.

1.) PINNEL, a river of Portugal, in Tra-los-

ntes, which runs into the Coha.

1, 3.) PINNEL, a strong town of Portugal, in blos-Montes, capital of a territory so named, ed at the conflux of the Coha and Pinnel, 25 25 N. of Guarda. Lon. 6. 40. W. Lat. 40. 46. N. INNENBURG. See Pinneberg.

PINNER. n. f. [from pinna, or pinion.] 1.

t lappet of a head which flies loofe.

Set off with kerchief starch'd, and pinners In antiquary will scorn to mention a pinner or ight-rail. Addison on Ancient Medals. 2. A pin-

ker. Ainfavorth.

PINNOCK. n. f. [curruca.] The tom-tit. Ainf.
'INNOPHYLAX, a kind of crab-fifth, furPINNOTERES, or nished with very good
PINNOTERUS, a kind of crab-fifth, furPINNOTERUS, a npanion of the pinna marina. They live and ge together in the same shell, which belongs to

the latter. When it has occasion to eat, it opens its valves, and fends out its faithful purveyor to procure food. If during their labour the pinnoterus perceives the polypus, it immediately returns to warn its blind friend of the danger, when, by flutting its valves, it escapes the rage of its enemy; but when the pinnoterus loads itself with booty without molestation, it makes a gentle noise at the opening of the shell, and when admitted the two friends feast on the fruits of its industry. See Pin-RA, Nº II.

PINNOW, a lake of Brandenburg, near Ora-

PINOLA, or PINGOLA, a town of Mexico, in Guatimala; 75 miles E. of Guatimala.

(1.) PINOS, a town of Spain, in Grenada; 5 miles E. of Grenada.

(2.) Pinos, an illand near the S. coast of Cuba, from which it is separated by a deep strait. It is 25 miles long, 15 broad, 75 in excumference, abounds with excellent pasture, and in its form refembles a horse shoe. It is mountainous, and covered with pines. Lon. 82. 33. W. Lat. 22. 2. N. PINOSA, a town in the iffe of May.

PINQUENTE, a town of Maritime Austria, in

Istria.

PINSK, or a town of Russian Lithuania, in PINSKO, Brzesk, seated on a river to name d, and furrounded by marthes. It was formerly a confiderable town, but was much damaged by the Collacks. It abounds with Jews and Greeks: the latter have a bishop. Its chief manufacture is Russian leather. It is 84 miles E. of Brzesk, and 100 SSE. of Grodno.

(1.)\* PINT. n. f. [pint. Sax. pinte, Fr. pinta, low Lat.] Half a quart; in medicine, twe've ounces; a liquid measure.—Well, you'll not believe me generous, till I crack half a pint with you

at my own charges. Dryden.

(2.) PINT, [pinta,] a veilel, or measure, used in estimating the quantity of liquids, and even sometimes of dry things.—Budæus derives the word from the Greek wasa; others from the German pint, a little measure of wine; Nicod from the Greek wow, to drink. The English pint is twofold; the one for wine measure, the other for beer and ale-measure. See MEASURE, § iii, and 4, ii. The Scots pint is 4 times as large.

PINTADA, a species of PROCELLARIA.
PINTARD'S Sound, a large bay on the NW. coaft of N. America, containing many islands, and extending from Point Disappointment to Cape Scott on the S. in Lon. 128. 57. W. Lat. 50. 55. N.

PINTCHLUCO, a river of N. America, which joins the Chata-Uche, and falls into the Appala-

chicola.

PIN-TCIANG, a town of China, in Quan-fi, of the 2d rank; 1212 miles SSW. of Peking. Lon. 123. 50. E. Ferro. Lat. 22. 9. N. PINTIA, an ancient town of Spain, supposed

to have been on the fite of VALLADOLID.

PINTLES, certain pints or hooks fastened upon the back part of the rudder, with their points downwards, in order to enter into, and reft upon, googings, fixed in the stern-post, to hang the rudder. See HELM.

(1.) PINTO, a town of Spain, in New Castile; miles S. of Madrid.

> Cccc 2 (2.) PINTO.

(2.) PINTO. See MENDEZ, No 2.

PINTOR, Peter, a native of Valentia in Spain, born in 1426; who was physician to Alexander VI. whom he followed to Rome, where he practised with great success. He wrote 2 works of confiderable merit, 1. Aggregator Sententiarum Doctorum de Curatione in Pestilentia, printed at Rome 1499, in folio. 2. De Morbo Fado & Occulto bis Temporibus Afligenti, &c. printed at Rome, 1500, in 4to, black letter; a book extremely scarce, unknown to Luisini and Astruc, and which traces the venereal disease to the year 1496. Pintor died at Rome in 1503, aged 83.

PINTURICCIO, Bernardin, a celebrated Italian painter, born at Perusia in 1454. He was the disciple of Peter Perugino, under whom he became fo good an artist, that he employed him on many occasions as his assistant. He principally painted history and grotesque; but he also excelled in portraits, among which those of pope Pius II. and Innocent VIII. of Julia Farnese, Cæsar Borgia, and Isabella Q. of Spain, are particularly diftinguished. His chief performance is the history of Pius II. painted in ten compartments in the hiftory of Siena; in which undertaking, Raphael, then a young man, affifted him to far as to iketch out cartoons of many parts of the composition. His death was occasioned by a singular disappointment. Being employed by the Franciscan monks of Siena, to draw a picture, they gave him a chamber to paint in, which they cleared of all furniture except an old trunk, which he intifted on being also removed, in doing so it broke and discovered 500 pieces of gold which the Monks gladly feized, and the painter died of vexation at milling the treafure.

\* PINULES. n. s. In aftronomy, the fights of an astrolable. Die.

PINUS, the PINE-TREE; a genus of the monodelphia order, belonging to the monœcia class of plants; and, in the natural method, ranking under the sift order, Conifera. The pine tree was well known to the ancients, and has been deferibed and celebrated both by their philosophers and poets. Pliny enumerates fix species of this genus; and it is mentioned by Virgil in his Eclogues, Georgies, and Æneid; by Horace in his Odes; by Oxid in his Metamorphofes; by Statius; and by Catulius, &c. There are generally reckoned 14 species of this genus. All of them are proparated by feed, produced in hard woody cones. The way to get the feeds out of these cones is to lay them before a gentle fire, which will cause the cells to open, and then the feeds may be eafily taken out. If the cones are kept entire, the feeds will remain good for fome years; so that the furest way of preferving them is to let them remain in the cones till the time for fowing the feeds. If the cones are kept in a warm place in fummer, they will open and emit the feeds; but if they are not expoled to the heat, they will remain close for a long time. The best season for sowing the pines is about the end of March. When the feeds are fown, the place should be covered with nets to keep off the birds; otherwise, when the plants begin to appear with the hufk of the feed on the top of them, the birds will peck off the

tops, and thus defroy them. The mon remaiable species are these:

1. PINUS ABIES, OF European Spruce fir, 2 to tive of the northern parts of Europe and of Ah, includes the Norway spruce and long-cond Co-nished fir. The former of these is a tree of as much beauty while growing as its timber is valuable when reared. Its growth is naturally upright; and the height it reaches renders it valuable: the white deal, fo much coveted by the joiners, atis the wood of this tree; and from this fir HIGH The leaves are dark green; they find is drawn. fingly on the branches, but the younger thousan very closely garnished with them. They are of narrow; their ends are pointed; and their last excite admiration. The cones are 8 or 10 more long, and hang downwards. The better the is, the faster will the spruce fir grow, thought will thrive very well in most lands. In street loamy earth it makes a furprifing progres; and delights in fresh land of all forts, which work has been worn out by ploughing, &c. though the never fo poor. The long-coned Comits of differs scarcely in any respect from the North fpruce, except that the leaves and the come larger.

2. PINUS BALSAMEA, the bemlock fr, 1 1004 of Virginia and Canada, possesses as httle in as any of the fir tribe; though, being rather it is deemed valuable. It is called by fort yeav-leaved fir, from the refemblance of the to those of the yew tree. It is a tree of the growth, with but few branches; and the long and flender, and fpread abroad without The leaves do not garnish the branches plentifully as those of any other species. cones are very small and rounded; they are half an inch long; and the scales are kning ranged. We receive these cones from by which we raise the plants. This tree of moift rich ground, and in fuch foil man

greatest progress. 3. PINUS CANADENSIS, American or North land spruce fir, a native of Canada, Pennsyna and other parts of North America, includes that varieties. The white, the red and the black My foundland spruce. These, however, differ very tle. They are of an upright growth, though the do not shoot so freely or grow so fast with us the Norway sprince. The leaves are of the in green, and garnith the branches in the fame bal tiful manner as those of that species; only 💆 are narrower, shorter, and stand cloter. greatest difference is observable in the cours thefe are only about an inch long, and the fel are closely placed. In the cones, indeed, cont the chief difference of these 3 varieties: the the white species are of a very light brown con those of the red more of a nut-brown or recolour; and those of the black species of a or blackith colour. This trifling variation ever is pretty constant in the plants raised in the feeds. The forts often flower, and proved cones when only about 5 or 6 feet high; and then very beautiful; but this is a fign of weekler in the plant, which it does not often fairly over. 4. Fis#

4. PINUS CEDRUS, ranked by Tournefort and hers under larix, famous for its duration, is that pularly called by us the cedar of Lebanon, by e ancients cedrus magna or the great cedar; also drelate, ribut arn; and fometimes the Phœnician Strim cedar, from the country where it grows as greatest perfection. It is a coniferous everrell, of the bigger fort, bearing large roundish nes of finouth scales, standing erect, the leaves ing imall, narrow, and thick fet .- They formehis counterfeit cedar, by dying wood of a redhave: but the fmell discovers the cheat, that bue cedar being very aromatic. In fome places, : wood of the cajou-tree pattes under the name cedar, on account of its reddiff colour and its matic fmell, which fomewhat refemble that fartal. Cedar wood is reputed almost immorand incorruptible; a prerogative which it owes elly to its bitter tafte, which the worms canendure. For this reason it was that the anits used cedar tablets to write upon, especially things of importance, as appears from that exthon of Pernius, Et cedra digna locutus. xwis also drawn from cedar, with which they ared their books and writings, or other mat-5 to preferve them from rotting; which is aled to by Horace: by means of which it was t Nama's books, written on papyrus, were faved entire to the year 535, as we are infor-4 by Pliny. Solomon's temple, as well as his were both of this wootl. That prince \* king Hiram feveral cities for the cedars he fimished him on these occasions. Cortes is Ito have erected a palace at Mexico, in which # 7000 beams of cedar, most of them 120 feet hand 12 in circumference, as we are informed Herrera. Some tell us of a ecdar felled in Cy-#130 feet long, and 18 in diameter. It was for the main-mast in the galley of king Dehus. Le Bruyn affures us, that the two bigghe law on mount Lebanon, measured, one of \$57 palms, and the other 47, in circumfer-La the temple of Apollo at Utica, there teder trees near 2000 years old; which yet mothing to that beam in an oratory of Diana emotum in Spain, faid to have been brought her 200 years before the destruction of Troy. br is of fo dry a nature, that it will not endure \* taltened with iron nails, from which it ufufirinks; so that they commonly fasten it with of the fame wood. Hanbury fays, the wood obnoxious to worms; that its oil preferves h and books from corruption, and that the dust will even preserve the human body from (See CEDAR, § 1.) This tree is not found nain any other part of the world but mount Li-15 as far as hath yet been discovered. What had mentioned in Scripture of the lofty cedars be nowife applicable to the common growth his tree; fince, from the experience we have hose now growing in England, as also from the mony of several travellers who have visited c few remaining trees on mount Libanus, they not inclined to grow very lofty, but on the rary extend their branches very far; to which allufion made by the Pfalmift agrees very well, a he is describing the flourishing state of a peo-

ple, and fays, "They shall spread their branches like the cedar-tree."

5. PINUS LARIX, the larch-tree, which the old botanifts ranked under larix, with deciduous leaves, and oval obtuse cones. It grows naturally upon the Alps and Apennines, and of late has been very much propagated in Britain. It is of quick growth. and the trunk rifes to 50 feet or more; the branches are slender, their ends generally hanging down ward, and are gamished with long narrow leaves which arise in clusters from one point, spreading open above like the hairs of a painter's brush; they are of a light green, and fall, away in autumn In April the male flowers appear, which are difposed in form of small cones; the female flowers are collected into oval obtuse cones, which in some fpecies have bright purple tops, and, in others they are white: these differences are accidental; the cones are about an inch long, obtuse at their points; the scales are smooth, and lie over each other: under each scale there are generally lodged two feeds, which have wings. There are other two varieties of this tree, one of which is a native of America, and the other of Siberia. The cones of the American kind which have been brought to Britain are in general larger than those of the common fort. In Switzerland their houses are covered with boards of this wood cut out a foot fquare; and, as it emits a retinous substance, it so disfuses itself into every joint and crevice, and becomes so compact and close, as well as so hardened by the air, as to render the covering proof against all weather. But as fuch covering for houses would cause great devastation in case of fire, the buildings are confined to a limited distance. The wood, when first laid on the houses, is said to be very white; but this colour, in two or three years is changed, by means of the fun and refin, to a black, I which appears like a fmooth flining varnish." O. the common larch there are feveral varieties. The flowers which it exhibits early in fpring are of a delicate red colour; another fort produces white flowers at the fame feafon, and these have a delightful effect among those of the red fort; whilst another, called the Black Newfoundland larix, increases the variety; though by an aspect little dif-fering from the others. There are also larches with greenish slowers, pale red, &c. all of which are accidental varieties from seeds. These varieties are eafily diffinguished, even when out of blow: the young shoots of the white flowering larch are of the lightest green, and the cones when ripe are nearly white. The red flowering larch has its shoots of a reddish cast, and the cores are of a brown colour; whilft the cones and fhoots of the black Newfoundland larch are in the fame manner proportionally tinged. Their chief beauty confifts in the manner of their growth, the nature and beauty of their peneilled leaves and fair flowers; for the cones that fucceed them are small, of a whitish, a reddish, or a blackish brown co-lour, and make no figure. The pinus cedrus and pinus larix are propagated by fowing in March on a bed of light earth exposed to the morning fun. The feed must be covered half an inch thick with fine light earth, and the beds watered at times when the weather is dry. In about fix weeks the plants

plants will appear; they must at this time be carefully guarded from the birds, shaded from the fun and winds, and kept very clear of weeds. In the latter end of April following, they may be removed into beds of fresh earth, placing them at ten inches distance every way. They are to be kept bere two years, and fuch of them as feem to bend must be tied up to a stake to keep them upright. They may afterwards be planted in the places where they are to remain. They thrive well on the fides of barren hills, and make a very pretty figure there. Dr Pallas, in his Flora Rossica, informs us, that if this tree is burnt, and the wood confined, the internal part of the wood diffills copioufly a drying reddish gum, a little less glutinous than gum arabic, fomewhat of a refinous tafte, but wholly foluble in water. At the instigation of M. Kinder, this gum has lately been fold in the Rufsian shops under the name of gummi Orenburgensis, but which our author thinks thould be called gummi uraliense loricis. It is eat by the Woguli as a dainty, and is faid to be nutritious and antifcorbutic. Some manna was gathered from the green leaves, but it could never be condenfed. Rustians use the boletus laricinus as an emetic in intermittents, and to check the leucorrhoea. At Baschir and Siberia the inhabitants sprinkle the dry powder on the wounds of oxen and horses, as a detergent and anthelmintic. The nuts of the pinus cembra, the fame author afferts, are eat as luxuries in Russia, and are even exported with the fame view. The unripe cones give a very fragrant oil, termed balfamic. The inhabitants of Siberia use the tender tops, and even the bark rubbed off in the fpring, as an antifcorbutic. The kernels of the nuts of the amygdalus nana give a very pleafing flavour to brandy; and, when preffed, afford a bitter oil in large quantities. The way of destroying the bitter is by digesting it in the fun with spirit of wine, and it then becomes sweet and extremely agreeable. From the larch-tree is extracted what we erroncoully call I'enice turpentine. This natural balfam flows at first without incision; when it has done dropping, the people make incilions at about 2 or 3 feet from the ground into the trunks of the trees, into which they fix narrow troughs about 20 inches long. The end of these troughs is hollowed like a ladle; and in the middle is a small hole bored for the turpentine to run into the receiver which is placed below it. As the gummy fubftance runs from the trees, it passes along the sloping gutter or trough to the ladle, and thence runs through the holes into the receiver. The people who gather it vifit the trees morning and evening from the end of May to September, to collect the turpentine out of the receivers. When it flows out of the tree, Venice turpentine is clear like water, and of a yellowish white; but, as it grows older, it thickens and becomes of a citron colour. It is procured in the greatest abundance near Lyons, and in the valley of St Martin near St Lucern in Switzerland.

6. PINUS ORIENTALIS, the oriental fir, a native of the East, is a low but elegant tree. The leaves are very short, and nearly square. The fruit is exceeding small, and hangs downward; and the whole tree makes an agreeable variety with the other kinds.

7. PINUS PICEA, or yew-leaved fir, is a tall of vergreen, and a native of Scotland, Sweden, as Germany. This species includes the fleer fr at the balm of Gilead fir. The first of these is a me ble upright tree. Mr Marsham says, "The m lest trees I have seen were spruce and silver fire the valleys in Switzerland. I saw severa the the dockyards in Venice 40 yards long; and at of 39 yards was 18 inches diameter at the fal end. Is was told they came from Switzerland The branches are not very numerous, and the bark is finooth and delicate. The leaves me fingly on the branches, and their ends are light indented. Their upper furface is of a fine hou green colour, and their under has an ormand two white lines running lengthwife on en in the midrib; on account of which firer in this fort is called the SILVER FIR. Thecore large, and grow erect; and when the warather comes on, they foon shed their seeds who with to raise this plant should therefore gain the cones before that happens. The Balmej lead fir has of all the forts been most coveted, account of the great fragrance of its kan though this is not its only good propert; [W is a very beautiful tree, naturally of ah en growth, and the branches are fo ornamental their balmy leaves, as to exceed any of forts in beauty. The leaves, which are unjuly fet on the branches, are broad; and to e are indented. Their upper furface, whenles is of a fine dark-green colour, and their unda white lines on each fide the midrib legardenearly like those of the filver fir. Thek in when bruifed are very finely fcented; buds, which fwell in the autumn for the year's shoot, are very ornamental all wite. ing turgid, and of a fine brown colour: ad these also exudes a kind of fine turpenties. fame kind of (though heightened) fragrand tree being wounded in any part, emits per this turpen ine; and Hanbury fays, " Ruposed by many to be the fort from where! balm of Gilead is taken, which occasions tree being fo called. But this is a militate! the true balm of Gilead is taken from a kill TERFEINTHUS: though I am informed, that has been collected from this tree has been over to England from America (where it en naturally), and often fold in the shops for the if fort." The filver fir is very hardy, and will g in any foil or fituation, but always make greatest progress in rich loamy earth. The of Gilead fir must be planted in deep, rich, earth; nor will it live long in any other. foil may be a black mould, or of a fandy na if it be deep enough, and if the roots have enough to strike freely.

8. Panus Pinea, or stone pine, is a tall green tree, native of Italy and Spain. It do in a fandy loam, though like most others it grow well in almost any land. Respeding uses of this species, Hanbury tells us that wernels are eatable, and by many present the monds. In Italy they are served up at the in their deserts.—They are exceeding wholes being good for coughs, colds, consumptions.

on which account only this tree deferres to

pagated." Hanbury observes, " it is a great ltake Mr Miller has committed, by faying, it feeds kept in the cones will be good and wif they are fown 10 or 12 years after the ies have been gathered from the trees; whereas feeds of this fort, whether kept in the cones taken out, are never good after the first year." 1. Pinus pineaster, or wild pine, grows naally on the mountains in Italy and the S. of ace. It grows to the fize of a large tree; the aches extend to a confiderable diffance; and le the trees are young, they are fully garnified h leaves, especially where they are not so close o exclude the air from those within; but as y advance in age, the branches appear naked, all those which are situated below become ightly in a few years; for which reason they now much less in esteem than formerly. From species is extracted the common TURPENte, much used by farriers, and from which is we the oil of that name. The process of makpitch, tar, refin, and turpentine, from these is very familiar. In spring when the sap is knee in running, they pare off the bark of pine tree, to make the fap run down into a which they cut at the bottom to receive it. he way, as it runs down, it leaves a white ter like cream, but a little thicker. This is different from all the kinds of refin and turtime in use, and it is generally foid to be used making of flambeaux instead of white bees Le The matter that is received in the hole at thiom is taken up with ladles, and put in a First. A great part of this immediately through, and this is the common turpentine. is received into stone or earthen pots, and ady for fale. The thicker matter, which remin the basket, they put into a common alac, adding a large quantity of water. They I this as long as any oil is feen swimming uthe water. This oil they separate from the in large quantities, and this is the common \* spirit of turpentine. The remaining matter bottom of the still is common yellow refin. athey have thus obtained all that they can the fap of the tree, they cut it down, and, the wood into billets, they fill a pit dug e carth with these billets, and, setting them fre, there runs from them, while they are to the bottom of the pit, and this is the TAR. lop of the pit is covered with tiles, to keep he heat; and there is at the bottom a little out at which the tar runs like oil. If this be made too large, it fets the whole quantithe tar on fire; but, if small enough, it runs tiy out. The tar, being thus made, is put arreis; and if it be to be made into pitch, put it into large boiling vessels, without adapt thing to it. It is then suffered to boil a and being then let out, is found when cold what we call pitch. A decoction of the for feeds of this species in milk, or of the exties of the branches pulled in fpring, is with a proper regimen, to cure the most inate scurvy. The wood of this species is not

PINUS RUBRA, the Scots fir or pine. It is

common throughout Scotland, whence its name; though it is also found in most of the other countries of Europe. M. Du Hamel, of the Royal Academy of Sciences, mentions his having received fome feeds of it from 8t Domingo, and thence concludes, that it grows indifferently in the temperate, frigid, and torrid zones. The wood is the red or yellow deal, which is the most durable of any of the kinds yet known. The leaves aremuch shorter and broader than those of the Pi-NEA, (N 8.) of a greyish colour, growing two out of one theath; the cones are small, pyramidal, and end in narrow points; they are of a light co-lour, and the feeds are fmall. The wood of the Scots pine is superior to that of any other species. When planted in bogs, or in a most foil, though the plants make great progress, yet the wood is white, foft, and little esteemed; but when planted in a dry foil, though the growth of the trees is there very flow, yet the wood is proportionably better. Few trees have been applied to more uses than this. The tailest and straightest are formed by nature for masts to our navy. The timber is refinous, durable, and applicable to numberleis domestic purposes, such as flooring and wainfcotting of rooms, making of beds, chefts, tables, boxes, &c. From the trunk and branches of this, as well as most others of the pine tribe tar and pitch is obtained. By incision, barras, Burgun-DY PITCH, and TURPENTINE, are acquired and prepared. The refinous roots are dug out of the ground in many parts of the Highlands, and, being divided into small splinters, are used by the inhabitants to ourn instead of candies .- At Loch-Broom, in Ross-shire, the fishermen make ropes of the inner bark; but hard necessity has taught the inhabitants of Sweden, Lapland, and Kamtichatka, to convert the same into bread. To essect this, they, in the spring season, make choice of the tallest and fairest trees; then stripping off carefully the outer bark, they collect the foft, white, fucculent interior bark, and dry it in the shade. When they have occasion to use it, they first toast it at the fire, then grind, and after steeping the flour in warm water to take off the refinous talte, they make it into thin cakes, which are baked for use. On this strange food the poor inhabitants are fometimes conftrained to live for a whole year; and, we are told, through sustom, become at last even fond of it. Linnæus remarks, that this same bark bread will fatten swine; and humanity obliges us to with, that men might never be reduced to the necessity of robbing them of such a food. The interior bark of which the above mentioned bread is made, the Swedish boys frequently peel off the trees in the spring, and eat raw with greedy appetite, From the cones of this tree is prepared a diuretic oil, like the oil of turpentine, and a refinous extract, which has fimilar virtues with the balfam of Peru. An infulion or tea of the buds is highly commended as an antifcor-The farina, or fellow powder, of the male flowers, is fometimes in the fpring carried away by the winds, in such quantities, where the trees abound, as to alarm the ignorant with the notion of its raining brimstone. The tree lives to a great age; Linnaus affirms to 400 years.

11. Pinus strueus, Lord Wymoutil's pine, or Notio

North American white pine. This grows fornetimes to the height of 100 feet and upwards, and is highly valued on account of its beauty. The bark of the tree is very smooth and delicate, especially when young; the leaves are long and flender, five growing out of one sheath; the branches are pretty closely garnished with them, and make a fine appearance. The cones are long, flender, and very loofe, opening with the first warmth of the spring; so that if they are not gathered in winter, the scales open and let out the seeds. The wood of the fort is esteemed for making masts for ships. In Queen Anne's time there was a law made for the preservation of these trees, and for the encouragement of their growth in America. Within these last 50 years they have been propagated in Britain in confiderable plenty. The best soil for this species is a sandy loam, but inferior foils will answer.

12. PINUS TEDA, the fwamp pine, is a tall evergreen tree, a native of the swamps of Virginia and Canada. There are several varieties of this genus which Hanbury enumerates and describes: such as, 1st, The three-leaved American swamppine. 2d, The two-leaved American pine. 3d, The yellow American pine, the yellow tough pine, and the tough pine of the plains; among which there is but little variety. 4th, The bastard pine. 5th, The frankincense pine. And, 6th The devart pine.

(1.) PIN-YANG, 2 city of China, of the first rank, in Chans; 337 miles SW. of Pekin. Lon. 128. 46. E. Ferro. Lat. 36. 6. N.

Small as an cunuch. 6. An office of the exchequer,-That office of her majesty's exchequer, we, by a metaphor, call the pipe, because the whole receipt is finally conveyed into it by the means of divers fmall pipes or quills, as water into a cistern. Bacon: 7. [ Peep, Dutch; pipe, Fr.] A liquid measure containing two hogsheads. I think I shall drink in pipe wine with Falffaff; I'll make him dance. Shak:

(2.) Pies, in building, &c. a canal, or conduit, for the conveyance of water and other liquids. Pipes for water, water-engines, &c. are usually of lead, iron, earth, or wood: the latter are ufually made of oak or elder. Those of iron are cast in forges; their usual length is about 24 feet: feveral of these are commonly fastened together by means of four ferews at each end, with leather or old hat between them, to ftop the water. Those: of earth are made by the potters; these are litted into one another, one end being always made wider than the other. To join them the closer, and prevent them breaking, they are covered with tow and pitch! their length is usually that of the ironpipes. The wooden pipes are trees bored with large iron augres; of different fizes, beginning with a less, and then proceeding with a largerfucceffively; the first being pointed, the rest beingformed like spoons, increasing in diameter, from one to fix inches or more: they are fitted into the extremities of each other, and are fold by the fuot. For the construction of leaden pipes, see PLUMBERY.

(3.) PIPE, PIPA, in law, is a roll in the exchequer, called also the great roll. See § 10.

(4.) Pire, in mining, is where the ore runs forwards endwife in a hole, and doth not fink downwards or in a vein.

(5.) Pipe, (§ 1. def. 7.) See Barrel and Mea-SURE,

(6.) PIPE, AIR. See AIR-PIPES.
(7.) PIPE, BAG. See BAG PIPES, § 1-5.

(8.) PIPE, CLERK OF THE. See CLERK, § 23. (9.) Pipe Fish. See Syngnathus.

(10.) PIPE, HORN. See Horn-PIPE.

(11.) PIEE OFFICE is an office wherein the officer called the clerk of the pipe, makes out leafes of crown lands, by warrant from the lord treafurer, or commissioners of the freasury, or chancellor of the exchequer. (See CLERK, \$ 23.) To this office are brought all accounts which pass the remembrancer's office, and remain there. All tallies which vouch the payment of any fum contained in fuch accounts are examined and allowed by the chief fecondary of the pipe. Belides the chief clerk in this office, there are eight attorneys or fworn clerks, and a comptroller.

(12.) PIPES OF AN ORGAN. See ORGAN, § 7. (t3.) Pires, SEA, in zoology, are univalve shells, of an oblong figure, terminating in a point, fometimes a little bending, and fometimes fraight. Sea ears, figures of which we have given along with sea-pipes, are also univalve flat shells, resembling Dddd

Digitized by Google

bling in shape the ear of a man. In sea ears it is not uncommon to find finall pearls, the feeds of which are often found in the middle of their cavities, which are of the finest naker or mother-ofpearl colour. There are ridges on both fides; those without form a kind of volute or spire, terminating in an eye. In these shells there is a row of round holes, fix of which generally go quite through. There is a shell of this kind, which is longer in proportion to its width, and much lefs common, for it is never found in our feas. There is another, very fine and thin, of a dirty grey colour, neither nakered nor perforated as the others are; the inner rim is spiral, and at some distance from the outer. The fea pipes are diftinguished from fea worms by having their pipes fingle; whereas the others form an affemblage of pipes joined together. The sea worms, from the number and junction of their parts, are multivalves. The shells of pipes called dentales and antales are diffinguithed from each other only by their fize, the antales being much the leaft. The fea-pencil, or watering-spout, is the most remarkable shell of this tribe, and must be considered as having a specific character either by its form, which is ftraight, or the fingularity of its fuperior extremity, which is perforated like the spout of a watering pot. In Plate CCI.XXIV. the fhell, fig. r. pierced with many holes, is found with its natural covering in our feas. It is finely nakered within, and in the middle of its hollow or cavity contains many fmall pearls. Fig. 2. is placed on its upper fide to show its spots, which are red upon a ground of the purest white; the ridges are proininent; the rim and the eye are irregular and notched. Fig. 4. the fingularity of this shell confifts in its being neither nakered nor perforated, and in turning very much up near the eye of its spire or contour. Fig. 5. is a pencil or watering fpout; at the head is a kind of ruff, and within it is formed like the end of a watering spout, perforated with many holes, which, when the lifth is alive, are filled with very fine threads, like the hairs of a painter's pencil. Fig. 6. are called dentals from their resemblance of elephants teeth; the point or apex is white, and the other extremity green. They are both ribbed and nakered, and are diffinguished from each other only by some excrefcences which appear on the uppermoft. Fig. . are two small shells of the dental figure, called for diffinction antales. They are perfectly fmooth; one is white, and the other reddiffi.

(14.) PIPE, TOBACCO. See TOBACCO PIPE. \* To Pipe. v. n. [from the noun.] I. To play on the pipe.-Merry Michael the Cornish poet jubed thus upon his oaten pipe for merry England. Comain.-We have piped to you, and you have

not danced. Matth .-

In finging, as in piping, you excel. Dryden. Lowing herds, and piping fwains,

Swift.

Come dancing to me. 2. To have a thrill found .-

His big manly voice,

Turning again toward childuh treble, pipes And whilles in his found. Shak.

(I.) \* PIPER. n. f. [from pipe.] One who plays on the pipe.-Pipers and trumpeters thall be and no more in thee. Revelations.

(II.) PIPER, Francis LE, an eminent Eggin painter, the fon of a gentleman in Kent, descent ed from a Walloon family. His father gave be a liberal education, but his genius led him to painting, in which he had a peculiar talent, le he needed but to fee a face once, whereby ke would paint as exact a likeness, as if the perior had fat often for it. He also painted landscape well; but he delighted in painting faces peculaly striking or ugly. He likewise modelled figure in wax to the life. In his travels he was equal whimfical. He often fet out on a tour throng France, the Netherlands, Germany, and even L gypt, without taking leave of his friends, or waring them of his return. He died at Alderman ry in 1740, in consequence of his surgeon part ing an artery, when bleeding him.

III.) PIPER, in ichthyology. See TRIGLA, F. (IV.) PIPER, in botany, PEPPER; a genud the trigynia order, belonging to the diandria do of plants; and ranking, in the natural method, under the 2d order Piperitae. There are 20 fpt-

cies; the most remarkable are these: 1. PIPER AMALAGO, or black pepper, and the PIPER INEQUALE, with fome other species, at indigenous, and named joint swood, or person ders. The first bears a small spike, on which are attached a number of small seeds of the fire of mustard. The whole plant has the exact the

the East India black pepper.

2. PIPER BETELUM, the BETEL, or Being creeping and climbing plant like the ivy; and its leaves a good deal refemble those of the care, though they are longer and narrower at the tremity. It grows in all parts of India, but the best in moist places. The natives cultivate and the vine, placing props for it to climb upon; it is a common practice to plant it against the which bears the areca nut. At all times of the day, and even in the night, the Indians chere leaves of the betel, the bitterness of which stars rected by the areca that is wrapped up is the There is constantly mixed with it the chief kind of burnt lime made of thells. The net quently add perfumes, either to gratify there nity, or their fenfuality; as it is a powerful metive to love. Betel is taken after meals; it is chewed during a vilit; it is offered when you meet, and when you separate; in short, nothing is to be done without betel. If it is prejudicial to the teets, it assists and strengthens the stomach. At least, it w a general fashion that prevails throughout India.

3. PIPER INEQUALE, the long peoper of Jan ca. The bush grows taller than the amalago. To leaves are broad, fmooth, and shining. The fruit is fimilar to the long pepper of the flows but fmaller. The common people in James feafon their meffes with the black pepper. I preferve both, the fruit may be flightly feel when green, then dried, and wrapped in pape

4. Piper Sirieoa, with oval, heart-thap nerved leaves, and reflexed spikes. This is the plant which produces the pepper used in food. is a shrub whose root is small, sibrous, and the ble; it rifes into a stem, which requires a tree as prop to support it. Its wood has the same fort of knots as the vine; and when it is dry, it exten resembles the vine branch. The leaves, which

r 1 r (579)
ve a ftrong smell and a pungent taste, are of an miles N al shape; but they diminish towards the extrety, and terminate in a point. From the flower Is, which are white, and are formetimes placed the middle and fometimes at the extremity of branches, are produced small berries resembling se of the currant tree. Each of these contains ween 20 and 30 corns of pepper; they are nmonly gathered in October, and exposed to fun 7 or 8 days. The fruit, which was green irst and afterwards red, when stripped of its tring assumes the appearance it has when we The largest, heaviest, and least shrivelled, ie best. The pepper plant slourishes in the ids of Java, Sumatra, and Ceylon, and more icularly on the Malabar coaft. It is not fown planted; and great nicety is required in the ice of the shoots. It produces no fruit tell the of 3 years; but bears fo plentifully the 3 fucling years, that some plants yield between 6 7 lb. of pepper. The bark then begins to ik; and the shrub declines so fast, that in 12 n it ceases bearing. The culture of pepper is difficult: it is sufficient to plant it in a rich and carefully to pull up the weeds that grow reat abundance round its roots, especially the A years. As the fun is highly necessary to growth of the pepper plant, when it is ready ear, the trees that support it must be lopped revent their shade from injuring the fruit. in the featon is over, it is proper to crop the dithe plant. Without this precaution, there who too much wood, and little fruit. See #account of the method of cultivating pepin Sumatra, in Mr Marsden's History of Sumaor New Annual Register, 1783, p. 147. The er exported from Malabar, which was foryentirely in the hands of the Portuguese, is at present divided between the Dutch, Briand French, amounts to about 10,000,000

(1.) \* PIPPIN. n. f. [purpynghe, Dutch. Skinner.] A sharp apple.—Pippins take their name from the small spots or pips that usually appear on the sides of them: some are called stone pippins from their obdurateness; some Kentish pip-pins, because they agree well with that soil; others French pippins, having their original from France, which is the best bearer of any of these pippins; the Hoiland pippin and the russet pippin, from its ruffet hue; but fuch as are diftinguished by the names of grey and white pippins are of equal goodness: they are generally a very pleasant fruit and of good juice, but flender bearers. Mortimer.—We will eat a last year's pippin of my own graffing. Sbak.—Entertain yourself with a pippin roafted. Harvey.—The pippin-woman, I look upon as fabulous. Addison.

His foaming tulks let some large pippin grace. King. This pippin shall another trial make.

(2.) PIPPIN, OF PIPPEN. See PYRUS, No 4. PIPRA, in ornithology; a genus of birds of the order of passeres. Latham gives it the name of manakin, and so does Buffon, who informs us that it was bestowed upon them by the Dutch fettlers in Surmain. Latham describes 25 different species, and 5 varieties. The general character is, that the bill is short, strong, hard, and flightly incurvated, and the nostrils are naked. The middle toe is connected to the outer as far as the third joint: this character, however, is not univerfal, some species differing in this particu-The tail is short. This genus has a conlar. fiderable refemblance to the genus parus, or tit-They are supposed to inhabit South America only, but Mr Latham has feen many of those species which he has described, that came from other parts, which certainly belong to this genus .- Buffon differs widely in his arrangement from him, and only enumerates fix species. Buffon gives the following account of the genus in general: " The natural habits common to them all were not known, and the observations which have been made are still insussicient to admit an exact detail. We shall only relate the remarks communicated to us by Sonnini of Manoncour, who faw many of these birds in their native climates. They inhabit the immense forests in the warm parts of America, and never emerge from their recesses to visit the cleared grounds or the vicinity of the plantations. They fly with confiderable swiftness, but always at a small height, and to fhort distances; they never perch on the fummits of trees, but on the middle branches; they feed upon small wild fruits, and also eat infects. They generally occur in small bodies of 8 or 10 of the same species, and sometimes intermingled with other flocks of the fame genus, or even of a different genus, such as the Cayenne warblers, &c. It is commonly in the morning that they are found thus affembled, and then Dddd a

feem to be joyous, and warble their delicate little potes. The freshness of the air seems to inspire the fong, for they are lisent during the burning heat of the day, and disperse and retire to the shade of the thickest parts of the forest. This habit is observed, indeed, in many kinds of birds, and even in those of the woods of France, where they collect to sing in the morning and evening; but the manaking never assemble in the evening, and continue together only from sun-rise to 9 or no o'clock A.M. and remain reparate during the rest of the day and the succeeding night. In general they prefer a cool humid situation, though they never frequent marshes or the margins of lakes."

quent marthes or the margins of lakes." 1. PIPRA MUSICALIS, or, as Mr Latham calls it, the tuneful manakin. Its length is 4 inches; the bill is dufky, the forehead yellow, and the crown and nape bute; the chin, fides of the head below the eyes, and the throat, are black; the upper part of the back, the wings, and the tail, are dufky black; the tail is very fhort; the lower part of the back and rump, the breaft, beily, vent, and thighe, are orange coloured; the legs are dusky. It is a native of St Domingo, where it has gamed the name of organiste from its note, forming the complete octave in the most agreeable manner, one note fuccessively after another. It is faid not to be uncommon, but not eafy to be shot, as, like the creeper, it perpetually shifts to the opposite part of the branch from the spectator's eye, so as to elude his vigilance. It is most likely the very bird mentioned by Du Pratz, above quoted, whose notes, he says, are so varied and fweet, and which warbles fo tenderly, that those who have heard it value much less the fong of the nightingale. It is faid to fing for near two hours without scarce taking breath, and, after a respite of about the same time, begins again. Du Pratz, who himfelf has heard it, fays that it fung perched on an oak, near the house he was then in. 2. PIPRA RUFRICOLA, the crefted manakin, is about the fize of a finall pigeon, being about 10 or 12 inches long. The bill is about an inch and a quarter long, and of a yellowish colour. The head is furnished with a double round creft; the general colour of the plumage is orange, inclining to faffron; the wing coverts are loofe and fringed; the quills are partly white and partly brown; the tail feathers are 12; the base half of the ten middle ones is of an orange colour; thence to the ends they are brown; the outer feathers are brown, and the base haif of the inner web is orange; all are similarly fringed; the upper tail coverts are very long, loofely webbed, and fquare at the ends; the legs and claws are yellow. The female is altogether brown, except the under wing coverts, which are of a rufous orange; the creft is neither fo complete nor rounded as that of the male. Both males and females are at first grey, or of a very pale yellow, inclining to brown. The male does not acquire the grange colour till the 2d year, neither does the female the full brown. "This beautiful species (says Latham), inhabits various parts of Surinam, Cayenne, and Guiana, in rocky muations; but is nowhere to frequent as in the mountain Luca, near the river Oyapoc, and in the mountain Couronaye, near the river Apronack, where they build in the cavernous hollows, and

the darkest recesses. ' They lay two round what eggs, the fize of those of a pigeon, and make the nest of a few dry bits of sticks. They are in & neral very shy, but have been frequently tamed infomuch as to run at large among the poulta. It is faid that the female, after the has laid en for fome years, and ceafes fo to do more, become at the enfuing moult of the fame colour as the maie, and may be mistaken for him; in this in tating the females of various kinds of poults fuch as the peacock, pheafaut, &c. (See Para &c.) A most complete pair is in the Levenia Me frum." Our author deferibes a variety of the species, which he calls the Peruvian manaba ! is longer than the preceding, especially in the and the upper coverts of it are not truncated the ends; the wing coverts are not fringed an the rock manakin, and the crest is not so walk fined as in that bird; the general colour da plumage inclines much to red; the fecond of verta and rump are of an ash colour; the and tail are black; the bill and legs are as in the laft described. It is an inhabitant of Pen, for whence its name.

· PIPRIAC, a town of France, in the dept of Ille and Vilaine; 10½ miles N. of Redon, and W. of Bain.

\* PIQUANCY. n. f. [from piquant.] Supple tartness.

\* PIQUANT. adj. [piquant, Fr.] 1. Proper piereing; ftimulating to the tafte.—As pince the tongue as falt. Addifon. 2. Sharp; the gent; fevere.—Some think their wits along to cept they dart out somewhat that is pinced to the quick: Bacon.—Men-make their mass a piquant as they can. Gov. of the Tonga.

\* PIQUANTLY. adv. from piquant. by; tartiy.—A fmall mistake may leave upon mind the memory of having been piquant.

wittily taunted. Lacke.

(1.) \* PIQUE. n. f. [pique, F.] 1. Arisan offence taken; petty malevolence used never any the least pique, difference of with the king his father. Bacon's Easy Wilden take up piques and displeasures at an Decay of Picty.—Out of a personal pique of in service, he stands as a looker-on, when the yernment is attacked. Addison. 2. A strong from.—

Though he have the pique, and long.
"Pis fill for fomething in the wrong, B. B. Point; nicety; punctilio.—

Add long prescription of establish'd law. And pique of honour to maintain a cause.

(1.) Pique, in entomology. See Nigus. (3.) Pique, or Pique Montvalles, pgraphy, the highest mountain among the NEES. It is in the form of a peak, and no miles distant. Lon. c. 22. W. Lat. 4.2.

\* To Ploue. v. a. [piquer, Fr.] 1. To with envy or virulency; to put into fret, to emulation.—

Piqu'd by Protogenes's fame, Front Co to Rhodes Apelles came. 2. To offend; to irritate.—

Why pique all mortals that affect a man

1.) • PIQUET. n. f. [picquet, Fr.] A game at

She commonly went up at ten,

Unless piques was in the way. Prior.

Instead of entertaining themselves at ombre or

we, they would wrestle and pitch the bar,

aator. a) Pigotet, or Picket, a game is much in use oughout the polite world. It is played beren two persons, with only 32 cards; all the res, threes, fours, fives, and fixes, being fet ain reckoning at this game every card goes the number it bears, as a ten for ten; only all in cards go for ten, and the ace for eleven; the usual game is 100 up. In playing, the wins the king, the king, the queen, and fo Twelve cards are dealt round, usually by and two; which done, the remainder are with middle: if one of the gamesters finds the not a court-card in his hand, he is to dethe has carte blanche, and tell how many the will lay out, and defire the other to difthat he may show his game, and satisfy his bronik that the carte-blanche is real; for ich he reckons ten. Each person discards, i. e. safide a certain number of his cards, and takes abke number from the flock. The first of the it cards may take three, four, or five; the at all the remainder, if he pleases. After difrards of; and reckoning how many points Min that fuit, if the other have not so many that or any other fuit, he tells one for every of that fuit. He who thus reckons most is to win the point. The point being over, ch examines what sequences he has of the same to viz. how many tieroes, or fequences of three, attes or fours, quintes or fives, fixiemes, or fix's For a tieree, they reckon three points, for a rate four, for a quinte 15, for a fixieme 16, &c. ad the several sequences are distinguished in may by the cards they begin from thus ace ag, and queen are called tierce major: king, keen, and knave, tierco to a king? knave, ten, d nine, tierce to a knave, &c. and the best tierce, sorte, or quinte, i. e. that which takes its delat from the best card, prevails, so as to make the others in that hand good, and destroy all bie in the other hand. In like manner, a quarte one hand fets afide a tierce in the other. quences over, they proceed to examine how any aces, kings, queens, knaves, and tens, each olds; reckoning for every three of any fort, hee: but here too, as in sequences, he that with he same number of threes has one that is higher

than any the other has, e.gr. three aces, has all his others made good hereby, and his adverfary's all set aside. But four of any fort, which is called a quatorze, always fets afide three. All the game in hand being thus reckoned, the eldeft proceeds to play, reckoning one for every card he plays above a nine, and the other follows him in the fuit; and the highest card of the suit wins the trick. Note, unless a trick be won with a card above a nine (except the last trick), nothing is reckoned for it: though the trick ferves afterwards towards winning the cards; and that he who plays laft does not reckon for his cards unless he wins the trick. The cards being played out, he that has most tricks reckons ten for winning the cards. If they have tricks alike, neither reckons any thing. The deal being finished, and each having marked up his game, they proceed to deal again as before, cutting afresh each time for the deal. If both parties be within a few points of being up, the carte blanche is the first thing that reckons, then the point, then the fequences, then the quatorzes or threes, then the tenth cards. He that can reckon 30 in hand by carte blanche, points, quintes, &c. without playing, ere the other has reckoned any thing, reckons 90 for them; and this is cal-led a repique. If he reckons above 30, he reckons fo many above 90. If he can make up 30, part in hand and part play, ere the other has told any thing, he reckons for them 60. And this is called a pique; whence the name of the game. He that wins all the tricks, instead of ten, which is his right for winning the cards, reckons 40. And this is called a capot.

R

(3.) PIQUETS, in artillery, &c. See PICKET.

(4.) Piquets, in botany, a species of Dianthus.

(1.) PIRA, in geography, a town of Germany, in Austria; 6 miles SSE. of Polten.

(II.) Pira, in ichthyology, a name given to a

variety of foreign fiftes:

1. PIRA ACA, a little horned fish of the West Indies, called by Clusius and others, MONOCE-

2. PIRA ACANGATA, a Brafilian fish, which refembles the perch in fize and shape; but seldom exceeds 4 or 5 inches in length; its mouth is small; its tail forked. On the back it has only one long sin, supported by rigid and prickly spines. This sin it can depress at pleasure, and sink within a quvity made for it in the back. Its scales are of a silvery white colour; it is wholesome and well tasked.

3. PIRA BEBE, the milvus, or kite-fish.

4. PIRA COABA, an American fish of the truttaceous kind, of a very delicate flavour. It grows to 12 inches; its nose is pointed, and its mouth large, but without teeth; the upper-jaw is longer than the under one, and haugs over like a cartilaginous prominence; its eyes are very large, and its tail is forked; under each of the gill fins there is a beard of lix white filaments, covered with slivery scales.

4. PIRA JURUMENBECA, a Brafilian fifth, otherwife called bocca molle. It lives in the muddy bottom of the American feas, and is a long bodied, not flatted fifth. It grows to a great fize, being found 9, fometimes even 10 or 11 feet long.

and

and 2½ feet thick. It has one long fin on the back, the anterior part of which is thin and pellucid. There is also a cavity on the back, as in the pira acangata, into which the fin can be depressed at pleasure; the tail is not forked, and the ficales are all of a silvery colour and brightness. The fish is very well tasted.

6. PIRA PIRANHA, an American fish, more ge-

nerally known by the name piraga.

7. PIRA PIRAQUIBA, or Ipiraquiba, a fish originally Brasilian, which some writers apply to the

remora, or fucking fish.

8. PIRA PIXANGA, another Brafilian fith of the turdus or wrasse kind, called by some the gatwisch. It is generally about 4 or 5 inches long; its mouth is pretty large, and furnished with very fmall, and very tharp teeth; its head is finall, but its eyes are large and prominent, the pupil being of a fine turquoite colour, and the iris yellow and red in a variety of shades. The coverings of the gills end in a triangular figure, and are terminated by a short spine or prickle; its scales are very imail, and so evenly arranged, and closely laid on the flesh, that it is very smooth to the touch; its tail is rounded at the end; its whole body, head, tail, and fins, are of a pale yellow colour, variegated all over with very beautiful blood-coloured spots; these are round, and of the bigness of hemp feed on the back and fides, and fomething larger on the belly \$ the fins are all spotted in the same manner, and are all marked with an edge of red. It is caught among the rocks, and about the shores, and is a very well tafted fish.

(1.) PIRACY. n. f. [engalum; piratica, Lat. firaterie, Fr. from pirate.] The act or practice of robbing on the fea.—Our gallants, in their fresh gale of fortune, began to kim the seas with their firacies. Carew.—

Now shall the ocean, as thy Thames, be

free,

From both those fates of storms and piracy.
Waller.

Sounding your name, and telling dreadful news

To all that piracy and rapine use. Waller.

—His pretence for making war upon his neighbours was their piracies; though he practised the

fame trade. Arbuthnot.

(2.) Piracy, by the ancient common law, if committed by a fubject, was held to be a species of treason, being contrary to his natural allegiance; and by an alien, to be felony only: but now, fince the flatute of treasons, 25 Edw. III.c. 2. it is held to be only felony in a subject. merly it was only cognizable by the admiralty courts, which proceed by the rules of the civil law. But, it being inconfiftent with the liberties of the nation, that any man's life should be taken away, unless by the judgment of his peers, or the common law of the land, the statute 28 Hen-VIII. c. 15. established a new jurisdiction for this purpose; which proceeds according to the course of the common law. This offence, by common kiw, confifts in committing those acts of robbery and depredation upon the high feas, which, if committed upon land, would have amounted to telony there. But, by flatute, some other offen12 W. III. c. 7. if any natural born subject conmits any act of hostility upon the high feat, against others of his majesty's subjects, under colour of a committion from any foreign power; this, though it would only be an act of waring alien, shall be construed piracy in a subject. And farther, any commander, or other leafaring per fon, betraying his truft, and running away with any flip, boat, ordnance, ammunition, or good; or yielding them up voluntarily to a pirate; or conspiring to do these acts; or any person affailing the commander of a veffel, to hinder he from fighting in defence of his ship; or confine him, or causing or endeavouring to cause and volt on board; thall, for each of these offers, be adjudged a pirate, felon, and robber, and fuffer death, whether he be principal, or many acceffory by fetting forth fuch pirates, or its ting them before the fact, or receiving or come ing them or their goods after it. And the hall 4 Geo. I. c. 11. expressly excludes the principals from the benefit of clergy. By the flat. & Geo. L. c. 24. the trading with known pirates, or furniting them with ammunition, or fitting out af vessel for that purpose, or in anywise consider combining, confederating, or corresponding them; or the forcibly boarding any modern veffel, though without feizing or campila off, and destroying or throwing any of the pass overboard; shall be deemed piracy; and sed 20 ceffories to piracy as are described by the of king William are declared to be principal prates; and all pirates convicted by virtue of act are made felons without benefit of cleg. the same statutes also, (to encourage the define of merchant veffels against 'pirates,') the comme ders or seamen wounded, and the widowself feamen as are flain, in any piratical engagent shall be entitled to a bounty to be divided. them, not exceeding one fiftieth part of the of the cargo on board: and fuch wounded men shall be entitled to the pension of Great hospital; which no other feamen are, except ly fuch as have ferved in a ship of war. And the commander fliall behave cowardly, 17 defending the ship, if she carries guns or arms or shall discharge the mariners from fighting, that the ship falls into the hands of pirates; for commander thall forfeit all his wages, and full tix months imprisonment. Lastly, by fature ! Geo. II. c. 30. any natural bom fubject or zen, who in time of war shall commit hostike at fea against any of his fellow-subjects, or !! affilt an enemy on that element, is liable to belt ed and convicted as a pirate. PIRÆEUS, or ? PORTUS, in ancient gorp

PIRÆEUS, or phy, a celebrated port the W. of Athens, confifting naturally of unharbours or basons, which lay neglected. Themistocles put the Athenians on making commodious port; the Phalerus, a small peand not far from the city, being what they unbefore that time. (Thuesd, Pans. Nepu.) Puzziwas originally a willage of Athea, on an illudiant though distant 40 stadue from Athens, joined to it by two long walls, and itself lock or walled round; with a very commodious

ife harbour. (Pauf. Strab. Thueyd.) The whole f its compals was 60 stadia, including the Muchia. Near the Piræus stood the sepulchre of hemistocles; whither his friends conveyed his nes from Magnesia, into the Hither Asia. (Cic. lut. Pau'.) The entrance of the Pirxus is narw, and formed by two rocky points, one benging to the promontory of Ection, the other that of Alcimus. Within were three flations rshipping; Kantharus, so named from a hero; PHRODISIUM, from a temple of Venus; and ta, the refort of vessels laden with grain. By was a demos or borough town of the fime me before the time of Themistocles, who remmended the exchanging its triple harbour for thingle one of Phalerum, both as more capaus and as better fituated for navigators. The Il was begun by him when archon, in the 2d r of the 75th Olympiad, A. A. C. 477; and awards he urged the Athenians to complete sthe importance of the place deserved. This desortification was of hewn stone, without ent or other material, except lead and irong its were used to hold together the exterior ges or facings. It was fo wide that the loadarts could pase on it in different directions, 4 was 40 cubits high, which was only about what he had defigned. The Pirzus, as Ashourished, became the common emporium AGreece. Hippodamus, an architect, celebelides other monuments of his genius, as mentor of many improvements in house was employed to lay out the ground. Maticoes, which uniting formed the Long were erected by the ports. Here was an wor market place, and, farther from the fea, for called Hippodamia. By the veilels were for the mariners. A theatre was openples were raised, and the Piræus, which the city in utility, began to equal it in The cavities and windings of Munychia, and artificial, were filled with houses; whole settlement, comprehending Phalethe ports of the Pirzus, with the arfethe Rorebouses, the famous armoury of Philo was the architect, and the sheds for at afterwards 400, triremes, refembled the of Rhodes, which had been planned by the ' Hippodamu's. The ports, on the com-\*ment of the Peloponnesian war, were sewith chains. Centinels were stationed, and inzus was carefully guarded. The Pirzus reduced with great difficulty by Sylla, who hithed the walls, and let fire to the armoury whenals. In the civil war it was in a defence-

1st, invested Athens, and ravaged the terri-Strabo, who lived under the emperors Aumand Tiberius, observes, that the many wars leftroyed the long walls, with the fortress of ghia, and had contracted the Pirecus into a ttlement by the ports and the temple of the Saviour. This fabric was then adornh capital pictures, the works of illustrious hand on the outfide with statues. In the ntury, belides houses for triremes, the tem-Jupiter and Minerva remained, with their is in brain, and a temple of Venus, a porti-

condition.

co, and the tomb of Themistocles. The port of the Pirzus has been named Porto Lione, from the marble lion feen in the chart, and also Porto Draco. The lion was a piece of admirable sculpture, 10 feet high, and as reposing on its hinder parts. It was pierced, and, as some think, belonged to a fountain. Near Athens, in the way to Eleusia, was another, couchant; probably its companion. Both these were removed to Venice by general Morofini, and probably thence to Paris, along with the two Venetian brazen lions, by Bonaparte. At the mouth of the port are two ruined piers. A few veffels, mostly small craft, frequent it. Some low land at the head feems an The buildings are incroachment on the water. a mean customhouse, with a few sheds; and by the shore on the east side, a warehouse belonging to the French; and a Greek monastery dedicated to St Spiridion. On the opposite side is a rocky ridge, on which are remnants of the ancient wall, and of a gateway towards Athens. By the water edge are vestiges of building; and going from the customhouse to the city on the right hand, traces of a small theatre in the side of the hill of Munychia.

PIRAGINEN, a town of Prussian Lithuania, a

miles NB. of Insterburg.

PIRANESI, an eminent Venetian architect and engraver, born about 1711. He was remarkable for a bold and free manner of etching, whereby he drew his figures upon the plate at once. He died in 1780.

PIRANO, a sea port town of Maritime Austria, in Istria, capital of a district so named, seated on a peninsula, 10 miles S. of Capo, samous

for its trade in falt. Lon. 14. 1. E. Lat. 45. 40. N.
(1.) PIRATE. n. f. [minesims, Gr. pirata,
Lat. pirate, Fr.] 1. A sea-robber.—Pirates all nations are to profecute, not fo much in the right of their own fears, as upon the band of human fociety. Bacon.-

Savage pirates feek through feas unknown The lives of others, vent'rous of their own.

Pope.

2. Any robber; particularly a bookseller who feizes the copies of other men.

(2.) PIRATE is also used for an armed ship that roams the feas without any legal commission, and feizes or plunders every vessel she meets indiscriminately, whether friends or enemies. The colours usually displayed by pirates are a black field, with a death's head, a battle-axe, and hour glass. The last instrument is generally supposed to determine the time allowed to the prisoners, whom they take, to confider whether they will join the pirates in their felonious combination, or be put to death, which is often perpetrated in the most cruel manner.

(1.) \* To PIRATE. v. a. [ pirater, Fr.] To take

by robbery.

They advertised, they would pirate his edi-

(2.) \* To Pirate. v. n. [from the noun.] To rob by fea.—They robbed at land, and pirated by Sea. Arbuthnot.

PIRATICAL. adj. [piraticus, L24. from pirate.] 1. Predatory; robbing; confisting in robbery.—A kind of piratical trade, robbing, spoil-

ing, and taking prisoners the ships of all nations. Bacon. 2. Practifing robbery.—The errours of the prefs were multiplied by piratical printers.

PIRAUGY, a river of Brazil, SE. of Rio

Grand.

PIRAZZETA, a town of Naples, in Bafilica-

ta; 14 miles NE. of Turfi.

L.) PISA, in ancient geography, a town of Exon the Alphaus, at the W. end of the Peloacius, founded by Pisus. Oenomaus reigning, till he was conquered by Pelops. (See 1975.) Its inhabitants accompanied Nestor be Trojan war, and long enjoyed the privious prefiding at the Olympic Games, which reclebrated near Pisa. But this honourable follow proved at last their destruction. For inverse envied for it by the people of Elis, who was upon them, and after many bloody batwish various success, at last took their city totally demolished it. Pisa was famous for its its; its inhabitants were called Pisæi and Pises; and a colony of them founded Pisæ, now in Italy. See N° 2.

.) Pisa, in modern geography, a large town truria, or Tuscany, seated on the Arno, 52 from Florence. It was a famous republic, abdued, first by the duke of Milan, and then E Florentines in 1406. Before it lost its free-, it is faid to have contained near 150,000 inants, but now it has not above 16,000 or 80. It was founded by the Pifans of Peloponand afterwards became one of the 12 muniof Tuicany. Its neighbourhood to Leghorn, the chief port in the Mediterranean, contri-I greatly to the decay of Pifa, which, hownow begins to flourish again. The houses reil built, and the streets even, broad, and paved; but in many places over-run with The univertity is well endowed, and has

)L. XVII. PART II.

able professors, but is not flourishing. The exchange is a stately structure, but little frequented. The king of Etruria's galleys are built, and commonly stationed here. This city is also the principal refidence of the order of St Stephen, and the fee of an archbishop. The cathedral, a large Gothic pile, contains a great number of excellent paintings and other curiofities. This church is dedicated to St Mary; is very advantageously fi-thated in the middle of a large piazza, and built out of a great heap of wrought marble, such as pillars, pedestals, capitals, cornices, and achitraves, part of the spoils which the Pisans took in their eastern expeditions, when the republic was flourishing. The roof is supported by 76 high marble pillars of different colours, finely gilt. In the same square with the dome, stands the baptiftry, a round fabric supported by stately pillars, and remarkable for a very extraordinary echo. - On the N. fide of the cathedral is the burying place, called Campo Santo, being covered with earth brought from the Holy Land. This burying-place is inclosed with a broad portico, well painted, and paved with grave flones. Here are many ancient tombs, among the rest that of Beatrix, mother of the counters Mathilda, with marble beforehevos, which the Pifans brought from Greece, wherein is the hunt of Meleager, which affifted Nicholas of Pifa in the restoration of sculpture. The walls of the Campo Santo are painted by the best-masters of their times. Giotto has drawn fix historical pieces of Job; and Andrew Orgagna a fine piece of the last judgment. Near the church is a steeple in the form of a cylinder, which is ascended by 153 steps; it inclines 15 feet to one side, which fome afcribe to art, but others to the finking of the foundation. It was built by John of Inspruck and Ponanno of Pifa, in 1174. Near this steeple is a fine hospital, dependent on that of St Maria Nuova in Florence. The steeple of the church of the Augustinians is an octagons adorned with pillars, built by Nicholas of Pifa. In the great market place is a statue of Plenty, by Da Vinci. The church of the knights of St Stephen, decorated with the trophies taken from the Saracens, is all of marble, with marble steps, and a front with marble statues. In the square there is a statue of Cosmo I. Contiguous to the church is the palace of the knights; also the churches of Madonna and Spina; the last of which was built by a beggar. There is a great number of colleges, the chief of which is the Sapienza, where the professors read their public lectures; next the colleges Puteano, Ferdinando, Ricci, and others. There are feveral palaces with marble fronts; the finest is that of Lanfranchi, which, with the rest along the Arno, makes a very fine appearance. There is a good dock, where they build the galleys, which are conveyed by the Arno to Leghorn. They have a famous aqueduct, confifting of 5000 arches, which conveys the water from the hills, 5 miles distant. This water is esteemed the best in Italy, and is carried in stalks to Florence and Leghorn. The city has a moat, walls, a castle, fort, and citadel; the last of which is a modern work. The Arno is of a confiderable breadth here, and has 3 bridges, one of marble: 6 miles below the town it falls into the fea. The physic garden is Ecco

very spacious, contains a great number of plants, and is decorated with water-works. The air is unwholesome in summer, from the neighbouring moraffes. Many buffaloes are bred in the neighbouring country, and their siesh is eaten. Be-tween Pisa and Lucca are hot baths. Lon. 10. 17. E. Lat. 43. 43. N.

(3.) Pisa, a river of Italy, in Etruria, which

runs into the Arno, near Pifa.

PISÆ, in ancient geography, a town of Etruria, built by a colony of Pisci, from Pisa in Peloponnefus. Dionysius of Halicarnasius says it was built before the Trojan war; but others fay it was built by those Pisæans, who were shipwrecked on the coast of Italy, in their return from it. The people were called Pisani, and were once very powerful. They conquered Sardinia, Corfica, and the Baleares Islands. Virg. En. x. 179. Strabo, 5. Lucan. ii. 401. Liv. 39. 2. It is now called Pifa. See Pisa, No 2.

PISÆANS, PISEANS, the ancient inhabitants PISÆI, or of Pisa in Elis.

PISÆUS, an epithet of Jupiter.

(1.) PISAN, Thomas, a celebrated aftrologer of Bologna, who was invited to Venice by Dr Forli, counsellor of the republic, who gave him his daughter in marriage. Charles V. of France invited him to his court, and he went in 1380, and predicted the day of his death, which it is faid, happened accordingly.

(2.) PISAN, Christina, daughter of the astrologer, was a person of more consequence than her father. She was born at Venice in 1363, and was both a beautiful woman and an accomplished writer. She wrote the Life of king Charles V. of France,

and was much patronifed by Charles VI.

PISANA. Sec Picosa.

PISANI, the ancient inhabitants of Pisæ.

PISANO, a territory of Italy, in Etruria, 47 miles long, and 25 broad. It is bounded on the N. by the Florentino, and the republic of Lucca; on the E. by the Siennese, and on the W. by the Mediterranean. It is fertile in corn, wine, and fruits; and abounds with fine cattle. It is efteemed the best county in Etruria. Pisa is the capital. There is a canal 16 Italian miles long, between Pisa and Leghorn.

PISANY, a town of France, in the department of Lower Charente; 6 miles SW. of Saintes.

PISATES, the people of Pifa, in Elis.

PISAURUM, in ancient geography, a town of Italy, in Picenum. It became a Roman colony, in the confulship of Claudius Pulcher. It is now called PESARO. It was destroyed by an earthquake, in the beginning of Augustus's reign. Plin. 3. Liv. 39. C. 44.

(1.) PISCO, a sea port town of Peru, in Lima, merly seated on the coast of the South Sea, but w removed a quarter of a league from it, in nlequence of a dreadful earthquake, which hapmed on the 19th Oct. 1682; when the sea retir-I half a league, and then returned with fuch viosec, that it overflowed nearly as much land beand destroyed the whole old town. Pisco mtains about 300 families, mostly negroes, mu-Moes and mestizoes, there being but few whites. has 3 churches and a chapel for Indians. led is fafe and capacious enough to hold a large 177. It is 18 miles from Chinca, and 110 SSE. Lima. Lon. 76. 15. W. Lat. 13. 36. S.
(2.) Pisco, Old. See above. The ruins of

be town are still visible and extend from the fea

wit to the new town.

(1.) Pisco Pagano, a town of Naples, is Bafilicata; 7 miles NW. of Muro.

PISCOBAMBA, a town of Peru, in Guamalies. PISCOPIA, an illand in the Mediterranean, 16 miles NW. of Rhodes.

PISDORFF, a town of Germany in Austria: 3

miles NE. of Entzerstorf.
PISEANS. See Pisa, N° 2, and Pisæi.

PISEK, a town of Bohemia, in Prachatitz, on the Watawa. It was dreadfully laid waste during the war that lasted 30 years in the 15th century. It is 20 m. N. of Prachatitz, and 46 S. of Prague.

PISELLO, the most northern cape of Asia, in Natolia, which projects into the Black Sea, op-

posite Crimea.

PISENBERG, a town of Germany in Austria,

one mile E. of Korn-Neuburg.

(1.) PISGAH, or Phasgan, a mountain on the other fide Jordan, joined to Abarim and Nebo, and running S. to the mouth of the Arnon: from which Moles had a view of the promised land, and where he died, after appointing Joshua his successor. (See ABARIM.) Wells takes Pisgah and Nebo to be different names of the same mountain, a part or branch of the mountains Abarim. (Deut. xxxii. 49. compared with Deut. xxxiv 1.) Or that the top of Nebo was peculiarly called Pifgab; or fome other part of it, cut out in sleps, as the primitive word denotes: and thus it is rendered by Aquila, by a Greek word fignifying cut out. Ferome.

(2, 3.) Pisgah, a city and territory of Palestine,

adjacent to Mount Pifgah. Jerome.

PISH. interj. A contemptuous exclamation. This is fometimes spoken and written place. I know not their etymology, and imagine them formed by chance.

However they have writ the stile of Gods, And made a pish at chance or sufferance. Shak. -She frowned and cried pifh, when I said a thing

that I stole. Spell.

\* To Pish. v. n. [from the interjection.] To express contempt.-He turn'd over your Homer, shook his head, and pish'd at every line of it. Pope.

PISHOUR. See PEISHORE. PISID/E, the ancient inhabitants of Pisidia.

Cic. de Div. 1. c. 1. Liv. 37. c. 54, 56.
PISIDIA, an inland country of Afia Minor, between Phrygia, Pamphylia, Galatia, and Isauria. Mela, 1. c. 2. Strabo, xii. Acts, xiii, 14-52. PISIN, a town of Maritime Austria, in Istria;

4 miles N. of Pedena.

PISIS, a native of Thespia, who obtained great influence among the Thebans and acted with great zeal and courage, in defence of their liberties. He was at last taken prisoner by Demetrius,

who made him governor of Thespia.

PISISTRATIDÆ, the two fons of Pifistratus. viz. Hipparchus and Hippias, who rendered themfelves as illustrious as their father; but the flames of liberty were two powerful to be extinguished. The Pifistratidæ governed with great moderation, but the name of tyrant or fovereign was insupportable to the Athenians. Of the conspiracy of HARMODIUS and ARISTOGITON against them, and the murder of Hipparchus, a full account is given under ATTICA, § 10. Hippias was at last expelled by the united efforts of the Athenians and their Renez

The rest of the Pisistratidz followed him in his banishment; and after they had refused to accept the liberal offers of the princes of Theffaly, and the king of Macedonia, who wished them to fettle in their respective territories, they retired to Siggum, which their father had, in the funmit of his power, conquered and bequeathed to his posterity. After the banishment of the Pisistratidæ, the Athenians became uncommonly jealous of their liberty, and often facrificed the best of their citizens, to their jealoufy of the influence which popularity and liberality might gain among a fickle and unsettled populace. (See Phocion.) The Pifistratidæ were banished from Athens about 18 years after the death of Pilistratus.

PISISTRATUS, an Athenian who early diftinguished himself by his valour in the field, and by his address and eloquence at home. After he had rendered himself the favourite of the populace by his liberality, and by the intrepidity with which he had fought their battles, particularly near Salainis, he resolved to make himself master of his country. Every thing feemed favourable to his ambitious views; but Solon alone opposed him, and discovered his duplicity before the public affembly. Of the various arts he adopted to attain the fupreme power; and of his fuccels, and repeated expulfions and restorations, a particular account is given under ATTICA, § 8, and 9. Upon his being the 3d time received by the people of Athens as their fovereign, he facrificed to his refentment the friends of Megacles, but did not lose fight of the public good, and while he fought the aggrandizement of his family, he did not neglect the dignity and the honour of the Athenian name. He died about A. A. C. 528, after he had enjoyed the fovereign power at Athens for 33 years, and was fucceeded by his fon Hipparchus. Pifistratus claims our admiration for his justice, his liberality, and his moderation. Even when he had the fupreme power, he often refused to punish the infolence of his enemies. In thort had he been born to the power he uturped, he would have been a most respectable character; but the utmost justice and moderarion in government can never vindicate the crime of usurpation.—It is to his labours, however, that we are indebted for the prefervation of the poems of Homer; and he was the first, according to Cicero, who introduced them at Athens in the order in which they now stand. He also established a public library at Athens; and the valuable books which he had diligently collected were carried into Persia, when Xerxes made himfelf master of Athens..

PISKOI, a town of Russia, in Archangel, on the Mesen; 188 miles E. of Archangel.

(1.) \* PISMIRE. n. f. [myra, Sax. pismiere,

Dutch.] An aut; an emmet.-

His cloaths, as atoms might prevail,

Might fit a pijmire or a whale. Prior. -Prejudicial to fruit are pismires, caterpillars and mice. Mort.

(2.) PISMIRES, are a kind of infects very common in Africa; of which there is fo great a variety, and fuch innumerable fwarms, that they destroy not only the fruits of the ground, but even men and beafts in fo flort a time as one fingle night; and would, without all doubt, prove more

fa ally destructive to the inhabitants, were the not fo happily deft, oyed by a proportionable number ber of monkeys, who greedily ferret and deror them. For a further account of these insects, Set ANT, FORMICA, and TERMES. As for locals and some other grievous plagues with which the far greater part of the valt continent of Aincas afflicted, but which do not belong to this gent fee GRYLLUS, No II. 6 iv.

PISO, the hereditary cognomen of a branda the illustrious Roman family of the Calumia CALPHURNII, which produced many great and during the republic, as well as fome inferral We subjoin a specimen of both classes

(1.) PISO, Lucius Calpumius, furnamed inc on account of his frugality, was tribune of people, A. A. C. 149, and afterwards confine ring his tribuneship, he published a law extortion, entitled Lex Calpurnia de permiis repto dis. He happily ended the war in Sicily. reward the fervices of one of his fons, who diftinguished himself in that expedition, he him by his will a golden crown, weighing to pounds. Piso joined to the qualities of a good

tize, the talents of a lawyer, an orator, and himse (2.) Piso, Caius Calpurnius, a Roman who in the year 67 before Christ, was author the law which forbid canvaffing for public and intitled Lex Calpurnia de ambitu. He all the firmness worthy of a conful in one de most stormy periods of the republic; and have determined resolution, prevented the people raifing Marcus Palicanus, a man of no ment,

the confular dignity.

(3.) P150, Cheius Calpurnius, was couthe reign of Augustus, and governor of Spa der Tiberius, whose confident he was. It had that by the order of this emperor he caule lo manicus to be poifoned. Being accused a crime, and feeing himfelf abandoned by em dy, he laid violent hands on himfelf A. D. 2 !! was a man of insupportable pride and exviolence. Of this many inflances are meed. but the following is the most extraordinan, " horrible: Having ordered a foldier to be execut because he had gone out of the camp with and foldier and returned without him, the other dier presented himself to the centurion, w finding he was not murdered, flopt the except and all three went to Piro, amidit the joynul plause of the whole army. Whereupon Pile ? a stop to their joy by ordering all three to be? to death. :.

(4.) Piso, Lucius, a Roman fenator, who tended the emperor Valerian in his unfortant expedition into Persia; (See Persia, § 16:) after his capture or death, proclaimed his emperor; but was defeated, taken prifoner,

put to death, by Valens, A. D. 261.
PISOGNE, a town of the Italian republic the department of Mincio, diffrict and late dis of Verona, with a harbour on the N. hans lake Iseo; containing about 2000 citizes have 3 iron founderies, with many iron last and carry on a very active trade. Oppenhan-

PISON, in ancient geography, the first of 4 rivers that watered the garden of Eden, we Mofes describes as " encompassing the whole is f Havilah, where there is gold," &c. (Gen. ii. 1, 12.) Some suppose the Pison to be the GANes; others particularly Calmet and Reland take to be the Phasis, which runs N. through olchis, (which they suppose to be Havilub,) om near the head of the Euphrates, to its exit the Euxine Sea; but these great commentators e Evidently mistaken, for the Phasis, instead of ing near the head of the Euphrates and running W. has its source about 350 miles N. of the he Euphrates, and runs SW. into the Euxt. The conjecture of Bochart and others apare to be more probable, that the Pifon is the branch of the divided streams of the Tigris d Euphrates, which runs along the fide of Haah in Arabia, and encompasses an extensive ter-

PISONIA, in botany, Fingrico, a genus of directs order, belonging to the polygamia is of plants.

PISS. n. s. [from the verb.] Urine; animal ter.—It would vex one more to be knocked on head with a pifs pot than a thunder bolt. Pope. To Piss. v. a. [piffer, Fr. piffen, Dutch.] To the water.—I charge the piffing conduit run now but claret. Shak.—One als piffes, the reft for company. L'Estrange.-

Once posses'd of what with care you save, The wanton boys would pifs upon your grave.

Dryden. ISA, a town of Prussian Lithuania; 4 miles stallaporen,

2) PISSABED. n. f. A yellow flower growin the grafs.

b) Pissabed, in botany. See Leontodon.

ESSASPALTO, a mountain in Bua. ISSASPHALTUM, EARTH PITCH; a fluid, mineral body, of a thick confistence, 🏂 fmell, readily inflammable, but leaving a hum of greyish ashes after burning. It arises of the cracks of the rocks, in feveral places illand of Sumatra, and some other places East Indies, where it is much esteemed in tic diforders. There is a remarkable mine the island of Bua, of which a curious de-Mon is given by Abbe Fortis, for which we to his work. It is a species of petroleum. MINERALOGY, Part II. Chap. VI. Gen. III. is and Petroleum, & III. Abbe Fortis fays, the piffafphaltum of Bua is correspondent to folli production, which by Hasselquist, in his rels, is called MUMIA MINERALE, and MUMIA IVA PERSIANA by Kompfer, which the Egypmade use of to embalm their kings. d in a cave of mount Caucasus, which is kept and carefully guarded by order of the king zha. " Mumiahi, or native Perlian mummy Kempfer) proceeds from a hard rock in very It is a bituminous juice, that ades from the stony superficies of the hill, rein appearance coarse shoemakers wax, as its colour as in its dentity and ductility. k adherent to the rock it is less solid, but is ed by the warmth of the hands. It is eafily d with oil, but repels water; it is quite of smell, and very like in substance to the tian mummy. When laid on burning coals, the finell of fulphur tempered a little with

that of naphtha, not disagreeable. There are two kinds of this mummy; the one is valuable for its fearcity and great activity. place of the best mummy is far from the access of men, from habitations, and from fprings of water, in the province of Daraab. It is found in a narrow cave, not above two fathoms deep, cut like a well out of the mass, at the foot of the ragged mountain Caucasus." Kampfer Aman. Pers. This description agrees perfectly with the pissasphaltum, or fossil mummy of Bua, differing only in the privation of fmell, which perhaps is not totally wanting in the Persian mummy. One of the qualities affigned by M. Linnæus to the finest bitumen is to fmoke when laid on the fire, as ours does, emitting a fmell of pitch not difagreeable. He believes it would be very good for wounds, as the oriental mumia is, and like the pitch of Castro, which is frequently used by the Roman surgeons for fractures, contusions, and in many external applications.

\* PISSBURNT. adj. Stained with urine.

PISSELÆUM INDICUM, Barbadoes Tur; z mineral fluid of the nature of the thicker bitumens, and of all others the most approaching, in appearance, colour, and confiftence, to the true PISSASPHALTUM, but differing from it in other respects. It is very frequent in many parts of America, where it is found trickling down the fides of mountains in large quantities, and fometimes floating on the furface of the waters. It has been greatly recommended internally in coughs and other diforders of the breast and lungs. See PE-TROLEUM, Nº 2, § I.

PISSER, a mountain of Germany, in Tyrol;

4 miles SE. of Landeck.

PISSIRUS, a town of Thrace, near the banks of the Neslius. Herodot. vii. c. 109.

PISSOS, a town of France, in the department of the Landes; 27 miles NW. of Tartas.

PISS-POT, a bay on the S. coast of the Straits

of Magellan; 24 miles W. by N. of Cape Notch. Lon. 75. 12. W. Lat. 53. 14. S. (1.) PISTACHIO. n. f. [piftacbe, Fr. piftacbi, Italian; piftacbia, Lat.] The piftacbia is or an oblong figure, pointed at both ends about half an inch in length, the kernel is of a green colour and a fort and unctuous substance, much like the pulp of an almond, of a pleasant taste: pistachios were known to the ancients, and the Arabians call them pefluch and fefluch, and we sometimes sistich nuts. Hill.-Piftachies, so they be good, and not musty, joined with almonds, are an excellent pourither. Bacon.

(2.) PISTACHIO, OF PISTACHIA. See PISTA-CLA

(I.) PISTACIA, TURPENTINE-TREE, Piftachia nut and Maslich tree; a genus of the pentandria order, belonging to the dioecia class of plants: and in the natural method ranking in the coth order, Amentacea. There are 9 species; of which the most remakarble are,

1. PISTACIA LENTISCUS, the common mastich tree, grows naturally in Portugal, Spain, and Italy. Being an evergreen, it has been preserved in this country in order to adorn the green-houles. In the countries where it is a native, it lifes to the height of 18 or 20 feet, covered with a grey bark

on the ftem; but the branches, which are very numerous, are covered with a reddiffi-brown bark, and are garnished with winged leaves, composed of 3 or 4 pair of finall fpearthaped lobes, without an odd one at the end. This species is commonly propagated by laying down the branches, though it may also be raised from the feed in the manner directed for the piftachia nut tree : (See No 3.) and in this manner also may the true mastich tree be raifed. But this being more tender than any of the other forts, requires to be confrantly flettered in winter, and to have a warm fituation in fummer. Pitlachia nuts are moderately large, containing a kernel of a pale greenish colour, covered with a reddish skin. They have a pleasant, sweet, unctuous tafte, refembling that of almonds; and they abound with a fweet and well-tafted oil, which they yield in great abundance on being preffed after bruifing them: they are reckoned amongst the araleptics, and are wholesome and nutritive; and are by some esteemed very proper to be prescribed by way of restoratives, eaten in finall quantity, to people emaciated by long ill-

(2.) PISTACIA ORIENTALIS the true maflich tree of the Levant, from which the maftich is gathered, has been confounded by most botanical writers with the common massich tree, above described, though there are considerable differences between them. The bark of the tree is brown; the leaves are composed of two or three parts of spearshaped lobes, terminated by an odd one; the outer lobes are the largest; the other gradually diminish, the innermost being the least. These two of a brownish colour towards the autumn, when the plants are expected to the open air; but it they are under glasses, they keep green. The leaves continue all the year, but are not so thick as those of the common fort, nor are the plants

to hardy.

3. PISTACIA TEREBINTHUS, the tipachia tree, grows naturally in Arabia, Perlia, and Syria, whence the nuts are annually brought to Europe. In those countries it grows to the height of 25 or 30 feet: the bark of the stem and old branches is of a dark ruffet colour, but that of the young branches is of a light brown. These are garnished with winged leaves, composed fometimes of two, at other times of three, pair of lobes, terminated by an odd one: thefe lobes approach towards an oval thape, and their edges are turned backward; and these when bruised, emit a finell fimilar to that of the shell of the nut. Some of these trees produce male and others female flowers, and fome have both male and female on the same tree. The rale flowers come out from the fides of the branthes in loof: bunches or catkins. They have no pitals, but five finall flamina crowned by large four-cornered fummits filled with farina; and when this is discharged, the flowers fall off. female flowers come out in clufters from the fides en the branches: they have no petals, but a large oval permen supporting three reflexed styles, and are faceceded by oval outs. This species is propagated by its nuts; which flould be planted in pors filled with light kitchen-garden earth, and pion ed into a moderate hot bed to hims up the plants: when these appear, they should have a

large share of air admitted to them, and by grees they should be exposed to the open which at last they will bear in all scalous, they not without great danger of being destroyed by vere winters.

(II.) PISTACIA TREE BLACK. See HAMMER
\* PISTE. n. f. [Freuch.] The track of to
a horseman makes upon the ground be good

PISTIA, in botany, a genus of the least order, belonging to the gypandria class of plaand in the natural method ranking in the

order, Miscellanea.

PISTIL, n. f. among botanists, the little and column which is generally found in the control every flower. According to the Lineau fits, it is the female part of generation, whose test to receive and fecrete the pollen, and produce fruit. It conflists of three parts, viz. germs, and stigma. See BOTANY, Index.

\* PISTILLATION. n. f. [pifillum, Int] lact of pounding in a mortar.—The best due we have are commissible, and fo far from being hammers, that they submit unt. pifillum, a resist not an ordinary pesse. Brown.

PISTILLUM. See BOTANY, Index. (1.) PISTOIA, a city of Italy, in Etrura, fine on the Stella, in a beautiful and fertile page the foot of the Apennine mountains. If it it is called Pifforium, and is faid to have once a Roman colony. At prefent it is a The flreets are m fee, fuffragan of Florence. and regular, the houses tolerably well built in poorly inhabited for want of trade. Formary was an independent republic, but fince it was dued by the Florentines in 1200, it has besut declining condition. The cathedral has a sm handsome cupola, and a magnificent franchi afcend to it. In the chapel dedicated to \$ 100 where his relics are preferved, the wall and most covered with plates of filver. Here marble statues of very good workmanles in marble pulpit, the basso-relievos, the sale holds the holy water, and the square Roy , the work of John Pifano. There is a fine oder Jefuits college, and the Franciscans, Domesto and Augustinians, have good churches. be church of Madonna dell' Umilta there are the of Leo X. and of Ciement VII. The pales. tuated in a large square is a handsome hulling feveral of the nobility have also very good had It is about 20 miles NW. of Florence, 201 NE. of Pifa. Lon. 11. 29. E. Lat. 43. 55. N.

(2.) PISTOIA MOUNTAINS, mountains new floid, a part of the Apennines. There are willages on them. The chief is St Marcella

Clarendon.—Quicksilver discharge a piffol will hardly pierce through a panel Brown.—A woman had a tubercle in the canthus of the eye, of the biguess of a pholet. Wiseman.—

How Verres is lefs qualify'd to feel, With fword and pifol, than with wix and

(2) PISTOL, the smallest piece of been

bin at the saddle-bow, on the girdle, and in the tocket. The barrel is generally 14 inches long. bitol barrels are forged in one piece; two at a ime, joined by their muzzles; and are bored beore they are cut afunder; whereby there is a faing of time and labour, and a greater certainty f the bore being the fame in both. The method swelding, boring, polishing, &c. is the same with hat of guns. See Musker, § 6, 7.

(3.) Pistol Bay, a bay at the N. extremity of

lewfoundland.

\* To Pistol. v. a. [pifloler, Fr.] to shoot with piftol.

(1.) PISTOLE. n. f. [piffole, Fr.] A coin of rany countries and many degrees of value.—I ali disburden him of many hundred pistoles. briden.

(2.) PISTOLE, a gold coin, struck in Spain and kveral parts of Italy, Switzerland, &c. The itole has its augmentations and diminutions, bith are quadruple pistoles, double pistoles, and alf pistoles. See Money, § 9.

\*PISTOLET. n. f. [diminutive of piflol.] A

nle pifol .-

Those unlickt bear-whelps, unfil'd pistolets, That, more than cannon-shot, avails or lets.

Donne. (1.)\* PISTON. n. f. [piflon, Fr.] The moveable art in several machines; as in pumps and symes, whereby the fuction or attraction is caused; oembolus.

(2) Piston, in pump-work, is a short cylinder Mutal or other solid substance, fitted exactly officeavity of the barrel or body of the pump. WHYDROS FATICKS, Sea. VII-X.

MSTORIA, or PISTORIUM, in ancient geoapply, a town of Etruria, at the foot of the Apemines; memorable for the defeat of Catiline; w called PISTOIA.

PISTORINE, a Spanish coin. See Money,

PISTORIUS, John, M.D. and D.D. was bornat ida, in 1546. He fludied medicine, and was admed M. D. with applause; but his prescriptions Theing attended with success, he quitted that Milion, and fludied the law. His merit proand him the appointment of counsellor to Er-# Frederick margrave of Baden-Dourlach. He a embraced the Protestant religion; but some me after returned to the communion of the urch of Rome. He became afterwards one of emperor's counsellors, provost of the catheal of Breslaw and domestic prelate to the abbot Pulda. He wrote r. Several Controversial Tracts ainst the Lutherans. 2. Artis Cabaliflica Scripprinted at Bale, 1587; a scarce and curious Heclion. 3. Scriptores rerem Polonicarum. riptores de rebus Germanicis, in 3 vols. folio, om 1603 to 1613. This is a curious and scarce riformance. The author died in 1608, aged 52. PISTOYA. See PISTOIA.

PISTRINA, a town of Servia, 48 miles SW. of

fiffa, and 100 E. of Ragufa.

PISTRITZER, a river of Upper Saxony, which

ins into the Elbe, near the Wittenberg.

PISUERGA, a river of Spain, which rifes in it N. part of Old Castile, and runs into the Duto, 10 miles SW. of Valladolid.

PISUM, PEASE; a genus of the decandria order, belonging to the diadelphia class of plants and in the natural method ranking under the 32d order, Papilionacea. The species are,

I. PISUM AMERICANUM, commonly called Cape-Horn pea, with an angular trailing stalk, whose lower leaves are spear-shaped, sharply indented, and those at the top narrow pointed.

2. Pisum Humile, the dwarf pea, with an erect branching stalk and leaves having two pair of round lobes.

3. PISUM MARITIMUM, the fea pea, with footstalks which are plain on their upper fide, an angular stalk, narrow pointed stipulæ, and footstalks bearing many flowers.

4. Pisum Ochrus, with membranaccous running foot-stalks, having two leaves and one flower

upon a foot-stalk.

- 5. PISUM SATIVUM, the greater garden pear whose lower stipulæ are roundish, indented, with taper foot-stalks, and many flowers on a foot-stalk. There is a great variety of garden peafe now cultivated in Britain, which are diffinguished by the gardeners and feedimen, and have their different titles; but as great part of these have been seminal variations, fo if they are not very carefully managed, by taking away all those plants which have a tendency to alter before the feeds are formed, they will degenerate into their original state: therefore all those persons who are curious in the choice of their feeds, look carefully over those which they design for seeds at the time when they begin to flower, and draw out all the plants which they diflike from the other. This is what they call roguing their peafe; meaning hereby the taking out all the bad plants from the good, that the faring of the former may not impregnate the latter; to prevent which, they always do it before the flowers open. By thus diligently drawing out the bad, referving those which come carlieft to flower, they have greatly improved their peafe of late years, and are confrantly endeavouring to get forwarder varieties; fo that it would be to little purpose in this place to attempt giving a particular account of all the varieties now cultivated: therefore we shall only mention the names by which they are commonly known, placing them according to their time of coming to the table, or gathering for use: 1. The golden botfpur. 2. The Charlton. 3. The Reading botfpur. 4. Master's hotspur. 5. Esfex botspur. 6. The dewarf pea. 7. The sugar pea. 8. Spanish Morotto. 9. Nonpareil. 10. Sugar dewarf. 11. Sickle pea. 12. Marrowfat. 13. Rose or crown pea. 14. Rouncival pea. 15. Gray pea. 16. Pig pea; with some others.
- 6. PISUM UMBELLATUM, the rose or croque pea, with 4 pointed acute stipuli, and foot-stalks bearing many flowers, which terminate the stalks.

PISUS, the fon of Perieres, and grandfon of Eolus, the founder of Pisa. Pauf. 15.

\* PIT. n. f. [ pit, Saxon.] i. A hole in the

ground .-Tumble me into some loathsome pit. Shak.

Our enemies have beat us to the pit. -Pits upon the fea-shore turn into fresh water, by percolation of the falt through the fand; but in some piaces of Africa, the water in such pits will become brackish again. Bacon. 2. Abyss; profundity .-

From the pit of Acheron Meet me i' th' morning. Into what pit thou feeft

Shak.

From what height fallen. Milton. 3. The grave.-Left I become like them that go down into the pit. Pjalm xxviii. 1. 4. The area on which cocks fight; whence the phrase, to fly the pit .-

Make him glad, at leaft, to quit

His victory, and fly the pit. Hudibras. -They managed the dispute as fiercely, as two game-cocks in the pit. Locke. 5. The middle part of the theatre.-

Let Cully, Cockwook, Fopling, charm the pit. And in their folly flew the writers wit. Dryd. Now luck for us, and a kind hearty pit. Dryd. 6. [Pis, peis, old Fr. from pedius, Lat.] Any holiow of the body: as, the pit of the stomach; the arm

pit. 7. A dint made by the finger. 8. A mark by a difeafe.

\* To Pir. v. a. 1. To press into hollows .- An anafarca, a species of dropsy, is characterised by the flining and foltness of the skin, which gives way to the least impression, and remains pitted for fome time. Sharp. 2. To mark with small

hollows, as by the imall-pox.

PITAHAIA, (Cactus Pitajaya, Lin. Syft. Vegetablium. Jacquin Amer. 151. ed. 2. p. 75 M. E. Carthagena,) a shrub peculiar to California, is a kind of beech, the fruit of which forms the greateft harvest of the natives. Its branches are finely fluted, and rife vertically from the stem, so as to form a very beautiful top. The fruit is like a horfe-chefnut. In fome white, in others yellow, and in others red, but always exquifitely delicious, being a rich sweet, tempered with a grateful acid. See CACTUS.

PITANE, in ancient geography, a town of Afix Minor, in Æolia, famous for bricks. Lucan.

PITANGUA GUACU. See BEMETRE.

\* PITAPAT. n. s. [probably from pas a pas, or patte patte, Fr.] 1. A flutter; a palpitation .-Vilon meets him, and the fox's heart went pitapat. L'Estrange. 2. A light quick step .- Now I hear the pitapat of a pretty foot through the dark alley. Dryden. PITAUTS.

See BIDALDI.

PITCAIRNE, Archibald, M. D. a most eminent physician and ingenious poet, descended from the ancient family of the Pitcairnes of Pitpairne in Fifeshire. He was born at Edinburgh on the 25th of December 1652. He commenced his studies at Dalkeith; and thence removed to the university of Edinburgh, where he improved himself in ciassical learning, and completed a regular course of philosophy. The law seems to have been his own choice, and to this science he thrned his attention. With an ardour peculiar to himfelf, he purfued it with fo much intenfenefs, that his health began to be impaired. On this account, his physicians advised him to set out for the fouth of France. By the time he reached Paris, he was happily to far recovered, that he determined to renew his studies; but being informed that there was no able professor of law in that

city, and finding feveral gentlemen of his quaintance engaged in the Rudy of physic, & went with them to the lectures and hospitals, me employed himfelf in this manner for feveral morne till his affairs called him home. On his reter he applied himself chiefly to the mathemen His intimacy with Dr D. Gregory, the celebrate mathematical professor, began about this to Pitcairne's progress in mathematics was rapid. correspondent to his other pursuits. His income ments on the method of infinite feries then ado ed, which Dr Wallis of Oxford afterward lished, were a conspicuous and early proofed abilities in this science. Had Dr Pitcairne co tinued to profecute the ftudy of the law, at could he have moulded his principles to be times, the first offices and honours of the might have been looked for without prefu as the probable reward of fuch talents as began feffed. Struck, however, with the charms de thematical truth, which had been lately in duced into the philosophy of medicine, and be ing to reduce the healing art to geometrical a thod, he unalterably determined on this kild piring profession. In Edinburgh at that time the was no school, no hospital, no opportunity de provement but the chamber and the shop. I therefore foon returned to Paris, where he vated the object of his purfuit with his wall enthusiasm, and with a steadiness from whole could not be diverted. On the 13th Aug. 10 he received from the faculty of Rheims the to gree of M. D.; which, on the 7th Aug. 169, wa likewife conferred on him by the university of & berdeen; both being attended with marks de culiar distinction. Other medical hosouries conferred on him in France and elfewhere; nothing affords a more unequivocal tellimora his abilities than that which the furgeons of Land burgh gave, in admitting him, freely and cited, a member of their college. None opportunities of judging of his merit as the tioner, and on no physician did they ever the the same public mark of respect. Soon zhe graduation at Rheims, he returned to Edinari where, on the 29th of November 1681, the Roy College of Physicians was instituted; and name, among others, graced the original pater from the crown In his Solutio Problematin it h ventoribus, the treatife above aliuded to, be covers a high degree of medical literature. makes use of it to vindicate Dr Harvey's chim? During his residence in Scotland, his reported became fo considerable, that, in 1691, the use fity of Leyden solicited him to fill the chair then vacant. Such an honourable tens ny of respect, from a foreign nation, and fuch an univerfity, cannot perhaps he proin the medical biography of Great Britain Pitcairne's well known political principles ed him from promotion at home: he there accepted the invitation from abroad; and, and the 26th of April 1692, delivered, at Leyden elegant and masterly inaugural oration: Oration: qua ostenditur medicinam ab omni philosopheran effe liberam. He discharged the duties of bat tice at Leyden fo as to answer the most sanguar expectation

xpectations. He taught with a perspicuity and loquence which met with univerfal applause. t the fame time, he was not more celebrated as professor than as a practical physician; and notithstanding the multiplicity of his business in oth these characters, he found leisure to publish veral treatifes on the circulation, and fome oer of the most important parts of the animal emomy. Previously to this he had married a ughter of Col. James Hay of Pitfour, by whom had two children who died young. At the of the fession he set out for Scotland, with intention of returning in time for the fucceedg one. On his marrying the daughter of Sir rehibald Stevenson, the object of his journey, her lations would on no account confent to part with m again. He was therefore reluctantly obliged remain; and he wrote the university a polite pology, which was received with the utmost reet. He even declined the most flattering solicitions and tempting offers to fettle in London. ideed he foon came into that extensive practice which his abilites entitled him, and was also pointed titular professor of medicine in the uversity of Edinburgh. In a science so slowly ogressive as that of medicine, Dr Pitcairne did great deal. By labouring in vain for truth in ac road, he faved many the fame drudgery, and sereby showed the necessity of another. He not aly exploded many falle notions of the chemists ad Galenists, which prevailed in his time, but many of those too of his own sect. In particular, be howed the absurdity of referring all diseases and their cures to an alkali or an acid. He refutd the idea of fecretion being performed by pores ifferently shaped, Bellini's opinion of effervesences in the animal spirits with the blood, and lorelli's of air entering the blood by respiration. le proved the continuity of the arteries and cins; and feems to have been the first who lowed that the blood flows from a smaller capaity into a larger; that the aorta, with respect othe arterial system, is the apex of a cone. In therefore he may be confidered as the latent ing of the discoveries respecting the powers noving the blood. He introduced a simplicity prescription unknown in pharmacy before his me; and fuch was the state of medicine in this ountry, that scarcely have the works of any coemporary or preceding author been thought forthy even of prefervation. As to the errors of is philosophy, let it be remembered, that no houry has as yet stood the test of many years in in enlightened period. His own hung very loofely bout him; and the present generally received ractice differs from his very little in reality. He reated inflammatory and hemorragic difeates by sleeding, purging, and bliftering, as has been done indormly and folely on the different theories ince. His method of administering mercury and he bark is observed at this day; and with respect o febrile, nervous, glandular, and dropfical affecbons, they feem to be as often the opprobriums of the art now as they were then. Dr Pitcairne was univerfally confidered as the first physician of his time. No one appears ever to have had fo much practice in this country, or fo many con-VOL XVII. PART II.

tultations from abroad; and no one from all accounts, ever practifed with greater lagacity and fuccefs. The emoluments of his profession must have been great; but his charities are known to have been correspondent. The possession of money he postponed to more liberal objects: he collected one of the finest private libraries in the world; which was purchased, after his death, by the Czar of Muscovy. Notwithstanding the fatigues he underwent in the exercise of his profesfion, his conflitution was naturally delicate. About the beginning of October 1713, he became affected with his last illness; and on the ijd he died, regretted by science as its orn ment, by his country as its boaft, and by humanity as its friend. The prefent noble family of Kelly are his descendants. Some anonymous publications are attributed to Dr Pitcairne, particularly a treatife De Legibus Historiæ Naturalis, &c.; but the only ones lie thought proper to legitimate are his Differtationes Meditie, and a short essay De Saiute.

PITCAIRN-GREEN, a village of Perthshire, in the

parish of Redgorton. .

PITCAIRN'S ISLAND, an island in the S. Pacific Ocean, 6 or 7 miles long and 2 broad. It has neither river nor harbour, but high mountains, which are visible at 45 miles distance. All the S. coast is rocky. Lon. 133. 21. W. Lat. 25. 2. S.

PITCAITHLY. See PITKEATHLY.

(1.) \* PITCH. n. f. [pic, Sax. pix, Lat.] 1. The refin of the pine extracted by nie and inspillated.—They that touch pitch will be defiled. Prov.

A rainy vapour

Comes on as blacke as pitch. Chapman.

Of air and water mixed together, and confumed with fire, is made a black colour; as in charcoal, oii, pitch, and links. Peacham.—

A vessel smear'd round with pitch. Milton.
2. [From pids, Fr. Skinner.] Any degree of eleva-

tion or height .-

Weak the makes ftrong, and ftrong things does increase,

Till it the pitch of highest praise exceeds. Spens. How high a pitch his resolution soars. Shak. Mount aloft with thy imperial mistress,

And mount her pitch. Shak. T. Andron.
Between two hawks, which flies the higher

I have, perhaps, some shallow judgment. Shak.
That greate worke maintaines a pitch above

All mortal powers. Chapman.

Driv'n headlong from the pitch of heaven,
down

Into this deep. Milton's Par. Loft.

-Others expectation was raifed to a higher pitch

than probably it would. Hammond.— Cannons shoot the higher pitches,

The lower we let down their breeches. Hidib.

—Alcibiades was one of the best orators of his age, notwithstanding he lived at a time when learning was at the highest pitch. Addison's Whig Examiner. 3. Highest rife. Not used.—

A beauty waining, and distressed widow, Seduc'd the piteb and height of all his thoughts. To base deciention. Shak

4. State with respect to lowness or height.—
From this high pirch let us descend.

Fiff
By

By how much from the top of wond'rous

To lowest pitch of abject fortune fali'n.

5. Size; ftature .-

That infernal monfter-

'Gan high advance his broad discoloured breast Above his wonted pitch.

It is of such a spacious lofty pitch,

Your roof were not sufficient to contain it. Shak. So like in person, garb and pitch,

'Twas hard t' interpret which was which. Hud.

6. Degree; rate. Manslaughter thall be held the highest pitch Of human glory. Millon.

Our refident Tom From Venice is come, Talks at the same pitch,

ls as wife is as rich. Denbam. No pitch of glory from the grave is free.

Waller. -Evangelical innocence amounts to such a pisch of righteoutiefs, as we call fincerity. South-When the fun's heat is thus far advanced, 'tis but just come up to the pitch of another set of vege-

tables. Woodward's Nat. Hift. (2.) PITCH (§-1, d.f. 1.) is a tenacious oily fubfrance drawn chiefly from pines and firs, and used in shipping, medicine, and various arts: it is more properly tar inspissated by booing it over a slow fire. See TAR. The bell black pitch is made of the refuse of rosin and turpentine, such as will not pass through the straw filtre, and the cuttings around the incision on the tree. These materials are put into a boiler 6 or 7 feet in circumference, and 8 or 10 feet high. Fuel is laid around the top, and the materials, as they melt, flow thro' a channel cut in the fire-place into a tub haif filled with water. It is then very red and almost liquid. To give this a proper confidence, it is put in a cauldron placed in a furnace, and boiled down in the same manner as rosin, but it requires much lefs precrution and double the time. It is then poured into moulds of earth, and forms the best black pitch.

(3.) PITCH, BASTARD, a mixture of colophony, black pitch, and tar. They are boiled down together and put into a barrel of pine wood, forming, when mixed in equal portions, a very liquid substance called in France bray gras. If it is defired of a thicker confiftence, a greater proportion of colophony is added, and it is cast into moulds.

(.4) PITCH, FOSSIL, or | See MINERALOGY, (4.) PITCH, MINERAL. | Part II. Chap. VI. Gen. III. Sp. 4. and PETROLLUM.

(5.) PITCH STONE. See MINFRALOGY, Part II.

Chap. IV, Class I. Ord. 1. Gen. II. Sp. 5.

(1.) \* To PITCH. w. a. preterite pitched, participle pitched, anciently pight. See Pight. [appieciare, Italian.] 1. To fix; to plant.

On Dardan plains the Greeks do pitch Their brave pavilions. Shak. Troil. and Creff. Sharp stakes, pluckt out of hedges,

They pitched in the ground. He counselled how to hunt his game,

What dart to cast, what net, what toil to pitch.

Fairfux. Mahometes pitched his tents in a little meadow. Knolles.

When the victor

Had conquer'd Thebes, he pitch'd upon the

His mighty camp. Dryden's Knight's Tak. To Chaffis' pleating plains he took his win,

There pitch'd his tents. Their proud foes in pitch'd pavilions in.

2. To order regularly.—He describeth the maner how to pitch a field. Hooker .- One pitch battle would determine the fate of the spant continent. Addison. 3. To throw headlong; in cast forward.

They'll not pitch me if th' mire. Shak Tank They would wrestie, and pitch the bur sis whole afternoon. Spectator. 4. To incar 🐗 PITCH. [piec, Lat. from the noun.]

The pitched veffels glide with easy force. Dyla

-Some pitch the ends of the timber in the will to preferve them from the mortar. Mozen's be eban. Ex.- I pitched over the convex vay their by dropping melted pitch upon it. Newton's Opticks, 5. To darken.-

The air hath starv'd the roses in her checks And pitch'd the lify tincture of her face. Soon he found

The welkin pisch'd with fullen cloud. 6. To pave. Amfworth.

(2.) \* To PITCH. v. H. I. To light; to -Take a branch of the tree whereon they and wipe the hive clean. Mortimer. 2. To headlong.

Forward he flew, and pitching on his hold He quiver'd with his feet, and lay for deal

3. To fix choice: with upon.-

They're all alike, yet we shall pitch On one that fits our purpole. -A free agent will pitch upon fuch a patient choice. More. - I pitched u'on this confide that parents owe their children spiritual tion to their mind. Digby .- The covetons ther. L'Estrange.—Pitch upon one thing also life, and custom will render it the most of Istson -I translated Chaucer, and amongh theme pitched on the wife of Bath's tale. Dryden 4. To fix a tent or temporary habitation.—They picked by Emmaus in the plain. 1 Mac. iii. 40.

\* PITCHER. n. f. [picher, French.] 1. An eat-

then veilel; a water pot .-

With suddain fear her pitcher down the three Sprafer And fled away. Pitchers have ears, and I have many ferrant

We read of kings, and gods, that kind took

A pitcher, fill'd with water, from the brook Carl

Pyreicus was only famous for counterfeiting base things; as earthen pitchers and a sculing Peacham on Drawing .-

Hylas may drop his pitcher, none will cry

2. An inftrument to pierce the ground in which any thing is to be fixed .- To the hills poles men

let deep in the ground, with a square iron pier or crow. Mort. Hufb.

' PITCHFORK. n. f. [pitch and fork.] A fork h which com is thrown upon the waggon .old ford in Leicestershire amused himself with nding pitchforks and spades. Swift.

P.TCHINESS. n. f. [from pitchy.] Blackness; knels.

'ITCHING, u. f. in sea-affairs, may be defined vertical vibration which the length of a thip tes about her centre of gravity; or the movest by which the plunges her head and after-part mately into the hollow of the fea. This momay proceed from two causes; the waves chagitate the vessel; and the wind upon the is which makes her floop to every blast thereof. that absolutely depends upon the agitation of les, and is not susceptible of inquiry; and the nd is occasioned by the inclination of the le, and may be submitted to certain establishnaxims. When the wind acts upon the fails, mast yields to its effort, with an inclination ch increases in proportion to the length of the , to the augmentation of the wind, and to the parative weight and distribution of the ship's ng. The repulsion of the water, to the effort ravity, opposes itself to this inclination, or at fastains it, by as much as the repulsion exis the momentum, or absolute effort of the b upon which the wind operates. At the each blast, when the wind suspends its achim repulsion lifts the vessel; and these sucin inclinations and repuisions produce the rement of pitching, which is very inconvenient; when it is confiderable, will greatly retard course, as well as endanger the mast, and o the vessel.

PITCHY. adj. [from pitch.] r. Smeared with

The planks, their pitchy cov'rings wash'd away

wyseld.

wield.

wield.

with no other than this very pitchy substance; mournful; exciting pity.—

Woodward

Woodward

Woodward

When they heard that pitcous strained voice, when they have the strained voice, when they have the strained voice, which we strain the strained

Night is fled, hole siteby mantle over-veil'd the earth. Shak. I will fort a pitchy day for thee. Henry VI. Pitchy and dark the night sometimes appears.

) \* PITCOAL. n.f. [pit and coal.] Fossile -The best fuel is peat, the next charcoal

of pitcoal or cinders. Mort. Hufb. PIT-COAL, OF STONE COAL. See CHEMIS-Index; COAL, LITHANTHRAI, MINERA-t, Part II. Chap. VI. Gen. IV. Part III, Chap. and XYLANTHRAX. Mr Bertrand, redukinds of coals to fix general classes, viz. thanthrak ligneus; 2. Petrofus; 3. Terref-4. Piceus; 5. Fissilis; 6. Mineralisatus. He that the Scots coals are heavier, and burn well as those of Newcastle; that those of burn quicker; and those from Brassac in rgne, and from La Fosse, burn with a more ableflame, &c. But Mr Morand, in his Nomene Raisonnée, distributes all forts of pit-coals inclasses: In the first he places nine varieties,

beginning with the gagas or succinum nigrum, to the variegated lithanthrax; in the second he reckous 7 varieties, beginning with the lithanthrax eleganti ffructura, to that facie granulata? and he forms the 4th class with the earthy and poorer kinds of foldi coais. He feems, however, to have been purried with the flaty coals, as he ranges them in a separate class, perhaps to shelter himself from the critical objections of those numerous superficial naturalists, who only look for the apparent configuration, without almost any regard to the component parts of foffiis. The coal-trade is of infinite importance to Great Britain, which never could have arrived at its prefent commercial eminence without it; and this eminence it will be impossible to retain if coal should ever become This we trust is not likely to be the case, though Mr Williams expresses great fears for it, and informs us that at Newcastle and in many parts of Scotland the mines near the fea are already wasted, the first consequence of which must be an enormous rife in the price. See his observations on this subject in his Natural History of the Mineral Kingdom, p. 156, &c. This author fays, that coal was not discovered till between the middle of the 12th and beginning of the 13th centuries: it is therefore, according to him, 400 years fince it was first discovered in Britain, but they have not been in common use for more than 200 years. The fame author gives us many pertinent observations on the appearances and indications of coal, instructions about searching for it, remarks on false and doubtful symptoms of coal; for all which, together with his observations on the different kinds of Scots coal, we refer our readers to the work itself; the first part of which, occupying the largest proportion of the first volume, is upon the strata of coal, and on the concomitant strata. See also Cualery.

PITEA. See PITHEA, No 1-4.

PITEOU, an island, near the coast of China.

The most arch deed of piteous mastricre, That ever yet this land was guilty of. Rich. III. Which when Deucalion with a piecous look

Beheld, he wept. 2. Compassionate; tender.-

Piteous transfer it to the mournful swain.

Prior

Thieves

She gave him, piteous of his case, A fhaggy tap'stry. Pope's Dunciad. 3. Wretched; paltry; pitiful.-Pitcow amends! unless

Be meant our grand foe. Milt. Par. Loft. \* PITEOUSLY. adv. (from piteous.) In a pite-

Ruthful to hear, yet piteoufly perform'd. Shak. \* PITEOUSNESS. n. f. [from piteous.] Sur-

rowfulness; tenderness. \* PITFALL. z. f. (pit and fall.) A pit dug and covered, into which a pattenger fails unexpectedly. Poor bird! thoud'st never sear the net nor

lime, The pitfall, nor the gin. Shak. Mach. Ffff2

-Thieves dig concealed pitfalls in his way. Sandys. -These hidden pitfalls were set thick at the en-

trance of the bridge. Addison.

(1.) \* PITH. n. f. [pitte, Dutch.] 1. The marrow of the plant; the loft part in the midst of the wood.—If a cion, fit to be fet in the ground, hath he pith finely taken forth, and not altogether, but some of it left, it will bear a fruit with little or no core. Bacon's Nat. Hift.

Her folid bones convert to foild wood,

To pith her marrow, and to tap her blood.

Dryden.

2. Marrow.-

As doth the pith, which left our bodies flack, Strings fast the little bones of neck and back; So by the foul doth death string heav'n and earth.

Donne. -The vertebres are all perforated in the middle, with a large hole for the spinal marrow or pith to pass along. Ray. 3. Strength; force.—Pith in Scotland is still retained as denoting strength, either corporeal or intellectual: as, that defies all your pith .-

Guarded with grandsires, babies and old wo-

Or pass'd, or not arriv'd to pith and puissance.

Since these arms of mine had seven years pith. Shak.

4. Energy; cogency; fulness of sentiment; closeness and vigour of thought and stile. 5. Weight; moment; principal part.-

That's my pith of bufiness. Shak. Enterprizes of great pith and moment. Shak.

6. The quintessence; the chief part.—
The owner of a foul disease,

To keep it from divulging, lets it feed

Ev'n on the pirb of life,

- Hambt. (2.) PITH, in vegetation, is the foft spongy substance contained in the central parts of plants and
- (1.) PITHEA, PETA, or PITEA, a province of Swedish Lapland, bounded on the N. by Lula, or Luhlia, E. by Bothnia, S. by Uhma or Elma, and W. by Norway.

(2.) PITHEA, a river which runs across the above province, and falls i to the Gulf of Bothnia.

(3.) PITHEA, or PITEA, the capital of the above province, (Nor.) is feated at the mouth of the river (No 2.) on a small island which is joined to the continent by a wooden bridge. It has a good harbour and a school, the streets run in parallel lines, but the church is on the other fide of the bridge. It is 80 miles SW. of Tornea. Lon. 22. 40. E. Lat. 65. 11. N.

(4.) PITHEA, OLD, a town in the above province, 3 miles above Pithea, which was built by Gustavus Adolphus in 1621, but was totally burnt in 1666; on which the new town (No 3.) was built at the mouth of the river. Old Pithen, however, is now a large village, confifting of a great number of houses, scattered irregularly on a fine

common.

PITHECUSA, an island of Italy, on the coast Etruria, anciently called ÆNARIA, with a town fo named on the top of a mountain. It was fubject to earthquakes and had a volcano; which led mythologias to fay, that the giant Typhon was buried alive under the mountain, and firingeled: fuch times to throw off his buiden. Oxid. 15.

\* PITHILY. adv. [from pithy.] With fireat;

with cogency; with force.

\* PITHINESS. n. f. [from pithy.] Enemy strength.-No less deserveth his wittiness in wifing, his pithinels in uttering, his complaint of her, so lovely. Spenser.

PITHIVIERS, a town of France, in the eq. of the Loire; 21 miles ENE. of Orleans, 2002

NW. of Montargis.

PITHLESS. adj. [from pith.] 1. With pith, wanting strength.-

Weak shoulders over-born with burthers grief

And pitbless arms. 2. Wanting energy; wanting force.

PITHO, in the mythology, the godders of per fuafion among the Romans, the daughter of Mrs. cury and Venus. She was represented with t diadem on her head, to intimate ber influence ver the hearts of man. One of her arms appear ed raised as in the attitude of an orator harage ing in a public affembly; and with the other hed ers, to fignify the powers of reasoning and the attractions of eloquence. A caduceus, as a track of persuation, appears at her feet, with the mitings of Demosthenes and Cicero, the two see celebrated orators among the ancients, wherear flood how to command the attention of their audence, and to rouse and animate their various patient

and confequently with the Mediterranear. The was an arm of the Nile called Pathmeters, micus, Phatnicus, or Phatniticus. that Pithom and Raamses are about five league above the division of the Nile, and beyond this ver: but this affertion has no proof from anti-

ty. Marsham will have Pithorn to be the fame

PELUSIUM OF DAMIETTA.

PITHOU, or Pithoeus, Peter, a Frenches of great literary eminence, descended of an area and noble family in Normandy, and born at Imin 1539. He first studied at Troyes, and wards at Paris, where he became the scholar friend of Turnebus. Having acquired the guages and belles lettres, he was placed und Jacius at Bourges to study civil law, and # panied him to Valence. In 1560, he returned Paris. In 1563, he published Adversaria & which laid the foundation of that great and car five fame be afterwards acquired. Soon after Henry III. advanced him to fome confident posts; in which, as well as at the bar, he are Either thron ted himfelf most honourably. these favours or through fear, he abjured the tant religion, and embraced the Catholic. He erwards attended the duke of Montmorency in-England. Henry III. and IV. were greatly oged to him for combating the League in the of intrepid manner, and for many other fervices. hous died upon his birth-day in 1596, leaving aind him a wife whom he had married in 1579, Thuanus fays he was the I some children. ift accomplished man of the age in which he ed. He collected a very valuable library, conaing a variety of rare M.SS. as well as printed oks. He published a great number of works m law, hiftory, and claffical literature; and he re several new and correct editions of ancient iters. He was the first who made the world acainted with the Fables of Phædrus: which, tober with the name of their author, were utteranknown and unheard of, till published from a S. of his.

PITHY. adj. [from pith.] 1. Confifting of h.—The pithy fibres brace and flitch together ligneous in a plant. Grew's Cofmol.—

The Herefordian plant that likes I' approach the quince, and th' elder's pithy flem. Philips.

Strong; forcible; energetick.—
Yet the with pithy words, and counsel fad, til strove their sudden rages to revoke. Spenfer.
I must begin with rudiments of aft,

More pleafant, pit by and effectual,

Man hath been taught by any.

Shak.

Many rare pithy faws concerning

This pithy speech prevail'd, and all agreed.

Dryden.

Ocodman Fact was very fhort, but pithy. Addif.

THYNIA, an ancient name of Chios.

THYUSA. See MILITUS, N° 2.

TI, a town of Thibet, 204 miles S. of Latac.

PITIABLE. adj. [pitovable, Fr. from pity.] Demog pity.—The pitiable persons relieved, are

Pantly under your eye. Atterbury.
PTIABLENESS. n. f. [from pitiable.] State
Persing pity.—For the pitiableness of his ignomand unwilled mistake, his neglect thereof
the excused. Kettlewell.

PITIFUL adj. [pitr and fiell.] 1. Melancholy; sing compassion.—Some, who have not deterdingment of death, have been for their good's caught up and carried straight to the bough; hing indeed very pitiful and horrible. Spenfer.—

A light most pitiful in the meanest wretch, Past speaking of in a king. Shak. King Lear.

All fwoln and ulc'rous, pitiful to the eye;
The mere despair of surgery he cures. Stak.
Will he his pitiful complaints renew? Sandys.
Connder what a pitiful condition we had been.
Ray on the Great. 2. Tender; compassionate.

Would my heart were flint, like Edward's, Or Edward's foft and pitifiel, like mine. Shak. Be pitiful to my condemned fons. Shak. Patry; contemptible; despicable.—That's vilbous, and shews a most pitiful ambition. Shak.—or, in a wild pamphlet, besides other pitiful massines, would scarce allow him to be a gentle-ian. Wotton.—This is the doom of fallen man, rihays to spin out his days and himself into one will controverted conclusion. South.—Sin can

please no longer, than for that pitiful space of time while it is committing. South.—If these pitiful shanks were answerable to this branching head, I should defy all my enemies. L'Estrange.—What entertainment can be raised from so pitiful a machine, where we see the success of the battle from the beginning. Dryden's Ded. to Jun.

\* PITIFULLY. adv. [from pitiful.] 1. With pity; with compassion.—Pitifully behold the forrows of our hearts. Comm. Prayer. 2. Mournfully; in a manner that moves compassion.—

He beat him most pitifully. Shak.—When any great evil has been upon them, they would figh and groan as pitifully as other men. Tillotfon. 3. Contemptibly; despicably.—Those men, who give themselves airs of bravery on reflecting upon the last scenes of others, may behave the most pitifully in their own. Clarissa.

\* PITIFULNESS. n. f. [from pitiful.] r. Tendernets; mercy; compassion.—Basilius giving infinite terms of praises to Zelmane's valour in conquering, and pitifulness in purdoning, commanded no more words to be made of it. Sidney.

 Defpicableness; contemptibleness. PITIGLIANO, a town and fortress of Etruria,

23 miles ENE. of Orbitello.
PITIHEMPO, a mountain of Afia, in Thibet,

which bounds that country on the NW.
\* PITILESLY. adv. [from pitilefs.] Without

\* PITILESNESS. n. f. Unmercifulness. .

\* PITILESS. adj. [from pity.] Wanting pity; wanting compaffion; mercileis.—

Fair be ye fure, but proud and pitiless, As is a ftorm.

Spenser.

Hadft thou in person ne'er offended me, Even for his sake am I now pitiless. Shak. My chance, I see,

Hath made ev'n pity pitiles in thee. Fairfux. Upon my livid lips bestow a kits,

Upon my livid lips befrow a kits,

Nor fear your kiffes can reftore my breath;

Even you are not more pitiles than death. Dryd. PITISCUS, Samuel, a learned antiquary, born at Zutphen, was rector of the college of that city, and afterwards of St Jerome at Utrecht, where he died, Feb. 1, 1717, aged 90. He wrote, 1. Lexicon Antiquitatum Romanorum, in 2 vols. folio; a work which is efteemed. 2. Editions of many Latin authors, with notes; and other works.

PITKEATHLY, or PITCAITHLY, a village of Perthshire, in Strathearn, in the parish of Dumbarny, about 5 miles SW. of Perth, famous for its mineral waters. 'The village and the wells are in a fituation truly rural and romantic; and the accommodations for the invalids are good. Of the waters, the following account is given by the rev. Mr David Beatton, in his Statistical Account of the parith: (Vol. VIII. p. 405.)-" The mineral waters of Pitkeathly, which have long been famed for their efficacy in curing or alleviating the ferophula, feurvy, gravel, &c. are fituated in this This mineral is gentle in its operation, parifh. has an agreeable effect in relieving the flomach of crudities, procuring an appetite, and exhilarating the spirits; and, instead of weakening, tends to strengthen the constitution. The water is of a cooling quality, and very efficacious in removing all heat and foulness of the blood. It is used both for drinking and bathing. In some eases the warm bath has the most falutary effect, especially in scrophulous and fcorbutic complaints; but should be used with caution, as it tends to weaken, if made too warm, or used too frequently. The time, when this mineral was discovered, cannot be ascertained; even tradition fays nothing of its first discovery. There are five distinct springs, all of the fame quality, but of different degrees of firength. In 1771, some experiments were made on one of the mineral fprings, by Dr Donald Monro of London, which, in 1772, together with a letter from the late Dr Wood of Perth, on the fame fubiect, were published in the 62d vol. of the Philof. Tranf. This year, (1792,) Mell'rs Stoddart and Mitchel, druggifts in Perth, have, with much attention and accuracy, analized the feveral fprings. The following table is the refult of their experiments:

A TABLE shewing the contents in a wine gallon of each of the mineral waters of the effates of PITKEATHLY and DUMBARNY.

PITLAR, a town of Ruffia, in Tobolik. PITLOCHRY, a village of Perthfhire, in Moulin parish, on the road from Perth to Inverness, 6 miles from Killicrankie; containing 160 fouls in 1793.

PITLUNDY, a lake of Scotland, in Rofs-shire. PITMAN. n. f. [pit and man.] He that in fawing timber works below in the pit.- With the pitfaw they enter the one end of the stuff, the topman at the top, and the pitman under him: the topman observing to guide the faw exactly, and the priman drawing it with all his strength perpendicularly down. Moxon.

PITOC, a town of Thibet, 24 m. NW. of Latac. PITOLO, a town of the Italian republic, in the dep. of the Mincio, diffrict and late duchy of Mantua; 2 miles SE. of Mantua.

PITORA, a river of Anossi.

PITOT, Henry, F. R. S. a learned writer, of a noble family in Languedoc, born at Aramont, on the 29th May, 1695. He acquired mathematics without a master, and went to Paris in 1718, where he formed a close friendship with the illustrious Reaumur. In 1724, he was admitted a member of the Royal Academy of Sciences with ris, and in a few years role to the degree of are tioner. Belides a vaft number of Memois preed in the collection of that fociety, he publical in 1731, The Theory of the Working of Ships, B1 vol. 4to; a work of confiderable ment, which translated into English, and procured the ada to be admitted into the Royal Society of Los In 1740, the states general of Languedoc app ed him their chief engineer, and inspeller of the canal. That country is indebted to for feveral monuments of his genius. He fe, Montpelier with water, by a noble aquedud. MONTPELIER.) The illustrious Marshaldes was the great patron and friend of Pitot, while taught this hero the mathematics. In 1988 married Maria-Leonina Pharambier de Sabban descended of a very ancient noble family d varre, by whom he had one fon, who was a cate-general of the Court of Accounts, Aid, Finances of Montpellier. Pitot was a prophilosopher, and a man of uncommon problem candour. He was also a member of the Roylling ciety of Sciences of Montpellier. He did # ramout, 27th Dec. 1771, aged 76.

PITQUIN, a town of Mexico, in New No.

\$70 miles NW. of Cinaloa.

PITRIOWIN, a town of Poland, in Line 32 miles SW. of Lublin.

PITS, John, a celebrated biographe, beau 1560, at Aulton in Hampshire, and educated Wykeham's school, near Winchester, ill ku 18 years of age; when he was fent to New Comin Oxford, and admitted probationer feller. L ving continued in that university near two he left the kingdom as a voluntary Roman and retired to Douay; from thence he would the English college at Rheims, where he to ed about a year; and then proceeded to lim where he continued a member of the college near 7 years, and was made a pre-1589, he returned to Rheims; and then two years, taught rhetoric and Greek. Ika quitted Rheims on account of the civil wal France; and retired to Pont à Mousson in Lors where he took the degrees of M. A. and B. Hence he travelled into Germany, and refurd year and a half at Triers, where he comment licentiate. From Triers he vifited feveral of principal cities in Germany; and continuing the years at Ingoldstadt in Bavaria, took the degree D. D. Thence having made the tour of Italy, returned once more to Lorrain; where he was tronifed by the cardinal of that duchy, who ferred him to a canonry of Verdun; and about years after he became confessor to the ducket Cleves, daughter to the Duke of Lorrain. W in this employment, he wrote in Latin the list the kings, bishops, apostolical men, and write England. The last of these, commonly and quoted by this title, De illufribus Angliz p coribus, was published after his death. The to first still remain in M.S. among the archives of collegiate church of Liverdun. The dike Cleves dying after Pits had been about 13 102 confessor to the duches, she returned to Line attended by our author, who was promoted the deanery of Liverdun, which, with a cancel

id officialship, he enjoyed to the end of his life. e died in 1616, and was buried in the collegiate mich. He is accused of partiality to the Rosish writers.

\*PIT-SAW. n. f. [pit and faw.] The large faw in by two men, of whom one is in the pit.—
te pitfaw is not only ufed by those workmen it faw timber and boards, but is also for small inters used by joiners. Moxon's Mechan. Exer.
PITSCHEN, a town of Silesia, in Brieg. It was int by the Poles in 1588; and again sacked in 17 and 1633. It has a college and 2 churches, I is 30 miles NE. of Brieg, and 42 E. of Bref-Lon. 18. 22. E. Lat. 51. 10. N.

TISEY, a town of Effex, near N. Benfleet, ich gives name to a creek of the Thames.

TISE, a town of China, in Koe-tcheou.

TISLE, a town of thma, in Roe-tcheous TISLIGO, a parish of Scotland, in Aberdeener, of a rectangular form, 3½ miles long from to W. and 3 broad from the S. to the coast. eastern extremity lies 2 miles W. of Kinnaird's 1, a conspicuous point in Aberdeenshire, where the house was lately erected by government. Climate is dry and healthy; the surface is letter foil on the S. black and light; towards N. a yellow clay, which produces good crops aley and beans; but in general is not favour-to oats, excepting in two sarms. A planta-of forcst trees reared by Sir W. Forbes, by the superiment, has succeeded well. The position in 1791, was \$300; the increase 76, since 1. considerable quantity of kelp is made universals.

PITT, Christopher, an eminent English i celebrated for his excellent translation of Eacid, was born in 1699. Having stuggers at New College, Oxford, he was preto the living of Pimperne in Dorfetshire, he held during life. He had so poetical a state he translated Lucan, while a boy. Next sine translation of Virgil, he gained the reputation by his excellent English transfevida's art of poetry. He died in 1648.

The William, earl of Chatham, a most collection of the was the youngest son of the was the youngest son of

The Pitt, Efq. of Boconnock in Cornwall; and

fon of Thomas Pitt, Esq. governor of Fortune in the East Indies, in the reign of queen, who sold an extraordinary fine diamond to ag of France for 135,000l. and thus obtained me of Diamond Pitt. His intellectual faculty powers of elocution very foon made a dished appearance; but at the age of 16 he attacks of an hereditary gout, by which tormented at times during the rest of his His lordship entered early into the army, red in a regiment of dragoons. Through rest of the duches of Marlborough, he obtained in the house was as His sirst appearance in the house was as

His first appearance in the house was as Mative of the borough of Old Sarum, in parliament of Great Britain. In the 10th resented Scaford, Aldborough in the 11th, e city of Bath in the 12th; where he contill he was called up to the house of peers in The intention of the duches in bringing us early into parliament was to oppose Sir

Robert Walpole, whom he kept in awe by the force of his eloquence. At her death the duchefo left him 10,000 on condition, as was then reported, that he never should receive a place in administration. However, if any such condition was made, it certainly was not kept on his lordship's part. In 1746 he was appointed vice-treasurer of Ireland, and foon after paymaster general of the forces, and fworn a privy-counsellor. He discharged the office of paymafter with fuch honour and inflexible integrity, refufing even many of the perquifites of his office, that his bitterest enemies could lay nothing to his charge, and he soon became the darling of the people. In 1755 he refigned the office of paymatter, on keing Mr Fox preferred to him. The people were alarmed at this relignation; and being difgufted with the unfuccesful beginning of the war, complained for loudly, that, on the 4th December 2756, Mr Pitt was appointed fecretary of frate in the room of Mr Fox afterwards Lord Holland; and other promotions were made to fecond his plans. He then took such measures as were necessary for the honour and interest of the nation; but in February 1757, having refused to affent to the carrying on a war in Germany for the fake of his majesty's dominions on the continent, he was deprived of the feals on the 5th of April following. Upon this the complaints of the people again became to violent. that on the 29th of June he was again appointed fecretary, and his friends filled other important offices. The war was now conducted with uncommon success; yet on the 5th Oct. 1762, Mr Pitt, to the aftonishment of the public, resigned the feals. The reason was, that Mr Pitt, having received certain intelligence that the family compact was figned between France and Spain, and that the latter was about to join France against us, thought it necessary to prevent her by commencing hostifities first. Having communicated this opinion in the privy council, the other ministers urged that they would think twice before they declared war against that kingdom. " I will not give them leave to think (replied Mr Pitt); this is the time, let us cruth the whole house of Bourbon. But if the members of this board are of a different opinion, this is the last time I shall ever mix in its councils." After his refignation in 1761, Mr Pitt never had any share in administration. He received a penfion of 3000l. a-year, to be continued after his decease, during the furvivancy of his lady and fon; and this gratuity was dignified with the title of Baroness of Chatham to his lady, and that of Baron to her heirs male. Mr Pitt at that time declined a title of nobility; but in 1766 accepted of a peerage under the title of Baron Pynsent and Earl of Chatham, and at the fame time he was appointed lord privy-feal. This acceptance of a peerage proved very prejudicial to his lordship's character. However, he continued stedfast in his opposition to the measures of administration. His last appearance in the House of Lords was on the 2d of April 1778. He was then very ill and much debilitated: but the question was important, being a motion of the duke of Richmond to address his majesty to remove the ministers, and make peace with America on any terms. His fordillip made a long speech, which had certainly over-

come his fpirits: for, attempting to rife a fecond time, he fell down in a convulfive fit; and though he recovered for that time, his diforder continued to increase till the 11th of May, when he died at his feat at Hayes. His death was lamented as a national lofs. As foon as the news reached the House of Commons, which was then fitting, Colonel Barré made a motion, that an address should be presented to his majesty, requesting that the Earl of Chatham should be buried at the public expence. But Mr Rigby having proposed the erecting of a statue to his memory, as more likely to perpetuate the fense of his great merits entertained by the public, this was unanimously carried. A bill was foon after passed, by which 4000l. a-year was fettled upon John, now earl of Chatham, and the heirs of the late earl to whom that title may defcend.—His lordship was married in 1754 to Lady Either, fifter to the earl of Temple: by whom he had three fons and two daugh-The manners of lord Chatham were eafy and bland, his converfation was spirited and gay, and he readily adapted himfelf to the complexion · of those with whom he affociated. That artificial referve, which is the never-failing refuge of felfdiffidence and cowardice, was not made for him. He was unconftrained as artlefs infancy, and generous as the noon-day fun: yet had he fomething impenetrable that hung about him. By an irrefiftible energy of foul, he was haughty and imperious. He was incapable of affociating councils, and he was not formed for the (weetest bands of fociety. He was a pleafing companion, but an unpliant friend. The eloquence of lord Chatham was one of his most striking characteristics. He far outstripped his competitors, and flood alone the rival of antiquity. But his spirit and intrepidity were confpicuous in every action of his life: nor did they leave him to the laft. As an inflance of his determined refolution, when he had any great national object in view, we shall conclude with one characteriftical anecdote:-Preparatory to one of the fecret expeditions during the war which ended in 1763 the minister had given orders to the different preliding officers in the military, navy, and ordinance departments, to prepare a large body of forces, a certain number of fhips, and a proportionable quantity of flores, &c. and to have them all ready against a certain day. these orders he received an answer from each of the officers, declaring the total impossibility of a compliance with them. Notwithstanding it was then at a very late hour, he fent immmediately for his fecretary; and after expressing his refeatment at the ignorance or negligence of his majefty's fervants, he gave the following commands: -" I defire, Mr Wood, that you will immediately go to Lord Anfon; you need not trouble yourfelf to fearch the admiralty, he is not to be found there; you must pursue him to the gaming house, and tell him from me, that if he does not obey the orders of government which he has received at my hands, that I will most affuredly impeach him. Proceed from him to Lord Ligonier; and though he thould be bolflered with harlots, undraw his curtains, and repeat the fame meflage. Then direct your course to Sir Charles Frederick, and affure him, that if his majefty's orders are not obeyed, they shall be the last which he shall no from me." In confequence of thele conza Mr Wood proceeded to White's, and told in rand to the first lord of the admiralty; who ed that the fecretary of state was out of his and it was impossible to comply with his man "however, (added he,) as madmen mut he fwered, tell him that I will do my utmok mi fy him." From thence he went to the der in chief of the forces, and delivered the message. He also said that it was an in-business; " and the secretary knows it, the old lord:) nevertheless, he is in the make us do what we can; and what spe do, inform him, shall be done." The general of the ordnance was next informatal Pitt's resolution; and, after some little tion, he began to think that the orders completed within the time prescribed. To fequence at last was, that every thing, impossibilities was ready at the time appre

(3.) PITT, in geography, a county of N. lina in Newburn diffrict; bounded on the N Edgcomb, NE. by Beaufort, S. by Crans, SW. by Glafgow. It contained 37d of and 2,367 flaves in 1795. Greenvile is des

on the banks of the Ohio, now keep town, called Pittsburg.

(5.) PITT ISLAND, an island in the Notean, near the W. coast of N. Americkeen Norfolk Sound and Salisbury Sound

miles long, and 3 broad. PITTACUS, a native of Mitylene is live was one of the feven wife men of Great father's name was Hyrradius. Withthe of the fons of Alcæus, he delivered in from the oppression of the tyrant Men and in the war which the Athenians were Lefbos, he appeared at the head of men, and challenged to fingle contains the enemy's general. As the event della feemed to depend upon this combat, Page recourse to artifice; and when he engaged tangled his adversary in a net which be cealed under his shield, and easily dispate He was amply rewarded for this victors country men, fensible of his merit, unant pointed him governor of their city with m authority. In this capacity Pittacus behave great moderation and prudence; and alter governed his fellow-citizens with the fire tice, and established the most faluting voluntarily religned the fovereign po ving enjoyed it for 10 years. His diffet gained him many admirers; and whenthe neans withed to reward his public ans fenting him with an immense tract of refused to accept more land than wha contained in the distance to which here a javelin. He died in his 70th year, about 579, after he had spent the last to year in literary ease and retirement. Many of ims were incribed on the walls of apollo at Delphi, to show to the world how cree as a philosopher, a moralift, and 2 man

ITTALY, a village of Scotland, in Aberdeene, in the parish of Pitsligo, 2 miles E. of Roserty. In 1791, it contained 116 inhabitants, who chiefly employed in fifhing.

PITTANCE. n. f. [pitance, Fr. pletantia, Iin. I. An allowance of meat in a monastry.

of Perth.

PITTOSPORUM, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The calyx is pentaphyllous, inferous and deciduous. The petals are 5; the style thread-thaped; the capfule somewhat angular, trilocular, and containing 3 or 4 angulated feeds, adhering to the capfule by means of a liquid refin in the loculaments. Of this there are 3 species,

1. PITTOSPORUM CORIACIUM, grows in Ma-

deria, and flowers in May and June.

2. PITTOSPORUM TENUIFOLIUM, and 7 are 3. PITTOSPORUM UMBELLATUM, both natives of the Cape of Good Hope.

PITTSBOROUGH or a town of N. Carolina, (1.) PITTSBURG, the capital of Chatham county, feated on an eminence near Hickory mountain in a fertile country and healthy climate, whence it has been called the Montpellier of N. Cirolina. It has a court-house, where quarterly courts are held. It is 26 miles SW. of Hilisborough, 54 SW. of Fayetteville, and 505 from Phi-

ladelphia.

- (2.) PITTSBURG, a post town of Pennsylvania, the Capital of Allegany county, is feated on a fine plain between the Allegany and Monongahelas about a quarter of a mile from their confluence, where they form the OH10, 1188 miles above its conflux with the Miffifippi. It is regularly laid out on Penn's plan, about 200 yards from the ground where formerly FORT Du Quesne stoods when the country was possessed by the French, and which was afterwards called FORT PITT. In 1756, Gen. Bradelock, and a party of British troops, going to take it, fell into an ambuscade, and he was killed and his troops taken; but in 1758, it was taken by the British. It consists of feveral streets crossing each other at right angles. In Dec. 1796 it contained above 200 houses, and 1353 citizens; but the number has fince, greatly increased. The adjacent hills abound with coals and before the revolution one of these coal hilis took fire and continued burning for 8 years, till part of the hill failing in extinguished the fire. During the floods in spring, vessels of 200 tons burden may go from Pittsburg to the sea in 17 days though 2000 miles distant. It has an academy a Presbyterian and a German Lutheran church, with a court-house, and quarterly courts, &c. It is 303 miles W. by N. of Philadelphia. Lon. 80 8. W. Lat. 40 31. N.
- (1.) PITTSFIELD, a port town of Maffachufetts, on the W. line of Berkshire county, 6 miles N. of Lenox, and 140 W. of Boston; containing 1992 citizens in 1795. It is 295 miles from Philadelphia, and 27 W. of Northampton.

(2.) PITTSFIELD, a township of New Hampsh. in Rockingham county; containing 888 citizens,

in 1795.
(1.) PITTSTON, or a post town of New
(1.) PITTSTOWN, Jersey, in Hunterdown county on the W. head water of the Raitton, 58 Gggg miles miles NNE. of Philadelphia. Lon. o. 13. E. of that city. Lat. 40. 36. N.

(2.) PITTSTOWN, a post town of Maine, in Lincoln county; on the Kennebeck, 187 miles N. by W. of Boston, and 540 from Philadelphia. In 1790, it contained 605 citizens.

(3.) PITTSTOWN, a post town of New York, in Rensfelaer. In 1795, it had 419 electors, 2414

citizens, and 33 flaves.

(1.) PITTSYLVANIA, a county of Virginia, between the Blue Ridge and Tide Waters, bounded on the N. by Campbell county, E. by Halifax, S. by N. Carolina, W. by Patrick, and NW. by Franklin counties. It is 40 miles long, and 37 broad; and, in 1795, contained 8600 citizens, and 2979 flaves.

(2.) PITTSYLVANIA, the capital of the above county, is 110 miles SW. of Richmond. It has a county court-house; the court meets the last

Tuesday of every month.

PITTY, a river of Indoftan, a branch of the Indus, which runs into the fea.

(1.) PITUITARY, adj. Of or belonging to phlegm.

(2.) PITUITARY GLAND. See ANATOMY, In-

\* PITUITE. n. f. [pituite, Fr. pituita, Lat.] Phlegm.—Serous defluxions and redundant pituite

were the product of the winter. Arb.

, 25 upon two pievots. Dryden.

1.) PIURA, a diffrict or jurisdiction of Peru, Fruxillo. It was the first Spanish settlement hat country. The climate is hot, and very sain being seldom known in it; but the want it is supplied by a river, the water of which is septed over the country by canals.

2) PURA, the capital of the above jurisdicly founded in 1531 by Francis Pirano, containabout 1500 inhabitants. It has a fine hospital, for the care of the Bethlehemites, remarkable its cures. It lies 25 miles SSE. of Paita. TUS. [Lat. i. e. pious.] a name deservedly gi-

to the emperor ANTONINUS; as well as to a of METELLUS, because he exerted himself may to get his father recalled from banishment. sallo a name assumed by 7 popes of Rome, and of whom is now (1804) living.

Rus I. Pope and Saint, succeeded Hyginus, D. 142. He was an Italian; he condemned berefies of Valentinian; and suffered martyra in 167.

IUS II. Æneas Sylvius Piccolomini, was 1 on the 18th Oct. 1405, at Corfigni, in Sienthe name of which he afterwards changed that of Pienza. Æneas was carefully edud, and having finished his studies at Sienna, vent in 1431 to the council of Bale with Car-Capranica, as his secretary. He afterwards d in the fame capacity to Card. Albergati, to Frederic III. who decreed to him the poecrown, and sent him ambassador to Rome, in, Naples, Bohemia, and other places. Ni-V. advanced him to the bishopric of Trieste, after to that of Sienna. In 1456, after hav-diffinguished himself in various nunciatures, ras made a Cardinal by Calixtus III. whom neceeded as pope on the 27th Aug. 1458. II. from the commencement of his pontifiappeared jealous of the papal prerogatives. 1460, he issued a bull, "declaring appeals from the pope to a council to be null, erroneous, detestable, and contrary to the facred canons.' That bull, however, did not prevent the procurator general of the parliament of Paris from appealing to a council in defence of the Pragmatic fanction, which the pope had strenuously opposed. Pius was then at Mantua, whither he had gone to engage the Catholic princes to unite in a war against the Turks. The greater part of them agreed to furnish either troops or money; others refused both, particularly the French, who from that moment incurred his holinefs's aversion. That aversion abated under Lewis XI. whom he perfuaded in 1461 to aboiith the Pragmatic fanction, which the parliament of Paris had supported with so much vigour. The year 1462 was rendered famous by a controversy which took place between the Cordeliers and Dominicans, about two very abfurd questions. The dispute became so violent, that they called each other bereties; which obliged the pope to iffue a bull, forbidding fuch odious epithets. He next published another bull, dated 26th April, retracting what he had written to the council of Bale when he was its fecretary: wherein he had written fome fentiments that "tended to burt the authority of the apostolic see." In this bull he gave a thort account of his life and actions, with the hiftory of the council of Bale, to which he went with Card. Capranica in 1431. In the mean time, the Turks were threatening Christendom. Pius, ever zealous against the insidels, resolved to sit out a fleet, and pass over into Asia himself. He went to Ancona, but fell fick with the fatigue of the journey, and died on the 16th Aug. 1464, aged 59. Pius was one of the most learned men of his time, and one of the most zealous pontiss. His chief works are, 1. Memoirs of the council of Balc. 2. The history of the Bohemiaus, from their origin to 1458. 3. Two books on cosmography. 4. The history of Prederic III. published in 1785, folio, and escemed pretty accurate. 5. A treatife on the education of children. 6. A poem upon the passion of Jesus Christ. 7. A collection of 432 letters, printed at Milan, 1473, in folio, in which are some curious anecdotes. 8. The memoirs of his own life, published by John Gobeiiu Personne, his secretary, at Rome, 4to. 1584. 9. Historia rerum ubicumque gestarum, of which only the first part was published at Venice in 1477 in folio. His works were printed at Helmstadt in 1700, in folio, with his life prefixed. The verse of Virgil's Æneid, (lib. i. v. 382.) which begins

Sum PIUS ÆNEAS,

was in the punning humour of the age applied to him.

Pius III. whose name was Francis Todeschini, was nephew of Pius II. who caused him take his name of Piccolomini, and made him an archbishop and cardinal. In 1503, he succeeded Alexander VI. but died in 21 days after his election.

Pius IV. John Angelo De Medicis, (not of the Florence family) was born at Milan in 1499. He was fon to Bernardin Medecini, and brother of the famous Marquis de Marignan, Charles Vth's Ggggg2 general,

general. He filled feveral important offices under Popes Clement VII. and Paul III. Julius III. who had entrusted him with several legations, made him a cardinal in 1549: and he was elected pope on the death of Paul IV. Dec. 25th 1559, predecessor had rendered himself detestable to the Romans. Pius IV. commenced his reign by punishing the nephews of Paul IV.; causing Card. Caraffe to be strangled, and his brother, Pr. Palliano, beheaded. His zeal was afterwards directed against the Turks and heretics. To stop the progress of these last, he renewed the Council of Trent. In 1561, he sent to all the Catholic and Protestant princes, the bull for calling that assembly. An end was, however, put to it by the induftry of his nephew, S. Charles Borromeus, in 1563; and, on 26th Jan. 1564, he confirmed its decrees. In 1565 a conspiracy was formed against his life by Benedict Acolti, and other visionaries; but was discovered, and Benedict put to death. Pius died Dec. 9th 1565, aged 66, with the hatred of the Romans, whom his severities had exasperated. He adorned Rome with several public edifices.

Pius V. S. Michael Ghisleri, born at Bosco, on the 17th Jan. 1504. was son of a senator of Milan. He turned a leminican friar. Paul IV. informed of his merit, made him bishop of Sutri, cardinal in 1557, and inquisitor-general in Lombardy; but the severity with which he exercised his office obliged him to quit that country. He was fent to Venice, where his zeal met with fill greater obfacles. Pius IV. made him bishop of Mondovi; and on his death he was elected Pope, in 1566. His first object was to repress the luxury of the clergy, the pride of the cardinals, and the licentious manners of the Romans. He caufed the decrees of reformation enacted by the Council of Trent to be put in execution; he prohibited bull-baiting in the Circus; he expelled prostitutes from Rome; and allowed cardinals to be profecuted for debt. Gentle measures failing to reclaim heretics, he had recourse to severity, and several perished in the slames of the inquisition. He particularly displayed his zeal for the grandeur of the Holy See in 1568, by ordaining that the bull In cana domini, which Clement XIV. had suppressed, should be published throughout the whole church. That bull establishes the unlimited power of the popes over all princes. It was rejected by most of the foreign states. Pius V. had the courage to make war on the Turks, by forming a league with the Venetians and Philip II. of Spain. This was the first time that the thandard of the towo keys was feen displayed against the crescent. The naval armies engaged on the 7th Oct. 1571, in Lepanto Bay, and the Christian princes obtained a signal victory over the Turks, who loft above 30,000 men, and near 200 galleys. The success was chiefly owing to the Pope, who exhapsted his treasury in fitting out that armament. He died of the gravel fix months after, 30th April 1572, aged 68. His name will for ever adorn the lift of Roman pontinis. His bulls against Elisabeth, indeed, and in favour of the inquilition, with his rigorous profecution of heretics, prove that he had more zeal than humanity; but in other respects, he was not without his virtues. Selim II. caused public splicings to be made at Constantinople for he death for 3 days. The pontificate of Puriodicele brated for the condemnation of Bains, the citiction of the order of Humilies, and the normation of that of the Cistercians. He was conized by Clement XI. in 1712. There are confeveral of his letters, printed at Anvers in tag, in 4to. Pelibian, in 1672, published his Lijour flated from the Italian of Agatio di Somma.

Prus VI. whose original name was Angele In chi, was of a nobie, but reduced family. He was born in 1718, and role to the rank of prelate at cardinal entirely by his merit. He was chied pope on the death of Clement XIV. Duringth first years of his pontificate, which were perfor tranquil, he executed a work, which some rors had attempted in vain, by draining the tine marshes, which extended about 40 to round Vellari, Terracina and Piperoo. Heronly employed the best engineers, but my inspected the work himself till it was tinded and he caused immense canals to be dug to any off the water, and thus recovered a great deal of fertile land from the marthes. Along the ball of these canals, which were ornamented will rows of poplars, he made a road restricted long, in a ftraight line, terminating sala gant palace. At last his tranquillity material rupted on the accession of the emperation II. whose plans of reformation prognotical good to the church. To prevent their esa, Pius paid a visit personally to the emparate Jan. 1782, who received him with all posters spect, but adhered inflexibly to his purpok. The revolution of France, and the confequent throw of all form of religion, gave her 1 greater flock. Pius, however, did his utal preserve peace with the republic, but the of citizen Basseville, the French ambifine 1793, (see Basseville,) furnished the land with a pretext, fuch as they were waiting overthrow the papal power, turn Ross democracy, and carry the Pope a prior Trance; where, after being shifted above various places, he died at Valence in 1799, and received a burial far inferior to be

PLACABILITY. n. f. [from placable.]
PLACABLENESS. Willingness to be apsed; possibility to be appeased.—The general
sent of all nations in their opinion of the merand placability of the divine nature. Anon.

PLACABLE. adj. [placabilis, Lat.] Willing possible to be appeased.—

Methought I faw him placable and mild.

Milton.

Rose implanted anticipations are, that there is ad, that he his placable. Hale.

PLACARD. ? n. s. [ plakaert, Dutch; pla-PLACART. } card, Fr.] An edict; a de-

ation; a manifesto.

To PLACATE. v. a. [placeo, Lat.] To apple; to reconcile.—This word is used in Scotte-A right to approach and rely on the proson and beneficence of a placated deity, is not uncible from nature. Forbes.

LACCIUS, Vincent, a learned philosopher lexicographer, born at Hamburgh, in 1642. fludied at Leiplic, and published a Difficurary

dnonymous and Pseudonymous Authors.

1.) PLACE. n. f. [place, Fr. piazza, Italian; n platea, Lat.] 1. Particular portion of space. earch you out a place to pitch your tents. a. i. 33.—We accept it always, and in all pla-AEs, xxiv. 3.—

Here I could frequent

With worship, place by place, where he vouch-

Presence divine.

Milton.

will teach him the names of the most cele-

brated persons who frequent that place. Addison.

2. Locality; ubiety; local relation.—Place is the relation of distance betwixt any thing, and any two or more points considered as keeping the same distance one with another; and so as at rest: it has sometimes a more consused sense, and stands for that space which any body takes up. Locke.

3. Local existence.—There was sound no place for them. Rev. xx. 11.

4. Space in general.—

But she all place within herself confines.

Davies.

5. Separate room.-

In his brain

He hath strange places cram'd with observation.

-His catalogue had an especial place for sequestered divines. Fell. 6. A feat; residence; manfion.—The Romans shall take away both our place and nation. Jo .- Saul fet him up a place. I Sam. 7. Passage in writing.—Hosea saith of the Jews, they have reigned, but not by me; which place proveth, that there are governments which God doth not avow. Bacon .- I could not pass by this place, without giving this short explication. Burnet. 8. Ordinal relation.-What scripture doth plainly deliver, to that the first place both of credit and obedience is due. Hooker.-Let the eye be satisfied in the first place. Dryden .- Consider, in the first place, that he is omnipresent; and, in the second, that he is omniscient. Addison. 9. State of actual operation; effect.-

These fixed evils sit so fit in him,

That they take place, when virtue's steely bones
Look bleak in the cold wind. Sbak.

These fair overtures could take no place. Hayquard.—They are desects in the brain; for they
take place in the stoutest natures. Bacon.—

With faults confess'd commission'd her to go, If pity yet had place, and reconcile her foe.

Dryden.
Where arms take place, all other pleas are

vain. Dryden.—
The unhappy omen took not place. Dryden.—
Virgil must be still excepted, when that perhaps takes place. Dryden.—It is stupidly soolish to venture our salvation upon an experiment, which we have all the reason imaginable to think God will not suffer to take place. Atterbury. 10. Existence.—Mixt government is by no means of Gothick invention, but hath place in nature and reason. Swift. 11. Rank; order of priority.—

The heavens themselves, the planets, and this center.

Observe degree, priority and place. Shak.

12. Precedence; priority. This tense is commonly used in the purase take place.—

Do you think I'd walk in any plot,

Where Madam Sempronia should take place of Ben Jonson.

There would be left no measures of credible and incredible, if doubtful propositions take place before self-evident. Locke.—As a British frecholder, I should not scrupie taking place of a French marquis. Addison. 13. Office; public character or employment.—

Do you your office, or give up your place.

Shak.

'Tis but the fate of place, and the rough

That virtue must go through. Shak. The horfemen came to Lodrinius, befeeching him to take upon him the place. Knoller .-

Nor doth he promife, which is more,

That we final have their places. Donham. Patriots for a place abandon'd fame. Garth. -Some magifirates are contented, that their plaes ihould adorn them; and fome fludy to adorn heir places. Atterbury. 14. Room; way; space for appearing or acting given by ceffion; not oppolition .- Rather give place unto wrath. Rom. xii.

Give place, and mark the diff'rence if you

Cally,

Between a woman warrior and a man. Dryden. Victorious York did first, with fam'd success, To his known valour make the Dutch give place. Dryden.

The ruftick honours of the feythe and fhare, Give place to fwords and plumes. Dryden. 15. Ground; room .- My word hath no place in you. Yo. vin. 37 .- There is no place of doubting. Hammond. 16. Station in life. God would give them, in their feveral places and callings, ail fpiritual and temporal bleflings. Duty of Man.

(2.) PLACE, LOCUS, in philosophy, a mode of space, or that part of immove ble space which any body possesses. See METAPHYSICS, \$ 59;

and Newtonian Philosophy, Sea. III, Sch. III. (3.) Place, in aftronomy. The place of the fun, a ftar, &c. denotes the fign and degree of the zediac which the luminary is in; or the degree of the ecliptic, reckoning from the beginning of aries, which the planet or flar's circle of longitude cuts: and therefore coincides with the longitude of the fun, planet, or ftar. As the fine of the fun's greatest declination 23° 30': to the fine of any prefent declination given or observed, for instance, 23° 15':: fo is the radius 10: to the fine of his longitude 81° 52'; which, if the declination were north, would give 20° 52' of gemini; if fouth, 20° 52' of capricorn, for the fun's place. See DECLINATION, &c. The place of the moon being that part of her orbit wherein the is found at any time, is of various kinds, by reason of the great inequalities of the lunar motions, which render a number of equations and reductions necesfary before the just point be found. The moon's fictitious place is her place once equated; her place nearly true, is her place twice equated; and her true place thrice equated. See Astronomy, poffim.

(4) PLACE, in war, a general name of all kinds of fortreffes where a party may defend themfelves. Thus, 1. A flrong or fortified place is one flanked, and covered with baltions. 2. A regular place, one whose angles, fides, bastions, and other parts, are equal; and this is ufually denominated from the number of its angles, as a pentagon, hexagon, &c. 3. an Irregular place is one whose sides and angles are unequal. 4. A Place of arms is a ftrong city or town pitched apon for the chief magazine of an army; or, in a city or garrifon, it is a Large open ipot of ground, ufually near the centre of the place where the grand guard's commonly kept, and the garmon holds its rendezyous at

reviews, and in cases of alarm to receive ala from the governor. 5. Place of arms of a metack, in a siege, is a spacious place cound fine from the governor. the enemy, by a parapet or epaulement, when the foldiers are posted ready to sustain the work in the trenches against the foldiers of the garrison. 6. Place of arms, particular, in 2 gas fon, a place near every baftion, where the Mil ers fent from the grand place to the quarters figured them relieve those that are either upon guard or in fight. 7. Place of arms without, 31 place allowed to the covert way for the place of cannon, to oblige those who advance in the approaches to retire. 8. Place of arms in a too. a large place at the head of the camp for the arr to be ranged in and drawn up in batalla. The is also a place for each particular body, troop company, to affemble in.

(5.) PLACE, COMMON. See COMMON-PLAN. \* To PLACE. v. a. [placer, Fr. from the mod 1. To put in any place, rank, condition, or the -Place fuch over them to be rulers. Ex. xim B. -He placed forces in all the fenced cities a Char

Xvi). 2 .-

And I will place within them as a guide My umpire conscience.

Our two first parents yet the only two Of mankind in the happy garden place to 2. To fix; to fettle; to establish.—The confutions had been more reasonable, if placed as ferior persons. Dryden's Aurengz .- God w w ture has not any where placed any fuch justice in the first born. Locke. 3. To put out at a tereft .-

'Twas his care

To place on good security his gold. PLACENTA, n. f. in anatomy and midraton, a foft roundish mass, found in the womb dipenant women; which, from its refemblance liver, was called by the ancients bepar mines uterine liver. See MIDWIFERY, Part IL

PLACENTATION. n. f. See BOTAN, (1.) PLACENTIA, a duchy of Italy, oraced with that of Parma, and included in the Parma (See Parmesan, No 1.) It is bounded on the L by Parma, S. by the Ligurian republic, and the N. and W. by the ci-devant Milandia and the department of Olona, in the Italian repelies It is very fertile; being watered not only by the Po, but by a great number of rivulets, and for rounded with hills, abounding in all kinds fruits. It has feveral falt fprings, from the of which a great deal of falt is made. It alor bounds in woods, warrens and mines of iron chief rivers are the Trebbia and Nurra.

(2.) PLACENTIA, OF PIACENZA, a town of he. and capital of the above duchy, with a bild fee. Its name is derived from its pleafant fits on the ancient Æmilian way, about half a from the Po, in a very fertile plain. It com great number of merchants, and is 3 miles cumference. Its wall and fortifications are fiderable; but the citadel is firong. The fire are ftraight, and the principal ftreet, called by done, is 25 paces broad and 3000 feet long at direct line, with 600 stone posts, for kpure the foot from the carriage-way, and on both [3] are 11 spacious convents. It contains 43 cherols 25 005

convents, and two alms-houses. The cathedral much in the Gethic tafte; but the church of he Augustines is worthy of its architect, Vignoli. n the area before the town-house stand two adsirable brass equestrian statues of Alexander I. nd Renatus IV. dukes of Parma and Placent a. t this city begins the Via Emilia, which extends if as Rimini on the Adriatic. The number of ne inhabitants is about 30,000, among whom here are 2000 ecclefiastics. This city has been ken several times in the wars of Italy. The king Sardinia took possession of it in 1744, it being ded to him by the queen of Hungary; but it is taken from him in 1746, after a bloody battle. has a famous university, and the inhabitants effected for politeness. There is a great fair ere every year on the 15th of April, which is sch frequented. It is about 32 miles NW. of rma, and 83 E. of Turin. It was taken by the ench republicans, under Gen. Murat, in June 30, after a warm action; with 2000 prisoners, much military stores. Lon. 10. 24. E. Lat. . 5. N.

3.) PLACENTIA, a sea port of Newsoundland, the SE. coast; 40 miles W. of St John, and E. of Cape Breton. Lon. 53. 43. W. Lat.

15. N.

4) PLACENTIA, a town of Spain in Estrema-2, with a good castle and bishop's see; seated the Xera, in a pleasant plain, surrounded by matains; 80 miles SW. of Midrid. Lon. 5. W. Lat. 50. 25. N.

(5.) PLACENTIA, a town of Spain, in Guipu-4, on the Deva, 25 miles SE. of Bilboa. Lon.

10. W. Lat. 43. 10. N.

6.) PLACENTIA BAY, an extensive Bay on the coast of Newfoundland; which forms, a good boar for vessels, and is much frequented by memployed in the Cod Fishery. The entrance narrow channel through which only one ship pass at a time; but the water is deep enough the largest, and the harbour is capacious eath to hold 150 sail, which are there secure at all winds, and can sish as quietly as in a 7. The current is very strong in the entrance, the same support of the same strong in the strange at ships must be towed through it. The great and is large enough to dry sish to load 60 vessels. Lon. from 54° to 55° 10' W. Lat. from to 47. co. N.

to 47. co. N. LACENTIUS, Peter, a German poet, who tars to have been extravagantly fond of his initial; for he wrote a Latin Poem of 360 ts, entitled Pugna Porcorum, in which every d begins with a P. He died in 1548.

LACENZA. See PLACENTIA, No. 1. and 2. PLACER n. f. [from places.] One that places. Thou placer of plants, both humble and tall.

LACETTE, John DE LA, an eminent pront minister, born at Pontac in Bern, in 1639; rducated by his father, who was also a cleran. He exercised his office, as a minister ag the Protestants in France till the revocation we edict of Nantes in 1685, when he retired emmark, where he continued till the death of meen, in 1711, who greatly valued his merit. Ther death he went to Holland; and settled at the Hague, and last at Utrecht, where he

died in 1718, aged 79. He wrote many valuable works on religion and morality; befides fome polemical pieces against the church of Rome. His treatise upon Conscience was translated into English by Dr Basil Kennet, in 1705.

\* PLACID. adj. [placidus, Latin.] 1. Gentle; quiet; not turbulent.—It conduceth unto long life, and to the more placid motion of the spirits, that mens actions be free. Bacon. 2. Soft; kind;

mild.-

That placid afpect and meek regard, Rather than aggravate my evil ftate, Would ftand between me and thy father's ire.

\* PLACIDLY. adv. [from placid.] Mildly; gently.—If into a phial, filled with good fpirit of nitre you caft a piece of iron, the liquor, whose parts moved uniformly and placidly before, by altering its motion, it begins to penetrate and featter abroad particles of the iron. Boyle.—The water easily infinuates itself into, and placidly distends the tubes and vessels of vegetables. Woodward.

\* PLACIT. n. /. [placitum, Lat.] Decree; determination.—We spend time in defence of their placits, which might have been employed upon

the universal author. Glanville.

\* PLACKET, or placquet. n. f. A petticoat.— You might have pinch'd a placket, it was fenfeless. Sbak.—The bone-ach is the curse dependant on those that war for a placket. Sbak.

PLADDAY, an island of Scotland, a mile from the isle of Arran, with a light-house, containing two different lights, to distinguish it from those of the Mulls of Kintyre, Galloway and Cumbray.

PLADIA, or BLADIA, a town of Prussia, in

Natangen; 22 miles SW. of Konigsberg.

PLADLING, a town of Lower Bavaria, on the Ifer; 5 miles SW. of Deckendorf, and 8 NW. of Ofterhofen.

\* PLAGIARISM. n. f. [from plagiary.] Theft; literary adoption of the thoughts or works of another.—With great impropriety, as well as plagiarifm, they have most injuriously been transferred

into proverbial maxims. Swift.

- (1.) \* PLAGIARY. n. f. from plagium, Lat.] 1. A thief in literature; one who steads the thoughts or writings of another.—The ensuing discourse, lest I chance to be traduced for a plagiary by him who has played the thief, was one of those that, by a worthy hand, were stellen from me. South.—Without invention, a painter is but a copier, and a poet but a plagiary of others. Dryden's Dufr. 2. The crime of literary thest. Not used.—Plagiary had not its nativity with printing, but began when the paucity of books scarce wanted that invention, Brown.
- (2.) PLAGIARY, in philology, is a purloiner of another man's works, who puts them off as his own. Among the Romans, plagiarius was properly a perfon who bought, fold, or retained a freeman for a flave; and was so called, because, by the Flavian law, such persons were condemned ad plagas, "to be whipped." Thomasius has an express treatise De plagio literario, wherein he lays down the laws and measures of the right which authors have to one another's writings.—"Dictionary-writers, at least such as meddle with arts and seiences (as is pertinently observed by Mr Cham-

bers), feem exempted from the common laws of meum and tuum; they do not pretend to fet up on their own bottom, nor to treat you at their own cost. Their works are supposed, in great measure compositions of other people; and what they take from others they do it avowedly, in the open sun.—In effect, their quality gives them a title to every thing that may be for their purpose, wherever they find it; and if they rob, they do not do it any otherwise than as the bee does, for the public service. Their occupation is not pillaging, but collecting contributions; and if you ask them their authority, they will produce you the practice of their predecessors of all ages and nations."

PLAGIUM, in law. See KIDNAPPING. (1.) \* PLAGUE. n. f. [plagbe, Dutch; plage, Teut. plaga, Latin; alnyn.] 1. Pettilence; a difcase eminently contagious and destructive.—

Thou art a bile, A plague-fore or imbofs'd carbuncle

In my corrupted blood. Shak King Lear.
—Many times there have been great plagues in dry years. Bacon's Nat. Hift.—

Snakes that use within thy house for shade, Securely lurk, and, like a plague, invade

Thy cattle with venom. May's Virgil.
All those plagues, which earth and air had brooded,

First on inferiour creatures try'd their force, And last they seized on man. Lee and Dryden.

2. State of misery.—I am set in my plague. Pfalm xxxviii. 17. 3. Any thing troublesome or vexatious.—'Trs the time's plague, when madmen lead the blind. Shakesp.—

I am not mad, too well I feel

The diff'rent plague of each calamity. Shakefp.

Good or bad company is the greatest bleshing or

greatest plague of life. L'Eftrange .-

Sometimes my plague, fometimes my darling, Killing to-day, to-morrow fnarling. (2.) The PLAGUE, PESTILENCE, or Peftilential Fever, is a very acute, malignant, and contagious difeafe; being a putrid fever of the worst kind, and seldom failing to prove mortal. Though it is generally defined a malignant fever, Diemerbroek thinks they ought to be diftinguished, fince the fever is not the effence of the difeafe, but merely a symptom or effect of it. See MEDICINE, Index. The plague, as is generally agreed, is never bred or propagated in Britain, but is frequent in the Levant, Leffer Afia, Egypt, &c. Authors are not as yet agreed concerning the nature of this dreadful diftemper. Some think that infects are the cause of it, in the same way that they are the cause of blights, being brought in swarms from other climates by the wind, when they are taken into the lungs in respiration; the consequence of which is, that they mix with the blood and juices. and attack and corrode the vifcera. Mr Boyle, on the other hand, thinks it originates from the offluvia or exhalations breathed into the atmoiphere from noxious minerals, to which may be added ftagnant waters and putrid bodies of every kind. Mr Gibbon thinks that the plague is derived from damp, hot, and stagnating air, and the putrefaction of animal fubftances, especially locusts. See Gibbon's Rom. Hift. 4to. vol. iv. p. 327 -- 332, where there is also a very particular account of the plague which depopulated the in the time of the Emperor Justinian. It is an markable fact, that plugues are fometimes partil and that they only attack particular animals, or particular description of persons, avoiding coo altogether, or attacking them but flightly. To Fernelius informs us of a plague, or murza, 1514, which invaded only cats. Dionyfus E carnaffus mentions a plague which attacked an but maids; and that which raged in the time Gentilis, killed fcarce any women, and very to but lufty men. Boterus mentions another plage. which affaulted none but the younger fort; we have inflances of the fame kind of a lar flanding. Many methods have been adopted different countries to prevent the importance this dreadful feourge of the human race, and flop the progress of infection after it has been ported. In England, mayors, bailiffs, head cers of corporations, and justices of peace, be power to tax inhabitants, houses, and lack & within their precinets, for the relief of perloss feeted with the plague; and justices of the comty may tax persons within five miles round, at parith's inability; the tax to be levied by and fale of goods, or in default thereof by forment. Infected perfons going abroad, at king commanded to keep house for avoiding the infection, may be refifted by watchmen, at all punished as vagrants, if they have no loss some them; and if they have infectious fores a sea it is felony. Justices of peace, &c. are to appear fearchers, examiners, and buriers of the deal. places infected, and administer oaths to the the performance of their duties, &c. flat. 13 1. cap. 31. See QUARANTINE.

(3.) PLAGUE, ANTIDOTES AGAINST THE THE commission at Moscow having, in 1770, in a fumigation-powder, which, from fever le experiments, had proved efficacious in personal the infection of the plague; in order mer a to ascertain its virtue in that respect, it waster mined, towards the end of the year, that malefactors under fentence of death should, out undergoing any other precautions that a fumigations, be confined three weeks in a bar retto, be laid upon the beds, and dreffed a clothes, which had been used by persons dying, and even dead, of the plague in the The experiment was accordingly tre and none of the ten malefactors were then into ed, or have been fince ill. The fumigation pader is prepared as follows. I. Powder of the frength. Take leaves of juniper, juniper pounded, ears of wheat, guaiacum-wood posed, of each 6 lb; common faltpetre pounded. fulphur pounded, 6 lb; Smyrna tar, or 2 lb; mix all together, which will produce of the powder of fumigation of the first in N. B. A pood is 40 lb. Russian, which are to 351 or 36 lb. English avoirdupoise. of the fecond firength. Take fouthern-wood to small pieces, 4lb; juniper berries pounded! common faltpetre pounded, 4 lb; fulphur poss ed, 21 lb; Smyrna tar, or myrrh, 11 lb; mis above together, which will produce half a p of the powder of fumigation of the fecond had 3. Odoriferous powder. Take the root called

and cut into small pieces, 3 lb; leaves of juniper ut into small pieces, 4 lb. frankingense pounded trossy, 1 lb; florax pounded, and rose slowers, 1/h; yellow amber pounded, 1 lb. common sattere pounded, 14 lb; sulphur, a quarter of a soun!; mix all the above together, which will moduce 94 lb. of the odoriferous powder. If unixum cannot be had, the cones of pines or its may be used in its stead; likewise the common and pines and firs may be used instead of myma tar, or myrrh, and mugwort may supply the place of southernwood.

te place of fouthernwood. (4.) PLAGUE AT LONDON. See LONDON, § 12. (5.) PLAGUE, DREADFUL INSTANCES OF THE, REUROPE. Thucydides, lib. ii. gives an acount of a dreadful plague which happened at thems about A. A. C. 430, and with which he ras himself infected, while the Peloponnesians uner the command of Archidamus wasted all her mitory abroad; but of these two enemies the lague was by far the most severe. The most readful plague that ever raged at Rome was in k reign of Titus, A. D. 80. The emperor left o remedy unattempted to abate the malignity of re distemper, acting during its continuance like father to his people. The faine fatal disease ged in all the provinces of the Roman empire in re reign of M. Aurelius, A. D. 167, and was slowed by a dreadful famine, earthquakes, inunations, and other calamities. About A. D. 30, eplague visited Britain, just after the Picts and had made a formidable invalion of the fou-hampart of the illand. It raged with uncomnon fury, and swept away most of those whom be sword and famine had spared, so that the liing were scarce sufficient to bury the dead. Aout A. D. 1348, the plague became almost gened over Europe. Many authors give an account this plague, which is faid to have appeared first the kingdom of Kathay in 1346, and to have neceded gradually W. to Constantinople and typt. From Constantinople it passed into Greece, 🚧, France, and Africa, and by degrees along coasts of the ocean into Britain and Ireland, Mafterwards into Germany, Hungary, Poland, kamark, and the other northern kingdoms. Acording to Autonius, Abp. of Florence, the difmper carried off 60,000 people in that city. In 556, the plague was brought from Sardinia to uples, being introduced into the city by a transart with foldiers on board. It raged with exfive violence, carrying off in lefs than fix months 20,000 of the inhabitants. In 1720 the city of larfeilles was visited with this destructive disease, ought in a thip from the Levant; and in feven onths, during which time it continued, it carrd off not less than 60,000 people. The ravas of this disease have been dreadful wherever it 4 made its appearance. On the first arrival of e Europeans at the island of Grand Canaria, it stained 14,000 fighting men, foon after which, to thirds of these inhabitants fell a sacrifice to e plague. The destruction it has made in Tury in Europe, and particularly in Constantinople, ust be known to every reader; and its fatal efets have been particularly heightened there by at firm belief which prevails among the people Vol. XVII. PART II.

of predestination, &c. It is generally brought into European Turkey from Egypt; where it is very frequent, especially at Grand Carro. To give even a list of all the plagues which have defolated many flourishing countries, would extend this article beyond all bounds, and minutely to describe them all is impossible. Respecting the plague which raged in Syria in 1760, we refer to the Abbe Mariti's Travels through Cyprus, Syria, and Palestine, vol. 18, p. 278—296. This product was one of the most malignant and stat that Syria ever experienced; for it scarcely made its apportance in any part of the body when it carried off the patient.

(6.) PLAGUE NOT CONTAGIOUS! Among the many bold affertions advanced by modern philofophers, in the present age, we have met with none more aftonishing, than that of Dr Moseley, who, in opposition to the fatal experience of all ages, afferts that the plague is "not contagious." In proof of this he quotes many medical writers ancient and modern; but what he chiefly places his confidence in, is founded on his own observations on pellilential fevers in the W. Indies, and on what is faid in Berthier's account of Bonaparte's expedition into Syria. " At the time of our entry into Syria, fays he, all the towns were intected by the plague, a malady which ignorance and barbarity render so fatal in the east. Those who are affected by it give themselves up for dead; they are immediately abandoned by every body; and are left to die, when they might have been faved by medicine and attention. Citizen Degenettes, principal physician to the army, displayed a courage and character which entitle him to the national gratitude. When our foldiers were attacked by the least fever, it was supposed that they had caught the plague, and these maladies were confounded. The fever hospitals were abandoned by the officers of health. Citizen Degenettes repaired in perion to them, visited all the patients, felt the glandular swellings, dressed them, declared and maintained that the fever was not the plague, but a malignant fever with glandular fwellings, which might eafily be cured by attention and keeping the patient's mind eafy." genette's views in making this distinction were highly commendable; "but certainly, favs Dr Moseley, this sever was the plague." The phy-fician however carried his courage so far, as to

a falfe hypothesis upon a series of mistaken facts.

(7.) PLAGUE, PREVENTIVE AND CURE FOR THE. In the hospital of St Anthony at Smyner, it has been long the practice to rub over with warm olive oil the bodies of persons infected by the plague, and it has been successful. It was Hhhh

make two incitions, and to inoculate the fuppu-

rated matter from one of these buboes above his

breast, and under his arm-pits, but was not assected with the malady. He thus eased the minds

of the foldiers, (the first step to a cure,) and by

his affiduity and attendance, a number of men, attacked with the plague were cured." From

these accounts, as well as from all that follows

in Dr Moseley's narrative, it is evident, that ir

Moseley has neveronce seen a case of the plague; that he has mistaken a malignant fever for it, and cressed.

first suggested by Mr Baldwin, the English conful, and from him ado red by P. Luigi di Paira, who for 27 years exposed himself to infection, by his unremitted attendance on those under this dreadful difeafe. During that long period Luigi found no remedy equal to that of rubbing olive oil, by the strongest friction, into the whole body of the infected person. When the body is thus rubbed, the pores being opened imbibe the oil, and a profuse perspiration takes place, by which the poifonous intection is thrown out. This operation must be performed the first day of the infection, and must be repeated till every particle of insection is removed, and the patient's whole body be in a profuse sweat. The patient's shirt and bed-clothes must not be changed till the perspiration has ceasted. The operation must be performed in a very close apartment, and a fire pan kept in it, over wrich fugar and juniper must be thrown to promote the perspiration.—In 5 years, during which this friction with oil was employed at Smyrna, of 250 perfons, attacked by the plague, the greater part were cured. This oil is also used with succefs as a preventative, as well as cure. Philof. Mag. Vol. 2.

\* To PLAGUE. v. a. [from the noun.] infect with pestilence. 2. To infest with disease;

to oppress with calamity -

Thou art not honest, and the gods will plague thee.

Thus were they plagu'd And worn with famine. Milton. 3. To trouble; to teaze; to vex; to harafs; to torment; to afflict; to diffress; to torture; to embarrafs; to excruciate; to make uneafy; to difturb. In this fense it is used ludicrously.

She will plague the man that loves her most.

Spenfer.

-People are stormed out of their reason, plagued into a compliance, and forced to yield. Collier .--When a Neapolitan cavalier has nothing elfe to do, he falls a tumbling over his papers, to fee if he can start a law fuit, and plague any of his neighbours. Addison.

PLAGUILY. adv. [from plaguy.] Vexatioufly; horribly. A low word.—He has me fo plaguily under the lash, I dare not interrupt him. Dryden .-

The doctor was plaguily down in the hips.

Swift.

PLAGUY. adj. [from plague.] Vexatious; troublefome. A low word.-

Of heats,

Ad! one more to the plagur bill. Donne. What plaguy mischiefs and mishaps

Do dog him still with after-claps? Hudibras.

PLAIAR, a town of European Turkey, in Romania; 6 miles S. of Gallipoli.
(1.) PLAICE. n. f. [plate, Dutch.] A flat

fish. -Of flat fish there are foles, flowkes, dabs and place. Carew:

(2.) PLAICE, or PLAISE, is the English name

of a species of pleurometers. See PLEURONECTES. PLAID. n. s. A striped or ariegated cloth; an outer loofe weed worn much by the Highlanderg in Scotland: there is a particular kind worn too by the women.

PLAILLY, a town of France, in the legament of the Oite; 6 miles S. of Scalis.

(1.) \* PLAIN. adj. [planus, Lat.] 1. Smoot; level; flat; free from protuberances or exceleces. In this fense, especially in philosophol writings, it is frequently written plane: 3/1 plane superficies.—It was his policy to miled plain and wafte. Speni .- The 8. and South-Eatile are rocky and mountainous, but plain in the rid.
Sandys.—They were wont to make their core or boats plain without, and hollow within. Et-

To break the clods, and make the fund

—Hilly countries afford the most entertaining polpects, though a man would chuse to trave in a plain one. Addison. 2. Open; clear; == Our troops beat an army in plain fight and que field. Felton. 3. Void of ornament; fimpe-

Plain without pomp, and rich without 25st

Men of wealth may venture to go plais.

4. Artless; not subtle; not specious; not keep ed; simple.—It is better to chuse menda flater fort, that are like to do that that is commend to them. Bacon. - Of many plain, yet pious civilans, this cannot be affirmed Hammond-At # thor that writ like a plain man, and me the profession was to tell truth. Temple.-

My heart was made to fit and par within Simple and plain.

Must then at once, the character to unc, The plain rough hero turn a crafty kurt? 5. Honeftly rough; open; fincere; not her a language. - Give me leave to be plain with for-Bacon. 6. Mere; bare.—He that begui'd yu 2 a plain accent, was a plain knave. Stak-

Some have at first for wits, then portune Turn'd criticks next, and prov'd plain for a

. Evident; clear; discernible; not discernible Expressions, which to them seemed very der plain. Clar.—,

Express thyself in plain, not doubtful me

—I can make the difference more plain, by 8 you my method of proceeding. Driden-T plain in the history, that Esau was never subject to Jacob. Locke.—That children have fuch and is plain from the laws of God. Locke-It is that these discourses are calculated for none, h the fashionable part of womankind. Addison-

Divide the fimple, and the plain define. P 8. Not varied by much art; fimple.-A plaining fong plain-finging voice required

-His diet was of the plainest meats. Fell. (2.) \* PLAIN. adv. 1. Not obscurely tinelly; articulately.—The string of his was loofed, and the spake plain. Mark vii. & Simply; with rough fincerity.-Goodman allowed by every body to be a plain-spoker

Ion. Addi on. (3.) \* PLAIN. n. f. [plaine, Fr.] Level ground open field; opposed to hilly ground; often of battie. In a plain in the land of Shinar the dwelt. Gen. xi. 2.- The Scots took the Egod foolish birds fallen into their net, forfook their , and marched into the plain directly towards n. Hayward.—They erected their castles and itations in the plains and open countries. Da-.-Pour forth Britannia's legions on the plain.

While here the ocean gains,

tother parts it leaves wide fandy plains. Pope. The repetuous courfer pants in ev'ry vein, nd pawing feems to beat the distant plain. Pope. .) Plain, in geography, a town of Bavaria, iltzburg, 2 miles N. of Saltzburg.

) A Plain Angle is one contained under lines, or furfaces, in contradiftinction to a angle. See ANGLE.

.) Plain Chart. See Chart.

.) A PLAIN FIGURE, in geometry, is an unifurface; from every point of whose perimeight lines may be drawn to every point in the

) Plain Sailing. See Navigation, Part i & I.

.) PLAIN TRIANGLES, those included under right lines. The doctrine is termed plain See TRIGONOMETRY.

) To PLAIN. v. a. [from the noun.] To ; to make even .- Upon one wing the artilleis drawn, every piece having his guard of eers to plain the ways, Hayward.

) \* To PLAIN. v. n. [plaindre, je plains, Fr.] ament; to wail. Little used .-

But more I plain, I feel my woes the more.

Sidney. The fox, that first this cause of grief did

an first thus plain his cause with words un-Spenfer.

The incessant weeping of my wife,

d piteous plainings of the pretty babes, m'd me to feek delays. Shak. He to himself thus plain'd. Milton, PLAINDEALING. adj. [plain and deal.] #; open; acting without art.—It must not med, but I am a plaindealing villain. Shak. wa plaindealing innocence into a confiftency accessary prudence. L'Estrange.

) PLAINDEALING. n. f. Management void incerity.-I am no politician; and was hought to have too little wit, and too much

ealing for a statesman. Denham.

t looks as fate with nature's law may firive, thew plain dealing once an age would thrive. Dryden.

un du Nord, a town of Hispaniola, 39 SE. of Port de Paix.

AINE, a town of France, in the dep. of and Loire; 15 miles SW. of Montreuil

PLAINFIELD, a flourishing town of Conat in Windham county, pleafantly feated on g ground, on the E. bank of the Quinabaug, les NE. of Northwick. It has 2 presbytesurches and an academy. It is 12 miles E. ndham and 237 from Philadelphia.

PLAINFIELD, a township of Massachu etts, appliere county; containing 458 citizens in

It is 120 miles W. by N. of Boston.

(3.) PLAINFIFLD, a township of, New Hampfhire, in Cheshire county, on the E. bank of the Connecticut; containing 1014 citizens in 1795.

(4.) PLAINFIELD, a townthip of Pennsylvania,

in Northamp on county.

\* PLAINLY. adv. [from plain.] 1. Levelly; flatly. 2. Not fubtilly; not speciously. 3. Without ornament. 4. Without gloss; fincerely.-You write to me with the freedom of a friend, dealing plainly with me in the matter. Pope. 5. In earnest; fairly.—They gave ground, and at last plainly run to a sate place. Clarend. 6. Evidently; clearly; not obscurety.—They are not only fet down, but also plainly fet down in scripture. Hooker .- Coriolanus, out of his carelesliness, let's them plainly fee't. Shak. - One may perceive plainly, that he thought the Anti-nicene church, both before and after Origen, to be of a very contrary judgment to that which he condemns in Lucian and Origen. Waterland.

Thy great deliverer, who shall bruise

The ferpent's head; whereof to thee anon Plainlier shall be reveal'd. Milton.

We fee plainly that we have the means. Addison. \* PLAINNESS. n. f. from plain.] 1. Levelnefs; flatnefs. 2. Want of ornament; want of

We in our plainness may be justly proud.

Modest plainness sets off sprightly wit. Pope. 3. Openness; rough fincerity.—I have not chosen Dametas for his fighting nor for his discourling, but for his plainnefs and honefty. Sidney .-

Your plainnes and your shortness please me

When pow'r to flatt'ry bows; to plainue's

Is bound, when majesty to folly falls. -Plainness and freedom, an epistolary stile required. Wake. 4. Artleffness; simplicity .-

Unthinking plainneft to o'erspreads thy mind, That thou could'st seriously persuade the crowd To keep their oaths.

PLAINT. n. f. [plainte, Fr.] 1. Lamenta-

tion; complaint; lament.—
Then pour out plaint, and in one word fay this:

Helpless his plaint, who spoils himself of bliss.

Bootless are plaints, and cureless are my wounds. Shak.

From inward grief

His bursting passion into *flaints* thus pour'd.

Milton. 2. Exprobration of injury .- There are three just grounds of war with Spain; one of plaint, two upon defence. Bucon. 3. Expression of forrow.-

How many childrens plaints, and mothers cries!

Yet even these gentle walls allow my moan, Whose doleful echoes to my plaints agree.

Liftening where the hapless pair Sat in their fad difcourfe, and various plaint, Thence gather'd his own doom. Milton.

Receive these plaints. Walier, PLAINTFUL. adj. [plaint and full.] Com-Hhhha plaining

plaining; audibly forrowful.—To what a fea of miseries my plaintful tongue doth lead me. Sidney. (1) PLAINTIFF. adj. [plaintif, Fr.] Com-

plaining. A word not in use .-

His younger fon on the polluted ground, First fruit of death, lies plainsiff of a wound Giv'n by a brother's hand. Prior.

(2.) \* PLAINTIFF. n. f. [plaintiff, Fr.] He that commences a fuit in law against another: opposed to the defendant. The plaintiff proved the debt by three politive witnesses. L'Estrange. You and I shall talk in cold friendship at a bar before a judge, by way of plaintiff and defendant. Dryden.

In such a cause the plaintiff will be his'd. Pope. \* PLAINTIVE. adj. [plaintif, Fr.] Complain-

ing; lamenting; expressive of forrow.-

His careful mother heard the plaintive found. Dryden.

Thé goddess heard,

Rose like a morning mist, and thus begun To footh the forrows of her plaintive fon. Dryd. Can nature's voice

Plaintive be drown'd?

Prior.

Leviathans in plaintive thunders cry. Young. PLAINVILLE, a town of France, in the dep. of the Oife; 6 miles E. of Bret-uil.

\* PLAINWORK, n. f. [plain and ework.] Needlework as diftinguished from embroidery; the common practice of fewing or making linen gar-

She went to plainwork. PLAJOW, a town in the island of Borneo, 250

miles N. of Banjar Maffin.

(1.) PLAISANCE, a town of France, in the dep. of the Gers; 11 miles SSE. of Nagaro, and 23 W. of Auch.

(2.) PLAISANCE, a town of Hispaniola, 36 miles 6W. of Cape François.

PLAISE. See PLEURONECTES,

\* PLAIT. n. f. [corrupted from plight or plyght, from to ply, or fold.] A fold; a double.-

These plaits and folds the sound restrain, That it the organ may more gently touch.

Davies. Nor shall thy lower garments artful plait, Arm their chaste beauties with a modest pride, And double ev'ry charm they feek to hide.

Prior. "Tis very difficult to trace out the figure of a west through all the plaits and foldings of the dra-

jery. Addison. \* To PLAIT. v. a. [from the noun,] 1. To

fold; to double.-7 · · buly fylphs furround their darling care, Some fold the fleeve, while others plais the gown.

Pope. Will she on funday morn thy neckcloth plait?

2. To weave; to braid.-Let it not be outward

adorning of plaiting the hair. 1 Peter, iii. 3. I'll weave her garlands, and I'll plait her hair.

Prior. - Your hands have not been employed in plaiting the hair, and adorning your persons. Law. To intangle; to involve.

Time shall unfold what plaited cunning hides.

\* PLAITER. n. f. [from plait.] He that plaits.

PLAK, a town of Hungary, 5 miles S. of Cal chau.

(1.) \* PLAN. n. f. [plan, French.] 1. A fchere;

a form; a model.-

Remember, O my friends, the laws, then its The generous plan of power delivered down From age to age by your renown'd forefalter,

2. A plot of any building or ichnography; for of any thing laid down on paper.-

Artifts and plans reliev'd my folemo hours.

(2.) PLAN, in general, denotes the representation tion of fomething drawn on a plane; such at maps, charts, ichnographies, &c. See Mis CHART, &c.

(3.) PLAN, in architecture, (§ 1, def. 1.) hp ticularly used for a draught of a building, finds it appears, or is intended to appear on the grown showing the extent, division, and distribution & its area or ground-plot into apartments north passages, &c. To render plans intelligible, it a ufual to diftinguifh the maffives with a blackwaig the projectures on the ground are drawn is fell lines, and those supposed over them industed hers The augmentations or alterations to be making distinguished by a colour different from that it already built; and the tines of each manufe lighter as the stories are raised. In lanching it is usual to have 3 several plans for the 3 5th ftories.

(4.) PLAN, in geography, a town of Ideas,

in Pilfen.

(5.) PLAN, a town of France, in the deposits Upper Garonne; 6 miles 8. of Rieux.

(6.) PLAN, a town of Spain, in Arragos; 13

miles S. of Ainfa.

(7.) PLAN DE BAIS, a town of France, a fee dep. of the Drome; 9 miles NE. of Crost

8.) PLAN, GEOMETRICAL, is that whomate folid and vacant parts are reprefented which tural proportions.

(9.) PLAN, PERSPECTIVE, is that exhault degradations or diminutions, according to the rules of perspective. See Perspective.

(10.) PLAN, RAISED, OF A BUILDING, ET fame with what is otherwise called an dermine orthography. See ORTHOGRAPHY, 9 30 4:

To PLAN. v. q. [from the noun.] To when

to form in defign,-

Plan with all thy arts the scene of fate. Pl (1.) PLANA, a town of Spain, in Valentia; miles E. of Segorbo.

(2.) PLANA, a town of Sweden, in W. Col land, 30 miles ENE. of Uddevalla.

PLANARY. adj. Pertaining to a plane. PLANASIA, in ancient geography; 1-2 land in the Tyrrhene Sea: 2, a town on the of the Rhone: 3. an island, on the coast where Tiberius ordered Agrippa the grand Augustus to be murdered. Fac. Ann. 1-3

\* PLANCHED. adj. [from planch] Nik boards.

To that vineyard is a planched gate, That makes his opening with this biggs by

\* PLANCHER. n. f. | plancher, Presch floot of wood. Not used .- Oak, code: and are the best builders; some are best for plan-irs, as deal. Bacon.

PLANCHES, a town of France, in the dep. of Jura, 7 miles SE. of Nozeroy, and 17 SE. of

PLANCHING. n. f. In carpentry, the laying

I floors in a building. Dist.

PLANCOE, a town France, in the dep. of the orth Coasts, 8 miles NW. of Dinan, and 11

ME. of Lamballe.

[1.] PLANCUS, Lucius Munatius, a writer The Augustan age, but a very versatile charac-He was an orator and a disciple of Cicero. was with Castar in Gaul, was a governor of a pince in Galiia Celtica, where he buit Lugrum, (now Lyons;) and was made conful awith Brutus. He then favoured the repubcause, but afterwards deserted to Castar. He aced himself still more, by becoming a mean herer of Antony and Cheopatra; to please in he acted as a stage dancer, and in a comeresonated the sea god GLAUCUS, by dancing naked, with his body painted green, a m of reeds on his head, and the tail of a large appended to his back. Finding that this fyantic adulation procured him contempt inof approbation, even from Antony, he deto Octavius, before the battle of Actium; received him with great marks of respect; h Planeus returned by proposing in the seto confer on him the title of Augustus. nt this period Horace dedicated his 7th Oce 2. The elegance of his Letters to Gicero, hare still extant, prove that he was not unby of a literary compliment.

PLANCUS. See MUNATIUS.

PLANCUS, Francis, M. D. was born at A-in 1696, and was author of some works h do honour to his memory. 1. A complete m of Surgery, in a vois 12mo: 2. A choice ry of Medicine: this curious collection, conand completed by M. Goulin, makes 9 vols pr 18 vols 12mo. 3. A Translation of Vanici's Observations on Medicine and Surgery, 2 vols 12mo. Plancus was the editor of is editions of works on medicine and furgend enriched them with notes. He died Sept.

PLANCY, a town of France, in the dep. of

t Aube, 7½ miles W. of Arcis.
[1.]\* PLANE. n. f. [planus, Lat. Plain is commly used in popular tanguage, and plane in geotry. I. A level furface.—Comets, as often as y are visible to us, move in planes inclined to plane of the ecliptick in all kinds of angles. nie.-Projectiles would ever move on in the ie right line, d.d not the air, their own gravity, the ruggedness of the plane, on which they ve. stop their motion. Cheyne. 2. [Plane, Fr.] instrument by which the surface of boards is othed.—The iron is fet to make an angle of with the fole of the plane. Moxon.

2.) PLANE, in geometry, denotes a furface that evenly between its bounding lines; and as a it line is the shortest extension from one point inother, so a plane surface is the shortest ex-

finn from one line to another.

3.) PLANE, in allronomy, conics, &c. is fre-

quently used for an imaginary furface, supposed to cut and pass through solid bodies; and on this foundation is the whole doctrine of conic fections built. See Astronomy, Conic Sections, &c.

(4.) Plane, in joinery, (§ 1, def. 2.) confifts of a piece of wood very fmooth at bottom, as a flock or fhaft; in the midft of which is an aperture, through which a steel edge, or chissel, placed obliquely, passes; which, being very sharp, takes off the inequalities of the wood along which it flides.

(4.) Plane, Inclined. See Inclined Plane,

and Mechanics, Part II. Sea. IV.

(6.) PLANE OF PROJECTION, in the stereographic projection of the sphere, is that on which the projection is made, corresponding to the per-

fpective plane. See Projection.
(7.) Plane, Perspective, in perspective, is supposed to be pellucid, and perpendicular to the horizon; the horizontal plane, supposed to pass through the spectator's eye, parallel to the horizon; the geometrical plane, likewise paraliel to the horizon, wherein the object to be reprefented is supposed to be placed, &c. See Perspective.

(8.) PLANES, in mechanics, are either horizontal, that is, partilel to the horizon, or inclined thereto. See MECHANICS. The determining how far any given piane deviates from an horizontal line, makes the whole business of levelling. See

LEVELLING.

(9.) Plane Sailing. See Navigation, Part II. S.&. I.

(10.) PLANES OF REFLECTION and REFRAC-TION, in optics, are those drawn through the incident and reflected or refracted rays. See Op-

TICS, Ind x.

(11.) \* PLANE-TREE. n. f. [platanus, Lat. plane. flatane, Fr. |- The plane tree hath an amentaceous flower confifting of feveral slender stamina, which are coilected into (pherical little balls and are barren; but the embryos of the fruit, which are produced on separate parts of the same trees, are turgid, and afterwards become large spherical balls, containing many oblong feeds intermixed with down: it is generally supposed, that the introduction of this tree into E gland is owing to lord chancellor Bacon. Miller .-

The beech, the swimming alder and the plane. Dryden.

(12.) PLANE TREE, in botany., See PLATANUE. \* To PLANE. v. a. (planer, Fr. from the noun.) s. To level; to smooth; to free from inequalities. -The foundation of the Roman causeway was made of rough stone, joined with a most sirm ce-ment; upon this was laid another layer of small stones and cement, to plane the inequalities of rough stone, in which the stones of the upper pavement were fixt. Arbuthnot. 2. To fmooth with a plane.-Thefe hard woods are more properly feraped than planed. Moxon.

(1.) \* PLANET. n. f. pluneta; Latin; «λαναω; planette, Fr.] - Planets are the erratick or wandering stars, and which are not like the fixt ones always in the same position to one another; we now number the earth among the primary planets. because we know it moves round the sun, as Saturn, Jupiter, Mars, Venus and Mercury do, and that in a path or circle between Mars and Venus:

and the moon is accounted among the fecondary planets or fatellites of the primary, fince the moves found the earth: all the planets have, belides their motion round the fun, which makes their year, also a motion round their own axes, which makes their day; as the earth's revolving so makes our day and night: it is more than probable, that the chameters of all the planets are longer than their axes: we know 'tis so in our earth; and Flamfteed and Cassini found it to be so in Jupiter: Sir Isaac Newton asserts our earth's equitorial diameter to exceed the other about 34 miles; and indeed else the motion of the earth would make the fea rife so high at the equator, as to drown all the parts thereabouts. Harris.—

Barbarous villains! hath this lovely face Rul'd like a wand'ring planet over me,

And could it not inforce them to relent? Shak.

And planets, planet flruck, real eclipse

Then fuffer'd. Milton.

There are feven planets or errant flars in the lower orbs of heaven. Brown.—The Chaldeans were much devoted to aftrological devices, and had an opinion that every hour of the day was governed by a particular planet, reckoning them according to their usual order, Saturn, Jupiter,

Mars, Venus, Mercury, Luna. Wilkins. (2.) A PLANET is a celeftial body, revolving round the fun as a centre, and continually changing its polition with respect to the fixed stars; whence the name planet, Thoman, Gr. from Theras, to wander. The planets are utually diffinguithed into primary and (condary. The primary oves, cailed by way of emmence planets, are those which revolve round the fun as a centre; and the feconclary planets, more usually called fatellites or moons, are those which revolve round a primary planet as a centre, and constantly attend it in its revolution round the fun. The primary planets are again diftinguished into superior as dinferior. The toperior planets are those farther from the lun than our earth; as Mars, Jupiter, Saturn, and the Georgium Sidus; and the inferior planets are those nearer the fun than our earth, as Venus and Mercury. See ASTRONOMY, Index. That the planets are opaque and inhabited bodies, like our earth, is thought probable for the following reafons: 1. Since in Venus, Mercury, and Mars, only that part of the disk illuminated by the fun is found to fline; and again, Venus and Mercury, when between the earth and the fun, appear like dark fpots or maduae on the fun's difk; it is evident, that Mars, Venus, and Mercury, are opaque bodies, illuminated by the borrowed light of the fun. And the fame appears of Jupiter, from its being void of light in that part to which the flirdow of the fatellites reaches, as well as in that part turned from the fun; and that his fatellites me opaque, and reflect the fun's light, is clearly fhown. As Siturn, with his ring and fatellites, only yield a faint light, fainter confiderably than that of the fixed flars, though there be vaftly more remote, and than that of the rest of the planets; it is past doubt that he too with his attendants are opaque bodies. 2. Since the fun's light is not transmitted through Mercury and Venus, when placed against him, it is plain they are dense oprque bodies; which is likewife evident of Jo ter, from his hiding the fateilites in his fladar; and therefore by analogy, the same may be concluded of Saturn. 3. From the variable spots of Vanus, Mars, and Jupiter, it is evident these places have a changeable atmosphere; which changes atmosphere may, by a like argument, be inferred of the fatellites of Jupiter; and therefore, by \$ militude, the fame may be concluded of the & ther planets. 4. In like manner, from the mostains observed in Venus, the same may be luppefed in the other planets. 5. Since, then, Sausa, Jupiter, and the fatellites of both, Mars, Venus and Mercury, are opaque bodies thining with the fun's borrowed light, are furnished with moun tains, and encompassed with a changeable atms pliere; they have, of confequence, waters, fea-&c. as well as dry land, and are bodies like the moon, and therefore like the earth. And here it feems also highly probable, that the other pa nets have their animal inhabitants as well as our earth. Q. E. D. See ASTRONOMY, Index.

(3.) PLANETS, NEW. A new planet was decovered by M. Piazzi, an Italian aftronomer, between Mars and Jupiter, on the first of January, 1801. This discovery had been expected by Prof. M'Laurin and others in the 18th century. A m. ter in the Courier, who figns C. L. and sis, " reviewing the Athenian Letters in the New London Revieno, had hinted his expectation & a a March 1800, and offered conjectures as to is be, probable distance, apparent magnitude, and degree of light, proposes that it should be called MINERVA, as the most proper name for a con planet discovered in this age of science. The be Prof. Minto proposed the same name for the discovered planet, called by British astronomers GEORGIUM SIDUS, but more generally be toreigners HERSCHELL after its discoverer .- Ocher two new planets were discovered by Dr Ohrs on the 28th March, 1802, and proposed to beled CERES and PALLAS. They were feen by Mr Harding, aftronomer, affiftant to Dr Schrieb. on the 19th Feb. 1803. They appeared was 270° right afcention, and 78° N. declination.

PLANETARIUM, n. f. an aftronomical machine, fo called from its representing the mount orbits, &c. of the planets, agreeable to the Copernican fystem. See ASTRONOMY, Index; and Plate XXXII.

(1.) \* PLANETARY. adj. [planetaire, French; from planet.] 1. Pertaining to the planets.— Their planetary motions and afpects. Miles.

Deferibe the fiars and planetary way, And trace the footsteps of eternal day, Gran 2. Under the dominion of any particular planet Darkling they mourn their fate, whom Circle power,

That watch'd the moon and planetary hom. With words and wicked herbs, from human lillad alter'd.

—I was born in the planetary hour of Saturn, at I think, I have a piece of that leaden planet me. Speciator. 3. Produced by the planets.—

Here's gold, go on;

Be as a planetary piague.

We make guilty of our difasters the fun, the move

oon, and the stars, as if we were villains by platary influence. Shak. 4. Having the nature of planet; erratick .--

We behold bright planetary Jove,

Blackmore. Sublime in air. (2.) PLANET ARY DAYS .- Among the ancients, e week was divided among the 7 planets, each thet having its day. This we learn from Dion flus and Pintarch, Sympof. 1. 4. q. 7. Herodoraids, that it was the Egyptians who first difused what god, that is, what planet, prefides treach day; for that among this people the mets were directors. And hence it is, that in of European languages the days of the week full denominated from the planets; Sunday, mday, &c. See WEEK.

J.) PLANETARY Hours, 12th parts of the arcial day and night; fo called because accordto astrologers, a new planet predominates ey hour, and the day is denominated from that ich predominates the first hour of it, as Monfrom the moon, &c. These hours are douthe length of the civil hour. They are still

1 by the Jews.

1.) PLANETARY SYSTEM is the fystem or ashage of the planets, primary and fecondary, ing in their respective orbits, round their imon centre the fun. See Astronomy, Ind. (1) PLANETARY YEARS, the periods of time thich the feveral planets make their revolutions if the fun or earth.—As from the proper rewion of the fun, the folar year takes its origi-: fo from the proper revolutions of the rest of planets about the earth, so many forts of 3 do arise, viz. the Saturnian year, which is red by 29 Egyptian years, 174 hours, 58 mi-4 equivalent in a round number to 30 folar 1.—The Jovial year, containing 317 days, 14 3, 59 minutes.—The Martial year, contain-121 days, 23 hours, 31 minutes.—For Venus Mercury, as their years, when judged of regard to the earth, are almost equal to the 'year; they are more usually estimated from unthe true centre of their motions: in which the former is equal to 224 days, 16 hours, unutes; the latter to 87 days, 23 hours, 14

LANETICAL. adj. [from planet.] Pertainplanets.—Add the two Egyptian days in month, the ecipples of fun and moon, conions and oppositions planetical. Brown.

LANETSTRUCK. adj. planet and strike.] d: fidere afflatus.-

ince I faw you, I have been planetstruck.

ANIEZ, an island of France, in the dep. of buths of the Rhone, near the coast, in the of Marfeilles.

'LANIFOLIOUS. adj. [planus and folium, Flowers are to called, when made up of leaves, fet together in circular rows round ntre, whose face is usually uneven, rough gged. Dia.

LANIMETRICAL. adj. [from planimetry.] ning to the menfuration of plane furfaces.

\* PLANIMETRY. n. f. plan s, Latin, rew; planimetric, Fr.] The mensuration of furtaces.

(2.) PLANIMETRY is that part of geometry which confiders lines and plain figures, without confidering their height or depth. See GEOME-

\* PLANIPETALOUS. adj. [planus, Lat. and mirelm.] Flat-leaved, as when the small flowers are hollow only at the bottom, but flat upwards, as in dandelion and fuccory. Diff.

\* To PLANISH. v. a. [from plane.] To polifh; to fmooth. A word used by manufacturers.

(1.) \* PLANISPHERE. n. f. [planus, Latin; and sphere.] A sphere projected on a plane; a map of one or both hemispheres.

(2.) PLANISPHERE lignifies a projection of the sphere, and its various circles on a plane.

Map, and Projection.

PLANITZ, a town of Germany, in the circle of Upper Saxony, and in Erzgeburg; 3 miles \$. of Zwickaw.

\* PLANK. n. f. [planche, Fr.] A thick strong board.—They gazed on their ships, seeing them so great, and consisting of divers planks. Abbot.-

The doors of plank were. Chapman. The fmoothed plank new rubb'd with balm.

-Some Turkish bows are of that strength, as to

pierce a plank of fix inches. Wilkins .-

Deep in their hulls our deadly bullets light, And through the yielding planks a passage find.

Late I saw adrift disjointed planks. Dryd. \* To PLANK. v. a. [from the noun.] To cover or lay with planks.—If you do but plank the ground over, it will breed faltpetre. Bacon.

The fides were plank'd with pine. Deyden. PLANKENBERG, a town of Germany, in Austria; 4 miles SSW. of Tulin.

PLANKENSTEIN, a town of Germany, in Stiria; 4 miles S. of Windisch Weistritz.

PLANKENWARD, a town of Germany, in

Stiria; 8 miles W. of Graz.

PLANO, an island of the Mediterranean, in the bay of Alicant; about a mile and an half in length.

PLANOCONICAL. adj. [planus and conus.] Level on one fide and conical on others.—Some few are planoconical, whose superficies is in part level. Grew.

\* PLANOCONVEX. n. f. [planus and convexus.] Flat on the one fide and convex on the other.—It took two object-glaffes, the one a planoconvex for a 14 feet telescope, and the other a large double convex for one of about 50 feet. Newton.

PLANSCHWITZ, a town of Upper Saxony, in Vogtland; 3 miles W. of Oelfartz.

(1.) \* PLANT. n. f. | plant, Fr. planta, Latin.]
1. Any thing produced from feed; any vegetable production.-What comes under this denomination, Ray has distributed under 27 genders or kinds: 1. The imperfect plants, which do either totally want both flower and feed, or elfe feem to do fo. 2. Plants producing either no flower at all, or an impertect one, whose feed is so sma'l as not to be discernible by the naked eye. 3. Those whose feeds are not so small, as singly to be invifibie, but yet have an imperfect or flummous flower; i. e. fuch a one, as is without the petals, he-

ving only the stamina and the perianthium. Such as have a compound flower, and emit a kind of white juice or milk when their stalks are cut off or their branches broken off. 5. Such as have a compound flower of a discous figure, the feed pappous, or winged with downe, but emit no milk. 6. The herbæ capitatæ, or fuch whose flower is composed of many small, long tistulous or hollow flowers gathered round together in a round button or head, which is usually covered with a squamous or scaly coat. 7. Such as have their leaves entire and undivided into jags. The corymbiferous plants, which have a compound discous flower, but the feeds have no downe adhering to them. 9. Plants with a perfect flower, and having only one fingle feed belonging to each fingle flower. 10. Such as have rough, hairy or britly feeds. 11. The umbelliferous plants, which have a pentapetalous flower, and belonging to each fingle flower are two feeds, lying naked and joining together; they are called umbelliferous, because the plant, with its branches and flowers, hath an head like a lady's umbrella: [1.] Such as have a broad flat feed almost of the figure of a leaf, which are encompassed round about with something like leaves. [2.] Such as have a longish feed, swelling out in the middle, and larger than the former. [3.] Such as have a shorter seed. [4.] Such as have a tuberose root. [5.] Such as have a wrinkled, channelated or ftriated feed. 12. The stellate plants, which are so ealled, because their leaves grow on their stalks at certain intervals or distances in the form of a radiant star: their flowers are really monopetalous, divided into four fegments, which look like to many petala; and each flower is succeeded by two feeds at the bottom of it. 13. The afperifola, or rough-leaved plants: they have their leaves placed alternately, or in no certain order on their stalks; they have a monopetations flower cut or divided into five partitions, and after every flower there succeed usually four feeds. 14. The suffrutices, or verticillate plants: their leaves grow by pairs on their stalks, one leaf right against another; their leaf is monopetalous, and usually in form of an helmet. 15. Such as have naked feeds, more than four, succeeding their flowers, which therefore they call polyspermæ plantæ semine nudo; by naked feeds, they mean such as are not included in any feed-pod. 16. Bacciferous plants, or fuch as bear berries. 17. Multifiliquous, or corniculate plants, or fuch as have, after each flower, many diffinct, long, flender, and many times crooked cases or sinque, in which their feed is contained, and which, when they are ripe, open themselves and let the seeds drop out. 18. Such as have a monopetalous flower, either uniform or difform, and after each flower a peculiar feed-case containing the seed, and this often divided into many distinct cells. 19. Such as have an uniform tetrapetaious, flower, but bear these feeds in oblong filiquous cases. 20. Vasculiferous plants, with a tetrapetalous flower, but often anomalous. 21. Leguminous plants, or such as bear pulse, with a papilionaceous flower. 22. Vasculiferous plants, with a pentapetalous flower; these have, besides the common calyx, a peculiar case containing their feed, and their flower confifting of five leaves. 23. Plants with a tres bous root, which confifts but of one roust in or head, out of whose lower part go many and to keep it firm in the earth: the plant eth kind come up but with one leaf; they here footstalk, and are long and slender: the hole fels are divided into three partitions: their lose is sexapetalous. 24. Such as have their fraux proaching to a bulbous form: thefe emit, aid coming up, but one leaf, and in leaves, flowered roots refemble the true bulbous plant. 19.04 miferous plants, with a graffy leaf, are loss have a smooth hollow-jointed stalk, with a fharp-pointed leaf at each joint, encompating ! stalk, and set out without any foot salk: the feed is contained within a chaffy huft. 16. Par with a graffy leaf, but not culmiferous will imperfect or flammous flower. 27. Plant 🖷 place of growth is uncertain and various, did water plants.~

Butchers and villains,
How fweet a plant have you untimely copt

Between the vegetable and sensitive possible there are plant-animals. Hale.—The sen red of life above the vegetable, is that of sens with some of those productions, which we plant-animals, are endow'd. Grew.—Lemind to be the same plant, as long as it provided to the same life, though that life be communite to the new particles of matter, vitally united to the ing plant, in a like continued organization, the

formable to that fort of plants. Later-Every plant that drinks the morning in

Some plants the fun-shine ask, and sand

2. A fapling.—A man baunts the force, the bufes our young plants with carving heart their barks. Sbak.—

Take a plant of stubbors

And labour him.

3. [Planta, Lat.] The fole of the foot. [ ] (2.) PLANT, in natural history, is definated an organical body, deflitute of fenicard neous motion, adhering to another boly of manner as to draw from it its nourithmen having a power of propagating it is by The vegetation and economy of plants is those subjects in which our knowledge is a A to al inattention ly circumferibed. structure and economy of plants is the chi of the small progress that has been made principles of vegetation, and of the infam fluctuation of our theories concerning which reason we shall give a short deking the structure of plants. See § 10, 14, 17, 14

CHYNOMENE.

(4.) PLANT, BURNING THORNY. Sci. BIA, No. 2.

(5.) PLANT, EGG. See SOLANUM, N. (6.) PLANT, HUMBLE. See MINOSA,

(7.) PLANT, MOVING. See HEDTSAIN 2. The motions of this plant are feet nary, and so greatly resemble those of that they have been adduced as a strong; the perception and sensation of plants: Se at fill they afford no decifive evidence. 24; Averenga, N° 3; Dionæa; & Motion. (8.) Plant Sensitive. See Mimosa. AL FLOWER, § 1-5; CORALLINES, POLYPUS, and Zoophytes.

(10.) PLANTS, CIRCULATION OF THE SAP IN. oncerning this there have been great disputes; me maintaining, that the vegetable fap has a culation analogous to the blood of animals; tile others affirm, that it only afcends in the y-time, and descends again in the night. In our of the doctrine of circulation it has been ged, that upon making a transverse incision into trunk of a tree, the juice which runs out proids in greater quantity from the upper than the per part; and the fwelling in the upper lip is a much greater than in the lower. It appears, wever, that when two fimilar incilions are made, \* near the top and the other near the root, the ter expends much more fap than the former, nce it is concluded, that the juice afcends by r let of vellels and deicends by another. But, thow this clearly, it would be necessary first to we that there is in plants, as in animals, fome d of centre from which the circulation begins, to which it returns; but no fach centre has milicovered by any naturalift; neither is there half provision apparently made whereby the imight be prevented from defcending in the Blue vessels through which it ascends. In elacai velfels of animals; which we may supin the analogous to the roots of vegetables, the are valves which effectually prevent the the when once absorbed from returning into the clines; but no fuch thing is observed in the lds of vegetables; whence it must be very proic, that when the propelling force ceafes, the \* deficends by the very fame veilels through ith it ascended. This matter, however, has p cleared up almost as well as the nature of the will admit of, by the experiments of Dr .These experiments are so numerous, that \*\* particular account of them we must refer to Hork itself; however, his reasoning against furculation of the fap will be fulficiently intelble without them. " We see (fays he), in my of the foregoing experiments, what quantiof moniture trees daily imbibe and perfpire: r the celerity of the fap must be very great, if I quantity of moisture must, wost of it ascend h top of the tree, then defeered, and afcend a, b. fore it is carried off by perspiration. The at of a circulation in vegetables feems in fome dure to be supplied by the much greater quanof iquor, which the vegetable takes in, than animal, whereby its motion is accelerated; we find the fun-flower, bulk for bulk, immand peripires 17 times more feela liquor 1 a man, every 24 h ur . Belides, Niture's it aim in vegetables being only that the veble life be carried on and maintained, there no occasion to give its sap the rapid motion th was necessary for the blood of animals. In nals, it is the heart which fets the blood in ion, and makes it continually circulate; but egetables we can discover no other gause of OL. XVII. PARTIL.

the fap's motion but the strong attraction of the capillary fap-veffels, affifted by the brifk undulations and vibrations caused by the fun's warmth, whereby the fap is carried up to the top of the tallest trees, and is there perspired off through the leaves: but when the furface of the tree is greatly diminished by the loss of its leaves, then also the perspiration and motion of the sap is proportionably diminished, as is plain from many of the foregoing experiments: fo that the afcending velocity of the tap is principally accelerated by the plentiful perspiration of the leaves, thereby making toon for the fine capillary velleis to exert their vally attracting power, which perspiration is effeeted by the brisk rarelying vibrations of warmth; a power that does not feem to be any ways well adapted to make the fap descend from the tops of vegetables by different veffels to the root. The inflances of the jeffamine tree; and of the paffion tree, have been looked upon as firing proofs of the circulation of the fap, because their branches, which were far below the inoculated bud, were gilded: but we have many visible proofs in the vine, and other bleeding trees, of the fap's receding back, and pulling forwards alternately, at different times of the day and night. And there is great reason to think that the sap of all other trees has fuch an alternate, receding, and progretfive motion, occasioned by the alternacies of day and night, warm and cool, moist and dry. For the fap in all vegetables does probably recede in some measure from the tops of the branches, as the fun leaves them; because its rarefying power then ceating, the greatly rarefied fap, and air mixed with it, will condense, and take up less room than they did, and the dew and fain will then be firougly imbibed by the leaves; whereby the body and branches of the vegetable which have been much exhaulted by the great evaporation of the day, may at night imbibe sap and dew from the leaves; for by feveral experiments, plants were found to increase confiderably in weight, in dewy and moist nights. And by other experiments on the vine, it was found that the trunks and branches of vines were always in an imbibing flate, caused by the great perspiration of the leaves except in the bleeding feafon; but when at night that perspiring power ceases, then the contrary imbibing power will prevail and draw the fap and dew from the leaves, as well as moulture from the roots. And we have a further proof of this by fixing mercurial gages to the flears of feveral trees which do not bleed, whereby it is found that they are aiways in a strongly imbibing state, by drawing up the mercury feveral inches; whence it is easy to conceive, how some of the particles of the gilded bud in the moculated jeffamine may be absorbed by it, and thereby coinranneate their gilding missing to the sap of other branches; especially when, some months after the inoculation, the flock of moculated jeffimine is cut off a little above the bud; whereby the flock. which was the counteracting part to the stem, being taken away, the ft in attracts more vigoroully from the bad. The initance of the ilex grafted upon the English oak, scems to afford a very confiderable argument against a circulation. For, if Iiii

there were a free uniform circulation of the sap through the oak and ilex, why flould the leaves of the oak fall in winter, and not those of the ilex. Another argument against an uniform circulation of the fap in trees, as in animals, may be drawn from an experiment, where it was found by the three mercurial gages fixed to the same vine, that while fome of its branches changed their state of protruding sap into a state of imbibing, others continued protruding fap; one 9, and the other 13 days longer." This reasoning of Dr Hales is confirmed by an experiment made by Mr Mustel of the Academy of Sciences at Rouen, which we need not quote, but only observe that it is decifive against the doctrine of circulation.

(11.) PLANTS, COLOURS OF. See COLOUR,

(12.) PLANTS, DISSEMINATION OF. So great are the prolific powers of the vegetable kingdom, that a fingle plant almost of any kind, if left to itfelf, would, in a short time, over-run the whole. Indeed, supposing the plant to have been only a fingle annual, with two feeds, it would, in 20 years produce more than a million of its own species; what numbers then must have been produced by a plant whose seeds are so numerous as many of those with which we are acquainted? See NATU-RAL HISTORY, Sed. III. where the very prolific nature of plants, and the means by which they are carried to diftant places, are noticed. This is a very curious matter of fact. If nature had appointed no means for the scattering of these numerous feeds, but allowed them to fall down in the place where they grew, the young vegetables must of necessity have choaked one another as they grew up, and not a fingle plant could have arrived at perfection. But so many ways are appointed for the diffemination of plants, that we fee they not only do not hinder each others growth, but a fingle plant will in a short time spread through different countries. The most evident means for this purpose are, 1. The force of the air.—That the efficacy of this may be the greater, nature has raifed the feeds of vegetables upon stalks, so that the wind has thus an opportunity of acting upon them with the greater advantage. The feed-captules also open at the apex, left the ripe feeds should drop out without being widely dispersed by the wind. Others are furnished with wings, and a pappous down, by which, after they come to maturity, they are carried up into the air, and have been known to fly to the distance of 50 miles: 138 genera are found to have winged feeds. 2. In some plants the feedveffels open with violence when the feeds are ripe, and thus throw them to a confiderable distance; and there are 50 genera whose seeds are thus disperfed. 3. Other feeds are furnished with hooks, by which, when ripe, they adhere to the coats of animals, and are carried by them to their lodging places. Linnæus reckons 50 genera armed in this manner. 4. Many feeds are dispersed by birds and other animals; who pick up the berries, and afterwards eject the feeds uninjured. Thus the fox diffeminates the privet, and man many species of fruit. The plants found growing upon walls and houses, on the tops of high rocks, &c. are mostly brought there by birds; and it is uni-

verfally known, that by manuring a fell ri new dung, innumerable weeds will spring to which did not exist there before: 193 speciar reckoned up which may be diffeminated the manner. 5. The growth of other feeds spemoted by animals in a different way. The fome are eaten, others are scattered and trook into the ground by them. The squired pass the cones of the pine, and many of the feeds is When the loxia eats off their bark, and his only food, many of their feeds are commend to the earth, or mixed in the morals with many where he had retired. The glandularia, who had hides up her nuts, often forgets them, and the ftrike root. The same is observable of the w nut; mice collect and bury great quantitie of them, and being afterwards killed by different mals, the nuts germinate. 6. We are aftended to find mosses, fungi, byssis, and mucor, ground everywhere; but it is for want of reflecting to their feeds are so minute that they are almost a visible to the naked eye. They float in the like atoms, and are dropped everywhere, he grow only in those places where there was no getation before; and hence we find the line and fes in North America and in Europe. 1.800 are also dispersed by the ocean, and by men " In Lapland (fays Linnæus), we fee theadendent proofs how far rivers contribute to light the feeds of plants. I have feen Alpar F growing upon their shores frequently is a distant from the Alps; for their seeds into the rivers, and being carried along and by the stream take root there.-We may pur likewife from many circumstances how made fea furthers this bufinefs .- In Rollagia, the of Græscea, Oeland, Gothland, and the shared Scania, there are many foreign and German not yet naturalised in Sweden. The center a German plant, whose feeds being carnel wind into the fea, the waves landed the upon the coasts of Sweden. I was altered fee the veronica maritima, a German plant ing at Tornea, which hitherto had been too only in Græfæa: the fea was the vehicle by was this plant was transported thither from Game or possibly it was brought from German to Ger fora, and from thence to Tornea. Many ba imagined, but erroneously, that feed compa water, and lofes its principle of vegetation. Wi ter at the bottom of the fea is fedom ward nough to deftroy feeds; we have feen water a ver the furface of a field for a whole w while the feed which it contained remained hurt, unless at the beginning of spring the was were let down fo low by drains, that the war of the fun-beams reached to the bottom. The the feed germinate, but prefently become cent; fo that for the rest of the year the mains naked and barren. Rain and shower feeds into the cracks of the earth, fireams rivers; which last, conveying them to a from their native places, plant them in a fire foil." 8. Laftly, fome feeds affift their prop to a distance in a very surprising manace. crupina, a species of centaury, has its seeds com ed over with erect briftles, by whole affinized creeps and moves about in fuch a manner, the

by no means to be kept in the hand. If you ifine one of them between the flocking and the t, it creeps out either at the sleeve or neckid, travelling over the whole body. If the rded oat, after harvest, be left with other grain he barn, it extricates itself from the glume; does it stop in its progress till it gets to the is of the building. Hence, fays Linnæus, the ecarlian, after he has cut and carried it into barn, in a few days finds all the glumes empty the oats separate from them; for every oat a spiral arista or beard annexed ti, which is tracted in wet, and extended in dry weather. en the spiral is contracted, it drags the oat awith it: the arista being bearded with minute s pointing downward, the grain necessarily ws it; but when it expands again, the oat not go back to its former place, the roughof the beard the contrary way preventing its m. If you take the feeds of equifetum, or , thefe being laid upon paper, and viewed in croscope, will be seen to leap over any obe as if they had feet; by which they are sepaone from another; so that a person ignorant is property would pronounce these seeds to many mites or fmall infects.

3.) Plants, Extraction of Colours
N. Sec Colour-Making. 6 71—00.

M. See Colour-making, § 71-99.
4) Plants, Flowers of. It is needless to mention any thing of the texture, or of the 4 &c. of flowers, as they are pretty fimilar to e of the leaf. For the characters and diftincof flowers, See BOTANY, Index. There is curious fact, however, which must be here ad, viz. That every flower is perfectly forma its parts many months before it appears raidly; that is, the flowers which appear year, are not properly speaking the flowers us year, but of the last. For example, mem generally flowers in January; but these ms were completely formed in the month of in preceding. Of this fact any one may Thimself by separating the coats of a tulipmove the beginning of September; and he ind that the two innermost form a kind of in the centre of which stands the young flowhich is not to make its appearance till the ring April or May. Fig. 18. Pl. 276. exhibits r of the tulip-root when diffected in Sept. the young flower towards the bottom.

.) PLANTS, FOOD OF .- This will be found led under the article RURAL OECONOMY. nethod of making oxygen gas is now fo improved, that numberless experiments e made with it both on animals and vege-It appears, indeed, that these two parts of eation are a kind of counterbalance to one er: and the noxious parts or excrements of e prove falutary food to the other. Thus, he animal body continually pass off certain a, which vitiate the air. Nothing can be prejudicial to animal life than an accumulaf these effluvia: on the other hand, nothing e favourable to vegetables than those excreious effluvia of animals, and accordingly preedily absorb them from the earth, or he air. With respect to the excrementitiirts of living vegetables, the case is reversed. The purest air is the common effluvium which passes off from vegetables; and this, however favourable to animal life, is by no means so to vegetable. See § 23.

(16.) PLANTS, FOSSIL. Many species of tender and herbaceous plants are found at this day. in great abundance, buried at confiderable depths in the earth, and converted, as it were, into the nature of the matter they lie among; fosfil wood is often found very little altered, and often impregnated with substances of almost all the different fosfil kinds, and lodged in all the several strata, sometimes firmly imbedded in hard matter; fometimes loofe: but this is by no means the cafe with the tenderer and more delicate subjects of the vegetable world. These are usually immersed either in a blackish slaty substance, found lying over the strata of coal, or else in loose nodules of ferruginous matter of a pebble-like form; and they are always altered into the nature of the substance they lie among: what we meet with of these are principally of the fern kind; and what is very fingular, though a very certain truth, is, that these are principally the ferns of American growth, not those of our own climate. The most frequent fossil plants are the polypody, spleenwort, ofmund, trichomanes, and the feveral larger and smaller ferns; but besides these there are also found pieces of the equisetum or horse-tail, and joints of the stellated plants, as the clivers, madder, and the like; and these have been too often mistaken for flowers; fometimes there are also found complete grasses, or parts of them, as also reeds, and other watery plants; sometimes the ears of corn, and not unfrequently the twigs or bark, and impressions of the bark, and fruit of the pine or fir kind, which have been, from their scaly appearance, mistaken for the skins of fishes; and fometimes, but that very rarely, we meet with mosses and sea-plants. Many of the ferns not unfrequently found, are of very fingular kinds, and some species yet unknown to us; and the leaves of some appear set at regular distances, with round protuberances and cavities. stones which contain these plants split readily. are often found to contain, on one fide, the impression of the plant, and on the other the prominent plant itself: and, beside all that have been mentioned, there have been frequently supposed to have been found with us ears of common wheat, and of the maize or Indian corn; the first being in reality no other than the common endmost branches of the firs, and the other the thicker boughs of various species of that and of the pine kind, with their leaves fallen off; fuch branches in such a state cannot but afford many irregular tubercles and papillæ, and, in some species, fuch as are more regularly disposed. These are the kinds most obvious in England; and these are either immersed in the slaty stone which constitutes whole strata, or in flatted nodules, usually of about three inches broad, which readily split into two pieces on being ftruck. They are most common in Kent, in coal-pits near Newcastle, and the forest of Dean in Gloucestershire; but are more or less found about aimost all our coalpits, and many of our iron mines. Though these feem the only species of plants found with us, yet

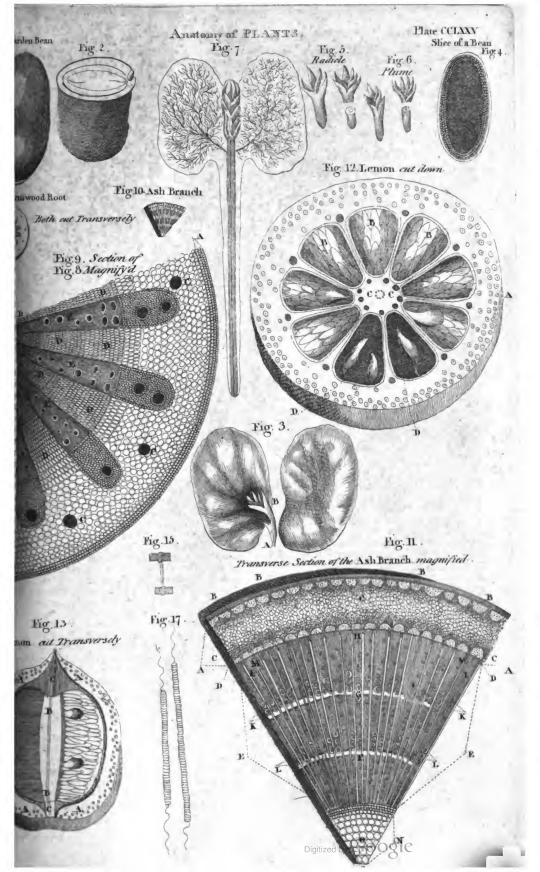

in Germany there are many others, and those found in different substancts. A whitish stone, a little harder than chalk, frequently contains them: they are found also often in a grey flaty frome of a firmer texture, not infrequently in a blackilli, one, and at times in many others. For are the hodies themselves less various here than the matter in which they are contained; the kayes of trees are found in great abundance, among which those of the willow, poplar, whitethorn, and pear trees, are the most common; fault branches of box, leaves of the olive tree, and flalks of garden thyme, are also found there; and fometimes ears of the various species of corn, and the targer as well as the fmaller moffes in great abundance. These seem the tender vegetables, or herbaceous plants, certainly found thus immerfed in hard flone, and buried at great depths in the carth: others of many kinds there are also named by authors; but as in bodies fo imperfect errors are eafily fallen into, these scen all that can be ascer-

tained beyond mere conjecture. (17. PLANTS, FRUITS OF. In deferibing the structure of fruits, a few examples shall be taken from fuch as are most generally known. A pear, belides the fkin, which is a production of the fkm of the bark, confifts of a double parenchyma or pulp, fap, and air-veffels, calculary and acetary. The outer parenchyma is the same substance continued from the bark, only its bladders are larger and more fuccilent. It is everywhere interspersed with finall globules or grains, and the bladders respect these grains as a kind of centres, every grain being the centre of a number of bladders. The fap and air-veffels in this pulp are extremely fmall. Next the core is the inner pulp or parenchyma, which confifts of bladders of the same kind with the outer, only larger and more oblong, corresponding to those of the puip, from which it feems to be derived. This inner pulp is much furer then the other, and has none of the finall grains interfperfed through it; and hence it has got the name of acetary. Bet ween the acetary and outer pulp, the globules or grains begin to grow larger, and gradually unite into a hard ftony body, especially towards the corculum or stool of the fruit; and from this circumstance it Las been called the calculary. These grains are not derived from any of the organical parts of the tree: but feem rather to be a kind of concretions recipitated from the fap, fimilar to the precipitation from wine, urine, and other liquors. The core 18 a roundish cavity in the centre of the pear, lined with a hard woody membrane, in which the need is inclosed. At the bottom of the core there is a small duct or canal, which runs up to the top of the pear; this canal allows the air to get into the core, for the purpose of drying and ripening Fig. 19. Pl. 276. a transverse section of a the feeds. pear, as is feen by the naked eye. A, the skin, and a ring of fap-veilels. B, the outer parenchyma, or pulp, with its vellels, and ligneous fibres intersperied. C, the inner parenchyma, or acetary, with its veries, which are larger than the outer one. D, the core and feeds. Fig. 20. a piece cut off fig. 19. Fig. 21. is fig. 20. magnified. AAA, the finall grains or globies, with the veffels radiite I from them. Fig. 22. a longitudinal fection

of the pear, flowing a different view of the fee parts with those of fig. 19. A the charml, -which runs from the top of the pear to the tom of the core. In a lemon, the parenchy pears in three different forms. The pares of the rind is of a coarfe texture, being me of thick fibrer, woven into large bladden. I nearest the fur see contain the effectial oil de fruit, which builts into a flame when the fqueezed over a candle. From this our can tenchyma 9 or 10 infertions or lamellane ded, which ion between as many portions puip, and unite into one body in the cot the fruit, which corresponds to the put in the or roots. At the bottom and top of the this pith evidently joins with the rind, va the intervention of any lamellæ. This con stance shows, that the pith and bark are and connected in the trunk and roots of though it is difficult to demonstrate the tion, on account of the closeness of their ter and the minuteness of their fibres. Many are dispersed through the whole of this pare ma; but the largest ones stand on the most of the rind, and the outer edge of the posat the two extremities of each lamella. It kind of parenchyma is placed between and the pith; is divided into diffine the lamellie; and each of these bods large bag. These bags contain a 3d prowhich is a ciuster of imaller bags, difficulty connected with each other, having a leby which they are fixed to the large here we in each of these small bags are many harms biadders, composed of extremely many These bladders contain the acid juice of mon. Tig. 12. Pl. 275. a longitudinal fed ... mon. AAA, the rind with the veffels wages the effential oil. B B, the substance of ing to the pith, formed by the union of to he or infertions. (18.) PLANTS GROWING ON ASIMALS.

INSECTS, \$ 10. (19.) PLANTS, LEAVES OF. The leave plants confift of the fame fubiliance with 12 the trunk. They are full of nerves or wood tions, running in all directions, and brand into innumerable fmall threads, interworks the parenchyma like fine lace or gauze. The of the leaf, like that of an arimal, is full which both ferve for perspiration and for forption of dews, air, &c., These pores fices differ both in shape and magnitude is rent plants, which is the cause of that texture or grain peculiar to every platpulpy or parenchymatous part confils minute fibres, wound up into small cells ders. These cells are of various fizes in 22.

af. All leaves, of whatever figure, have a margiil fibre, by which all the rest are bounded. The irticular thape of this fibre determines the figure faleaf. The veffels of leaves have the appearice of inosculating; but, when examined by the icroscrope, they are found only to be interwoin or laid along each other. Air-veffels, or those hich carry no fap, are visible even to the naked te in fome leaves. When a leaf is flowly broke, ey appear like finali woolly fibres, connected to th ends of the broken piece. Fig. 14. Pl. 275. The pearance of the air-veffels to the eye, in a vineif drawn gently afunder. Fig. 15. A small piece it off that leaf. Fig. 16. The same piece magfied, in which the veffels have the appearance a screw. Fig. 17. The appearance of these siels as they exist in the leaf before they are

riched out. (26.) PLANTS, METHOD OF DRYING AND PRE-RVING, FOR BUTANICAL PURPOSES. sthods have been devised for the prefervation of ants: we shall relate only those that have been and most successful. First prepare a press, ach a workinan will make by the following di-Take two planks of a wood not liable warp. The planks must be two inches thick, inches long, and 12 inches broad. Get 4 male d 4 female ferews, fuch as are uled for fecuring h-windows. Let the 4 female screws be let inthe four corners of one of the planks, and corfounding holes made through the four corners the other plank for the male screws to pass rough, fo as to allow the two planks to be awed tightly together. It will not be amiss to or the bearing of the male forews upon the wood th iron plates; and if the iron plates went aols from corner to corner of the wood, it would agood security against the warping. 2dly, Get t a dozen quires of large foft spongy paper, ich as the stationers call bioffom blotting paper is e belt,) and a few sheets of strong pasteboard. in a dry day, after the fun hath exhaled the T; taking particular care to collect them in al flate wherein their generic and specific chaders are most conspicuous. Carry them home a tin box 9 inches long, 43 inches wide, and 14 tp. Get the box made of the thinnest tinned n that can be procured; and let the lid open ion hinges. If any thing happens to prevent the mediate use of the specimens you have collected, cy will be kept fresh two or three days in this is much better than by putting them in water. o preserve them, let them lie upon a table until ey become limber; and then lay them upon a meboard, as much as possible in their natural m, but at the same time with a particular w to their generic and specific characters. or this purpose it will be advisable to separate te of the flowers, and to display the generic If the specific character depends uin the flower or upon the root, a particular difay of that will be likewife necessary. When the ant is thus disposed upon the pasteboard, cover with 8 or 10 layers of fpongy paper, and put it to the prefs. Exert only a finall degree of prefre for the first two or three days; then examine unfold any unnatural plaits, rectify any mif-

takes, and, after putting fresh paper over it, screw the prefs harder. In about three days more feparate the plant from the pasteboard, if it is sufficiently firm to allow of a change of place; put it upon a fresh pasteboard, and, covering it with fresh blossom-paper, let it remain in the press a few days longer. The prefs thould fland in the fun-thine, or within the influence of a fire. When it is perfectly dry, the usual method is to fasten it down, with parte or gum-water, on the righthand inner page of a sheet of large strong writing paper. It requires fome dexterity to glue the plant neatly down, so that none of the gum or paste may appear to defile the paper. Press it gently again for a day or two, with a half sheet of bloffom paper betwixt the folds of the writing When it is quite dry write upon the lefthand inner page of the paper the name of the plant: the specific character; the place where, and the time when, it was found; and any other remarks you may think proper. Upon the back of the same page, near the fold of the paper, write the name of the plant, and then place it in your cabinet. A imall quantity of finely powdered arienic, or corrofive fublimate, is mixed with the paste or gumwater, to prevent the devastations of insects; but the feeds of staves-acre finely powdered will anfwer the fame purpofe, without being liable to corrode or to change the colour of the more delicate plants. Some people put the dried plants into the sheets of writing paper, without fastening them down at all; and others only fasten them by means of finall flips of paper, pasted across the ftem or branches. Where the species of any genus are numerous, and the specimens are finall, feveral of them may be put into one sheet of paper. - 2. A more expeditious method is to take the plants out of the press after the first or second day; let them remain upon the pasteboard; cover them with five or fix leaves of bloffom paper, and iron them with a hot fmoothing iron until they are perfectly dry. If the iron is too hot, it will change the colours; but some people, taught by long practice, will fucceed very happily. This is the best method to treat the orchis and other slimy mucilaginous plants. 3. Another method is to take the plants when fresh gathered, and, instead or putting them into the press, immediately to fasten them down to the paper with strong gum water: then dip a camel-hair pencil into spirit-varnish, and varnish the whole surface of the plant two or three times over. This method fucceeds very well with plants that are readily laid flat, and it preserves their colours better than any other. The spirit varnish is made thus: To a quart of highly rectified spirit of wine put five ounces of gum fandarach; two ounces of mastich in drops; one ounce of pale gum elemi, and one ounce of oil of spike-lavender. Let it stand in a warm place, and thake it frequently to expedite the folution of the gums. The specimens may be disposed syftematically in a large folio book; but a vegetable cabinet is upon all accounts more eligible. In Pl. CCLXXVII. there is a fection of a cabinet, in the true proportions it ought to be made, for containing a complete collection of British plants. By the affiftance of this drawing, and the adjoining feale, a workman will readily make one. The

drawers must have backs and sides, but no other front than a small ledge. Each drawer will be 14 inches wide, and 10 inches from the back to the front, after allowing half an inch for the thickness of the two fides, and a quarter of an inch for the thickness of the back. The fides of the drawers, in the part next the front, must be sloped off in a ferpentine line, fomething like what the workmen call an ogee. The bottoms of the drawers must be made to slide in grooves cut in the uprights, so that no space may be lost betwixt drawer and drawer. After allowing a quarter of an inch for the thickness of the bottom of each drawer, the

clear perpendicular space in each must be as in

the following table: I. Two tenths of an inch. One inch and two tenths.

> III. Four inches and fix tenths. IV. Two inches and three tenths.

V. Seven inches and eight tenths.

VI. Two inches and two tenths.
VII. Two tenths of an inch.

VIII. One inch and four tenths.

IX. Two tenths of an inch.
X. Two inches and eight tenths,

XI. One inch and two tenths.

XII. Three inches and five tenths. XIII. Two inches and four tenths.

XIV. Three inches and eight tenths. XV. Three inches and four tenths. XVI. One inch and three tenths.

XVII. Two inches and eight tenths.

XVIII. Six tenths of an inch.

XIX. Ten inches.

XX. One inch and nine tenths.

XXI. Four inches and four tenths.

XXII. Two inches and fix tenths.

XXIII. One inch and two tenths.

XXIV. Seventeen inches.

This cabinct thuts up with two doors in front; and the whole may fland upon a base, containing a few drawers for the reception of duplicates and papers.

(21.) PLANTS, METHOD OF PRESERVING, IN THEIR ORIGINAL SHAPE AND COLOUR. Wash a inflicient quantity of fine fand, so as perfectly to separate it from all other substances; dry it; pass it through a fieve to clear it from any gross particles which would not rife in the washing: take an earthen veiled of a proper fize and form, for every plant and flower which you intend to preferve; gather your plants and flowers when they are in a state of perfection, and in dry weather, and always with a convenient portion of the stalk: heat a little of the dry fand prepared as above, and lay it in the bottom of the veffel, fo as equally to cover it; lay the plant or flower upon it, so as that no part of it may touch the fides of the vessel: fift or shake in more of the fame fand by little upon it, so that the leaves may be extended by degrees, and without injury, till the plant or flower is covered about two inches thick: put the vessel into a stove, or hot-house, heated by little and little to the 50th degree; let it stand there a day or two, or perhaps more, according to the thickness and succulence of the flower or plant; then gently shake the fand out upon a theet of paper, and take out the plant, which you will find in all its beauty, the shape as

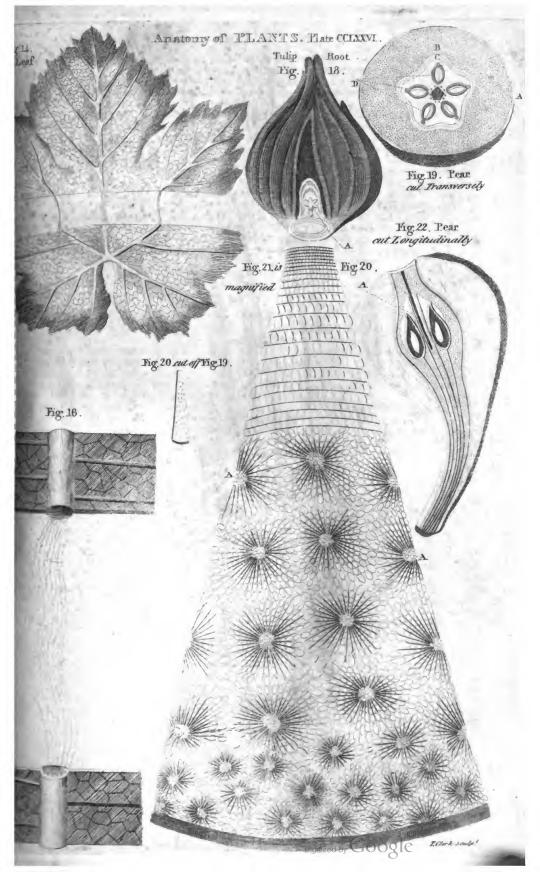

elegant, and the colour as vivid as when it gar. Some flowers require certain little operations preferve the adherence of their petals, particular ly the tulip; with respect to which it is needy, before it is buried in the fand, to cut the tranlar fruit which rifes in the middle of the four, for the petals will then remain more firmly and ed to the stalk. A HORTUS SICCUS prepara this manner would be one of the most beautif and ufeful curiofities imaginable.

(22.) PLANTS, MOTION OF. See HEDYSARDS,

N° 2; and Morion, § 10.

(23.) PLANTS, NUTRITION OF. Various open ons have been entertained by modern chearing this subject. M. Hassenfratz confiders carbon the fubitance, which chiefly nourthes vegetine M. Ingenhousz, in his work on this subject, each deavours to prove, that, if carbon has any ence, it can only be in the state of carbonicate as that acid is abforbed and decomposed by no tables, while the natural ligneous carbon prodoc no effect on the expansion of plants. Mr A. You has endeavoured to demonstrate this by er co ments. Prof. Rafn of Copenhagen, made a krei of experiments for 3 years, from which he cludes, that carbon has a decided influence and nourithment of plants; that the carbonicail duces exactly the fame effect as charcoald and that coal athes, which both English as Coman farmers celebrate fo much, destroy to if the foil contains one 8th of this mixture. No feed germinates in oil. A fingle grain of common falt in 200 grains of water is fufficient to read vegetation, and may even kill the plants, i water ed with it. Shavings of horn and charcol are vourable to vegetation.

(24.) PLANTS, PERCEPTION OF. Dr Balds dinburgh and many other ingenious mes, bei that plants have a power of perception biad vol. of the Manchester Transadions, w some speculations on the perceptive power of bles, by Dr Percival, who attempts to be, the feveral analogies of organization, life, fpontaneity, and felf-motion, that plants, le inimals, are endued with the powers both of peception and enjoyment. The attempt is incoous, and is ingeniously supported, but in a man nion fails to convince. That there is an arthur between animals and vegetables is certain; but cannot from thence conclude that they exher po ceive or enjoy. Botanists have, it is true, define from anatomy and physiology, almost all the terms employed in the description of plants. But accannot from thence conclude, that their organic tion, though it bears an analogy to that of mals, is the fign of a living principle, if to its principle we annex the idea of perception; It fully is our author convinced of the truth da that he does not think it extravagant to fur that, in fome future period, perceptivity me discovered to extend even beyond the limits assigned to vegetable life. Corallines, madrepoor millepores, and spunges, were formerly coelesed as fosfil bodies; but the experiments of Cont Marfigli evinced, that they are endowed with and led him to class them with the maritime plant And the observations of Polis, Juffier, and Period have fince raifed them to the rank of a

he detection of error, in long established opinins concerning one branch of natural knowledge, istifies the suspicion of its existence in others, hich are nearly allied to it. He then goes on to aw a comparison between the instincts of anials and those of vegetables: the calf, as soon as comes into the world, applies to the teats of the w; and the duckling, though hatched under a m, runs to the water. "Inftincts analogous to ele (says our author,) operate with equal energy the vegetable tribe. A feed contains a germ, plant in miniature, and a radicle, or little root, ended by nature to supply it with nourishment. the feed be fown in an inverted polition, still each nt pursues its proper direction. The plumula ms upward, and the radicle strikes downward o the ground." But these and all the other innious arguments drawn by the Doctor from the belower, the DIONEA MUSCIPULA, &c. howr plaufible, are by no means convincing, and re certainly must ever remain a distinct and enal barrier between the perceptions of animals I the motions of vegetables; although even the at Dr Watson, Bp. of Landass, has espoused the e fide of the question with Dr Percival. See TION, \$ 10.

15.) Plants, Perpendicularity of.—This curious phenomenon in natural history, which i first observed by M. Dodart, and published in essay on the affectation of perpendicularity ened in the stems or stalks of all plants, in the th of many, and even in their branches, as that possible. Though almost all plants rife tile crooked, yet the stems shoot up perpendiwly, and the roots fink down perpendicularly: a those, which by the declivity of the soil come inclined, or those which are diverted out of perpendicular by any violent means, again reand straighten themselves and recover their endicularity, by making a fecond and contraend or elbow without rectifying the first. We monly look upon this affectation without any rife; but the naturalist who knows what a uis, and how it is formed, finds it a subject fonfhinent. Each feed we know contains in little plant, already formed, and needing nos but to be unfolded; the little plant has its ; and the pulp, which is usually separated inwo lobes, is the foundation of the first food it is by its root when it begins to germinate. feed in the earth therefore be disposed so as the root of the little plant be turned down-Is, and the ftem upwards, and even perpendily upwards, it is eafy to conceive that the plant coming to unfold itself, its flalk and need only follow the direction they have to perpendiculæly. But we know that the of plants, whether fown of themselves or by fall in the ground at random; and among great variety of fituations with regard to the of their plant, the perpendicular one up-is but one. In all the reft, therefore, it is Tary that the stalk rectify itself, so as to get of the ground: but what force effects this ge, which is unquestionably a violent action? ecount for two fuch different actions, M. Dosupposes that the fibres of the stalks are of a nature as to be contracted and shortened by the heat of the fun, and lengthened out by the moisture of the earth; and, on the contrary, that the fibres of the roots are contracted by the moifture of the earth, and lengthened by the heat of the fun. When the plantule therefore is inverted. and the root at the top, the fibres which compose one of the branches of the root are not alike exposed to the moisture of the earth, the lower part being more exposed than the upper. The lower must of course contract the most; and this contraction is again promoted by the lengthening of the upper whereon the fun acts with the greatest force. This branch of the root must therefore recoil towards the earth, and, infinuating through the pores thereof, must get underneath the bulb, &c. By inverting this reasoning we discover how the stalk comes to get uppermost. We suppose then that the earth attracts the root to itself, and that the fun contributes to its descent; and, on the other hand, that the fun attracts the flem, and the earth contributes to fend it towards the fame. With respect to the straightening of the stalks in the open air, our author imagines that it arises from the impression of the sun and rain. For the upper part of a stalk that is bent is more exposed to the rain, dew, and even the fun, &c. than the under; and these causes, in a certain structure of the fibres, both equally tend to straighten the part most exposed by the shortening they successively occasion in it; for moisture shortens by swelling and heat by diffipating. What that structure is which gives the fibres fuch different qualities, or whereon it depends, is a mystery as yet beyond our depth. M. de la Hire accounts for the perpendicularity of the stems or stalks of plants by suppoling that the roots of plants draw a coarfer and heavier juice, and the stem and branches a finer and more vo'atile one; but this appears to be one of those conjectural hypotheses, of which no evidence can be adduced, like the doctrines of athers, atmospheres, &c. (See Optics, § 153-156.) M. Aftruc accounts for the perpendicularity of the flems, and their redreffing themselves, thus: 1. He thinks the nutritious juice arises from the circumference of the plant, and ferminates in the pith: And, 2. That fluids, contained in tubes either parallel or oblique to the horizon, gravitate on the lower part of the tubes, and not at all on the upper. Hence it follows, that, in a plant placed either obliquely or parallel to the horizon. the nutritious juice will act more on the lower part of the canals than on the upper; and thus they will infinuate more into the canals communicating therewith, and be collected more copioully therein: thus the parts on the lower fide will receive more accretion and be more nourished than those on the upper; the extremity of the plant will therefore be obliged to bend upwards. principle brings the feed into its due fituation at first. In a bean planted upfide down, the plume and radicle may be feen with the naked eye shooting at first directly for about an inch; after which they begin to bend, the one downward, and the other upward. The same is the case in a heap of barley to be made into malt, or in a quantity of acorns laid to sprout in a moist place, &c. Each grain of barley and each acorn has a different fituation; and yet every sprout tends directly up-

ward, and every root downward, and the curvity or bend they make is greater or lefs as their fituation approaches more or lefs to the direction wherein no curvature at all would be necessary. But two fuch opposite motions cannot possibly arife without supposing some difference between the two parts: the only one we know of is, that the plume is fed by a juice imported to it by tubes parallel to its fides, whereas the radical imbibes its nourithment at every pore in its furface. When the plume therefore is either parallel or inclined to the horizon, the nutritious juice, feeding the lower parts more than the upper, will determine its extremes to turn upward, for the reafons before given. On the contrary, when the radicle is in the like fituation, the nutricious juice penetrating through the upper part more copioufby than through the under, there will be a gleater accretion of the former than of the latter; and the radicle will therefore be bent downwards, and this mutual curvity of the plume and radicle must continue till such time as their sides are nourished a-. like, which cannot be till they are perpendicular.

(26.) PLANTS, PERSPIRATION OF, AND QUANTITY OF MOISTURE IMBIBED BY. These curious particulars have been determined with great accuracy by Dr Hales. The method he took to accomplish his purpose was as follows.—In July, the warmest season of the year, he took a large sunflower 31 feet high, which had been purpofely planted in a flower-pot when young. He covered the pot with thin milled lead, leaving only a small hole to preferve a communication with the exterted air, and another by which he might occasion-By supply the plant with water. Into the former he inferted a glass tube nine inches long, and another florter tube into the hole by which he poured in the water; and the latter was kept close stopped with a cork, except when there was occafrom to use it. The holes in the bottom of the pot were also stopped up with corks, and all the crevices that with cement.-Things being thus prepared, the pot and plant were weighed for 15 feveral days; after which the plant was cut off close to the leaden plate, and the stump well covered with cement. By weighing, he found that there perspired through the unglazed porous pot two ounces every 12 hours; which being allowed for in the daily weighing of the plant and pot, the greatest perspiration, in a warm day, was found to be one pound 14 ounces; the middle rate of perspiration, one pound sour ounces; the perspiration of a dry warm night, without any fentible dew, was about three ounces; but when there was any fenfible though finall dew, the perspiration was nothing; and when there was a large dew, or fome little rain in the night, the plant and pot was increased in weight 2 or 3 ounces. To know what quantity was perspired from a square inch of surface, our author cut off all the leaves of the plant, and laid them in five feveral parcels, according to their feveral fizes; and then meafured the furface of a leaf of each parcel, by laying over it a large lattice made with threads, in which each of the little squares were 4 of an inch; by numbering of which, he had the furface of the leaves in fquare inches; which, multiplied by the number of leaves in the corresponding parcels, gave

the area of all the leaves. By this method's found the furface of the whole plant above med to be 5616 square inches, or 39 square fea iz dug up another fun-flower of nearly the iamis, which had eight main roots, reaching 13 ice deep and fidewife, from the ftem. It had blok a very thick bufft of lateral roots from the taz roots, extending every way in a hemispheralist 9 inches from the ftem and main roots. how to estimate the length of all the roots, he took w of the main roots with its laterals, and mediate and weighed them; and then weighed the airr 7 with their laterals; by which means he was the fum of all their lengths to be 1448 feet. So poling then the periphery of these roots x are dium to be o'; or an inch, then their surfaces be 2276 square inches, or 15'8 square set; 14 is, equal to o's of the furface of the plant alm ground. From calculations drawn from there fervations, it appears, that a square inch a upper furface of this plant perspices one 16st part of an inch in a day and a night; and that square inch of the surface under ground mile one 67th of an inch in the same time. The que tity peripired by different plants, however, wh no means equal. A vine-leaf perspires con co 191th of an inch in 12 hours; a cabbige page one 80th of an inch in the same time; 25% tree one 102d in 12 hours; and a lemon or unit in 12 hours.

(27.) PLANTS, ROOTS OF. In examination roots of plants, the first thing is the thin, which of various colours in different plants. Eurm after it has arrived at a certain age, has a desh fkin. The first is coeval with the other patts exists in the seed: but afterwards there Bia fent off from the bark, which forms a know to e.g. in the root of the dandelion, towards hed of May, the original or outer skin appears and led, and is callly separated from the Man which is fresher, and adheres more firms bark. Perennial plants are fupplied in the ner with a new fkin every year; the outrast ways falls off in autumn and winter, and an one is formed from the bark in the faccount fpring. The tkin has numerous cells or west and is a continuation of the parenchymatous F of the radicle. However, it does not connt b ly of parenchyma; for the microscope shows ! there are many tubular ligneous vehicls in the fed through it. When the skin is removed true cortical substance or bark appears, while alfo a continuation of the parenchymatous? of the radicle, but greatly augmented. The is of very different fizes. In most trees it is ceeding thin in proportion to the wood and p On the other hand, in carrots, it is aimcit! half of the femidiameter of the root; and, and, delion, it is nearly twice as thick as the The bark is composed of two subles the parenchyma or pulp, which is the part part, and a few woody fibres. The partial is exceedingly porous, and has a great refeating to a sponge; for it shrivels considerable to dried, and dilates to its former demembers to infuled in water. These pores are not period fo as to communicate with each other; but of fift of diffinct little cells or bladders, leave?

fible without the microscope. In all roots, these bacells are constantly filled with a thin water. They are generally of a spherical figure; though in some roots, as the bugloss and dandelion, they are oblong. In many roots, as the horse radiffi, peony, asparagus, potatoe, &c. the purenchyma s of one uniform structure. But in others it is nore diverlified, and puts on the shape of rays, unning from the centre towards the circumfeence of the back. These rays sometimes run juite through the bark, as in lovage; and fomeines advance towards the middle of it, as in meflot and most of the leguminous and umbellifeous plants. These rays generally stand at an emal distance from each other in the same plant; ut the diffance varies greatly in different plants. Nother are they of equal fizes: in carrot they are xceedingly small, and scarcely discernible; in nellot and chervil, they are thicker. They are kewife more numerous in fome plants than in ohers. Sometimes they are of the same thickness rom one edge of the bark to the other; and fome row wider as they approach towards the skin. ne veffels with which thefe rays are amply furified, are supposed to be air-vessels, because they re always found dry, and not so transparent as re vessels which contain the sap. In all roots are are ligneous vessels dispersed in different proortions through the parenchyma of the bark. hele ligneous vessels run longitudinally through be bark in the form of finall threads, which are ubular, as is evident from the rising of the sap in hem when a root is cut transversely. Thefe ligwous lap-vessels do not run in direct lines through be bark, but at small distances incline towards ne another, in fuch a manner that they appear o the naked eye to be inosculated; but the mirokope discovers them to be only contiguous, and braced together by the parenchyma. These: races or coarctations are very various both in ze and number in different roots; but in all lants they are most numerous towards the inner de of the bark. Neither are these vessels single abes; but, like the nerves in animals, are bunlet of 20 or 30 small contiguous cylindrical tubes, thich uniformly run from the extremity of the oot without fending off any branches or fuffering ay change in their fize or thape. In fome roots, s parsnep, especially in the ring next the inner xtremity of the bark, these vessels contain a kind Hymph, which is fweeter than the fap contained the bladders of the parenchyma. From this reumstance they have got the name of lymphuls. These lymph-ducts sometimes yield a muilaginous lymph, as in the comphrey; and fomemes a white milky glutinous lymph, as in the igelica, fonchus, burdock, scorzonera, dandeon, &c. The lymph-ducts are supposed to be te vessels from which the gums and balsams are cemed. The lymph of fennel, when exposed to ie air, turns into a clear transparent balfam; and lat of the scorzonera, dandelion, &c. condenses to a gum. The tituation of the veffels is vari-18. In some plants they stand in a ring or circle the inner edge of the bark, as in afparagus; in thers, they appear in lines or rays, as in borage; the parfnep, and feveral other plants, they are inft confpicuous towards the outer edge of the Vol. XVII. Part II.

bark; and in the dandelion, they are disposed in the form of concentric circles. The wood of roots is that part which appears after the bark is taken off, and is firmer and lefs porous than the bark or pith. It confifts of two diftinct substances, viz. the pulpy or parenchymatous, and the ligneous. The wood is connected to the bark by large portions of the bark inferted into it. Thefe infertions are mostly in the form of rays, tending to the centre of the pith, which are eafily difcernible by the eye in a transverse section of most roots. These insertions, like the bark, consist of many vessels, mostly of a round or oval figure. The ligneous veffels are generally disposed in collateral rows running longitudinally through the root. Some of these contain air, and others sap. The air-vessels are so called, because they contain no liquor. These air-vessels are distinguished by being whiter than the others. The pith is the centrical part of the root. Some roots have no pith, as the stramonium, nicotiana, &c.; others have little or none at the extremities of the roots, but have a confiderable quantity of it near the top. The pith, like every other part of a plant, is derived from the feed; but in some, it is more immediately derived from the bark; for the infertions of the bark running in betwixt the rays of the wood, meet in the centre, and constitute the pith. Roots, which have no pith in their lower parts, are amply provided with it towards the top, as in columbine, lovage, &c. The bladders of the pith are of different fixes, and generally of a circular figure. Their position is more uniform than in the bark. Their fides are not mere films, but a composition of small fibres or threads; which gives the pith, when viewed with a microicope, the appearance of a piece of fine gauge or network. In a word, the whole substance of roots, is nothing but a congeries of tubes and fibres, adapted for the absorption of nourishment, and of course the extension and augmentation of their parts. Fig. 8. Pl. 275. A transverse section of the root of wormwood as it appears to the naked eye. Fig. 9. A fection of fg. 8. magnified. AA, the fkin, with its vessels. BBBB, the bark. The round holes CCC, &c. are the lymph-ducts of the bark: All the other holes are little cells and sap-vesiels. DDD, parenchymatous infertions from the bark, with the cells, &c. EEEE, the rays of the wood, in which the holes are the air-veffels. N. B. This root has no pith.

(28.) PLANTS, SEA. Sec SEA PLANTS.

(29.) PLANTS, SEEDS OF, are of various figures and fizes. Most of them are divided into two lobes; though fome, as those of the cress kind, have fix; and others, as the grains of corn, are entire. But as the effential properties of all feeds are the fame, whem confidered with regard to the principles of vegetation, we need only describe one feed, viz. the great garden bean. it to all others, because, after it begins to vegetate, its parts are more confpicuous than many others, and confequently better calculated for investigation. It is covered with two coats or membranes. The outer coat is extremely thin, and full of pores; but may be eatily separated from the inner one (which is much thicker), after the bean has been boiled, or lain a few days in the Kkkk

foil. At the thick end of the bean there is a small hole visible to the naked eye, immediately over the radicle or future root, that it may have a free passage into the soil (fg. 1. A. Plate CCLXXV.) When these coats are taken off, the body of the feed appears, which is divided into two fmooth portions or lobes. The fmoothness of the lobes s owing to a thin film or enticle with which they At the basis of the bean is placed are covered. the radicle or future root (fig. 3. A). The trunk of the radicle, just as it enters into the body of the feed, divides into two capital branches, one of which is inferted into each lobe, and fends off imalier ones in all directions through the whole substance of the lobes (fig. 4. AA Pl. CCLXXV.) These ramifications become so extremely minute towards the edges of the lobes, that they require the finest glasses to render them visible. To these ramifications Grew and Malpighi have given the name of feminai root; became, by means of it, the radicle and plume, before they are expanded, derive their principal nourithment. The plume, bud, or germ (fig. 3), is inclosed in two small corresponding cavities in each lobe. Its colour and confiftence is much the same with those of the radicle, of which it is only a continuation, but having a quite contrary direction; for the radicle defeends' into the earth, and divides into a great number of smaller branches or filaments; but the plume afcends into the open air, and unfolds itfelf into all the beautiful variety of ftem, branches, leaves, flowers, fruit, &c. The plume in corn shoots from the smaller end of the grain, and among maltsters is named ACROSPIRE. The fubfrance, or parenchymatous part of the lobes, is not a mere concreted juice, but is curioufly organized, and confifts of a valt number of fmall bladders refembling those in the pith of trees (fig. 4.) Belides the coats, cuticle, and parenchymatous parts, there is a fubiliance perfectly diffinet from these, distributed in different proportions through the radicle, porme, and lobes. This inner fubiliance appears very plainly in a transverse fection of the radicle or plume. Towards the extremity of the radicle, it is one entire trunk; but higher up it divides into three branches; the middle one runs directly up to the plume, and the other two pass into the lobes on each side, and forced out into a great variety of small branches through the whole body of the lobes, (fig. 4.) This fubitance is very properly termed the feminal root of for when the feed is fown, the moisture is first absorbed by the outer coats, which are everywhere furnified with fap and air veffels; from thefe it is conveyed to the cuticie; from the cuticle it proceeds to the pulpy part of the lobes; when it has got thus far, it is taken up by the mouths of the fmall branches of the feminal root, and passes from one branch into another, till it is all collected into the man, trunk, which commupicates both with the plume and radicle, the two principle involved organs of the future plant. Affer this the fap or vegetable food runs in two opposite directions: part of it ascends into the plume, and promotes the growth and expansion of that organ; and part of it descends into the tadicle, for nouriffing and evolving the root and its various filaments. Thus the plume and radi-

cle continue their progrets in opposite dindies till the plant arrives at maturity. Every place possessed of two roots, both of which are contaed in the feed. The plume and radicio, was the feed is first deposited in the earth, denie a nourishment from the semmai root; but, anwards, when the radicle begins to floot on filaments, and to abforb some moisture, not, inever, in a fufficient quantity to supply the gencies of the plume, the two lobes, pr min dy of the feed, rife along with the plume, after the appearance of two leaves, refembling to lobes of the feed in fize and shape, but having the refemblance to those of the plume, for which in fon they are named dissimilar leaves. Tack a fend the young piume from the weather, and abforbing dew, air, &c. affift the tender rade nourishing the plume, with which they have a connection by the feminal root. But when radicle or 2d root has descended deep enough to the earth, and has acquired a sufficient ber of filaments or branches for abforbing at a aliment as is proper for the growth of theple then the feminal or diffimilar leaves, ther to being entirely superfeded, begin to decay and off. Fig. 1. A, the foramen or hole in the through which the radicle flioots into the Fig. 2. A transverse section of the beat; being the branches of the feminal root. Fill the radicle. (30.) PLANTS, SEXES OF. The establishment of the fexual fystem in vegetables, and the gy between vegetable and animal bodies gested a method of improving plants, as are, by croffing the breed. In the Phini To 1799, there is an account of some very experiments on this subject made by h Knight, Efq. For the particulars of the riments we shall refer to that work, and here only mention the refult of one or ten! different species or varieties of peafe and a By introducing the farina of the larged and luxuriant species of pea into the blodoms most diminutive, and by reversing this par found that the powers of the male and found their effects on the offspring were exact The vigour of the growth, the fize of the produced, and the scason of maturity we fame, though the one was a very carry, of other a very late variety. He had alb experiment a firking inflance of the form-effects of crofling the breeds; for the moriety whose height rarely exceeds 2 feet, 15 creased to 6 feet, while the height of the and luxuriant kind was very intile dimen Hence it is evident that by this proces a number of new varieties may be obtained. fuccels of Mr Knight's experiments on the

as also been fully equal to his hopes. The plants which he obtained from his efforts to unite the ood qualities of two different kinds of appies, offers the greatest health and luxuriance of rowth, as well as the best properties in other repects. See Botany, Index.

(I.) PLANTS, SLEEP OF. See PHYSIOLOGY, ья. XIII.

(12.) Plants, Trunk, Stalk, OR STEM OF. Vhatever is faid with regard to the trunk of lants, applies equally to the branches. unk, like the root, conflits of 3 parts, viz. the ak, wood, and pith. These parts, though subantially the fame in the trank as in the root, are many cases very different in their texture and pearance. The skin of the bark is composed ivery minute bladders, interspersed with longlidnal woody fibres, as in the nettle, thiftle, and The outlide of the skin is visibly poous in fome plants, particularly the cane. micipal body of the back is composed of pulp parenchyma, and innumerable vessels much rger than those of the skin. The texture of the ilpy part, though the same substance with the reachyma in roots, yet feldom appears in the m of rays running towards the pith; and when ele rays do appear, they do not extend above if way to the circumference. The veffels of t bark are very differently lituated, and destinfor various purposes in different plants. For cample, in the bark of the pine, the inmost are repuducts, and exceedingly finall; the outmost rgum or refiniterous vettels, delt ned for the fiction of turpentine; and are so large as to be finally visible to the naked eye. The wood 1 between the bark and pith, and confifts of o parts, viz. a parenchymatous and ligneous. all trees, the parenchymatous part of the wood, ough much divertified as to fize and confiftence, aniformly disposed in diametrical rays, or intions running betwixt similar rays of the ligne-"part. The true wood is nothing but a conhe of old dried lymph-ducts. Between the thand the wood a new ring of these ducts is med every year, which gradually lofes its fofthas the cold feafon approaches, and towards middle of winter is condensed into a foild g of wood. These annual rings, which are disdly visible in most trees when cut through, ve as natural marks to distinguish their age 7. 10. 11.) The rings of one year are someies larger, sometimes less than those of ano-5 probably owing to the favourableness or avourableness of the leason. The pith, though a different texture, is exactly of the same subrtions of the wood. The quantity of pith is ious in different plants. Inflead of being inand every year like the wood, it is annually annthed, its veffers drying up, and affuming appearance and structure of wood; infomuch t in old trees there is fearee fuch a thing as a to be discerned. A ring of sap-vessels are ully placed at the outer edge of the pith, next wood. In the pine, fig, and walnut, they are y large. The parenchyma of the pith is comed of finalicells or bladders, of the fame kind

with those of the bark, only of a larger size. The general figure of these bladders is circular; the in some plants, as the thistic and borage, they are Though the pith is originally one conangular. nected chain of bladders; yet as the plant grows old they shrivel, and open in different directions. In the walnut, after a certain age, it appears in the form of a regular transverse hollow division. In some plants it is altogether wanting; in others. as the fonchus, nettle, &c. there is only a transverie partition of it at every joint. Fig. 10. A transverse section of a branch of ash, as it appears to the eye. Fig. 11. The same section magnified. AA, the bark. BBB, an arched ring of sap-vessels next the skin. CCC, the parenchyma of the bark. with its cells, and another arched ring of fap-veffeis: DD, a circular line of lymph-ducts immedistely below the above arched ring. EE, the wood. Fi the first year's growth. G, the second. II, the third year's growth. III, the true wood. RK, the great air-vessels. LL, the lesser ones. MMM, the parenchymatous infertions of the bark represented by the white rays. NO, the pith, with its bladders or cells.

(1.) \* To PLANT. v. a. [ planto, Lit. planter, 1. To put into the ground in order :9 grow; to fet; to cuitivate.—Plant not thee a grove of any trees near unto the altar of the Lord. Deit. xvi. 21. 2. To procreate; to gene-

The honour'd gods the chairs of justice Supply with worthy men, plant love among? Sbak.

It engenders choler, planteth anger. Shak.

3. To place; to fix .-

The fool hath planted in his memory An army of good words. Skat.

I will advise you where to plant yourselves.

Sbak.

The mind through all her powers Irradiate, there plant eyes. Milton. Turnus had affembled all his pow'rs,

His standard planted on Laurentum's tow'rs.

4. To fettle; to establish: as to plant a colony. I Create, and therein plant a generation.

-To the flanting of it in a nation, the foil may be mellowed with the blood of the inhabitants; nay, the old extirpated, and the new colonies. planted. Decay of Piety: 5. To fill or adorn with fomething planted; as, he planted the garden or the country. 6. To direct properly : as, to plaint a cannon.

(2.) \* To PLANT. v. n. To perform the ack of planting.

To build, to plant, whatever you intend, In all let nature never be forgot.

Pobes If you plant where fivages are, do not only entertain them with trifles and jingles, but ute them justly. Bacon.

PLANTA, a plant. See Plant. Plants, iu the Linnzan lystem, are thus distinguished:

I. PLANTA ANDROGYNA, IN androgynous or bermaphrodite plant, which bears both maie and temale flowers.- The great majority of plants are of this kind. Kkkka

Digitized by Google

2. PLANTA FOEMINEA, a female plant, one which bears female flowers only. Female plants are produced from the same seed with the male, and are arranged under the class of diœcia in the fexual method.

3. Planta Mas, a male plant, which bears

only male flowers.

(1.) \* PLANTAGE. n. f. [plantago, Lat.] An herb, or herbs in general.-

Truth, tir'd with iteration,

As true as fleel, as plantage to the moon. Shak.

(2.) PLANTAGE. See PLANTAGO.

PLANTAGENET, the furname of 14 kings of England from Henry II. to Richard III. inclutive. (See England, § 23-36.) Antiquarians are much at a loss to account for the origin of this name; the best derivation they can find for it is, that Fulk, the first earl of Anjou of that name, being stung with remorte for some wicked action, went in pilgrimage to Jerusalem as a work of atonement; where, being foundly fcourged with broom twigs, which grew plentifully on the spot, he ever after took the furname of *Plantagenet*, or broomstalk, which was retained by his nobie po-Berity.

PLANTAGO, PLANTAIN; a genus of the monogynia order, belonging to the tetrandria class of plants. To this genus Linnæus has joined the coronopus and pfyllium of Tournefort. Of these there are several distinct species, and some varietics; but as they are rarely cullivated in gardens, we shall only mention such of them as grow naturally in Britain. Of the plantain there are the following forts: The common broad-leaved plantain, called weybread; the great hoary plantain, or lambs-tongue; the narrow-leaved plantain, or ribwort: and the following varieties have also been found in England, which are accidental; the besom-plantain and rose-plantain. The plantains grow naturally in pastures in most parts of England, and are frequently very troublesome weeds. The common plantain and ribwort plantain are both used in medicine, and are so well known as to need no description. They are said to be flightly aftringent; and the green leaves are commonly applied to fresh wounds by the common prople.

1. PLANTAGO CORONOPUS, Hartshorn, or bucksborn plantain. There are two varieties growing in England, viz. the common buckshorn, which grows plentifully on heaths everywhere; and the narrow-leaved Welch fort, which is found upon many of the Welch mountains. The first of these was formerly cultivated as a falad herb in gardens, but has been long banished from thence for its rank disagreeable flavour; it is sometimes used

in medicine.

2. PLANTAGO PSYLLIUM, fleacwort, is found growing naturally in England, and is used in medicine. It was found in the earth thrown out of the bottom of the canals which were dug for the Chélsea water-works, where it grew in great plenty. The feeds must have been buried there some ages; for no perfon remembered any of the plants growing in that neighbourhood before. The feeds of this species are sometimes used, as they are imported from the fouth of France.

(1.) \* PLANTAIN. n. f. [plantain, Fr. plan-

tago, Lat.] 1. An herb .- The toad, being oncharged with the poison of the spider, as the lieved, has recourse to the plantain less. Mm--The most common simples are mugwort, for tuin and horsetail. Wijeman. 2. A tree in the Wid Indies, which bears an elculent fruit.-

I long my carelefs limbs to lay West. Under the plantain's shade.

(2.) PLANTAIN. See PLANTAGO.

(3.) PLANTAIN, LEAST WATER, the English name of the genus Limofella. Limosella, in bo tany, is a genus of the Angiospermia order, to longing to the Didynamia class of plants; ada the natural method ranks under the 118 orde, Precia.

(4.) PLANTAIN RIVER, a river of Junity which runs into the lea, at the E. coaft, N. by M.

of Point Morant.

(5.) PLANTAIN SHOT. See CANNA, & LN's (6.) PLANTAIN, STAR-HEADED WATEL & ALISMA, Nº 2.

(7.) PLANTAIN TREE. See Musa, No III

(8.) PLANTAIN, WATER. Sec ALISHA. \* PLANTAL. adj. [from plant.] Potting to plants. Not used .- There's but little inte tude betwixt a terreous humidity and plant at minations. Glanville.

PLANTATION. n. f. [plantals for (1.) planto, Latin.] 1. The act or practice of put ing. 2. The place planted .- As swine mate dens and orderly plantations, so are tumelings liaments. King Charles.

Some peafants

Of the same soil their nursery prepare, With that of their plantation.

Let his plantation stretch from down to down

-Virgil was feated by Calliope in the middle plantation of laurel. Addison. 3. A colon. I principal thing, that hath been the definition most plantations, hath been the bale drawing of profit in the first years; feed is not to be neglected, as far as may find the good of the plantation. Bacon .- Towns In are few either of the old, or new planter Heylyn. 4. Introduction ; eftablifhinent,-Epin pacy must be cast out of this church, after post fion here, from the first plantation of chulus

in this island. King Charles. (2.) PLANTATION, § 1. Def. 3. See Coloss

(3.) PLANTATION, in the West Indies, denote a spot of ground which a planter, or perior rived in a new colony, pitches on to cultivated his own use, or purchases for that purpose.

\* PLANTED. participle. [from plant.] word feems in Shakespeare to fignify, kild

well grounded .-

A man in all the world's new fashion

\* PLANTER. n. f. | planteur, Fr. from 1. One who fows, fcts, or cultivates; culind There stood Sabinus, planter of the vines

The cruel battle mows The planters, with their harvest immature.

That product only which our pations here Pri Lludes the planter's miserable earc. 1. Ox

One who cultivates ground in the West Indian lonies .- A planter in the West Indies might ufter up, and lead all his family out against the dians, without the absolute dominion of a morch, descending to him from Adam. Locke .-

He to Jamaica feems transported,

Alone, and by no planter courted. Swift. One who differinates or introduces. - The ly Apostics, the first p'anters of christianity. tion.-Had these writings differed from the serms of the first planters of christianity in history doctrine, they would have been rejected by se churches which they had formed. Addison. 1.) PLANTERSHIP, n. f. in a general fense,

bufiness of a planter.

1.) PLANTERSHIP, in the West Indies, denotes management of a fugar plantation, including only the cultivation of the cane, but the variprocedes for the extraction of the fugar, tober with the making of fugar spirits. See Rum, CHARUM, and SUGAR.

3.) PLANTERSHIP, GENERAL DIRECTIONS PECTING. As it is the interest of every planto preferve his negroes in health and strength; very act of cruelty is not less repugnant to the ler's real profit, than it is contrary to the laws umanity: and if a manager confiders his own and his employer's interest, he will treat all mei under his care with due benevolence: good discipline is by no means inconfistent humanity: on the contrary, it is evident acaperience, that he who feeds his negroes 4 proportions their labour to their age, fex, frength, and treats them with kindness and d nature, will reap a much larger product, with infinitely more ease and self-satisfaction, the most cruel taskmaster, who starves his och or chastifes them with undue severity. y planter then, who wishes to grow rich with must be a good economist; must feed his es with the most wholesome food, sufficient referve to m in health and vigour. Common mence points out the methods by which a may preferve his people in health and Besides plenty of wholesome food, tare other means, equally necessary to the 5th and longevity of negroes, well worth the ter's attention: fuch as, to choose airy dry tions for their houses; and to observe that be kept clean, in good repair, and perfectly r-tight; for nastines, and the inclemencies eather, generate the most malignant discases. ng thus hinted the duties of a planter to his xs, let the next care be of cattle, mules, and The first care is to provide plenty and ty of food. In crop-time, profusion of canemay be had for the labour of carriage; but will be more wholesome and nutritious if ed like hay by the fun's heat, and sweated ying them in heaps a few days before they In this season of abundance, great of cane-tops (the butt ends turned inwards) d he made in the most convenient corner of field, to supply the want of pasturage and food: and these are very wholesome if ped into fmall parts, and mixed fometimes common talt or sprinkled with melasses mixith water; but yet the cattle require change

of food to preserve them in strength; such as Guinea corn, and a variety of grass, which every foil produces with a little care in moist weather; and indeed this variety is found necessary in all climes. But fince that variety is not to be had during those severe droughts to which hot climates are liable, and much less in those small illands which cannot furnish large tracts of meadow lands for hay, the only resource is the sodder of cane-tops or tedded Guinea corn leaves; which are very nutritious, and may be preserved in perfection for more than a whole year, provided the tops or Guinea corn are well tedded for 3 or 4 hot days, as they lie spread in the field; and then, being tied into bundles or sheaves, they must lie in the hot fun for 3 or 4 days more, when they may be fit to be put up into ricks. The best method of making them is in an oblong figure, about 30 feet in length, and 16 or 18 feet wide; 7 feet high at the fides, and thence floping like the roof of a house, the ridge of which must be thatched very carefully; for the fides may be secured from wet by placing the bundles with the butts upwards towards the ridge, in courses, and lapping the upper over the lower course. The best method of forming these ricks, is to place the first course of bundles all over the base one way; the fecond course reversely; and so alternately till the rick be finished. When cattle are to be sed with this fodder, it must be observed to take down the bundles from the top, at the west end of the rick, to the bottom; for all these ricks must stand E. and W. lengthwise, as well to secure them from being overturned by high winds, as for the convenience of preferving them from wet, which cannot be done when ricks are made round. By this husbandry, an herd of cattle may be kept in strength, either in severe droughts, or in wet seasons when grass is purgative; and thus the necessity or expence of large pastures may be faved. The hay knife used in England for cutting hay, answers for cutting ricks of tops. The method of tedding Guinea corn to make a kind of hay, will require a little explanation. Guinea corn is planted in May, and to be cut down in July, in order to bear feed that year, that cutting, tedded properly, will make an exceilent hay, which cattle prefer to meadow hay. In like manner, after Guinea corn has done bearing feed, the after crop will furnish a great abundance of that kind of fodder which will keep well in The next care of a ricks for two or three years. planter is to provide a shade for his cattle; either by trees where they are fed in the heat of the day, if his foil requires not dung; or by building a flat shade over the pen where cattle are confined for making it. That fuch shades are indispenfably necessary, for the health of all animals, especially in hot weather, and in a hot climate, is indifputable.

(4.) PLANTERSHIP, SOIL AND CULTIVATION, PROPER FOR. In the British sugar colonies there is as great a variety of foils as in any country of Europe; some naturally very rich or fruitful, yielding a luxuriant product with little labour or culture. This fruitful foil is of three kinds: a loofe hazel mould mixed with fand, like that of St Christopher's, and is the best in the known

world for producing fugar in great quantity, and of the best quality. The brick mould of Jamaica is fomewhat of the fame nature, and next in value; and then the various mixtures of mould and gravel, to be found in veins or plats over all the other illands. When any of these soils are exhausted of their fertility by long and injudicious culture, they may be reftored by any kind of dung well rotted; for these warm soils eannot bear hot unrotten dung, without being laid fallow for a confiderable time after it. Another improvement is by fea-fand or fea-weed; or by digging in the cane-trash into steep lands, and by letting it lie to rot for fome months. A 3d method is, by plowing and laying it fallow; and the 4th method (the best of all), is by folding the fallows by sheep. But this can be practised only where there are extensive pastures; nor can the plough be employed where the foil abounds with large stones. In that case, however, the former method of digging in trash will be nearly as effectual, though more expensive, by hand-labour or hoeplowing. The next best soil for producing good fugar is a mould upon clay, which if fhallow requires much culture and good labour, or its produce will be small in quantity, though of a strong grain and bright colour, fo as to yield most profit to the refiner of any fugar, except that produced from an hazel or gravelly foil. All the black mould foils upon marle are generally fruitful, and will take any kind of dung; but yield not fo strong or large grained fugar. Marle, however, of a white, yellow, or blue colour, or rich mould from washes, or ashes of every kind, are excellent for every strong foil, as the chief ingredient in the compost of dung: either of them will do aione for ftiff lands; but the yellow and chocolate marle are the most foapy, and the richest kind of manure (except fine mould) for all fliff lands. If these are well opened, pulverized by culture, and mixed with hot dung, or any kind of loofe earth or marle, they will produce as plentifully as lighter foils: and all kinds of clay foils, except that of a white colour, have thefe two advantages above the finest gravel foils, that they do not fcorch foon by dry weather, and never grow weary of the same manure, as most other foils do. By the art of caring, 10 miles, or horses, and two light timbrels with broad wheels, and ten able negroes, may, by the common use of spades, shovels, and light mattocks, or grubbling hoes, make more dung than 60 able negroes can do in the prefent methods. If marle lies upon tifing ground, or in hillocks, as it often does, the pit is to be opened at the foot of the declivity; which being dug inwards till the bank is 3 feet high, then it is to be caved thus. Dig an hollow space of 12 or 18 inches deep under the foot of the bank; then dig into each fide of it another perpendicular cut of the fame depth, and 18 inches wide from the top of the bank to the bottom: that being finithed, make a fmall trench, a foot or two from the brink of the bank; pour into it water till full; and when that is done, fill it again, till the water foaking downward makes the marle separate and fall down all at once. This may be repeated till the pit rifes to 50 feet high; and then many hundreds of cart-loads of marle may be thrown down

by four negroes in two bours; from where ? may be carted into cattle-pens or laid out mos lands, as occasion requires. Five or fix remove with spades or shovels will keep two or threebrels employed, according to the distance of an age: and thus as much dung may be made ten negro men as will dung richly at leaft + a 80 acres of land every year, and laid out alfo the affiftance of cattie-carts: An improved highly worth every planter's confideration, when negroes and feeding them are so expensive. he vel lands, the same operation may be as effects provided the mouth of the pit be opened by dual descent to any depth: but when marie in be found on the fides of hills, the operation a laborious for the horses. But if the surface of marle-pits (as it often happens) be covered clay or fliff foil, fo that the water cannot quan foak from the trench above; in that case, peor of hard wood, made like piles, 4 feet long, and inches square, pointed at one end, and secured the other square head by an iron clamp, may driven by heavy mauls into the trench, as fo man wedges, which will make the caved part turned down: but a skilful eye must watch the last on ration, or the labourers may be buried or in But clay foils that are level, and subject to be overflowed, or to retain water in stagnated procan never be made fruitful by any kind of without being first well drained: for water upon any foil will most certainly transform was ftiff unfruitful clay; as appears evidently by bogs of Ireland, the fens of Lincoln and Cobridgeshire, and even by the ponds of Bartala fituated in the deepest and lightest black for that fine foil being washed in those posts. comes the stiffest black clay, not fit even for a ingredient in dung, until it has been laid dry exposed to the fun for a whole year: ber to thefe bogs and fens are well drained, the the most fruitful foils. Natural clay the ted Boerhaave thinks the fattest of all feet; " then it must be opened by culture, mark, was dy manures. A mixture of fand in get and is the best of all manure for stiff and barren and lands; provided they be well drained, by this ing the whole foil into round ridges of 13 10 wide, with furrows of three feet wide bets each ridge. And this is done with little hand labour than that of hoe-plow well in to common way. For if a piece of land be ed in lines at 74 feet distance from each at and the labourers are fet in to hoe-plow 25 fecond line, hauting back each clod 12 15 haif the ridge, and near haif the furrow, is see at the fame time; and thus a piece of land be round-ridged, and the furrows all me once, by the common operation of hoe-r provided the digger drives his hoe up to t at every stroke. Hoe-plowing in clay for the have lain long under water, is indeed hard but it will every year grow the lighter by well-drained by round ridging: and in the while the labour may be rendered much early by the plough conducted by the lines 2h. described. As therefore landy mould is the manure for fliff clay; fo, by parity of reason, as firmed by long experience, stuff clay is the

mure for fandy or chaffy foils. This method round-ridging is, by feveral years experience, and the most essential improvement of flat clayfoils. But ridges were never proposed for ht foils or fleep lands; and even in flat foils on loam they fliould be made with great caun, because loam melts away by water. But ere are peachy lands of a white clay, even upon all descents, too retentive of water; these may tainly be improved much by ridges of 12 feet de, as above described, without fear of washes. ie general maxim of not burning cane-trash hich may be called the flubble of cane-lands) un any kind of foil, is a great mistake; as may evinced by observing the contrary practice of best husbandmen in England, where burn-bastis found an admirable method of fertilizing d, stiff, or ciayey lands. It must indeed be a ifiant practice, not only for the fake of contriing to warm and divide the foil, but as the onflectual means of destroying pernicious infects, weeds of yarious kinds, fuch as French weed, d peafe, and wild vines. Deep mould upon f or loam, being subject to the grub worm, I not take any kind of dung, till perfectly rot-, except that of the sheep-fold; which is the manure for all kinds of light foils, and is of others the least expensive, as not requiring d-labour. But the use of the fold is impractik in any island not abounding with large fa-Thofe has or sheep-pastures, as in Jamaica. stherefore which are subject to the grub, and if he fertilized by common dung, which is a pernell for the mother beetle to deposite its must be well impregnated with the brine of blied falt, after the dung is first cut up; two whoksheads of falt will make brine enough for sug-pen of 50 feet square. This cure for the bus a late diff overy, and has been attended h success. But though it proves effectual to roy that pernicious infect in plant-canes, it anot be fufficient to fave rattoons, without a application of falt in powder; because the brine must be washed away by the time ratm spring. The planter who would fave his bons from the grub ought therefore to cut off heads of his stools with sharp hoes 3 inches w the furface of the foil, and then strew an dul of falt round each stool, and cover it up level with fine mould taken from the edges. he foils where there is no grub, and the planwiffics to have very good rattoons, let him, as 1 as his canes are cut, draw all the traff from dools into the alternate spaces, if planted in manner; or into the furrows, if his land be id-ridged; and then cut off the head of his is with tharp hoes, as above directed. Expece has shown the great benefit of the rattoon juts rifing from three inches below the furface, and of superficial shoots which come to noroand only starve the strong sprouts. Besides, flubs, which are left upon the floois after the is are cut, not the flools; which is one reason good rattoons are uncommon in foils long culted. Yet it is the opinion of some, that by plowing and even dunging rattoons, the proe might be as good plantcanes, which would

the labour of holing and plausing to eften as

planters commonly do. Fallowing is of incredible advantage to every foil, not only by being divided into the minutest parts, but also by imbibing those yegetative powers with which the air is impregnated by the bountiful hand of Providence, whenever rain falls. What those powers are has been expanded under PLANT, \$ 10, 15, and experience evinces, that tender vegetables of the earth are envigorated more by the smallest shower of rain, than by all the water which human art can bestow. Let it therefore be a conftant maxim of the planter, never to plant his ground until the foil is well mellowed by fallowing, even though he bestows upon it a due proportion of dung: for too much will force up rank canes, which never yield good fugar; and though fome advantage may be reaped from the rattoons, yet it will not compensate the loss by the plants. In flony or fleep foils, where the plough cannot be used, or where a sufficient strength of cattle cannot be supported for that purpose, hand-labour, or hoe-ploughing must be substituted: but even in that case, much labour may be saved by spreading the dung according to the English husbandry, and digging it into the foil. To evince this truth let any planter compute his negroes labour of distributing dung by baskets, and by spreading it with dung-forks; and then judge for himself by one fingle experiment which is the most profitable. As to weeding, by the use of the Dutch hoe, he may dispatch more work than by any other. The Dutch hoe being fastened upon the end of a stick, is pushed forward under the roots of the small weeds, in such a manner as to cut them up a little below the furface of the foil, and will do more execution at one shove than can be done by three strokes of the common hoe: but there is yet another practice of the horse-hoe plough, whereby all weeds growing in rows between beans and peafe, are extirpated with incredible eafe and expedition. It is a very fimple machine, drawn by one or two horses, confisting of a pair of low wheels turning upon a common axis; from whence two fquare irons are let down at equal distances, and triangular hoes made at the ends, the points of the triangles being placed forward, and fo fixed as to cut all weeds an inch below the furface, in the fame manner as the Dutch garden hoe above-mentioned. By this machine a man and a boy, with two horses or mules, will clear perfectly all the spaces of a field of ten acres in two days, and may be of admirable use in all loose and dry soils in the fugar islands: for while a horses or mules draw in the space before each other, the wheels pass on the outside of each row of canes, without doing the least injury, while the plough-holder at-tends to his business. In stiff foils which require draining, neither the horie-hoe plough nor the Dutch hoe can be proper; or any other instrument so effectual as the spade used in the manner above hinted, where the staple is deep. But where the staple of land is shallow, care must be taken not to dig much below it, according to the universal opinion of all the best writers, supported by the experience of 100 years. Yet some good planters are fallen into the contrary practice, and dig up stiff clay far below the staple. This, Mr Martin fays, was done in his own lands, during his ab-

fence, by injudiciously ploughing below the staple; and fo injured the foil, that all the arts of culture for many years hardly retrieved its former fertility. Indeed, where the staple is shallow, upon a fat clay, the turning up a little of it at a time, from the bottom of the cane-holes, and mixing it with rich hot dung, made of murle, or fandy mould, which may take off its cohelive quality, will in due time, and by long fallow, convert it into good foil: but if foff clay be turned up, without any fuch mixture in large quantities, it will infallibly disappoint the operator's hopes: for though folid clay will moulder, by exposure, to a seeining fine earth, yet it will return to its primitive state very foon after being wet, and covered from the external air, if not divided, as above fuggefted. After all, the common horfe-hocing plough drawn by two mules in a line before each other, or the hand-hoe in common use, will antiver the purpose very well, where the lands are planted in Mr 'Full's method; that is, where the spaces are equal to the land planted, in the following manner a Belides all the advantages of planting the land in alternate double rows with equal spaces, the canes, when at full age, may be eafily flripped of their traffi, and the juice thus rendered fo mature as to yield double the produce, and much better fugars than unftripped canes. This method of culture may be recommended for all kinds of foil: for as by this practice the rank luxuriant canes will be more matured, fo the poor foils will be rendered more fruitful; and as the roots of the canes which expand into these spaces will be kept moist by being covered with rotten trash, so much longer in the burning foils. In those low lands which require draining by furrows, the alternate double rows and spaces must be made cross the ridges; by which means those spaces, being hoe-ploughed from the centre to the fides, will be always preferved in a proper state of roundness. By this method of planting, the canes may be fo well ripen-ed as to yield double the quantity of fugar of caues planted in the close manner; which faves half the labour of cartage, half the time of grinding and boiling, and half the fuel, befides yielding finer fugar. Yet, how well soever the method of planting in fingle or double alternate rows has fucceeded in the loofe and ftiff foils, it is a wrong practice in fiff lands that are thrown into round or flat ridges: for these being most apt to crack, the fun-beams penetrite foon to the caneroots, flop their growth, and have an ill influence upon the fugar. It is therefore advisable to plant fuch lands full, but in large holes, of 4 feet, by 5 feet towards the banks: after the plant-canes are cut, to dig out one, and leave two rows flanding, hoe-ploughing the spaces after turning all the trash into furrows till almost rotten: for if the trash is drawn upon the hoe-ploughing spaces, they will hardly ever moulder, at least not till the trash is quite rotten. This is an infallible proof from experience of how little advantage trash is to the foil, unless it be in great droughts, to keep out the intenfe fun-beams: for, in all other respects, it prevents that joint operation of the fun and air in mouldering and fructifying the foil, as has been proved by repeated experiments. But in flat fliff

foils that are properly drained by round-nine no culture prevents cracking fo effectually as plowing into them a quantity of lock mot if which that of a chocolate or of a yellow chair best; and it will be still much better, by pon the land, in fmall heaps, or in cane-bed fome time, to imbibe the vegetative power is air before it is intimately mixed with their to the manner of planting canes, the general tice of 4 feet by 5 to a hole, and two freft plan is found by experience to be right in the rows. But the following precautions are new ry to be observed. First, let all the cane-room E. and W. that the trade wind may pas for adly, Let not any access through them. mould be drawn into hills round the yourge except where water flagnates; because the which run horizontally, and near the furface, much broken and fpoiled by that practice. Let the fugar-canes be cut at their full mater which, in a dry loofe foil, is generally at then of 14 or 15 months after being planted; or i cold clay-foils, not till 16 or 17 months. As the cane-rows run E. and W. in 21 proper direction as poslible for cartage to the fagured fo canes must be cut the contrary way if the past er expects any great produce from his report for by beginning to cut canes at the pur the field most remote from the works, the not often pass over the same tract, z quently the cane-stools cannot be injured .... especially if he takes due care to cut the care ry close to their roots; for, by leaving a log ... (which must perish) the cane-stools are jured. in round-ridged land, it is proper well canes in the fame direction of the ndge, ing the tops and trash into the furrows week the cartage easy, and to preserve the their proper form. The expediency of the cane-pieces of a plantation in out fo that the intervals may interfect at right is obvious, fince fuch regularity is not beautiful, more fafe in case of accidents and a better disposition of the whole for and planting one third or fourth part of se tion every year, but also much easier granted le a few watchmen: for one of these walks line from E. to W. and the other from N. .. look through every avenue, where the months thief cannot escape the watchful eye. And intervals furrounding the boundary of a ruplantation be made 24 feet wide, the prowill receive ample recompense for so much by the fecurity of his canes from fires bear the neighbourhood, and by planting all the in plantain trees, which may at once yield no excuse for absence from their proper But as fuel grows very scarce in most of our it is also expedient to plant a logwood or fence in all the boundaries of every p which, being cut every year, will furnil store of faggots. Logwood makes the and quickeft of all fences, and agrees with a foil: the cuttings make excellent over-fix! are the general operations of plantership. ing to the approved directions of Mr Mins

particular cuitivation of the fugar-canes, the raction of fugar, and the diffillation of rum, fee im, Saccharum, and Sugar-

PLANTIN, Christopher, a celebrated printer, s born near Tours in 1733, and bred to an art ich he carried to the highest degree of perfec- He went and settled at Antwerp; and there fled a printing-office, which was confidered not v as the chief ornament of the town, but as one the most extraordinary edifices in Europe. A it number of ancient authors were printed; these editions were valued not only for the my of the characters, but also for the correctsof the text, with regard to which Plantin was rery nice, that he procured the most learned 1 to be correctors of his press. He got imisc riches by his profession; which, however, did not hourd up, but spent like a gentleman. died in 1598, aged 65; and left a most sumptuand valuable library to his grandfon Balthafar. 1.) PLANTING, part. n. s. in agriculture and dening, is fetting a tree or plant, taken from proper place, in a new hole or pit: throwing h earth over its root, and filling up the hole he level of the furface of the ground. thing in planting is to prepare the ground bethe trees or plants are taken out of the earth, they may remain out of the ground as fhort me as possible; and the next is, to take up the sor plants, to be transplanted. In taking up trees, carefully dig away the earth round the the fo as to come at their feveral parts to cut mest; for if they are torn out of the ground fout care, the roots will be broken and bruifed, he great injury of the trees. The next thing o prepare them for planting by pruning the trand heads. And first, as to the roots, all the Il fibres are to be cut off, as near to the place a whence they are produced as may be, except rare to be replanted immediately after they are m up. Then prune off all the bruised or broken is, all fuch as are irregular and cross each o-4 and all downright roots, especially in fruits: shorten the larger roots in proportion to at, the strength, and nature of the tree; obing that the walnut, mulberry, and some other kr-rooted kinds should not be pruned so close he more hardy forts of fruit and forest trees: oung fruit-trees, fuch as pears, apples, plums, thes, &c. that are one year old from the time kir budding or grafting, the roots may be left about 8 or 9 inches long; but in older trees, must be lest of a much greater length; but is only to be understood of the larger roots; he finall ones must be mostly cut quite out, runed very fhort. The next thing is the prunif their heads, which must be differently pered in different trees; and the delign of the must also be considered. Thus, if they are med for walls or espaliers, it is best to plant with the greatest part of their heads, which ld remain on till they begin to shoot in the ig, when they must be cut down to 5 or 6 , taking care not to disturb the roots. But if rees are deligned for standards, prune off all small branches close to the place where they produced, also the irregular ones which cross other; and after having displaced these bran-OL. XVII. PART II.

ches, cut off all fuch parts of branches, as have by any accident been broken or wounded; but by no means cut off the main leading shoots which are necessary to attract the sap from the root, and thereby promote the growth of the tree. Having thus prepared the trees for planting, proceed to place them in the earth: but first, if the trees have been long out of the ground, so that the fibres of the roots are dried, place them 8 or 10 hours in water, before they are planted, with their heads erect, and the roots only immerfed therein; which will swell the dried vessels of the roots, and prepare them to imbibe nourishment from the ear h. planting them, great regard should be had to the nature of the foil: for if that be coid and moift, the trees should be planted very shallow; and if it be a hard rock or gravel, it will be better to raise a hill of earth where each tree is to be planted than to dig into the rock or gravel, and fill it up with earth, as is too often practifed, by which means the trees are planted as it were in a tub, and have but little room to extend their roots. The next thing to be observed is, to place the trees in the hole in fuch a manner that the roots may be about the fame depth in the ground as before they were taken up; then break the earth fine with a forde, and scatter it into the hole, so that it may fail in between every root, that there may be no hollowness in the earth: then having filled up the hole gently, tread down the carth with your feet, but do not make it too hard; which is a great fault, especially if the ground be strong or wet. Having thus planted the trees, they should be fastened to stakes driven into the ground, to prevent their being displaced by the wind, and some mulch aid upon the furface of the ground about their roots; as to fuch as are planted against walls, their roots should be placed about five or fix inches from the wall, to which their heads should be nailed to prevent their being blown up by the wind. seasons for planting are various, according to the different forts of trees, or the foil in which they are planted. For the trees whose leaves fall off in winter, the best time is the beginning of October, provided the foil be dry; but if it be a very wet soil, it is better to defer it till the end of Feb. or beginning of March: and for many kinds of evergreens, the beginning of April is by far the best feason; though they may be safely removed at midfummer, provided they are not to be carried very far; but should always make choice of a cloudy wet feafon. In the 2d vol. of the Bath Society's Papers, a letter on planting waste grounds relates, that, " about 30 (now 40) years ago, the W. part of it abounded with fand, so very light that it was blown away with the wind; that Mr Buxton of Shadwell Lodge, near Thetford, mixed fine white and yellow marle with this light foil, and planted Scots and spruce firs in it which soon corrected the loofeness of the soil; so that it was quickly covered not only with grass and herbs, but with vaft plantations of firs, oaks, and forest The benefit of plantations, whether of shrubs, copie, or trees, is not confined to the immediate advantage, or even the future value of the wood. By annually shedding a great number of leaves, which the winds differfe, and the rains wash into the foil, it is considerably improved;

and whenever fuch copfes have been stubbed up, the ground (however unfruitful before planting) has thereby been so enriched as to bear excellent crops for many years, without the additional help of manure. How much land-owners are interested in planting wafte or barren spots I need not mention; and nothing but a degree of indolence or ignorance unpardonable in this enlightened age could induce them to neglect it. Nature has furnished us with plants, trees, and shrubs, adapted to almost every soil and situation; and as the laws of vegetation are now much better understood than formerly, it is a reproach to those whose practice does not keep pace with their knowledge in making the best use of her bounty. Let no man repine and fay the land is barren; for those spots which appear to be so, owe that appearance to human negligence. Industry and art might foon render an 8th part of this kingdom nearly as valuable as all the reft, which now remains in a state unprofitable to the owners, and difgraceful to the community."

(2.) PLANTING, REVERSE, a method of planting in which the natural polition of the plant or shoot is inverted; the branches being set into the earth, and the root reared into the air. Dr Agricola and Dr Bradley mention this monftrous method of planting, and that it succeeded very well in most or all forts of fruit-trees, timber-trees, &c. Mr Fairchild of Hoxton has practifed the same, and gives the following directions for performing it: "Make choice of a young tree of one shoot, of alder, elm, willow, or any other tree that eafily takes root by laying; bend the shoot gently down into the earth, and so let it remain until it has taken root. Then dig about the first root, and raise it gently out of the ground, till the stem be nearly upright, and stake it up. Then prune the roots, now erected in the air, from the bruises and wounds they received in being dug up; and anoint the prined parts with a composition of 2 oz. of turpentine, 4 oz. of tallow, and 4 oz. of here wax, melted together, and applied pretty warm. Afterwards prune off all the buds or shoots that are upon the stem, and dress the wounds with the same composition, to prevent any collateral shootings, that might spoil the beauty of the stem."

PLANT-LICE, or Pucerons. See Aphis.

PLANTULE, n.f. A small plant; a very young

; lant, or a plant in embryo.

PLANUDES, Maximus, a Greek monk of Constantinople, towards the end of the 14th century, who published a collection of epigrams entitled Anthologia; a Greek translation of Ovid's Metamorpholes; a Life of Æsop, which is rather a romance than a history; and some other works. He suffered some persecution on account of his attachment to the Latin church.

PLAQUEMINES, a country of the United States, in Louisiana, about 40 miles from the Sea. It is low and swampy, mostly covered with reeds. It was overflowed in 1764, and much

damaged.

PLARDWICK, a fmall town of England, in

Staffordshire, E. of Forton.

PLASCHKEN, a town of Prussian Lithuania, g miles W. of Tust,

PLASENCIA, 2 towns of Spain. ScePtern TIA, No 4 and 5. Mr Cruttwell adopts the linglar spelling, as he does many others, quite dirent from other geographers.

\* PLASH. n. f. [plasche, Dutch; plate.]b. nish.] 1. A small lake of water or pudde.

He leaves

A shallow plass to plunge him in the deep bei
—Many plasses, that they had repaired to rea
dry. Bacon.—I understand the aquatic or rea
frog, whereof in ditches and standing plass we
behold millions. Brown.—

With filth the mifereant lies bewry'd, Fall'n in the plass his wickedness had his bear.

2. [from the verb To plass.] Branch party of off and bound to other branches,—In the play your quick, avoid laying of it too low and thick, which makes the sap run all into the had, and leaves the plasses without nourithment. In

To Plash. v. a. [pleffer, Fr.] To internal branches.—Plant and plash quickiets. Eutr.

PLASHING OF HEDGES, is an opening thought by fome persons to promote the good and continuance of old hedges; but whether the fact be so or not will admit of some dispute. Set HEDGES, § 3-12. It is thus performed: The old stubs must be cut off, &c. within two the inches of the ground; and the best and best the middle-fized shoots must be left to be Some of the ftrongest of these must also with answer the purpose of stakes. Their muk cut off to the height at which the hedge stand ed to be left; and they are to frand al to be distance one from another: when there are proper shoots for these at the due distants, and places must be supplied with common the dead wood. The hedge is to be first tiled! cutting away all but those shoots which made ded to be used either as stakes, or the other met of the plashing: the ditch is to be classed with the spade; and it must be now was first, with sloping sides each way; and waster is any cavity on the bank on which the hits grows, or the earth has been wasted any the roots of the shrubs, it is to be made good by facing it, as they express it, with the mount of from the upper part of the ditch: all the id the earth dug out of the ditch is to be bid on the top of the bank : and the owner flouid ied carefully into it that this be done; for the will men are apt to throw as much as they can up the face of the bank; which, being thus of loaded, is foon washed off into the dich as and a very great part of the work undore; vie as what is laid on the top of the bank them! mains there, and makes a good fence of as ferent hedge. In the plashing the quick, two tremes are to be avoided; these are, the land too low, and the laying it too thick. The makes the fap run all into the shoots, and the plaines without fufficient nouriflment; with the thickness of the hedge, finally that The other extreme of laying them too high. qually to be avoided; for this carries up and nourifliment into the plashes, and io put fhoots finall and weak at the bottom, and cal quently the hedge thin. This is a common cal in the north of England. The best hences 20) where in England are those in Hertfordshire; they are plathed in a middle way between the extremes, and the cattle are thus prevented h from cropping the young shoots, and from ng through; and a new and vigorous hedge oon formed. When the shoot is bent down t is intended to be plashed, it must be cut half y through with the bill: the cut must be given ring, formewhat downwards, and then it is to wound about the stakes, and after this its fufluous branches are to be cut off as they stand at the fides of the hedge. If for the first year two, the field where a new hedge is made can ploughed, it will thrive the better for it; but he stubs are very old, it is best to cut them te down, and to secure them with good dead lges on both fides, till the shoots are grown up n them strong enough to plash: and wherever d spaces are seen, new sets are to be planted ill them up. A new hedge raifed from fets in common way, generally requires plashing in ut 8 or 9 years after.

PLASHY. adj. [from plash.] Watery; filled h puddles.-

Near stood a mill in low and plasby ground.

Betterton.

PLASM. n. f. [ \*\aspa.] A mould; a ma-; in which any thing is cast or formed .- The Is served as plasms or moulds to this sand. odward.

PLASSAC, a town of France, in the dep. of Lower Charente; 8 miles S. of Mirabeau.

PLASSENDAL, a fortress of the French renic, in the department of the Ly3, and late v. of Austrian Flanders; seated on the canal ween Bruges and Oftend, 3 miles E. of Oftend. LASSEY, a town, plain, and grove near the of Muxadab in India, famous for a battle 3ht between the British under Lord Clive and native Hindoos under the Nabob Surajah wiah, it 1757. The British army consisted of 1 1200 men, of whom the Europeans did not and 900; while that of the Nabob confifted of so foot, and 18,000 horie. Notwithstanding great disproportion, however, Lord Clive efwilly routed the Nabob and his forces, with loss of 3 Europeans and 26 Seapoys killed, 5 Europeans and 40 Seapoys wounded. bob's loss was estimated at about 200 men, besoxen and elephants. See CLIVE, No 2. The n of Plassey lies 25 miles S. of Moorshedabad, 70 from Calcutta.

1.) PLASTER. n. f. [plastre, Fr. from πλαζω.] substance made of water and some absorbent ter, fuch as chalk or lime well pulverifed, with ich walls are overlaid or figures cast.-In the ic hour came forth fingers of a man's hand, and Me upon the plaster of the wall. Dan. v. 5 .-The floors of plaster, and the walls of dung.

Maps are hung up so high, to cover the naked ler. Watts on the Mind. 2. [Emplastrum, Lat. English, formerly emplaster.] A glutinous or clive salve.—Seeing the fore is whole, why re-1 we the plaster? Hooker .-

You rub the fore, When you should bring the plasser. Shak. It not only moves the needle in powder, but likewise, if incorporated with plasters, as we have made trial. Brown .- Plafters, that have any effect, must be by dispersing or repelling the humours. Temple's Mifc.

(2.) PLASTER, OF EMPLASTER, in pharmacy, an external application of a harder confiftence than an ointment; to be spread, according to the different circumftances of the wound, place, or patient, either upon linen or leather. See Phar-MACY, Index.

(3.) PLASTER, or PLAISTER, in building, a composition, of lime, sometimes with fand, &c. to parget, or cover the nudities of a building. See

PARGETING and STUCCO.

(4.) PLASTER OF PARIS, a preparation of several species of gypsum dug near Mount Maitre, a village near Paris; whence the name. See A-LABASTER, CHEMISTRY, Index, GYPSUM, MINERALOGY, &c. The best fort is hard, white, fhining, and marbly; known by the name of plaster stone, or parget of Mount Maitre. It neither gives fire with seel, nor ferments with aquafortis; but readily calcines into a fine plaster, the use of which in building and casting statues is well known. According to Bergman, it contains 32 parts calcareous earth, 46 of vitriolic acid, and 22 water.

(5.) PLASTER OF PARIS, EXPERIMENTS ON. Two or three spoonfuls of burnt alabaster, mixed up thin with water, in a short time coagulate, at the bottom of a veilel full of water, into a hard lump, notwithstanding the water that surrounded Artificers observe, that the coagulating property of burnt alabaster will be very much impaired or loft, if the powder be kept too long, efpecially in the open air, before it is used; and when it hath been once tempered with water, and suffered to grow hard, they cannot, by any burning or powdering of it again, make it serviceable for their purpose as before. This matter, when wrought into vessels, &c. is still of so loose and spongy a texture, that the air has easy passage through it. Mr Boyle gives an account, among his experiments with the air-pump, of his preparing a tube of this plaster, closed at one end and open at the other; and on applying the open end to the cement, as is usually done with the receivers, it was found utterly impossible to exhaust all the air out of it; for fresh air from without presfed in as fast as the other, or internal air, was exhausted, though the sides of the tube were of a considerable thickness. A tube of iron was then put on the engine; so that being filled with water, the tube of plaster of Paris was covered with it a and on using the pump, it was immediately seen, that the water passed through into it as easily as the air had done, when that was the ambient fluid. After this, trying it with Venice turpentine instead of water, it succeeded; and the tube could be perfectly exhaufted, and would remain in that state several hours. After this, on pouring fome hot oil upon the turpentine, the case was also tered; for the turpentine melting with this, that became a thinner fluid, and in this state capable of passing like water into the pores of the plaster. On taking away the tube, the turpentine, which had pervaded and filled its pores, rendered it transparent, in the manner that water gives transparency to that fingular stone called ocurus Lilla

MUNDI.

MUNDI. In this manner, the weight of air, under proper management, will be capable of making leveral forts of glues penetrate plafter of Paris; and not only this, but baked earth, wood, and all other bodies, porous enough to admit water.

(6.) PLASTER OF PARIS, METHOD OF TAKING A FACE IN. The method of representing a face truly in plaster of Paris is this: The person, whole figure is defigued, is laid on his back, with any convenient thing to keep off the hair. Into. each nostril is conveyed a conical piece of suff paper, open at both ends, to allow of respiration. These tubes being anointed with oil, are supported by the hand of an affiftant; then the face is lightly oiled over, and the eyes being kept shut, alabafter, fresh calcined, and tempered to a thinnish confisence with water, is by spoonfuls nimbly thrown all over the face, till it lies near the thickness of an inch. This matter grows sensibly hot, and in about a quarter of an hour hardens into a kind of flony concretion; which being gently taken off, represents, on its concave surface, the minutest part of the original face. In this a head of good clay may be moulded, and therein the eyes are to be opened, and other ne-This fecond face becellary amendments made. ing anointed with oil. a fecond mould of calcined alabaster is made, consisting of two parts joined lengthwife along the ridge of the nofe; and herein may be cast, with the same matter, a.

face extremely like the original. (7.) PLASTER OF PARIS, USE OF, AS A MA-NURE. Plaster of Paris is used as a manure in Pennsylvania, as we find by a letter from a gentleman in that country, inferted in the Bath Society Papers, vol. 5; of which the following is an extract: " The best kind is imported from hills in the vicinity of Paris; it is brought down the Seine, and exported from Havre de Grace. There are large beds of it in the Bay of Fundy, forme nearly as good as that from France. The lumps composed of flat shining specula are preferred to those formed of round particles like-sand: the method of finding out the quality is to pulverize fome, and put it dry into an iron pot over the fire, when that which is good will foon boil, and great quantities of the fixed air escape by ebullition. It is pulverized by first putting it in a flamping-mill. The finer its pulverization the better, as it will thereby be more generally diffused. It is best to sow it in a wet day. The proper quantity for grass is fix bushels per acre. No art is required in fowing it but making the diftribution as equal as possible. It operates altogether as a top manure, and therefore should not be out on in the fpring, until the principal frofts are over and vegetation hath begun. The general time for flowing with us is in April, May, June, July, August, and September. Its effects generaily appear in 10 or 15 days; after which the growth of the grass will be so great as to produce a large burden at the end of six weeks. It must be fown on dry land, not subject to be overflown. I have fown it on fand, loam, and clay, and it is difficult to fay on which it has best answered. It has been used as a manure in this state for upwards of 12 years. In all experiments with clover, mix about one 3d timothy graß feel; it rer much facilitates the curing of clover, 28d who cured is a superior solder. The plaster operate equally well on the other grasses. On Indian on its operation is great; we use it at the raiditable spoonful for a hill, put immediately alters from some accurate experiments use and reported to our Agricultural Society, its pears that 9 bushels of additional competer were produced by this method of using plaste.

\* To PLASTER. v. a. [plaster, French, tm the noun.] 1. To overlay as with piaker.— Boils and plagues

Plaster you o'er.

The harlot's cheek beautied with plasting

—A heart fettled upon a thought of rededacing is as a fair plaffering on the wall. Eather 17.—With cement of flour, whites of eggs and ftone powdered, pifeina mirabilis is faid to have walls plaffered. Bacon.—

Plaster the chinky hives with clay. Dries.—The brain receives not much more impress, than if you wrote with your singer on a plast is wall. Wattr. 2. To cover with a viscous idea medicated plaster.

\* PLASTERER. n. f. [ plassier, Fr. from teter. 1 . One whose trade is to overlay with will plaster.—

Thy father was a plasterer.

2. One who forms figures in plaster.—The patterer makes his figures by addition, and the crever by fubtraction. Wotton.

PLASTERING, part. n. f. See PARGEING. (1.) PLASTICK. adj. [what most] Having the power to give form.—

Benign Creator! let thy plaffick kand
Dispose its own effect.

There is not any thing strange in the price it on of the formed metals, nor other the strange in the strange

tion of the formed metals, nor other the concerned in shaping them into the gures, than merely the configuration of the icles. Woodward.

(2.) PLASTICK denotes a thing endowed with

(2.) PLASTICE denotes a thing endores as a formative power, or a faculty of forming of fathioning a mais of matter after the likesch of a living being.

(3.) PLASTICK ART, the art of representing all forts of figures by the means of moulds. The term is derived from the Greek, elens, the of forming, modelling, or cafting in a most A mould in general is a body that is made is low for that purpole. The artist makes of them to form figures in bronze, lead, gold, and or any other metal or fufible substance. mould is made of clay, stucco, or other cos tion, and is hollowed into the form of the that is to be produced; they then apply which is a fort of funnel, through which tal is poured that is to form the figures, and is called running the metal into the mould 18 thus, after much practice and attention, that artift forms, r. Equeftrian and pedefirian films of every kind; 2. Groups; 3. Pedeftale; 4. 15 reliefs; 5. Medallions; 6. Cannons, mortars other pieces of artillery; 7. Ornamints of arts tecture, as capitals, bases, &c.; 8. Various in

furniture, as lustres, branches, in every kind metal; and in the same manner figures are cast fluceo, plafter, or any other fufible matter. c Phaster, § 6. Wax being a substance that very easily put in fusion, plastics make much r of it. There are impressions which are highpleating in coloured wax, of medailions, baffo d alto relievos, and of detached figures; which, werer, are fomewhat brittle. But this matter, ne think, has been carried too far: they have tonly formed moulds to represent the likeness of the buff of a living person, by applying the ider to the face itself, and afterwards casting sted wax into the mould; but they have also inted that waxen buft with the natural colours the face, and have then applied glass eyes and tural hair; to which they have joined a stuffed dy and limbs, with bands of wax; and have, lly, dreffed their figure in a real habit. But if chole imitation of nature in painting and statu-, upon canvas, and in itone or metal, has been mired in all ages, we cannot fee why an equalclose imitation in wax should not be equally object of admiration. There is another invenin no less ingenious and pleasing, which is that kerein M. Lippart, antiquary and artist at Dresn has so much excelled. He has found the cans of refembling, by indefatigable labour, cat expence, and infinite tafte, that immense imber of ftones, engraved and in camaieu, hich are to be feen in the most celebrated cabicts. (Sec Pastes, § 11.) He has made choice I those that are the most beautiful; and, with a the of his own invention, he takes from these ones an impression that is surprisingly accurate, id which afterwards becomes as marble: thefe pressions he calls passi. He then gives them a oper colour, and incloses each with a gold rim; d, by ranging them in a judicious order, forms them an admirable system. They are fixed on affeboards, which form so many drawers, and then inclosed in cases, which represent folio olumes, and have titles written on their backs; that these dictitious books may conveniently ccupy a place in a library. Nothing can be ore ingenious than this invention; and, by cans of it, persons of moderate fortune are enoled to make a complete collection of all that itiquity has left that is excellent of this kind: id the copies are very little inferior to the orinals. There is also another method of taking e impressions of camaieus, medals, and coins, hich is as follows: They wash or properly clean e piece whose impression is to be taken, and fround it with a border of wax. They then diflve ifinglas in water, and make a decoction of , mixing with it some vermilion, to give it an treeable red colour. They pour this paste, when ot, on the stone or medal, to the thickness of aout the tenth part of an inch; then leave it exoled to the sun, in a place free from dust. After few days this paste becomes hard, and offers to ie eye the most admirable and faithful represenition of the medal that it is possible to conceive: bey are then carefully placed in drawers; and housands of these impressions which comprehend lany ages, may be included in a small compass. the proficients in plastics have likewise invented

the art of casting in a mould papier maché or disfolved paper, and forming it into figures, in imitation of fculpture, of ornaments and decorations for ceilings, furniture, &c. and which they afterwards paint or gild. There are, however, fome inconveniencies attending this art; as, for example, the imperfections in the moulds, which render the contours of the figures inelegant, and give them a heavy air: these ornaments, moreover, are not so durable as those of bronze or wood, seeing that in a few years they are preyed on by worms. The figures that are given to porcelain, Delft ware, &c. belong also to plastics; for they are formed by moulds, as well as by the art of the fcuiptor and turner; and by all these arts united are made vales of every kind, figures, groups, and other defigns, either for use or ornament. See CASTING, DELFT, § 3, FOUNDERY, GLAZING, Papier Mache', Porcelain, Pottery, &c.

(4.) PLASTIC NATURE, a certain power by which, as an instrument, many philosophers, both ancient and modern, have supposed the great motions in the corporeal world, and the various procelles of generation and corruption, to be perpetually carried on. Among the philosophers of Greece, such a power was almost universally admitted. It feems, indeed, to have been rejected only by the followers of Democritus and Epicurue, who talk as if they had thought gravity effential to matter, and the fortuitous motion of atoms, which they held to have been from eternity, the fource not only of all the regular motions in the universe, but also of the organization of all corporeal systems, and even of fensation and intellection, in brutes and in men. It is evident, that those men, whatever they might profess, were in reality atheifts; and Democritus avowed his atheifin. The greater part of the philosophers who held the existence of a plastic nature, considered it not as an agent in the strict fense of the word, but merely as an instrument in the hand of the Deity; though even among them there were fome who held no superior power, and were of course as gross atheifts, as Democritus himself. Such was STRA-To of Lampfacus, who was originally of the peripatetic school, over which he presided many years, with great reputation. He was the first and chief affertor of what has been termed Hylozoic atheism; a system which admits of no power superior to a certain natural or plastic life, effential, ingenerable, and incorruptible inherent in matter, but without fense and consciousness. That such was his doctrine we learn from Cicero. (De Nat. Deor. l. i. c. 13.) Cicero adds, however that, Strato, in admitting this praftic principle, differed widely from Democritus. That the rough and fmooth, and hooked and crooked, atoms of Democritus, were indeed dreams and fancies is a polition which no fensible person will controvert; but furely Strato was himfelf as great a dreamer when he made fenfation and intelligence refult from a certain piaftic or spermatic life in matter, which is itself devoid of sense and consciousness. It is, indeed, inconceivable, to use the emphasic language of Cudworth, " how any one in his tenfes should admit such a monstrous paradox as this, that every atom of dust has in itself as much wish dom as the greatest politician and most profound philosopher

philosopher, and yet is neither conscious nor intelligent!" Strato likewife, though he attributed a certain kind of life to matter, by no means allowed of one common life as ruling over the whole material universe. He supposed the several parts of matter to have fo many several plastic lives of their own, and seems to have attributed something to chance in the production and prefervation of the mundane fystem. In denying the existence of a God, perpetually directing his plastic principle, and in supposing as many of these principles as there are atoms of matter, Strato deviated far from the doctrine of Ariftotle. The great founder of the peripatetic school, as well as his apoftate disciple, taught that mundane things are not effected by fortuitous mechanism, but by such a nature as acts regularly and artificially for ends; yet he never confiders this nature as the highest principle, or supreme Numen, but as subordinate to a perfect mind or intellect; and he expreisly affirms, that " mind, together with nature, formed or fashioned this universe." He evidently confiders mind as the principal and intelligent agent, and nature as the subservient and executive instrument. Indeed, we are strongly inclined to adopt the opinion of the learned Motheim, who thinks that by nature Aristotle meant nothing more than that eightern; quiter, or animal heat, to which he attributes immortality, and of which he expressly fays that all things are full (De Gener. Anim. 1. iii. c. ii.) Be this as it may, he always joins God and nature together, and affirms that they do nothing in vain. The same doctrine was taught before him by Plato, who affirms that " nature, together with reason, and according to it, orders all things." Plato however, attributed intelligence to the principle by which he supposed the world to be animated, as Chalcidius, commenting on the Timæus, affirms: Apuleius, too, affures us of the fame thing in Dogmat. Platon. This doctrine of Plato has been adopted by many moderns of eminence both for genius and for learning. The celebrated Berkeley Bp. of Cloyne, after giving the view of Plato's anima mundi, which the reader will find in our article Morion § 6, recommends the study of his philosophy in the strongest terms. (See his Siris, No 3,38.) Cudworth and Lord Monboddo are likewife firenuous advocates for the Aristotelian doctrine of a plastic nature diffused through the material world; and a notion very fimilar has lately occurred to a writer who does not appear to have borrowed it either from the Lyceum or the Academy. This is Mr Young, of w tofe active fubstance, and its agency in moving bodies, some account has been given elsewhere. See Motion, § 7. As a mere unconscious agent, inmaterial, and, as he calls it, immental, it bears a striking resemblance to the plassic nature or vegetable life of Cudworth; but the author holds it to be not only the principle of motion, but also the bajis or fulfication of matter itself; in the production of which, by certain motions, it may be flad to be more strictly ploffic than the hylarchical principle, or vis renitrix, or any other philosopher with whose writings we have any acquaintance. Though this opinion be fingular, yet as one great part of the uturty of fuch works as ours confids in their terving as indexes to science, we shall lay

before our readers a short abstract of his take ings, and shall offer some remarks upon the p we proceed. The author, in a chapter ental Analysis of Matter in general, treats of program and fecondary qualities, and adheres too dis to the language of Locke, when he far, to " the nature of bodies fignifies the aggregate all those ideas with which they furnish us, and which they are made known." This sentence s inaccurately expressed. An aggregate of ide may be occasioned by the impulse of bodies a the organs of fenfe, but the effect of impulsersnot be that which impels. Having july ohimed, that we know nothing directly of bodiesia their qualities, he proceeds to investigate the ture of folidity. "Solidity (he fays) is the quain of body which principally requires our notice. I is that which fills extension, and which refusther folids, occupying the place which it on pies; thus making extension and figure real, al different from mere space and vacuity. If the lecondary qualities of bodies, or their powers uriously to affect our senses, depend on their prmary qualities, it is chiefly on this of folicers which is therefore the most important of the pomary qualities, and that in which the effect of body is by I me conceived to confift. This was of folidity has been judged to be incapabled of analysis; but it appears evident to me, the dea of folidity may be refolved into another the which is that of the power of retifting with extension of body. Hence it becomes unneces ry, and even inadmissible, to suppose that see ty in the body is at all a pattern or archety, our fenfation." That folidity in the body. we know nothing of folidity any where elle, and pattern of any fentation of ours, is indeed true. (See MFTAPHYSICS, Sed. I.I. 11-11 but to reconcile this with what our author in that " folidity is no more in podies than and and flavours are, and that it is equally water a fenjation and an idea," would be a takto cur ingenuity is by no means equal. He indeed, that folidity, as it is faid to be in book is utterly meomprehensible; that we can peretly comprehend it as a fendation in ourlessy that in bodies nothing more is required that power of active reliftance to make upon our letter those impressions from which we inter the many of primary and fecondary qualities. This pure of relitance, whether it ought to be called after or passive, we apprehend to be that which at a ther philosophers have meant by the word fraing and though Locke, who uses the words that " notion indifferiminately, often talks of the is fondity, we believe our author to be the trd human beings who has thought of treating for as a femation in the mind. Though it is to innovate in language, when writing on fawhich require much attention, we however fortow our author in his endeavours to aleas what this power of refistance is, which a monly k own by the name of foldity. All post he justly holds to be active; and having attended ted to prove that it is by an inward proved not by its inertia, that one body prevents and the from occupying the fame place with itelli ke naturally enough infers matter to be effectially as

P L A (639) P L A

ie. Sometry alone of the primary qualities ing politive, and peculiar to bodies, and our ther having refetved this into ACTION or POWi, it follows, by his analysis, that the ESSENCE Boor is reduced to power likewife. But, as properly observes, power is an idea of reflecin, not acquired by the fenfes, but fuggefted thought. Hence our knowledge of real exifice in body must be such as is suggested to us our thoughts exercifed about our fentations. We are capable of acting and producing chans in appearances; and this faculty, which we perience to exist in ourselves, we call power. c are conscious of the exertion of our own wer; and therefore, when we see ACTION or ange happen without any exertion of ours, refer this to other powers without us, and nefarily conclude the POWER to exist where the inge begins or the action is exerted. This wer, then, referred to bodies, must exist in m, or it can exist no where." Our author et analyzes ATOMS, or the primary particles of

itter, and ftrenuoufly oppofes their impenetrabili-He allows that there are atoms of matter not nfible by any known force; but as thefe, howir fmall, must still be conceived as having exthin, each of them must be composed of parts id together by the fame power which binds tother many atoms in the fime body; and as the al analysis may be carried on ad infinitum, the ly politive idea which is fuggetted by atoms, or aparts of atoms, is the idea of a retisting pow-That this power, which conflitutes the folity of boilies, may not be absolutely impenethe, he attempts to prove, by showing that reonce does in fact take place in cases where penetrability, and even foildity, are not supled by any man. "Let us endeavour (lays ) to bring together two like poles of a magnet, d we shall experience relistance to their approxation. Why, then, may not a piece of iron, nch between our fingers refifts their coming rether, relift by an efficacy perfectly fimilar, ough more strongly exerted? If magnetism me to act upon our bodies as upon iron, we spid feel it; or were magnets endowed with uation, they would feel that which relifts their arer approach. The relifting extention between two magnets is permeable to all the rays of it, and reflecting none is therefore unfeen. us we see that an action, in which no supposin of folidity or impenetrability is involved, y be conceived to assume all the qualities of tter, by only supposing a familiar effect extend-in its operation." This reasoning is ingenious, t it does not approach to near to demonstration the author supposes. It magnets operate by a id illuing from them (fee MAGNETISM, Sed. .) those who held the folidity or impenetrabiliof matter will maintain, that each atom of the gnetic fluid is folid and impenetrable. That do not see nor feel those atoms, will be consird as no argument that they do not exist; for do not fee, nor in a close room feel, the atoms the furrounding atmosphere; which yet Mr ung will acknowledge to have a real existence, I to be capable of operating upon our fentes of

hearing and smelling. Let us, however, suppose, that by this reasoning he has established the nonexistence of every thing in the primary atoms of matter but active powers of relistance, and let us fee how he conceives the actions of thele powers to conflitute what give just no notion of inert and folid body; for that we have fuch a notion cannot be defied. To ACT he allows to be an attribute, and justiy observes, that we cannot conceive an attribute to exist without a substance. " But (fays he) we have traced ail phenomena to action as to a generic idea, comprehending under it all forms of matter and motion as species of that genus. By this analysis, that complex idea we have usually denominated matter, and confidered as the fubstance or substratum to which motion appertained as an attribute, is found to change its character, and to be itfelf an attribute of a substance effentially active, of which one modification of motion produces matter, and another generates motion." The action of this fubstance Mr Young determines to be motion; (fee Motion § 7.) and he proceeds to inquire by what kind of motion it produces matter, or inert and refifting atoms. "Whatever portion of the ACTIVE SUBSTANCE is given to form an atom, the following things are necessary to be united in such portion of active substance: 1/1, It must in some respect continually move; for otherwise it would lose its nature, and cease to be active. 2d/2, It must also in some other respect be at rest, for otherwise it could not form an inactive atom. 3dly, It must preferve unity within itself." The author's proof of the first of these positions we have given elsewhere. The 2d he holds to be feif-evident; and the third he thinks established by the following reasoning: " Solidity is the result of those actions among the parts of any whole, whereby the unity of the whole is preferred within itself. Several uncohering things may be united by an external bond: this does not constitute these one solid; it may be one bundle; but if feveral things cohere, and have a unity preserved within themfelves, they become one folid. An atom is the least and most simple folid." After some additional arguments, he concludes, that "fince any portion of active substances does, by revolving about a centre, become an united, relifting, and quiescent whole, the smallest portions of the Ac-TIVE SUBSTANCE which have fuch motions will become atoms or make the finallest portions of matter." He next explains what at first he confeties may have appeared a paradox, "how the ACTIVE SUBSTANCE, retaining its own nature and effential properties, continuing immaterial, unfolid, and affive, puts on at the same time the form of matter, and becomes material, folid and inert. A sphere of revolving active substance, as it revolves continuany about a centre, and as parts of the fubstance, are confidered as successively paffing through every point in the orbit; confidered thus in its parts, and in its motions; it is ACTIVE SUBSTANCE, immaterial, and unfolid: but the whole sphere, confidered unitically, collectively, and as quiescent, is in this point of view a folid atom, material, and inert." Such is the astive substance of Mr Young, and such his theo-

ry of the formation of matter. That he has not copied from the ancients, every learned reader will acknowledge; if his theory be well founded, he has discovered a middle substance between prind and matter, more properly plassic, than Ariftotic or Plato, Cudworth or Berkeley, ever conceived. But his theory labours under insuperable objections. That there may be in the universe a fubitance effentially active, and at the fame time not intelligent, is a proposition which we by no means controvert. Various phenomena, both in vegetable and animal life, lead us to suspect that there is such a substance; but it does not follow that we are to adopt our author's doctrine respecting the formation of matter. He conceives his proof, indeed, not to fall thort of demonstration; and if any one refuse it, he thinks it will be necessary for him to show, either that the explanation offered is not sufficient, or that some other explanation will serve equally well." To show that the explanation offered is not sufficient, will not be a very arduous talk; but we will not attempt another expranation, because we believe, that, of the formation of matter, no other account can be given, than that which refolves it into the fut of the Creator. That it cannot be formed by the motion of an immaterial fubiliance in the manner which our author has deferioed, is a truth fo evident as not to admit of proof; for if motion be, as he defines it, a change of place, every thing that is moved must have the quality of extension. But all the parts of this active substance which are given to form an atom, move round a centre, and are expressly faid to occupy fuccessively different places in the orbit of rotation. Every one of these parts, therefore, is an extended being: and fince, according to our author, folidity is nothing but an affire power of refiflance, and the parts of this active substance, in their rotation round their centre, all upon and refill whatever interferes to oppose their activity, it follows that each of thefe parts is likewife a folid bring. But, in the opinion of Mr Young himself, and of all mankind, whatever is extended and folid is material. This theory, therefore, exhibits a procels in which atoms are formed of a substance, which, though it is faid to be affive, immaterial, and unfolid, appears, when narrowly inspected, to be nothing eife than a collection of those very atoms of which the author pretends to explain the formation.

PLASTOW, or PLAISTOW, a township of New Hampshire, in Rockingham county, separated from Haverhill in Massachusetts by the S. State Line. It contained 521 citizens in 1795, and lies

28 miles SW. of Portfmouth.

\* PLASTRON. n. f. [French.] A piece of leather fuffed, which fencers ute, when they teach their feholars, in order to receive the pushes made at them. Trevoux.—

Addison.

(1.) PLATA, or LA PLATA, a very large see of S. America, abfurdly stiled, as well as in country through which it runs, by many India writers Rio-de-la-Plata, assif these words Rio-(i. e. River of the) either could not be trained into English, or formed a part of the name of the river or country. This river was first discount by John Dias de Salis, or Solis, a Spanifa => gator, who, in 1515, failed up the Plata as bra an island, which lies in 34°. 40' Lat. S. but the imprudently venturing to go ashore with is in among fome of the native Indians, they were if murdered by the favages. From him the ma was at first named Soiis; but afterwards Solution Cabot, having procured a great deal of gold and filver plate from the adjacent inhabitants, andorfidering thefe metals as the produce of the are try, though in fact they came from Pen, and both the country and river Plata. Mr Carrel however, favs the banks of the Plata about and the precious metals. This river is formed with junction of three large rivers, in Lat. 27.468 the Paraguay, the Uruguay and the Param Be PARAGUAY, No 2.) It is afterwards gray creafed by the waters of many other lage many whereby it often overflows its banks for forest leagues, like the Nile, and fertilizes the time fields. Its waters are clear and freet, also bound with fuch variety and pleaty of the the people take them with their hands where nets. In some places also its waters peting It crosses the country of Paraguay, and 155 18 miles, mostly S. and SE. from its me were junction of the 3 rivers to its mouth; what is 210 miles broad, and falls into the fea will and force and rapidity, that the water continus in for feveral leagues from its mouth. It is the spersed with many islands and is navigable by the largest ships. It falls into the South Sea in La. 35° S.

(2.) PLATA, an extensive and fertile country S. America on the banks of the Plata, in 22 cellent climate, called also Paraguay. See Paraguay, N° 1. Lat. from 32° to 37° S.

(3.) PLATA, a province in the above territor on the SW. bank of the Plata. The climber The winter is in May, June, and Ja liealthy. when the nights are indeed very cold, but " days moderately warm; the frost is neither med nor lafting, and the fnows are very inconfident The country confifts mostly of plains of a state tent, and exceeding rich foil, producing of European and American fruits, wheat, cotton, fugar, honey, &c. and abounding fuch excellent pastures, that the beasts brush hither from Spain are multiplied to fuch a deput that they are all in common, no man chang any property in them, but every man takes with he hath occasion for. The number of blick of

is so prodigious, that many thousands of them killed merely for their hides, every time the ps go for Spain, and their carcases left to be roured by wild beafts and birds of prey, which also very numerous. Horses are no less nurous, and in common like the other cattle; I of those that are already broke, one may buy ne of the best, and of the true Spanish breed, a dollar per head. Wild fowls also are in great nty here; partridges are more numerous, and large and tame as our hens. Their wheat kes the finest and whitest of bread; and, in a rd, the natives want for nothing but falt and The former the Spaniards have brought to m from other parts; and the latter they supply mselves with, by planting vast numbers of alnd, peach, and other trees, which require no er trouble than putting the kernels into the und, and by the next year they begin to bear The return for European commodities is great here, that an ordinary two-penny knife s for a crown, and a gun of the value of 10 or shillings 20 or 30 crowns, and so of the rest. 4) PLATA, a province and archbithop's fee of America, in Buenos Ayres, about 600 miles g from N. to S. and 300 broad, lying on both s of the Plata. It is an extensive country and

(5) PLATA, a city of Buenos Ayres, and an Mishop's see, capital of the above province; it in 1539, by Capt. Peter Anzures, by order Gonzales Pizarro. It stands in a plain, enviet by eminences, which defend it from all ds. The climate is mild; only in winter there thunder storms and great rains. The greatest is scarcity of water. The number of inhasts, Spaniards and native Indians, is about too. The cathedral is large, well built and smly adorned. It has also an university and premaded by an alcayd. Lon. 49. o. E. The Grecian aronly 91 Spartans, \$2 Athenians, and 16 fearcely 3000 escaped. The Grecian aronly 91 Spartans and Aritides, wherein mer were defeated with great flaughter.

tained another important victory at Mycale. (See MYCALE, N° 1.) The Greeks, in memory of it, built a temple to Jupiter Eleutherius, and inftituted the games called ELEUTHERIA. Platæa was taken by the Thebans, after a famous fiege in the begin; ning of the Peloponnetian war; and afterwards deftroyed by the Spartans, A. A. C. 427. It was rebuilt by Alexander the Great; but is now in ruins. Herodot. Pauf. Plut. &c.

PLATÆANS, the people of PLATÆÆ. They were greatly attached to the Athenians, and fent them 1000 men, when Greece was invaded by

Darius's general, Datis.

PLATALEA, the SPOONBILL, in ornithology, a genus belonging to the order of grallæ. The beak is plain, and dilates towards the point into an orbicular form; the feet have three toes, and are half palmated. See Plate CCLXXIV. There are three species distinguished by their colour: and three varieties:

1. PLATALEA AJAJA, the roseate spoonbill, is but a little less than the white, No2. The bill is marked all round with a furrow parallel to the edge, and is of a greyish white colour, so transparent as to show the ramification of the blood-veffels belonging to it: the forehead is of a whitish colour between the bill, and eyes, and throat: the plumage is a fine rofe-colour, deepeft on the wings: the legs are grey; the claws blackish; and the toes have membranes as in the next species. The variety of this species is entirely of a beautiful red colour, having a collar of black at the lower part of the neck; the irides are red. Mr Latham imagines it is the roseate in full plumage. It is said to be of a blackish chesnut the sirst year; becomes rose-coloured the second, and of a deep scarlet the third. It lives on fmall fifh.

2. PLATALEA LEUCORODIA, the wbite spoonbill, is about the fize of a heron, but fomewhat fhorter in the neck and legs. The bill is more than half a foot long, and, like that of the rest of the genus, is shaped like a spoon: the colour of the bill is very various, being in fome birds black, in others brown, and fometimes spotted; from the base to two thirds of its length feveral indentations crofs it, the rifing parts of which are of a dark colour: the tongue is short and heart-shaped: the irides are grey: the skin of the lore round the eyes and of the throat is bare and black: the plumage is entirely white, though in some specimens the quills were tipped with black: the legs are generally either black or of a greyish brown colour; between the toes there is a membrane connected to the outer one as fat as the second, and to the inner as far as the first joint. "This bird (says Mr Latham) is found in prious parts of the old continent, and from the Ferro illes near Iceland to the Cape of Good Hope. It frequents the neighbourhood of the fea; and has been met with on the coasts of France; at Sevenbuys, near Leyden, once in great plenty, annually breeding in a wood there. The neft is placed on high trees near The female lays three or four white the fea-fide. eggs, powdered with a few pale red fpots, and of the fize of those of an hen. They are very noify during breeding time, like our rooks; are feldom found high up the rivers, chiefly frequenting the mouths of them. Their food is fish, which they Mmmm

often take from other birds, in the manner of the bald eagle; also mullels and other shell-fish being found in greatest numbers where these are plenty; and they will also devour frogs and snakes, and even grafs and weeds, which grow in the waiter, as well as the roots of reeds. They are migratory, retiring to the warmer parts as the winiter approaches, and are rarely feen in England. Their flesh is said to have the flavour of a goose, and is eaten by tome, and the young birds have been thought good food. By many authors they are called pelicans." The two varieties of this species are equal in fize to the rofeate species. The bill of the first is reddish; the plumage mostly white; the feathers of the wines partly white and partly black, and the legs reddish. The plumage of the other is entirely white, not excepting even the quills. It has a creft of feathers whose webs are very loofe, and separated from one another; the bill is of a rufous grey colour, having red edges, and the legs are of a dull pale red. They both inhabit the Philippine Islands.

3. PLATALEA PIGMEA, the dwarf spoonbill, is about the size of a sparrow. The bill is black, longer than the head, flat at the end, and nearly of a rhomboidal form; the angles and top of the upper mandible are white; the tongue is smooth; the body is brown above and white bepeath; the quills have white shafts; the tail is rounded, short, and of a brownish white colour; the seet have 4 toes, are cloven, and the claws are pointed. It

inhabits Surinam and Guiana.

PLATAMONE, a town of European Turkey, in Moldavia: at the mouth of the Jenicoro, 44 miles SSE. of Edesa.

(1.) \* PLATANE. n. f. [platane, Fr. platanus, Latin.] The plane tree.—

The platane round,

The carver holm, the mapple seldom inward found. Spenser.

Milton.

I espy'd thee, fair and tall, Under a platane.

(2.) PLATANE. See PLATANUS.

PLATANI, a river of Sicily, which rifes near Castro Nuovo, and runs into the sea 10 miles S. of Sacco.

PLATANIUS, a river of Bœotia. Pauf.

PLATANUS, the PLANE-TREE; a genus of the polyandria order, belonging to the monocia class of plants; and, in the natural method, ranking in the 50th order, Inventages. There are two foecies:

- 1. PLATANUS OCCIDENTALIS, occidental, or swellern plane tree, rifes with a straight smooth sit has lobated leaves, 7 or 8 inches long, and from 9 or 10 to 12 or 14 broad, divided into three large lobes; with very small slowers, collected into round heads, succeeded by round rough balls of seed. It is a native of Viiginia and other parts of North America; where it attains an enormous size, and is remarkable for having its stem all of an equal pirth for a considerable length; some trees being 8 or 9 yards in circumserence, which, when felled, afforded 20 loads of wood.
- 2. PLATANUS ORIENTALIS, oriental or eaffern plane tree, rifes with a very straight facooth branching stem to a great height. It has palmated leaves, 6 or 8 inches long and as broad, divided into five

large fegments, having the fide ones cut into to fmaller, green above, and pale underneath; zi long pendulous pedunculi, each fustaising week round heads of close-fitting very small hos; fucceeded by numerous downy feeds, with into round, rough, hard balls. It is a mine of Afia and many parts of the east, and grown great p'enty in the Levant. The varieties or her two species are the Spanish or middle placers. having remarkably large leaves of 3 or 5 miles fegments; and the maple-leaved plane tre, him fmaller leaves, formewhat lobated into ; femen refembling the maple tree leaf.-All thek equ trees are of a hardy temperature, is a to page here in any common foil and exposure in our oper plantations, &c. and are some of the most dias trees of the deciduous tribe. They were in ferlar efteem among the aucients of the caft, fatter extraordinary beauty, \* d the delightful they afforded by their noble foliage. These commonly expand in May, and fall of care autumn; and the flowers appear in fring, and before the leaves, being succeeded by freds als in fine feafons frequently ripen here in September These fine trees are singularly fitted for all on mental plantations. Their straight growth and lar branching heads, and the lofty flator by tain, together with the extraordinary their luxuriant leaves, render them cheen's firable furniture to adorn avenues, hora pet and woods; some disposed in ranges, some a beg standards, others in clumps, some in grove, & They are most excellent for shade; for motice better calculated to defend us from the ice fummer, by its noble foreading foliage, 2013) mit the fun's rays more freely in winter, on a count of the distance of its branches, white ways in proportion to the fize of the lears. The may also be employed in the collection of its trees, in woods, to grow up to timbe, case they will also prove advantageous in its In short, they claim the attention of cor 6 concerned in plantations of every kind. Tat pagation of these trees is by seed, byes exis tings. The feeds frequently ripen in the F and are also procured from other countries may be obtained of the nurserymen or kells The best season for sowing them is antumn, it can be then procured. Choose a semental? moift foil; and having dug the ground, and " it fine, form it into 4 feet wide beds, and c featter the feeds evenly on the furface and them in, or previously with the back of 7 turn the earth off the furface near half " deep into the alleys; then fow the feed, " rectly, with the rake turned the proper will the earth evenly over the feeds, and trin te face fmooth: many of the plants will rife & and probably may not till the fpring When they are one or two years old, party half that diffance in the lines; to remain : proper fize for final transplantation. The of propagation by layers is commonly probe the nurieries, in default of feed, and he they most readily grow; for which purposed front plants for stools must be planted, which year after must be headed down near the be

iat they may throw out many shoots near the ound, convenient for laying; which, in the au-mu after they are produced, lay by for flit-layg; and by autumn after, they will be well root-, and form plants 2 or 3 feet high, fo may be parated, and planted in nursery rows like the edings. All the forts will take tolerably by cutig off the strong young shoots; but the platanus identalis more freely than the oriental kind. ntumn is the best season; as foon as the leaf ls, choose strong young shoots, and plant them a moift foil; many of them will grow, and ike tolerable plants by next autumn. To conue the diffinction of the varieties more effectuy, they should be propagated either by layers cuttings: for, when raifed from feed, those of : respective species generally vary.

(1.) PLATBAND, n. f. in gardening, a border bed of flowers, along a wall, or the fide of a neme, frequently edged with box, &c.

(2.) PLATBAND of a door or window, is used the lintel, where that is made square, or not sch marked.

(1.) \* PLATE. n. f. [plate, Dutch; plaque, Fr.] A piece of metal beat out into breadth.—

Crowns and coronets, realms and illands were as plates dropt from his pocket. Shak. Make a plate, and burnish it as they do iron. Ban-The censers of rebeliious Corah, &c. were by xl's mandate made plates for the covering of the sy altar. Winte.—A leaden bullet shot from one these guns, the space of 20 paces, will be beaten to a thin plate. Wilkins.—The censers of these methes were appointed to be beaten into broad stee, and saftened upon the altar. South.—

Who write whatever time shall bring to pass With pens of adamant on plates of brass. Dryd. Armour of plates.—

With their force they pierc'd both plate and

[Plata, Spanish.] Wrought silver .-

And leaving plate,

Do drink in stone of higher rate. Ben Johnson. The Turks entered into the trenches so sar, that Tearried away the plate. Knolles's History.—

A table stood

Yet well wrought plate strove to conceal the wood. Cosuley.

They, that but now for honour and for plate slade the fea blush with blood, resign their hate.

At your defert bright pewter comes too late, When your first course was all serv'd up in plate.

King.

What nature wants has an intrinsick weight; Ill more, is but the fashion of the plate. Young. Piat, Fr. piatta, Italian.] A small shallow vesus metal on which meat is eaten.—

Meaning this observ'd, and, smiling, said, ec, we devour the plates on which we fed. Dryd.

1) PLATE is likewise used by sportsmen to exfethe reward given to the best horse at races; ich was formerly often a piece of elegant silver to, as a tea pot, tea kitchen, caudle cup or her bowl; but is now almost universally conted into a purse. The winning a plate or purse to the work of a few days to the owner of the

horse;, but great care and preparation is to be made for it, if there is any great dependence on the success. A month is the least time that can be allowed to draw the horse's body clear, and to refine his wind to that degree of perfection that is attainable by art. See RACE.

attainable by art. See RACE.
(3.) PLATE, in geography, a town of Upper Saxony, in Pomerania, on the Rega; 17 miles LSE. of Cammin, and 22 S. of Colberg. Lon. 33.

o. E. Ferro. Lat. 53. 49. N.

(4.) Plate, a town of Hispaniola, or St Domingo, on the S. fide of the N. Peninsula. Lon. 75.

40. W. of Paris. Lat. 10. 16. N.

(5.) Plate, Monte De, a mountainous district near the centre of Hilpaniola, towards the E,

(6.) Plate, Port De, a fea-port on the N. coast of Hispaniola, near a mountain; 66 miles W. of Old Cape François. The environs abound with gold, filver and copper, whence the name, Before the late horrors committed by the French and Negroes, it had 2500 inhabitants and a handfome church.

\* To PLATE. v. a. [from the noun.] I. To cover with plates.—The doors are curioufly cut through and plated. Sandys.—M. Lepidus's house had a marble door-case; afterwards they had gilded ones, or rather plated with gold. Arbuthnot.
2. To arm with plates.—

Plate fin with gold,

And the strong lance of justice hurtless breaks.

Shak.

Marshal, ask yonder knight in arms, Why plated in habiliments of war?

Old warriours turn'd

Their plated backs under his heel.
3. To beat into laminæ or plates.—

The mifer will his empty palace lend, Set wide his doors, adorn'd with plated brafs.

—If a thinned or plated body, of an uneven thickness, which appears all over of one uniform colour, should be slit into threads of the same thickness with the plate; I see no reason why every

thread should not keep its colour. Newton.

\* PLATEN. n. f. Among printers, the slat part of the press whereby the impression is made.

(1.) \* PLATFORM. n. f. [plat, flat, Fr. and form.] 1. The sketch of any thing horizontally delineated; the ichnography.—When the workmen began to lay the platform at Chalcedon, eagles conveyed their lines to the other side of the streight. Sandy's Journey. 2. A place laid out after any model.—

Grove nods at grove, each alley has a brother, And half the *platform* just restects the other.

Pope.

3. A level place before a fortification.— Where was this?

-Upon the platform where we watch. Sbak.

4. A scheme; a plan.—Their minds and affections were universally bent even against all the orders and laws wherein this church is sounded, conformable to the platform of Geneva. Hooker.—I have made a platform of a princely garden by precept. Bacon's Essays.—They who take in the entire platform, and see the chain, which runs through the whole, will discern how these propositions flow from them. Woodsward.

M m m m 2 .(2.) PLAT-

(2.) PLATFORM, in architecture, is a row of beams which support the timber work of a roof, and lie on the top of a wall where the entablature ought to be raifed. This term is also used for a kind of terrace, or broad fmooth open walk, at the top of a building, from whence a fair prospect may be taken of the adjacent country. Hence an edifice is faid to be covered with a platform, when it is flat at top, and has no ridge. Most of the oriental buildings are thus covered, as were all those of the ancients. It is aftonishing, that the useless and inconvenient mode of the ridged roofs, which are fo often attended with fatal accidents, should ever have become fo general as they now are in

(3.) PLATFORM, in the military art, is an elevation of earth, on which cannon are placed to fire on the enemy; fuch are the mounts in the middle of curtins. On the ramparts there is always a platform, where the cannon are mounted. It is made by the heaping up of earth on the rampart, or by an arrangement of madriers, rifing intentibly, for the cannon to roll on, either in a cafe-mate or on attack in the outworks. All practitioners are agreed, that no shot can be depended on, unless the piece can be placed on a folid platform; for if the platform thakes with the first impulse of the powder, the piece must likewife shake, which will alter its direction, and render the flot uncertain.

(4.) PLATFORM, of ORLOP, in a man of war, is a place on the lower deck, abaft the main mast, between it and the cockpit, and round about the main capitan, where provision is made for the

wounded men in time of action.

\* PLATICK ASPECT. In aftrology, is a ray caft from one planet to another, not exactly, but with-

in the orbit of its own light. Bailey.

(1.) PLATINA, Bartholomew Sacchi, or Phiirp, as others call him, a learned Italian historian, born in 1421, at Piedena, a village between Cremona and Mantua. He first embraced a military life, but afterwards devoted himfelf to literature. He went to Rome under Calixtus III, about 1456; was introduced to Cardinal Beffarion, obtained : me benefices from Pius II, and was appointed apostolical abbreviator. Paul II. succeeding, abolished the offices of all the abbreviators. Platina complained to the Pope, and requested to be judged by the auditors of the Rota. Paul gave him a haughty repulse: Piatina wrote to him, which Paul confidered as an act of rebellion, and put him in prison, where he suffered great hardships for 4 months, when he was liberated, but forbid to leave Rome. After this he was again imprisoned with many others, on fuspicion of a plot, and put to the rack. The plot being found imaginary, he was next accused of herefy: All this perfecution he is faid to have fuffered for affuming the name it Callimachus. (See NAME, & II, 2.) Sixtus IV. facceeding Paul, in 1467, appointed Platina keeper of the Vatican library; in which station he lived very happily till 1481, when he died of the plague. He was author of feveral works, of which the most famous is his Hoftory of the Popes.

(2.) PLATINA, OF PLATINUM. See PLATI-

(1.) PLATING, part. n. f. is the art of covering bafer metals with a thin plate of filver either

for use or for ornament. It is said to have been invented by a spur-maker, not for show but he real utility. Till then the more elegant from common use were made of folid filver, and the flexibility of that metal they were liable ! bent into inconvenient forms by the flighted dent. To remedy this defect, a workman also mingham contrived to make the branchods pair of fpurs hollow, and to fill that hollow a flender rod of fleel or iron. Finding that great improvement, and being defirous to at cheapness to utility he continued to make be hollow larger, and of course the iron thicker at thicker, till at last he discovered the mean of coating an iron four with filver, in fuch a mass as to make it equally elegant with those and were made wholly of that metal. The inverse was quickly applied to other purpofes; 22/2 numberless utenfils which were formerly mand brafs or iron are now given the strength of the metals, and the elegance of fiver, for a final at ditional expence. The filver plate is general made to adhere to the bafer metal by mean d folder; which is of two kinds, the foft and the hard, or the tin and filter folders. The format these consists of tin alone, the latter general d three parts of filver and one of brass. Who a buckle, for instance, is to be plated by men of the fost solder, the ring, before it is best 1 12 tinned, and then the filver plate is gently ed upon it, the hammer employed being also covered with a piece of cloth. 'The fire rer forms, as it were, a mould to the ring, and whaters of it is not intended to be used is cut of. The mould is fastened to the ring of the buckle by or three cramps of finail iron' wire; after the buckle, with the plated fice undermon, a sid upon a plate of iron sufficiently hot to sal # tin, but not the filver. The buckle is the coned with powdered refin or anointed with ting; and lest there should be a deficience a small portion of rolled tin is likewise and The buckle is now taken off with top, al commonly laid on a bed of fand, where the part and the ring, while the folder is yet in a tited fusion, are more closely compressed by a feed stroke with a block of wood. The buckle's terwards bent and finished. Sometimes the med ed tin is poured into the filver mould, which has been previously rubbed over with some flat. I'm buckle ring is then put among the metel and the plating finished. This is called by the workmen filling up. When the hard folder he ployed, the process is in many respects discus-Before the plate is fitted to the iron or other? tal, it is rubbed over with a folution of bons Stripes of filver are placed along the junish the plate; and instead of two or three crasps in the former case, the whole is wrapped with fmall wire; the folder and joinings an rubbed with the borax, and the whole put #1 charcoal fire till the folder be in fufion, Wa taken out the wire is instantly removed, the page is cleaned by the application of some acid, and terwards made smooth by the strokes of 1

(2.) PLATING, FRENCH, is when filverkels burmilled on a piece of metal in a certain des

heat. When filver is diffolved in aquafortis, I precipitated upon another metal, the process ailed SILVERING.

3.) PLATING, METAL, is when a bar of filver I copper are taken of at leaft one equal fide. e equal fides are made smooth, and the two s fastened together by wire wrapped round m. These bars are then sweated in a charcoal; and after sweating, they adhere as closely other as if they were foldered. After this y are flattened into a plate between two rollers, on the copper appears on one side and the silon the other. This sort of plate is named ted metal.

1.) PLATINUM, or PLATINA, the most preus of all the metals excepting GOLD, and by ne even reckoned superior to it. Dr Thomson, his Syft. of Chem. vol. 1. p. 91.) fays, "Gold been always in high estimation, on account of fearcity, beauty, ductility and indestructibility; t Platinum, though perhaps inferior in a few of se qualities, is certainly far superior in others." CHEMISTRY, Index; METALLURGY, Part II. 7. II. and MINERALOGY, Part II. Chap. VII. d. II. Part. III. Chap. IV. § II. and Chap. V. §. "It was unknown, (adds the learned Doctor) a distinct metal before 1752. It has hitherto en found only in America, in Choco in Peru, d in the mine of Santa near Carthagena. It was known in Europe till Mr Wood brought some it from Jamaica, in 1741. In 1748 it was noad by Don Antonio De Ulloa, a Spanish macmatician;—several papers on it were published 'Dr Watson in the 46th vol. of the Philos. Trans. bele immediately attracted the attention of the of eminent chemists. In 1752, Mr Scheffer of reden published the first accurate examination its properties. He proved it to be a new me-, approaching very much to the nature of gold, d therefore gave it the name of aurum album, tite gold. Dr Lewis published a still more comthe let of experiments on it, in 1754. Soon afdiffertations were published on it by Margraf, bequer and Beaume; Buffon, Tillet, and Mor-20; Sickingen; Bergman; and more lately by luffin, Pulchkin, and Morveau," &c. " Platinum, hen pure, is of a white colour like filver, but not To this colour (the Dr adds in a note) owes its name. Plata in Spanish is filver, and uina, little filver, was the name first given to e metal. Bergman changed it into Platinum, at the Latin names of all the metals might have e fame termination and gender. It had been, wever, called platinum by Linnaus long before. It has no taste nor smell. Its hardness is 8. Its specigravity, after being hammered, is 23'000; fothat 16 by far the heaviest body known. It is exceedgly ductile and malleable; it may be hammered it into very thin plates, and drawn into wires. it exceeding one 1940th of an inch in diameter. these properties it is probably inferior to gold; it it seems to surpass all the other metals. Its nacity is such, that a wire of Platinum +10 inch diameter is capable of supporting a weight of 37 lb. without breaking. It is the most infusible fall the metals, and cannot be melted, in any uantity at leaft, by the strongest artificial heat, thich can be produced. Macquer and Beaume

melted small particles of it by a blow-pipe, and Lavoisier by exposing them on red hot charcoal to a stream of oxygen gas. It may, indeed, be melted without difficulty when combined or mixed with other bodies, but then it is not in a state of purity. Pieces of platinum, when heated to whiteness, may be welded together by hammering in the same manner as hot iron. This metal is not in the smallest degree altered by the action of air or water."

(2.) PLATINUM, ALLOY OF. "When gold and platinum are exposed to a strong heat, they combine, and form an alloy of gold and platinum. If the platinum exceed one 17th of the gold, the combine of the alloy is much paler than gold; but if it be under one 17th, the colour of the gold is not fensibly altered. Neither is there any alteration

in the ductility of the gold."

(3.) PLATINUM, OXIDE OF. " Platinum (faya Dr Thomson,) cannot be combined with oxygen, and converted into an oxide by the strongest artificial heat to which it has been possible to expose it. Platinum, indeed, in the state in which it is brought from America, may be partially oxydated by exposure to a violent heat, as numerous experiments have proved; but in that state it is not pure, but combined with a quantity of iron. It cannot be doubted, however, that, if we could fubject it to a sufficient heat, platinum would burn and be oxidated like other metals: For when Van Marum exposed a wire of platinum to the action of his powerful electrical machine, it burnt with a faint white flame, and was diffipated into a species of dust, which proved to be the oxide of platinum. This metal may be oxidated in any platinum. quentity, by boiling it in 16 times its weight of nitro-muriatic acid. The acid diffolves it, and affumes first a yellow, and afterwards a deep red, or rather brown colour. On the addition of lime to the folution, a yellow powder falls to the bot-This powder is the oxide of platinum. Its properties have not been examined with fufficient accuracy. It feems to contain but a small proportion of oxygen; probably not more than c.o.7. This oxide may be decomposed, and the oxygen driven off, by exposing it to a violent heat.

(4.) PLATINUM, PHOSPHURET OF. See Phos-

FHURET, Nº 13.

(5.) PLATINUM, QUANTITIES OF, FOUND NA-In the Physical Journal for Nov. 1785, we are told, that a native piece of platina was found nearly of a square figure, and almost as large as a pigeon's egg, which was deposited in the Royal Society of Biscay. M. de Busson says, that " a person of credit had affured him that platina is fornetimes found in large maties; and that he had feen a lump of it weighing no less than 20lb, which had not been melted, but taken in that state out of the mine." As to the small particles, they are of a whiter colour than iron, with a smooth surface. Their figure is generally of an oblong form, very flat, rounded in the edge, and has been afcribed to the hammering of the mills in which the gold is amalgamated. The heterogeneous substances with which the platina is generally mixed are particles of gold, grains of quartz or crystal, some saud of a brownith bue, and fome dust of a dark colour obedient to the magnet, and which seems to be

flagments of other irregular dark-coloured particles, which refemble pieces of emery or loadthone. Dr Ingenhouiz, however, fays, that every particle even of some fine platina which he examined obeyed the magnet more or lefs, excepting fome that were transparent and stony; and that these were all magnets in themselves, or that each of these particles had two poles, which he could change at pleasure by magnetic bars. In about 72 lb. weight of platina which was brought from Spanish America, M. Magellan found not only a large quantity of ferruginous fand, but many pieces of vegetable stalks, a number of feeds, and tome very small red crystals like rubies. These crystals being sent to M. Achard of Berlin, he tried them as far as their minuteness and small quantity would permit, and at last concluded that they

really were rubies! (6.) PLATINUM, VARIOUS DISCOVERIES, MA-NUFACTURES AND USES OF. Dr Lewis found that copper was much improved by allaying it with plaina in certain proportions; and that equal parts of platina and heafs formed a compound not subject to tarnish, and which might be empleyed with great advantage for the speculums of telefcopes. Befides allaying it with the different metals, it was an object equally interesting to the chemists and society, that platina should be obtained pure and unmixed; and that means thould be contrived to render it fulible, malleable, and ductile. After a vaft variety of experiments by the most eminent chemists in Europe, it was found that the most effectual and advantageous method of separating plating from gold was founded on a property which gold has, and not platina, of being capable of precipitation from aqua regia by martial vitriol; and upon a property which platina has, and not gold, of being capable of precipitation from aqua regia by fal am-When therefore we would discover if gold be allayed with platina, let it be diffolved in aqua regia; and to this folution, which will contain both metals, let some sal ammoniae dissolved in water be added; upon which the platina will be precipitated in form of a brick-coloured fediment. If, on the other hand, we would know if platina contain any gold, let this platina be diffolved in aqua regia, and to the folution add a folution of martial vitriol in water; upon which the liquor will become turbid, and the gold will form a precipitate which may be eafily separated by decanting and filtrating the liquor. This property which platina poffetles of being precipitated by martial vitriol was first discovered by M. Scheffer. With respect to the iron contained among the platina, M de Buffon Eparated, by means of a magnet, fix parts out of feven of a percel of platina. He diffinguished two different matters in platina; which one was black, friable, and attractable he majnets; and the other confided of larger grains, was of a livid white or vellowish colour, isuch less attractable, and was extensible. tween thefe two different matters were many intermediate particles, some partaking more of the tormer, and some of the latter. But the most impotent discovery concerning the separation of platina from other metals was a method of melting 11, by which it became a perfect metal, mal-

leable, and denfer than gold. It was in 1733 Ed 1774 that M. de Lille effected this, by dinac; crude platina in aqua regia, precipitating ithin the acid menstruum by fal ammoniac, and ighfing this precipitate, without addition, in aude crucible, exposed to the intense heat of a sefire excited by double bellows. M. Moriestipeated the experiment, and found that hear melt the precipitate with feveral fluxes; be has likewife that by means of white glass, bons, at charcoal, he could melt even crude planta, zi could allay together platina and fleel in vanus proportions. M. de Sickengen was the interest of another method: he diffolved his plating is qua regia, and precipitated the iron by the pracat of potafs. In evaporating this liquor icotained small octahedral crystals of the colourd + bies; which, being exposed to a firong hear, pared a metal which bore easily the stroke of = hammer, which could be readily drawn into xt., and was extremely malleable. In attempting to refine platina by the dry way, cupellation was method to which the chemists early had recomin but, notwithstanding their utmost endeasours has not been attended with all the faced with could have been wished. Mest. Macque and Beaumé kept the matter exposed to a violet E. about 50 hours fucceffively: and althorn the platina was tarnished and rough on its infact a was internally white and thining, and call the rable from the cupel, and a little diminibal 5 weight; a certain proof that no lead remaid This platina was also ductile, and capable : extention under the hammer. Cupellation, thenfore, though not the best, is at least a certain me thod of applying platina to use, and of forming a into utenfils. What has been thought a priorble method, is first to fuse the platina with alou and afterwards diffipate this last metal by a tag. heat: by these means Achard and Rochaster able to obtain a pure platina; of which the war made fome small crucibles, and the late has laying it with copper and tin, some large sents for reflecting telescopes. Jeanety of Paris larger ftill farther: befides fnuff-boxes, watch-chart, and a coffee-pot of platina prepared by this artif, the world has feen a lens weighing 6 lb. a ball withing 9, and two bars 19 feet long, and weighing to less than 11 lb. each. This gentleman has the 20 rit of being the first who wrought this metal in the great way. The method he employed was L from being new; it had been suggested by School. by Willis, by Margraf, and was afterwards 712. tifed by Achard, Morveau, and many others, he who always prepared it in very fmail quantitate In the Chemical Annals for July 1792, the fixed ing account of it is given by himself. The is first pound d in water to disengage it for # ferruginous and other heterogeneous particing are mixed with it. "This being done, is (fays he) 11 lb. of platina, 2 lb. of white arks. powder, and 1lb. of purified potath. I math whole: I put a crucible in the fire capable of sile faining about 20 lb. when my furnace and must ble are well heated, I throw into the crucibe or ad of the mixture, and apply a good heat; Ithe add a 2d quantity and a 3d, and fo on, alness taking care at every time to mix the where and

ad of platina. I give now a confiderable force to ie fire; and when I am certain that the whole is empletely in a state of fusion, I withdraw my ucible and leave it to cool. After breaking it, I nd a button that is well formed and attractable y the magnet. I bruife this button into fmall eces, and fuse it a 2d time in the same manner: if is 2d fusion, which it generally is, be not suffient to effect the separation of the iron from the atina, I fuse it a 3d time; but if I be obliged to it a 3d time, I always put two buttons togeer, to fave at once a crucible and charcoal. This nt operation being finithed, I take a crucible ith a flat bottom, and of a circumference to give the button about 31 inches in diameter. I make is crucible red hot, and throw into it 13 lb. cf e platina which has been already fused with the fenic after it was broken into fmall pieces; to is I add a quantity of arfenic of the same weight, ed about half a pound of refined potash. I give the fire a confiderable force; and when I am rtain that the whole is completely in a state of thon, I withdraw my crucible and leave it to sol, taking care always to place it horizontally, 12t the button may be of an equal thickness. Afir breaking the c ucible. I find a button clear and morous, and weighing commonly about 11b. 102. I have remarked, that in proportion to he quantity of arienic combined with the platina, he purification always fucceeds with the more or th promptness and ease; and the greater the prowition fo much the better. In this state I put ny button into a furnace under a muille, not "gher than the edge of the button lying on its flat ide, and inclining a little to the walls of the muffle. n this manner I place three buttons on each fide if the muffle, and apply fire to my furnace, that he muffle may be equally heated throughout: as you as the buttons begin to evaporate I flut the loors of my furnace, that the heat may be kept ip to the same degree; this ought always to be arefully attended to even to the end of the opechon, for even a temporary excels of heat might foil the whole of my put operations and render them abortive. I cause my battons to volatilize during fix hours, always taking care to change their fituation, that every part may receive an emal portion of heat: I then put them in common ill, and for a like time keep them in a fire fullizient to diflipate the oil in moke, I continue this speration as long as the button emits vapours; and when the evaporation has ceased I push the hre as far as it will go by means of the oil. Thefe affected vapours have a bright thining metallie appearance, which I never can obtain any other way, and without which I have never been able to render platina perfectly malleable. fleps which are here pointed out be properly followed, the operation latts only 8 days. My buttons are then thrown into the nitrous acid, and afterwards boiled in diffilled water, till no part of the acid remains with them: I now heap them together one above another, apply the strongest possible heat, and beat them with a hammer, taking always care at the first heat to make them red hot in the crucible, that no foreign bodies may mix with them, as before this compression they are only to many spongy mailes. I afterwards

heat them in a naked state (les chauffe à nud); and bringing them to a square form, I hammer them on all fides for a fliorter or longer time according to their bulk." Such is the process obferved by Jeanety in futing platina; but he thinks that the working of this metal is susceptible of still greater improvement. In 1788 it was accordingly proposed by some of the French chemists to sufe plating by mixing it with charcoal and phosphoric glafe, and afterwards to expose the phosphure of platina to a heat sufficient to volatilize and dislipate the photphorus. This method fucceeded very well with M. Pelletier; but, befides being tedious, it is difficult to separate the last portions of the phofphorus; and as these operations are always coally, few artists are willing to undertake them. M. de Morveau has also sused platinum with his vitreous flux, made of pounded glass, borax, and charcoal: and Beaume has advifed to fufe it with a flight addition of lead, bifinuth, antimony, or arfemic, and by keeping the alloy in the fire a long time to diffipate the metals which have facilitated the fution. Platinum may likewife be fufed with a metal foluble in an acid: the mixture being pulverized, the alloyed metal may be diffolved, and the powder of platinum may then be futed with the flux of De Morveau; or, inflead of using a foluble metal, M. Chaptal fays, a calcinable metal may be employed, and heated as before. The colour of platinum, when properly refined, is fomething between that of iron and filver. It is the most durable of all the metals: it is harder than iron; it undergoes no alteration in the air. and fire alone does not even appear to possess the power of changing it; for which reason it forms the best of all crucibles that have yet been invented. It relifts the action of acids, alkalis, and fulphurs: it may be rolled into plates as fine as leaves of gold which are used in gilding; it is likewise extremely ductile; and Dr Withcring tells us, that a wire of platinum is ftronger than a wire of gold or of filver of the same thickness; it is preferable to gold by the property which it has of foldering or wedding without mixture; and it unites, fays Chaptai, two qualities never before found in one and the fame fuoltance. When formed into a mirror, it reflects but one image, at the faine time that it is as unchangeable as a mirror of glafs. It is faid, that a mine of platinum has been lately difcovered in S. America.

PLATO, an illustrious philosopher of antiquity, was by defcent an Athenian, though the place of his birth was the island of Æ ina. His descent by his father was from Codeus the last king of Athens, and by his mother from Sonos the celebrated legislator. The time of his birth is placed in the beginning of the 88th Olympiad; but Dr. Enfield thinks it may be more accurately fixed in the 3d year of the 87th Olympiad, or 430 years before the Chrittian era. He gave early indication a of an extensive and original genius, and had an education furtable to his high rank, being inftructed in the rudiments of letters by the grammarian Dionyfius, and trained in athletic exercises by Ariftoof Argos. He applied with great diligence to the artso: painting and poetry; and wrote an epic poen. which, upon comparing it with those of Homer, he burnt. He next wrote a dramatic piece, which

was to have been acted, but happening to attend

upon a discourse of Socrates, he was so captivated by his eloquence, that he reclaimed his tragedy, renounced the Mufes, burnt all his poems, and applied himself wholly to the study of wisdom. It is faid, that Plato's first masters in philosophy were Cratylus and Hermogenes, who taught the fystems of Heraclitus and Parmenides; but when he was 20 years old, he attached himself wholly to Socrates, with whom he remained 8 years as a fcholar. During this period, he frequently difpleafed his companions, and fometimes even his mafter, by grafting upon the Socratic fystem opinions which were taken from some other stock. Plato, however, retained the warmest attachment to his master. When that great and good man was fummoned before the fenate, his illustrious fcholar undertook to plead his cause, and begun a fpeech in his defence; but the partial judges would not permit him to proceed. After the condemnation, he presented his master with money fufficient to redeem his life; which, however, Socrates refused to accept. During his imprisonment, Plato attended him, and was present at a conversation which he held with his friends concerning the immortality of the foul; the fubstance of which he afterwards committed to writing in the beautiful dialogue entitled Phado. The philofophers at Athens were fo alarmed at the death of Socrates, that most of them fled from the city. Plato, whose grief upon this occasion is faid by Plutarch to have been excellive, retired to Megara; where he was kindly entertained by Euclid, who had been one of Socrates's first scholars, till the ftorm was over. Afterwards he travelled in purfuit of knowledge; and from Megara he went to Italy, where he conferred with Eurytus, Phi-Iolaus, and Archytas, the most celebrated of the followers of Pythagoras, whose doctrine was then become famous in Greece; and from thefe the Pythagoreans have affirmed that he had all his natural philosophy. He next went to Cyrene, where he learned geometry of Theodorus the mathematician. Thence he paffed into Egypt, to acquire their theology, to fludy more nicely the proportions of geometry, and to instruct himself in aftronomical observations; and having taken a full furvey of all the country, he fettled for some time in the province of Sais, learning of the wife men there, what they held concerning the universe, whether it had a beginning, whether it moved wholly or in part, &c.; and Paufanias affirms, that he learned from these the immortality and transmigration of souls. He next travelled into Pertia to confult the magi about the religion of that country. He then returned into Italy, to the Pythagorean ichool at Tarentum, where he endeavoured to improve his own fystem, by incorporating with it the doctrine of Pythagoras, as it was then taught by Archytas, Timæus, and others. And afterwards, when he vifited Sicily, he retained fuch an attachment to the Italic school, that, through the bounty of Dionyijus, he purchased at a vast price several books which contained the doctrine of Pythagoras, from Philolaus, one of his followers. Returning home richly stored with knowledge of various kinds, Plato fettled in Athens, and formed a new ichool for the instruction of youth in philosophy, in the as demy. (See Academus and Academy, [ 1.] The

new school soon became famous, and its mice was ranked among the most eminent philospha People of the first distinction in every deprese frequented the academy. Even female, did ed in mens clothes, often attended his ledies. Among the illustrious names which appears catalogue of his followers are Dion the Synchia prince, and the orators Hyperides, Lycurgus, la mosthenes, and Isocrates. The distinguished to putation of Plato brought upon him the car of his former companions in the school of Samtes, and they loaded him with detraction and loguy. From this spirit, Xenophon and be, the they relate the discourses of their communication ter, avoid mentioning one another. Diogesus Cynic ridiculed Plato's doctrine of ideas. https://doi.org/10.1001/10. midst of these private censures, however, theplic fame of Plato daily increased; and food states, among which were the Arcadians and Tubans, fent ambaffadors with earnest requestive he would come over, not only to infrud !! young men in philosophy, but also to present them laws of government. The Cyreniaus, Synculians, Cretans, and Eleans, fent also to him !! did not go to any of them, but gave live me rules of governing to all. He lived hope per foberly and chaftly. He was a man of gram tues, and exceedingly affable; of which we will greater proof, than his civil manner of come with the philosophers of his own time, when pride and envy were at their height. Diores piqued at the politeness and fine tafte of Plan took every opportunity of fnariing at him. In dired one day at his table with other companand, trampling upon the tapeftry with his land feet, faid, "I trample upon the pride Pato;" which Plato wifely reparteed, "Wilh put pride." The fame of Plato drew disciplent from all parts; among whom were Specifical Athenian, his fifter's fon, whom he apparent fuccessor in the academy, and the great leave. The admiration of this illustrious man was sel contined to a few philosophers. He was in was elteem with feveral princes, particularly Account laus king of Macedon, and Dionysius tycza Sicily. At three different periods he vifited to court of this latter prince, and made feveral bid but unfuccessful attempts to subdue his hught fpirit. The professed object (fays Dr Enfeld, a his Hift. of Philof.) of Plato's first visit to Son which happened in the 40th year of his age, deing the reign of the elder Dionysius, the last Hermocrates, was, to take a survey of the ilent and particularly of Mount Ætna. While her fided at Syracuse, he was employed in the intro tion of Dion, the king's brother-in-law, who fessed excellent abilities, though hitherto reason ed by a tyrannical government, and related the luxuries of a licentious court. Diffuled the debaucheries of the Syracufans, Plato end voured to rescue his pupil from the general to pravity. Nor did Dion disappoint his hopes. No tooner had he received a tafte of that philos. which leads to virtue, than he was fired with ardent love of wisdom. Hoping that philosop might produce the same effect upon Dionyi

procured an interview between Plato and the int. During the conference, whilft Plato difrfed on the happiness of virtue, and the miseries nding injuffice and oppression, Dionysius took nee, difmiffed him with displeasure, and even ned a delign against his life. It was not withdifficulty that Plato escaped. A vessel which brought over Pollis, a delegate from Sparta, fortunately then returning to Greece. iged Pollis to land Piato fately in his native itry; but Dionysius discovered the design, made Pollis promise, that he would either him to death, or fell him as a flave. Poliis rdingly fold him in his native island of Ægi-Anicerris a Cyrenaic philosopher discovered franger, and purchased his freedom for 30 e, (841, 108. Sterling,) and fent him home thens. Repayment being afterwards offered nicerris by Plato's relations, he refused the ey, faying, with that generous spirit which philosophy inspires, that he saw no reason the relations of Plato should engross to thems the honour of ferving him. After a short val, Dionysius repented of his unjust resentt, and wrote to Piato, requesting him to rehis credit by returning to Syracuse; to which o gave this high-spirited answer, that philosowould not allow him leifure to think of Dious. He was, however, prevailed upon by a to return to Syracuse, and take upon him education of Dionysius the younger, the heir arent. He was received by Dionysius I. with y possible respect; but after seeing his friend shed, and being himself kept as a kind of prir at large in the palace, he was by the tyrant back into his own country, with a promife both he and Dion should be recalled at the of the war in which the Sicilians were then iged. This promife was not fulfilled. The at wished for the return of Plato; but could resolve to recal Dion. At last, however, haprobably promifed that the philosopher should it his friend at the court of Syracuse, he preed upon Plato to visit that capital a third time. en he arrived, the king met him in a magniat chariot, and conducted him to his paiace. Sicilians too rejoiced in his return; for they ed that the witdom of Piato would at length mph over the tyrannical spirit of the prince. nyfius feemed wholly diverted of his former atments, liftened with apparent pleafure to ph lofopher's dostrine, and among other exlions of regard, prefented him with 80 talents old. In the midst of a numerous train of phiphers, Plato now possessed the chief influand authority in the court of Syracuse. ilft Aristippus was enjoying himself in spienmxury; while Diogenes was freely indulghis acrimonious humour; and whish Æschiwas gratifying his thirst atter riches; Plato orted the credit of philosophy with an air of alty, which his friends regarded as an indicaof fuperior wisdom, but which his enemies uted to pride. After all, Plato could not preupon Dionysius to alter his system of policy, to recal Dion from exile. At length Plato ected permission to return to Greece, which OL. XVII. PART II.

was at last granted him, and he was fent home loaded with rich prefents. On his way to Athens, passing through Elis during the celebration of the Olympic games, he was prefent at this general affembly of the Greeks, and engaged universal attention. From this narrative it appears, that if Plato visited the courts of princes, it was chiefly from the hope of feeing his ideal plan of a perfect republic realized. Plato now devoted himself to science, and spent the last years of a long life in the instruction of youth. Having enjoyed the advantage of an athletic constitution, and lived all his days temperately, he arrived at the 19th or 81st year of his age, and died, in the first year of the 108th Osympiad. He passed his whole life in a flate of celibacy, and therefore left no natural heirs, but transferred his effects by will to his friend Adiamantus. The grove and garden, which had been the scene of his philosophical labours, at last afforded him a sepulchre. Statues and altars were erected to his memory; the day of his birth long continued to be celebrated as a festival by his followers; and his porttrait is to this day preferved in gems: but the most lasting monuments of his genius are his writings, which have been transmitted, without ma-terial injury to the present times. The character of this philosopher has always been high. He had a comprehensive understanding, a yast fund of wit and good tafte, great fweetness of temper, all cultivated and refined by education and travel; for that he was honoured by his countrymen, efteemed by strangers, and adored by his scholars. The ancients thought more highly of Piato than of all their philosophers: they always called him the Divine Plate; and they refolved that his descent thould be more than human, for Apuleius mentions a common report, " that his mother Perictione, who was a very beautiful woman, was impregnated by Apollo in the shape of a spectre." Plutarch, Suidas, and others, affirm this to have been the common report at Athens. When he was an infant, his father Aritto went to Hymettus, with his wife and child, to facrifice to the Muses; and while they were busted in the divine rites, a swarm of bees came and distilled their honey upon his lips. This, fays Tully, was confidered as a prefage of his future eloquence. The Greeks loved tables; these show, however, what high respect was paid to the memory of Plato. Tully adored him; tells how he was justly called by Panatius the divine, the most wife, the most facred, the Homer of philosophers; entitled him to Atti-cus, Deus ille noffer; thought, that if Jupiter had spoken Greek, he would have spoken in Plato's language; and made him to implicitly his guide in wildom and philosophy, as to declare, that he had rather err with Plato than be right with any one else. But, panegyric aside, Plato was certainly a very wonderful man, of an imagination amazingly fertile, and of a most copious eloquence. Yet the heat of fancy prevailing in his compopolition over his judgment, he was too apt to foar beyond the limits of earthly things, to range in the imaginary regions of general and abstracted ideas; and therefore though there is always a greatness and sublimity in his manner, he did not philosophize Nunn

losophize so much according to with and nature as Aristotle, though Cicero gives him the preference. The writings of Plato are all in the form of dialogue; where he feems to deliver nothing from himself, but every thing as the sentiments and opinions of others, of Socrates chiefly, of Timzus, &c. He does not mention himfelf anywhere except once in his Phædo, and another time in his Apology for Socrates. His ftyle, as Ariftotle obferved, is betweet profe and verte: on which account some have not secupled to rank him with the poets. A better reason may be assigned for this: his matter is oftentimes the offspring of imagination, instead of truths deduced from nature. The first edition of Piato's works in Greek was published by Aldus at Venice in 1513; but a Latin version by Marshius Ficinus had been printed there in 1491. They were reprinted together at Lyons in 1588, and at Francfort in 1602. Henry Stephens, in 1578, gave a most beautiful and correct edition of Plato's works at Paris, with a new Latin version by Serranus, in 3 vots felio; and this passes for the best edition of Plato: yet in many respects, if not in all, it is inserior to that of Ficinus.

PLATOBERG, a mountain of Germany, in the ci-devant duchy of Deux-Ponts, now included in the French republic, and dep. of the Rhine and Moselle. It was fortified by the Prussans, who held it as a strong hold in 1793: but the French took it by assault in July 1794. It is four

miles N. of Landau.

PLATONIC, adj. relating to Plato, his philo-

fophy, opinions, or the like. Thus,

r. PLATONIC LOVE denotes a pure spiritual affection, for which Plato was a great advocate, subsisting between the different sexes, abstracted from all carnal appetites, and regarding no other object but the mind and its beauties; which many persons justly reckon an impossibility; or it is a sincere disinterested secondship subsisting between persons of the same sex, abstracted from any selfish views, and regarding no other object than the person; and such love or friendship certainly has a soundation in nature; and history secred and profane records glorious instances; witness Jonathan and David; Orestes and Pylades, Achilles and Patroclus; Damon and Pythias, &c.

2. PLATONIC PHILOSOPHY. See PHILOSOPHY, Seel. I; PLASTIC, § 4; and PLATONISM.

3. PLATONIC TRINITY. See PLATONISM.
4. PLATONIC YEAR, or the GREAT YEAR, is a

4. PLATONIC YEAR, or the GREAT YEAR, is a period of time determined by the revolution of the equinoxes, or the space wherein the stars and constellations return to their former places, in respect of the equinoxes. The piatonic year, according to Tycho Brahe, is 25816, according to Ricciolus 25920, and according to Cassini 24800 years. This period once accomplished, it was an opinion among the ancients that the world was to begin anew, and the same series of things to turn over again.

PLATONISM, n. f. the philosophy of Plato, which was divided into three branches, theology, thysics, and mathematics. Under theology was comprehended metaphysics and ethics, or that

which in modern language is called moral planfophy. Plato wrote likewife on dialedia, in with fuch inferiority to his pupil Anflote, #2 his works in that department of science and The ancient philosopher's dom mentioned. ways began their theological fystems with the fitions on the nature of the gods, and the ker tion of the world; and it was a fundamentalectrine with them, that from nothing nothing in proceed. They believed that a proper creation: impossible even to Omnipotence, and that to be production of any thing, a material is rotalize coffery than an efficient cause. (See METAPHYSIS, Sec. XXXV.) That with respect to the man tant ou stion, Plato agreed with his predecess. and contemporaries, appears evident fron the whole tenor of his Time us. We agree with Dr Enfield in thinking, that in this dialogue, who comprehends his whole doctribe on the forments of the universe, matter is so manifestly spoke of as eternally co-existing with God, that this pet of his doctrine could not have been mikater by ৰ্বত many learned and able writers, had the আ been feduced by the defire of establishing accescidence of doctrine between the writing of Pate and Misses. It is certain that neither Elono, & pulcius, Alcinous, nor even Chalcidius, vanflood Plato in any other fense than as within two primary and incorruptible principle & and matter; to which we have reason to #1 third, namely ideas. The passages quotely thole who maintain the contrary opinion is so means answer their purpose. Plato, inded, com God the parent of the unreverse, and speaks it is as " forming animate and inanimate being, hich did not before exist:" but these expression de not imply that this offspring of Deity was profe ced from nothing, or that no prior matter caled from which they were formed. Through the whole Timzeus, Plato supposes two standard independent causes of all things; on # ? which all things are made, which is Godien ther, that from which all things are mak, is matter. He diftinguishes between God # ter, and the universe, and supposes the Archivel of the world to have formed it out of a mais # pre-existent matter. Matter, according to Plate, is an eternal and infinite principle. His doctors on this head is thus explained by Cicero: " 164ter, from which all things are produced and form ed, is a fubiliance without form or quality, be capable of receiving all forms, and undergoing very kind of change; in which, however, it need fuffers annihilation, but merely a solution de parts, which are in their nature infinitely direct and move in portions of space which are 16 finitely divisible. When that principle which call quality is moved, and acts upon matel undergoes an entire change, and those forms produced, from which arises the diversised coherent lystem of the universe." Plato in fifts upon the notion, that matter has organo form, but is capable of receiving any. It it the mother and receptacle of forms, by the nion of which with matter the universe become perceptible to the fenfes; and maintains that visible world owes its forms to the energy of

ivine intellectual nature. Our author is supportd in drawing this inference by the testimony of liogenes Laertius, who furely understood the nguage and opinions of Piato better than the oft accomplished modern scholar can pretend ido; y t the learned Dr Ozilvie has expressed reat furprise that any one should consider matr as having been, in Plato's opinion, uncreated; id he affirms, that Laertius, instead of afferting at spirit and matter were the principles of ail ings, ought to have faid that God aione, in Piai's estimation, was their original. To prove this, gives from the Timæus a quotation, in which ato declares that God framed heaven and earth, id the inferior deities; and that as he fallioned. he pervades all nature. He observes, that Cito denominates the god of Plato the maker, and e god of Aristotle only the governor, of the ond. And, to fatisfy those who demand a proof Pato's having taught a real creation, he affirms at his writings abound with declarations on the bject, of which the meaning cannot be misapchended. But the deciarations of Piato on is subject appear by no means explicit; and the ference which Dr Ogiivie drawn from the words Cicero feems not to flow necessarily from the if of those-words. That Plato believed God have framed the heaven and the earth, and to we fashioned all nature, is a polition which has ver been controverted; but between framing fashioning the chaos, and calling the universe du obvious difference. The distinction made Cicero between the God of Plato and the God Aristotle is just, but it will not bear the superudure which Dr Ogilvie builds upon it. Arifthe maintained the eternity of the world in its refent form. Plato taught that the first matter is in time reduced from a chaotic state into m by the power of the Demiurgus; but noing in his writings declared his belief that the A matter was itself created. The learned Cudorth, who withed, like Dr Ogilvie, to find a cotidence of doctrine between the theology of 20 and that of the Gospel, exerted all his abies to prove that Plato taught a proper crea-0; but he laboured in vain. He gives a numr of quotations in support of his position; of ich we shall here insert only those two upon sich Dr Ogitvie seems to lay the greatest stress. ito, (favs he) calls the one God, " He that kes earth, and heaven, and the gods, and doth all rgs hoth in beautin, and bell, and under the th." And, again, "he by whose efficiency things of the world were afterwards made m they were not before." Both Cudworth and we think this laft fentence an explicit declaun of Piato's belief in the creative power of id: but that they are mistaken has been evinby Mosheim with a force of argument which a limit of no reply. Mosheim thinks that divorth was miffed by too implicit a confidence Ficinus; and it is not impossible that Dr Ogilmay have been swayed by the authority of evorth. That intellect existed antecedent to podies is endeed a Piatopic dogma, from which Ogilvie, after Cudworth, wiftes to infer that

the doctrine of the creation was taught in the academy; but Dr Ogilvie knows, and no man knew better than Cudworth, that Piato, with every other Greek philosopher, diftinguished between body and matter; and that though he held the priority of intenect to the former, it by no means follows that the believed it to have existed antecedent to the latter. That he believed mind, or rather foul (for he distinguishes between the two), to be the cause or principle of motion, cannot be denied; but we are not therefore authorifed to conclude that he likewife believed it to be the cause of the existence of matter. That he believed mind to be the most ancient of all things, taking the word things in the most absolute sense, cannot be true, fince by Dr Ogilvie's own acknowledgment he held the existence and eternity of ideas, not to add that he belie ed to or o'eyado-the first hypostanis in his trinity, to be superior to mind and prior to it, though not in time, yet in the order of nature. When, therefore, he calls mind the most ancient of all things, he must be supposed to mean only that it is more ancient than all bodies and inferior fouls. It is no reflection on Plato that he could not, by the efforts of his own reason, acquire any notion of a proper creation; fince we, who have the advantage of his writings, and of writings infinitely more valuable, find it extremely difficult, if not impossible, to conceive how any thing can begin to be. We believe the fact on the authority of revelation; but fliould certainly have never agitated fuch a question, had it not been stated to us by writers inspired with celestial wisdom. In the Platonic cosmogony we cannot therefore doubt but that the eternity of the μλη προίη was taken for granted. But Plato did not believe it to have a fingle form or quality which it did not receive either from the Demiurgus or the Psyche-the 2d or 3d person of his trinity. Except Aristotle, all the Greek philosophers, who were not materialists, held nearly the same opinions respecting the origin of the world; so that in examining their fystems, we shall be greatly misled if we understand the terms incorporeal and immaterial as at all fynonymous. It was also a doctrine of Plato, that there is in matter a necessary but blind and refractory force; and that hence arifes a propenfity in matter to diforder and deformity, which is the cause of all the imperfection which appears in the works of God, and the origin of evil. On this subject Piato writes with wonderful obscurity, but he appears to have thought, that matter, from its nature, results the will of the Supreme Artificer, for that he cannot perfectly execute his defigns; and that this is the cause of the mixture of good and evil in the material world. Plato, however, was no materialist. He taught, that there is an intelligent cause, which is the origin of all spiritual being, and the The nature of former of the material world. this great being he pronounced it difficult to difcover. The existence of God he interred from the marks of intelligence, which appear in the form and arrangement of bodies in the visible world: and from the unity of the material fyftem he concluded, that the mind by which it was Nuona

formed must be one. God, according to Plato, is the fupreme intelligence, incorporeal, without beginning, end, or change, and capable of being perceived only by the mind. His notions of God are indeed exceedingly refined, and such as it is difficult to suppose that he could ever have acquired, but from some obscure remains of primeval tradition. In the Divine Nature he believed that there are two, and probably three, bypoftafes, whom he called to or and to it, rous and wuxn. The first he considered as self-existent, and elevated far above all mind and all knowledge; calling him, by way of eminence, the being, or the one. The only attribute which he acknowledged in this person was goodness; and therefore he frequently ftyles him re ayaln-the good, or effential goodness. The sd he confidered as mind, the evision or reason of the first, and the maker of the aworld; and therefore he styles him me, sayes, and enumbers. The 3d he always speaks of as the soul of the eworld; and hence calls him ψυχη, or ψυχη του ποσμού. He taught that the fecond is a necellary emanation from the first, and the third from the fecond, or perhaps from the first and second. Plato often afferts, as superior to the seifmoving principle, an immoveable was, or intellect, which was properly the demiurgus or framer of the world; and above this bytoftafis one most simple and absolutely perfect being, who is considered in his Theology as aufolior, the original deity, in contradiffinction from the others, who are only lin in trov. There doctrines are to be gathered from his works at large, particularly from his Timæus, Philebus. Sophista, and Epinomis: but there is a passage in his 2d epistle to Dionysius, in answer to a letter in which that monarch had required him to give a more explicit account of the nature of God, in which the doctrine of a Trivity feems to be directly afferted., "The Lord of Nature (fays Plato) is furrounded on all fides by his works: whatever is, exists by his permussion; he is the fountain and fource of excellence: around the 2d person are placed things of the 2d order; and around the 3d those of the 3d degree." Of this obleure passage a very satisfactory explanation is given in Dr Ogiivie's Theorogy of Plato, to which we refer the reader. The account given above of the Platonic Trinity is abiy supported by the Doctor. In treating of the eternal enianation of the fecond and third Hypoftales from the first, the philotophers of the academy compare them to light and heat proceeding from the fun. Plato himfelf, as quoted by Dr Cudworth, illustrates his doctrine by the fame comparison. resemblance which this trinity of Plato bears to that revealed in the gospel, must be observed by every reader; but the two doctrines are in some refpects exceedingly diffimilar. The third hypostaft; in the Platonic system appears in no point of view co-ordinate with the first or second. Indeed the first is elevated far above the second, and the third funk still farther beneath it, being confidered as a mere foul immerfed in matter, and forming with the corporeal world, to which it is united, one compound animal. Nay, it is not certain, that Piato confidered his ways new KISHOU as a pure spirit, or as having substited from eternity as a distinct Hypostasis. " This governing

fpirit, of whom the earth, properly to called a the body, confifted, according to him, of the fil matter, and of pure intelligence, framed to star the machinery of nature. The Supreme lay placed him in the middle of the earth; with a the vivid idea of Plato, seemed itself to man confequence of an influence that was fell more part of it. From this feat his power is represed as being extended on all tides to the utmormit of the heavens; conferring life, and proming harmony in the various and complicated per of the universe. Upon this being God noted with pecunar complacency after having hims him as an image of himfeif, and gave beauty in perfect proportion to the manfion which he was defined to occupy. The Supreme Being had out from this original mind innumerable trans inferior order, endowed with principles disfon; and he committed to divinities of koody rank the task of investing these in materal treas and of dispersing them as inhabitants of the inmoon, and other ceiestial bodies. He taugut and that at death the human foul is remared to the Turn row norms, as to the fource from which a riginally came. Such is the third person of its Piatonic triad, as we find his nature and surbutes accurately flated by Dr Ogivie; and the Christian philosopher will not require acte proof, that the triad of Piato differ county from the Trinity of the Scriptures. The inditrine on this fubject should be inaccorate with roncous, can excite no wonder; whilt take confessed to have such a resemblance to the inthe and to be so incapable of being proved by rate ing from effects to capies, that we could ad doubt of his having inherited it by tradition net though we had not complete evidence that forething very fimilar to it was taught long better him, not only by Pythagoras and Paraculas but by the philosophers of the caft. It have cosmogony there is another principle, and terious, if possible, than any thing yetang This is his intellectual fystem of ideas, with not easy to collect from his writings, whether the confidered as independent existences, or only a archetypal forms, which had sublitted from to nity in the Loyo; or divine intelle &. On the I ject he writes with fuch exceeding obscurt, men of the first eminence, both among the cients and the moderns, have differed about real meaning. Some have supposed, that by he meant real beings sublifting from cierns dependent of all ininds, and separate iron matter; and that of thefe ideas he concurred to be living, and others to be without this manner his doctrine is interpreted by lian among the ancients, by the celebrated er among the moderns; and by many of qually learned, candid, and acute. But Crit and his aunotator Motheim, contend, that ideal world Piato meant nothing more that there existed from eternity in the Loya, or of God, a notion of every thing which time to be made. This is certainly much probable, than that such a man as Pisto have supposed, that there are somewhere tramundane space real living incorporcal eating and drinking, which are the idea of

animals which ever have been or ever will be eating and drinking in this world. Yet Mosheim acknowledges, that if the controversy were to be decided by the votes of the learned, he is doubtfu! whether it would be given for or against him; and Cudworth owns, that on this fubject Piato's language cannot be vindicated. This indeed is true, for Piato contends, that his ideas are not only the objects of science, but also the proper or physical causes of all things here below; that the dea of fimilitude is the earle of the retemblance retween two globes; and the idea of diffimilitude he cause that a globe does not resemble a pyranid: he likewise calls them oversi, effences or subfunces, and many of his followers have pronouned them to be animals. Dr Enfield, having obarred, that foine of the admirers of Piato conand, that by ideas existing in the reason of God, othing more is meant than conceptions formed the Divine mind, controverts this opinion with such effect. " By ideas, Plato (lays he) appears have meant formething much more mysterious; amely, patterns or archetypes sublisting by themlves, as real beings, orrus orla in the Divine rean, as in their original and eternal region, and ifing thence to give form to fenfible things, and become objects of contemplation and science rational beings. It is the doctrine of the Tizus, that a Loyurpos To Gin, the reason of God, morehends exemplars of all things, and that in reason is one of the primary causes of things. burch fays, that Plato supposes three princies, God, Matter, and Idea. Justin Martyr, endo-Origen, and others, affert the same thing. but this is the true Platonic doctrine of ideas pears probable from the manner in which Plato amed his fyfteen of opinions concerning the oriof things. 'Having been from his youth (fays ufforle) convertant with Cratylus, a disciple of craclitus, and instructed in the doctrine of that bool, that ail fentible things are variable, and anot be proper objects of science, he reasonably ncluded, that if there be any such thing as unce, there must exist, best 'es sensible objects, main permanent natures, perceptible only by emtenect.' Such natures, divine in their ori-4 and eternal and immutable in their existence, admitted into his fystem, and called them ideas, fible things were regarded by Plato as flecting ides, and ideas as the only permanent jubitan-5. These he conceived to be the proper objects science to a mind raised by divine contemplaabove the perpetually varying feenes of the sterial world." It was a fundamental doctrine the fystem of Piato, that the Deity formed the iterial world after a perfect model, confitting of ofe ideas which had eternally sublisted in his n reason; and yet, with apparent contradicn, he calls this model "felf-existent, malivisible, I eternally generated." Nay, he talks of it as ng intelligent as well as eternal, and wholiy erent from the transcripts, which are subjected our inspection. There is so much mysterv, fution, and apparent abfurdity, in the whole this fystem, as it has come down to us, that it urprifing, that Piato should have had so many nivers. With almost every ancient theist of ecce, Plato-believed in an order of beings call-

ed demons, which were superior to the souls of men, and struck off by the Demiurgus from the foul of the world. Of these the reader will find some account under Damon and Polytheism. We mention them here because they make an important appearance in Piato's system of physics, which was built upon them. He taught, that the visible world was formed by the Supreme Architect, uniting eternal and immutable ideas to the first matter; that the universe is one animated being, including within its limits all animated natures: that, in the formation of the visible and tangible world, fire and earth were first formed. and were afterwards united by means of air and water; that from perfect parts one perfect whole was produced, of a spherical figure, as most beautiful in itself, and best suited to contain all other figures; that the elementary parts of the world are of regular geometrical forms, the particles of earth being cubical, those of fire pyramidical, those of air in the form of an octohedron, and those of water in that of an icosohedron; that these are adjutted in number, measure, and power, in perfect conformity to the geometrical laws of proportion; that the foul which pervades this sphere is the cause of its revolution round its centre; and, lastly, that the world will remain for ever, but that by the action of its animating principle, it accomplishes certain periods, within which every thing returns to its ancient place and This periodical revolution of nature is state. called the Platonic or GREAT YEAR. PLATONIC, § 4.) Plato, preparatory to the fludy of all philosophy, required from his diferples a knowledge of the elements of MATHEMA-TICS. In his Republic, he makes Glaucus, one of the fpeakers, recommend them for their ufeful-Concerning policy, Plato ness in human life. has written at large in his Republic and in his Dialogue on Laws. He was to fond of his own ideas on this subject, that it was chiefly the hope of having an opportunity to realife his plan of a republic, which induced him to visit the court of Dionyfius. But they who are converfant with mankind, and capable of calmly investigating the fprings of human actions, will eafily perceive that his projects were chimerical, and could only have originated in a mind replete with philosophical enthulialm. Of this pothing can be a clearer proof than the delign of admitting in his republic a community of women, to give reaf n an extire controll over defire. The main object of Lis political institutions appears to have been, the fubjugation of the passions and appetites, by means of the abstract contemplation of ideas. fystem of policy, raised upon such fanciful grounds, cannot merit a more diffinct confideration." Such is genuine PLATONISM as it was taught in the old academy by the founder of the school and his immediate followers; but when Arceliaus was piaced at the head of the academice, great innovations were introduced both into their doctrines and mode of teaching. (See ARCESILAUS.) This man was therefore confidered as the founder of what was afterwards called the middle academy. Being a professed sceptic, he carried his maxim of uncertainty to such a height, as to alarm the general body of phile-Sophers, Tophers, offend the governors of the state, and foring just odium upon the very name of the academy. At length Carneades, one of the disciples of this school, relinquishing some of the more obnoxious tenets of Arcefilaus, founded what has been called the new academy with very little improvement on the principles of the middle. See CARNEADES. Under one or other of these forms Platonitm found its way into the Roman republic. Cicero was a Piatonift, and one of the greatest ornaments of the school. A school of Platonifts was likewife founded in Alexandria in the ad century of the Christian era; but their doctrines differed in many particulars from those taught in the three academies. They professed to seek truth wherever they could find it, and to collect their dogmas from every school. They endeavoured to ben't fome of the principles of Plato into a conformity with the doctrines of the golpel; and they incorporated with the whole many of the maxims of Aristotle and Zeno, and not a few of the fictions of the east. Their system was therefore extremely heterogeneous, and feldom to rational as that of the philosopher after whose name they were called, and of whose doctrines we have given so copious a detail. See AMmonius, Eclectics, and Plotinus;

PLATONIST, n. f. A philosopher, who adopts the sentiments and system of Plato.

To PLATONIZE, v. n. [platonizo, Lat.] To adopt and imitate the ftyle, fentiments and philo-fophy of Plato. See To Philonize.

(1.) \* PLATOON. n. f. [a corruption of pelacon, Fr.] A finall fquare body of musketeers, drawn out of a battalion of foot, when they form the hollow fquare, to strengthen the angles: the grenadiers are generally thus posted; yet a party from any other division is called a platoon, when intending too far from the main body. Military Dis.—

In comely wounds shall bleeding worthies fland.

Webb's fir n platoon, and Lumly's faithful band.

(2.) PLATOON EXERCISE, an important branch of MILITARY fervice, which is the figuel of the MANUAL EXPRCISE, and the regulations respecting which are published along with those respecting the former. The following is an abstract of the PLATOON EXERCISE, as altered and abridged "by his Majesty's Command, April 20. 1792," and published at London, in 1795, by William Tawcett, Adjutant General " to be invariably practifed by his whole army." The PLATOON Ex-ERCISE is always to be done with ranks closed, except at the Drile. Words of Command. 1. " Make ready. As shall, bring the firetock to the recover, and instantly cocking. Ift. Sho the left hand along the fling as far as the fired of the firelock, and bring the piece down to H. Prefent, stepping back about fix inches to the rear with the right foot. II! Fire. After firing, drop the firelock brifkly to the priming polition. 2d. Half cock. IV. Handle Cartridge. ift. Draw the cartridge from the pouch. 2d. Bring it to the mouth, holding it between the fore-inner and thumb, and bite off the top of it. V. P in . re-Shake some powder into the pan. 2d. Shut the

pan with the three last fingers. 3d. Seize the small of the butt with the above turce from VI. Load. 1st. Face to the left on both here, is that the right toe may point directly to the ... and the body be a very little faced to the ... bringing at the same time the firelock round to left fide without finking it. It flouid, in these mentary polition, be atmost perpendicular, (lang the muzzle only a small degree brought formal and as foon as it is fleady there, it work men be forced down within a mches of the ground, " butt nearly opposite the left heel, and the first itled tomewhat floped, and directly to the from, the right hand at the time inflant catches le muzzle, in order to fleady it. 21. Shake in powder into the barrel patting in after it to pe per and ball. 3. Seize the top of the rame with the fore-finger and thumb. VII. Dresses rods 11t. Force the ramfod half out, and late backhanded exactly in the middle. 2d. Day entirely out, and turning it with the whole had and arm extended from you, put it one inch its the barrel. VIII. Ram down Cartridge. 18.1 . the rameod down, holding it as before examin the middle till the hand touches the ourse. 2d. Slip the fore-hoger and thumb to the ign end, without letting the ramrod fa'l further a the barrel. 3d. Puth the cartridge well des the bottom. 4th. Strike it two very quilled with the ramifod. 1ft. Draw the rame of out, catching it backhanded. 2d. Drie 100 tirely out, turning it very brifkly from potissi the arm extended, and put it into the loops is it as quick as possible to the bottom; then better the proper front, the finger and thumb, with right hand holding the ramrod, as in the town immediately previous to drawing it, and uz at raifed two inches from the ground. See top of the muzzle fmartly with the right order to fix the bayonet, and ramrod, me ly, and at the fame time throw it nich . one motion, to the shoulder. N. B. Topic butts are not to come to the ground in calbout, as accidents may happen from it, pt [5] are permitted, while loading, to be to while but it must be done without noise, and was no ner imperceptible in the front. Explanated OF PRIMING AND LOADING QUICE. Winds C mma\_d. I. Prime and Load. 1ft. Bring the be took down in one brifk motion to the price? ficion, the thumb of the right hand placed a the pan cover, or feel; the fingers denehed: the cibow a little turned out, so that the m may be clear of the cock. 2d. Open the past turnwing up the free', with a ftrong motion of right arm, turning the elbow in, and keeping frenck fleady in the left hand. 3d. Bring p hand round to the pouch, and draw out the tindge. The reft as above defembed, com that, in the qui k lozoing, all the motion be done with as much dispatch as publish." diers taking their time, from the flugo trunt. for easting over, and shooldering at ing three deep, the priming pofune for the runk is the height of the wailthan of the band : for the center on k, about the middle of the " mach: and to the rear rank, che to " the sit, the firelock, in all these positions, is to h

pt perfectly horizontal. EXPLANATION OF THE ISITION OF EACH RANK IN THE FIRINGS. out rank, kneeling. II. Make ready. Bring the clock brifk y up to the recover, catching it in e left hand; and, without stopping, fink down th a quick motion upon the right knee, keepg the left foot fail, the butt end of the firelock, the fame moment, failing upon the ground; en cock, and infantly feize the cock and steel gether in the right hand, holding the piece firm the left, about the middle of that part which is tween the lock and the swell of the Rock: the int of the left thumb to be close to the swell, d pointing upwards. As the body is finking, right knee is to be thrown fo far back, that : lett leg may be right up and down, the right at a little turned out, the body straight, and : head as much up as if shouldered; the firek must be upright, and the butt about four hes to the right of the infide of the left foot. . Prefent. Bring the firelock down firmly to the fent, by fliding the left hand, to the full extent the arm, along the fling, without letting the tion tell;-the right hand at the same time inging up the butt by the cock so high against right shoulder, that the head may not be too ich lowered in taking aim; the right check to close to the butt; the left eye shut, and the idle finger of the right hand on the trigger, look ing the barrel with the right eye from the breech to the muzzle, and remain steady. IV. Fire. ill the trigger strong with the middle singer, da foon as fired, fpring up nimbly upon the tleg, keeping the body erect and the left foot hand bringing the right heel to the hollow of theft; at the same instant drop the firelock to spriming polition, the height of the waistband of breeches; balf cock; band cartridge, and go with loading motions, as before described. tre rank. I. Make Ready. Spring the firelock kly to the recover; as foon as the left hand tes the firelock above the lock, raise the right ow a little, placing the thumb of that hand ua the cock, with the fingers open on the plate the lock, and then, as quick as possible, cock piece, by dropping the elbow, and forcing m the cock with the thumb, step at the same e with the right foot a moderate pace to the ht, and keeping the left fast, seize the small of butt with the right hand: The piece must be d in this position perpendicular, and opposite left fide of the face, the butt close to the breaft, not pressed, the body straight and full to the at, and the head erect. II. Prefent. As in the igoing explanation for the front rank. III. . Pull the trigger strong with the middle fin-, and, as foon as fired, bring the firelock to priming polition, about the height of the Roch; the rest, as in explanation of priming and ting-with this difference only, that the left t is to be drawn up to the right, at the same e that the firelock is brought down to the primpolition; and that, immediately after the firek is thrown up to the shoulder, the men spring the left again, and cover their file leaders. ir Rank. I. Make Ready. Recover and cock, before directed for the center rank, and as the lock is brought to the recover, step briskly to

the right a full pace, at the same time placing the left heel about fix inches before the point of the right foot.—The body to be kept straight, and as square to the front as possible. II. Present. As in explanation for the center rank, remembering only the difference of the priming polition for this rank, as before described; after firing and shouldering, the men step, as the centre rank does. III. Fire. In firing with the front rank flanding, that rank makes ready, &c. as specified in the article relative to the platoon exercise. N. B. In giving words of command, as well in as out of the ranks, officers are to stand perfectly steady, and in their proper polition; their fwords held. firmly in the full of the right hand, with the upper part of the biade refting against the shoulder, the right wrist against the hip, and the elbow drawr. back. Firing by Platoons. The officers, in-Read of giving the words, platoon, make ready, present, fire, are to pronounce the words short, as for instance, toon, ready, pent, fire. In firing by platoons, or divisions, the officers commanding them are to step out one pace, on the close of the preparative, and face to the left towards their. men: They there stand perfectly steady till the least part of the general, when they slep back again into their proper intervals, all at the same time.—After a division has fired, the right hand man of it steps out one pace, in front of the officer, but still keeping his own proper front, and gives the time for easting about and shouldering, after which he falls back again into his place in the front. The flugel man of a battailon is also to keep his front, in giving the time of exercise. firing by grand divisions, the center officer falls back, on the preparative, into the fourth rank, and is replaced by the covering ferjeant."

PLATS, n. f. in fea language, the flat ropes, used to keep the cable from guiling. Ash.

PLATTEN, a town of Bohemia, in Leitme-

ritz; 4 miles E. of Kamnitz.

PLATTENBURG, a town of Upper Saxony, in Prignitz; 4 miles, E. of Wilfnack.

\* PLATTER. n. f. [from plate.] A large dish, generally of earth.—

The servants wash the platter. Dryden.

-Satira is an adjective, to which lanx, a charger, or large platter is understood. Dryden.

(1.) PLATTSBURG, or an extensive town-(1.) PLATTSBURGH, ship of New York, in Cinton county, on the W. bank of Lake Champlain, about 300 miles N. of New York. In 1790, it contained 445 citizens, and 13 slaves. In 1796, 142 of the citizens were qualified to be electors.

(2.) PLATTSBURGH, the capital of the above township, has a church, court-house, and gaol, with artists in almost every branch. Courts of Common Pleas, and general Sessions, are held in it twice a year. It is 5 miles W. of Ticonderoga. PLATZ, a town of Bohemia, in Bechin.

\* PLAYTHING. n. f. [play and thing] To: thing to play with,-

O Castalio! thou hast caught My foolish heart; and like a tender child, That trufts his plaything to another hand, I fear its harm, and fain would have it back.

-A child knows his nurse, and by depres to playthings of a little more advanced age. Lub-The servants should be hindered from maker court to them, by giving them fruit and playthers. Locke .

Would fortune calm her present rage,

And give us playthings for our age. Allow him but the plaything of a pen,

He ne'er rebels or plots like other men. Pix PLAYWRIGHT. n. f. [play and sorget.]
A maker of plays.—Horace's rule for a play sif as well be applied to him as a playuright lar-

(1.) \* PLEA, st. f. [plaid, old Freich, 1 12 set or form of pleading. 2. Thing offered en

manded in pleading.-

None can drive him from the envious Of forfeiture of juffice and his bond. Their respect of persons was expressed in inch cial process, in giving rash sentence in finder of the rich, without ever staying to hear the the weigh the reasons of the poor's cause. Litted. 3. Ailegation-

They towards the throne supreme, Accountable, made hafte, to make appear With righteous pleas their utmost viginor.

4. An apology; an excuse.-

The fiend, with necessity, The tyrant's plea, excus'd his devilin deck Mein.

Thou determin'st weakness for no plan Mittes

No plea must serve; tis cruelty to spare Detail

-Whoever argues in defence of absolute port in a fingle person, though he offers the old planfible pleas that, it is his opinion, which he cand help, unless he be convinced, ought to be treated as the common enemy of mankind. Swift.

(II.) PLEA, in law, is what either party sire? for himself in court, in a cause there depending and in a more restrained sense, it is the defendant answer to the plaintiff's declaration. Pleas usually divided into Pleas of the crows COMMON PLEAS.

i. PLEAS, COMMON, (fays Judge Blackflooth fuch fuits as are carried on between community fons in civil cases. These are of two sorts; tory pleas, and pleas to the action.

1. PLEAS, DILATORY, are fuch as tend mer's to delay or put off the fuit, by questioning it propriety of the remedy, rather than by despite the injury: pleas to the action are such as disput

the very canfe of fuit. They are, 1. To the jurisdiction of the court; alleging, that it ought not to hold plea of this injury, it arising in Wales or beyond fea; or because the land in question is of incient demesse, and ought only to be demanded n the lord's court, &c. 2. To the disability of he plaintiff, by reason whereof he is incapable to commence or continue the fuit; as, that he is an vien enemy, outlawed, excommunicated, attaintd of treason or felony, under a præmunire, not u rerum natura (being only a fictitious person), n infant, a feme couvert, or a monk professed. . In abatement: which abatement is either of the vrit, or the count, for some defect in one of them; s by misnaming the defendant, which is called a nifnomer; giving him a wrong addition, as efire inflead of knight; or other want of form in my material respect. Or, it may be that the faintiff is dead; for the death of either party is t once an abatement of the fuit. These pleas to he jurisdiction, to the disability, or in abatement, ere formerly very often used as mere dilatory leas, without any foundation in truth, and callated only for delay; but now by stat. 4 & 5 nn. c. 16. no dilatory plea is to be admitted ithout affidavit made of the truth thereof, or me probable matter shown to the court to inace them to believe it true. And with respect the pleas themselves, it is a rule, that no exption shall be admitted against a declaration or nt, unless the defendant will in the same plea we the plaintiff a better; that is, show him how might be amended, that there may not be two bjections upon the fame account. All pleas to r jurifdiction conclude to the cognizance of the pat; praying "judgement whether the court ill have farther cognizance of the fuit." the difability conclude to the person; by prayg " judgment, if the said A the plaintiff ought be answered:" And pleas in abatement (when e fuit is by original) conclude to the writ or deiration; by praying "judgement of the writ, or claration, and that the same may be quashed," Four, made void, or abated: but if the action by bill, the plea must pray "judgement of the 1," and not of the declaration; the bill being re the original, and the declaration only a py of the bill. When these dilatory pleas are swed, the cause is either dismissed from that issiction, or the plaintiss is stayed till his disaty be removed; or he is obliged to fue out a writ, by leave obtained from the court, or to end and new-frame his declaration. But when, the other hand, they are over-ruled as frivolous, defendant has judgement of respondent ousler, to answer over in some better manner. It is n incumbent on him to plead.

i. Pleas to the action are to answer to merits of the complaint. This is done by coning or denying it. A confession of the whole aplaint is not very ufual; for then the defendant uld probably end the matter fooner, or not id at all, but fuffer judgement to go by default. sometimes, after tender and refusal of a debt, he creditor harasses his debtor with an action, uen becomes necessary for the defendant to acwledge the debt, and plead the tender; ad-3, that he has always been ready, tout temps

prist, and is still ready, unco e prist, to discharge it: for a tender by the debtor and refusal by the creditor will in all cases discharge the costs, but not the debt itself; though in some particular cases the creditor will totally lose his money. But free quently the defendant confeiles one part of the complaint (by a cognovit actionem in respect thereof), and traverses or denies the rest; in order to avoid the expense of carrying that part to a formal trial, which he has no ground to litigate. A species of this fort of confeilion is the payment of money into court: which is for the most part necessary uspon pleading a tender, and is itself a kind of tender to the plaintiff; by paying into the hands of the proper officer of the court as much as the defendant acknowledges to be due, together with the costs hitherto incurred, in order to prevent the expence of any farther proceedings. This may be done upon what is called a motion; which is an occasional application to the court by the parties or their counsel, in order to obtain some rule or order of court, which becomes necessary in the progress of a cause; and it is usually ground. ed upon an affidavit (the perfect tense of the verb affido), being a voluntary oath before fome judge or officer of the court; to evince the truth of certain facts, upon which the motion is grounded: though no fuch affidavit is necessary for payment of money into court. If, after the money is paid in, the plaintiff proceeds in his fuit, it is at his own peril: for if he does not prove more due than is so paid into court, he shall be nonfuited and pay the defendant's cofts; but he shall still have the money so paid in, for that the defendant has acknowledged to be his due. To this head may also be referred the practice of what is called a fee off; whereby the defendant acknowledges the justice of the plaintiff's demand on the one hand; but on the other, fets up a demand of his own. to counterbalance that of the plaintiff, either in the whole or in part; as, if the plaintiff fues for L10. due on a note of hand, the defendant may fet off L9. due to himself for merchandize sold to the plaintiff; and, in case he pleads such set-off, must pay the remaining balance into court. Pleas that totally deny the cause of complaint are either the general issue, or a special plea in bar. 1. The general iffue, or general plea, is what traverfes, thwarts, and denies at once, the whole declaration, without offering any special matter whereby to evade it. As in trespass either vi et armis, or on the case, " non culpabilis, not guilty;" in debt "pon contract, " nibil debet, he owes nothing; ' in debt on bond, " non oft fullum, it is not his deed;" on an affunipfit, " non affumpfit, he made no fuch promife." Or in real actions, " nul tort, no wrong done; nul diffeifin, no diffeifin;" and in a writ of right, the mife or iffue is, that " the tenant has more right to hold than the demandant has to de-These pleas are called the general iffue, because, by importing an absolute and general denial of what is alleged in the declaration, they amount at once to an iffue; by which is meant a fact affirmed on one side and denied on the other. 2. Special pleas in bar of the plaintiff's demands are very various, according to the circumftances of the detendant's cafe. As, in real actions, a general release or a fine; both of which may destroy 00003

and bar the plaintiff's title. Or, in personal actions, an accord, arbitration, conditions performed, nonage of the defendant, or fome other fact which precludes the plaintiff from his action. A justification is likewife a special plea in bar; as in actions of affault and battery, on affault demefne, that it was the plaintiff's own original affault; in trespals, that the defendant did the thing complanned of in right of forme office which warranted him to to do; or, in an action of flander, that the plaintiff is really as bad a man as the defendant Laid he was. Also a man may plead the statutes of limitation in bar; or the time limited by certain acts of parliament, beyond which no plaintiff can lay his cause of action. This, by the statute of 32 Hen. VIII. c. 2. in a writ of right is 60 years: in affifes, writs of entry, or other poffeffory actions real, of the feifin of one's angestors in lands; and either of their feifin, or one's own, in rents, fuits, and fervices, 50 years : and in actions · real for lands grounded upon one's own feifin or possession, such possession must have been within 30 years. By flat. I Mar. ft. a. c. 5. this limitation does not extend to any fuit for avowfons. But by stat. 21 Jac. I. c. 2. a time of limitation was extended to the cafe of the king; viz. 60 years precedent to 19th Feb. 1623: but this becoming ineffectual by efflux of time, the same date of limitation was fixed by stat. 9 Geo. III. c. 16. to commence and be reckoned backwards, from the time of bringing any fuit or other process to recover the thing in question; so that a possession for 60 years is now a bar even against the prerogative, in-derogation of the ancient maxim, Nullum tempas occur it regi. By another statute, 21 Jac. I. c. 16 20 years is the time of limitation in any. write of formedon: and, by a confequence, 20 years is alforthe limitation in every action of ejectment; for no ejectment can be brought, unless where the telfor of the plaintiff is entitled to enter on the lands, and by stat. 21 Jic. I. c. 16. no entry can be made by any man, unless within 20 years after his right thall accrue. Also all actions of trespals (quare cla sum fregit, or otherwise), detinue, trover, replevin, account, and cafe (except upon accounts between merchants), debt on simple contract, or for airears of rent, are limited by the statute last mentioned to fix years after the cause of action commenced: and actions or assault, menace, battery, mayhem, and imprisonment, must be brought within four years, and actions for words two years, after the injury committed. and by flat. 3x Eliz. c. 5. all fuits, indictments, and informations, upon any penal statutes, where any forfeiture is to the crown, shall be fued within two years, and where the forfeiture is to a subject, within one year, after the offence committed, unlets where any other time is specially limited by the statute. Lastly, by stat. 10 W. III. c. 14. no writ of error, scire facias, or other fuit, shall be brought to reverse any judgment, fine, or recovery, for error, unless it be profecuted within 20 years. The use of these statutes of limitation is to preferve the peace of the kingdom, and to prevent those innumerable persuries while might culue if a man were allowed to bring an action to, any injury committed at any diffance o time.

interest releablice at fit jons littem; and upon the fame principle the Athenian laws in general prohibited all actions where the injury was consuld five years before the complaint was mak I therefore, in any fuit, the injury or care i action, happened earlier than the period expen limited by law, the defendant may plead in a tutewof limitations in bar: as upon an affect or promife to pay money to the plaintiff, the ... fendant may plend, Non affum hi infra far and He made no fach promife within fix years; visit is an effectual bar to the complaint. An depis likewife a special plea in bar; which hopped where a man hath done some act, or executi forme deed, which effore or precludes him to averring any thing to the contrary. As fataur for years (who hath no freehold) levies 2 ix :: another person. Tho' this is void as to wars yet it shall work as an estopped to the coguser for, if he afterwards brings an action to men these lands, and his fine is pleaded against him. shall thereby be estopped from faying, that keep no freehold at the time, and therefore was in it ble of levying it. The conditions and craftical a plea (which, as well as the doctrire of chapter will also hold equally, mutaris mutantis, with the gard to other parts of pleading), are, a Third be fingle and containing only one material duplicity begets confusion. But by fize a life; Ann. c. 15. a man, with leave of the out, mer plead two or more diffinct matters or fingk gives; as in an action of all ault and battery, the time Not guilty, fon affault de nefne, and the frant o limitations. 2. That it be direct and posting all not argumentative. 3. That it have contract certainty of time, place, and perfors. 4 The answer the plaintiff's allegations in everyment point. 5: That it be so pleaded as to be crew of tial. Special pleas are usually in the many tive, sometimes in the negative, but the advance fome new fact not mentioned attack claration; and then they must be avended true in the common form :- " And this he is not to verify."-This is not necessary in piets of the general iffue, those always containing a total de nial of the facts before advanced by the other party ty, and therefore putting him upon the proof of them. See PLEADINGS, \$ 2.

ii. PLEAS OF THE CROWN are all fuits in the king's name, or in the name of the attorner? neral in behalf of the king, for offences comme ted against his crown and dignity, and against the peace; as treason, murder, selony, &c. Sedi-

RAIGNM+NT. (III.) PL A TO INDICTMENT, the defenfire at ter alleged by a criminal on his indiducation ARRAIGNMENT.) This is either, 1. Aperten jurisdiction ; 2. A demuerer ; 3. A p.ca in 200 ment; 4. A special plea in bar; or, 5. Tur ral iffue. I. A plea to the jurification, & an indictment is taken before a court that n's cognizance of the offence; as it a make dicted for a rape at the sheriff's tourn, or said fon at the quarter-tellions: in these or fimia o fes, he may except to the juridiction of the car without answering at all to the crime allered Ademarrer to the indistanent, is incident toals both these accounts the law therefore holds, that cases, as well as civil, when the face is also

owed to be true, but the prisoner-joins issue un some point of law in the indictment by which infilts, that the fact, as flated, is no felony, uson, or whatever the crime is alleged to be. ius, for instance, if a man be indicted for felooully ficaling a greyhound; which is an animal which no valuable property can be had, and refore it is not felony, but only a civil trefpafs to ii it; in this case the party indicted may demur the indictment; denying it to he felony, tho confesses the act of taking it. Some have held, t if, on demurrer, the point of law be adjud-Larginit the prisoner, he shall have judgment lexecution, as if convicted by verdict. But ses denied by others, who hold, that in fuch e he shall be directed and received to plead the eral iffue, Not guilty, after a demurrer deterned against him. Which appears the more reaable, because it is clear, that if the prisoner rly discovers the fact in court, and refers it to court whether it be felony or no; and upon fact thus shown, it appears to be sclony, the ort will not record the confession, but admit n afterwards to plead not guilty. And this ms to be a case of the same nature, being for most part a mistake in point of law, and in the iduct of his pleading; and, though a man by spirading may in some cases lose his property, the law will not fuffer him by fuch niceties to chis life. However, upon this doubt, demurrers indictments are feldom used: fince the same admages may be taken upon a plea of not guilty; or grwards in arrest of judgment, when the verdict echablished the fact. III. A plea in abatement principally for a misnomer, a wrong name, or a le addition to the prisoner. As, if James Allen, otleman, is indicted by the name of John Allen, sire, he may plead that he has the name of ines, and not of John; and that he is a gentle-in, and not an efquire. And, if either fact is and by a jury, then the indictment shall be ai'ed, as writs and declarations may be in civil lions. But, in the end, there is little advantage cruing to the prisoner by means of these dilato-'pleas: because, if the exception be allowed, a w bill of indictment may be framed, according what the prisoner in his plea avers to be his ue name and addition. For it is a rule, upon pleas in abatement, that he who takes advange of a flaw, must at the same time show how may be amended. Let us therefore next conler a more substantial kind of plea, viz. IV. second pleas in bar; which go to the merits of e indictment, and give a reason why the prisonought not to answer it at ail, nor put himself on his trial for the crime alleged. These are 4 kinds: a former acquittal, a former convicon, a former attainder, or a pardon. There are any other pleas which may be pleaded in bar of appeal: but these are applicable to both apcais and indictments. 1. First, the plea of au-"foits acquit, or a former acquittal, is grounded n this univerful maxim of the common law of ingland, that no man is to be brought into jeoandy of his life, more than once, for the same ffence. And hence it is allowed as a confequence, hat when a man is once fairly found not guilty pon any indicament, or other profecution, be-

fore any court having competent jurisdiction of the offence, he may plead such acquittal in bar of any subsequent accusation for the same crime. 2. Secondly, the plea of auterfoits convict. or a former conviction for the same identical crime, tho no judgment was ever given, or perhaps will be, (being suspended by the benefit of clergy or other causes,) is a good plea in bar to an indictment. And this depends upon the fame principle as the former, that no man ought to be twice brought in danger of his life for one and the same crime... 3. Thirdly, the plea of auterfoits attaint, or a for, mer attainder, is a good plea in bar, whether it be for the same or any other felony. For whereever a man is attainted of felony, by judgment of death either upon a verdict or confession, by outlawry, or heretofore by abjuration, and whether. upon an appeal or an indictment; he may plead fuch attainder in bar to any subsequent indictment. or appeal, for the same or for any other felony. And this because, generally, such proceeding on a fecond profecution cannot be to any purpofe; for the prisoner is dead in iaw by the first attainder, his blood is already corrupted, and he hath forfeited all that he had: fo that it is abfurd and fuperfluous to endeavour to attaint him a fecond time, Tho' to this general rule, as to all others, there are fome exceptions; wherein, ceffante ratione, ceffat et ipsa lex. 4. Lastly, a pardon may be pleaded in har; as at once destroying the end and purpose of the indictment, by remitting that punishment, which the profecution is calculated to in-There is one advantage that attends pleading a pardon in bar, or in arrest of judgment, before sentence is past; which it gives by much the preference to pleading it after fentence or attain-This is, that by stopping the judgment it der. stops the attainder, and prevents the corruption of the blood: which, when once corrupted by attainder, cannot afterwards be reftored otherwise than by act of parliament. V. The general issue, or plea of not guilty, upon which plea aione the prisoner can receive his final judgment of death. In case of an indictment of selony or treason, there can be no special justification put in by way of plea. As, on an indictment for murder, a man cannot plead that it was in his own defence against a robber on the highway, or a burglar; but he must plead the general issue, Not guilty, and give this special matter in evidence. For (besides that these pleas do in effect amount to the general isfue; fince, if true, the prisoner is most clearly not guilty) as the facts in treafon are laid to be done proditorie et contra ligeantiæ fue debitum; avd, in felony, that the killing was done felonice; these charges, of a traiterous or felonious intent, are the points and very gift of the indictment, and must be anfwered directly, by the general negative, Not guilty; and the jury upon the evidence will take notice of any defensive matter, and give their verdict accordingly as effectually as if it were or could be specially pleaded. So that this is, upon ad accounts, the most advantageous plea for the profon-When the prisoner hath thus pleaded not guity, non culpabilis, or nickt culcable: which was formerly used to be abbreviated upon the minutes, thus, Non (or ment) cul. the elerk of the allize, or clerk of arraigns, on behalf of the crown repocs,

\* To PLEACH. v. a. [pleffer, Fr.] To bend; A word not in use. to interweave.

Would'st thou be window'd in great Rome,

and fee Thy master thus, with pleacht arms, bending down His corrigible neck? Shak. Steal into the pleached bower. Shak.

(1.) \* To PLEAD. v. n. [plaider, Fr.] 1. To argue before a court of justice.

To his acculations He pleaded still not guilty. -O that one might plead for a man with Get, as a man pleadeth for his neighbour. John

Let others govern or defend the flate, Plead at the bar or manage a debate. Gun -Lawyers and divines write down thort note; by preach or plead. Watts. 2. To fpeak in an argo mentative or perfualive way for or againft; torefon with another.-

To plead for that, which I would not obtain.

-Who is he that will *plead* with me? Job--If nature plead not in a parent's heart,

Pity my tears, and pity her defert. Date -It must be no ordinary way of reasoning, as man that is pleading for the natural power of begs. Locke. 3. To be offered as a plea .-

Since you can love, and yet your error let, The same resisties power may plead for me.

(2.) \* To PLEAD. v. a. I. To defend; to en

Our swords shall plead it in the field. Sink 2. To allege in pleading or argument-Thr could not juftly plead law of nations, for the were not lawful enemies. Spenfer .- They will have against me thy reproach. Job, xix. 5. 3. Ted fer as an excuse.- I will neither plead my w fickness, in excuse of faults. Dryden.

PLEADABLE. adj. [from plead.] Capable to be alleged in plea. - This privilege is that the law. Dryden.

Might ftop our countryman. So fair a pleader any cause may gan. Int (1.) \* PLEADING. n. f. (from please) ba w form of pleading.

If the heavenly folk should know

500 These pleadings in the court below. (2.) PLEADINGS, in law, are the mutual alice cations between the plaintiff and defendant in PROCESS, SUIT, and WRIT.) They form I'm third part or stage of a fact; and at prefert or fet down and delivered into the proper office? writing, though formerly they were usual see in by their council ore tenus, or viva ver, ! court, and then minuted down by the chief tents or prothonotaries; whence, in old law fined the pleadings are frequently denominated in The first of these is the declaration, name or count, anciently called the tale; in which plaintiff fets forth his cause of complaint at king being indeed only an amplification or exposing of the original writ upon which his action is to ded, with the additional circumstances of tore and place, when and where, the injury est committed. In local actions, (fays judge Badstone) where the possession of land is to be to

vered, or damages for an actual trespass, or for itte, &c. affecting land, the plaintiff must lay his claration or declare his injury to have happenin the very county and place that it really did ppen; but in transitory actions, for injuries that ght have happened anywhere, as debt, detinue, nder, and the like, the plaintiff may declare in at county he pieales, and then the trial must in that county in which the declaration is laid. lough, if the defendant will make affidavit that cause of action, if any, arose not in that but ther county, the court will direct a change of were or vifue (that is, the vicinia or neigharhood in which the injury is declared to be nc), and will oblige the plaintiff to declare in proper county. For the statute 6. Ric. II. c. niving ordered all writs to be laid in their procounties, this, as the judges conceived, imrered them to change the venue, if required, I not to infift rigidly on abating the writ: ich practice began in the reign of James I. d this power is discretionally exercised, so as to cause but prevent a defect of justice. refore the court will not change the venue to of the four northern counties previous to the ng circuit; because there the affizes are holonly once a-year, at the time of fummer cir-L. And it will fometimes remove the venue n the proper jurisdiction (especially of the narand limited kind), upon a fuggeftion, duly ported, that a fair and impartial trial cannot had therein. It is generally usual, in actions on the cafe, to fet forth feveral cafes, by differcounts in the same declaration; so that if the intiff fails in the proof of one, he may succeed nother. As in an action on the case upon an UMPSIT for goods fold and delivered, the ntiff usually counts or declares, first, upon a led and agreed price between him and the delant; as, that they bargained for 201.: and he should fail in the proof of this, he counts wife upon a quantum valebant; that the delant bought other goods, and agreed to pay so much as they were reasonably worth: and lavers that they were worth other 201, and fo 13 or 4 different fliances; and at-last concludes declaring, that the defendant had refuled and any of these agreements, whereby he is imaged to fuch a value. And if he proves the laid in any one of his counts, though he fails ie rest, he shall recover proportionable dama-

This declaration always concludes with e words, " and thereupon he brings fuit," &c. producit fellam, Ge. By which words, fuit or , (a fequendo) were anciently understood the eiles or followers of the plaintiff. Por in fortimes, the law would not put the defendant he trouble of answering the charge till the ttill had made out at least a probable case, the actual production of the fult, feda, or fol-rs, is now antiquated, and hath been totally led, ever fince the reign of Edward III. though form still continues. At the end of the deition are added also the plaintiff's common lges of profecution, John Doe and Richard ; which, as eliewhere observed, (See WRIT), now mere names of form; though formerly were of use to answer to the king for the

amercement of the plaintiff, in case he were nonfuited, barred of his action, or had a verdict and judgment against him. For if the plaintiff neglects to deliver a declaration for two terms after the defendant appears, or is guilty of other delays or defaults against the rules of law in any subsequent stage of the action, he is adjudged not to follow or purfue his remedy as he ought to do; and thereupon a non/mit, or non projequitur, is entered, and he is faid to be non-p of d. And for thus deferting his complaint, after making a faife claim or complaint (pro fulfo clamore fuo), he shall not only pay cofts to the defendant, but is liable to be amerced to the king. A retrant differs from a nonfuit, in that the one is negative and the other positive: the nonsuit is a default and neglect of the plaintiff, and therefore he is allowed to hegin his fuit again upon payment of costs; but a retraxit is an open and voluntary renunciation of his fuit in court; and by this he for ever lofes his action. A discontinuance is somewhat similar to a nonfuit; for when a plaintiff leaves a chalm in the proceedings of his cause, as by not continuing the process regularly from may to day, and time to time, as he ought to do, the fuit is discontinued, and the defendant is no longer bound to attend; but the plaintiff must begin again, by fuing out a new original, usually paying collecto his antagoing. When the plaintiff hath stated his cafe in the declaration, it is incumbent on the detendant. within a reasonable time, to make his defence, and to put in a plea; or elfe the plaintiff will at once recover judgment by default, or nibil dicit, of the defendant. Defence, in its true legal fenfe, fignifies not a justification, protection, or guard, which is now its popular fignification; but merely an opposing or denial (from the French verb defendre) of the truth or validity of the complaint. It is the contessatio litis of the civilians: a general affection that the plaintiff hath no ground of ace tion; which affertion is afterwards extended and maintained in his piea. Before defence made, if at all, cognizance of the fuit must be claimed or demanded; when any person or body corporate hath the franchife, not only of holding pleas within a particular limited jurisdiction, but also of the cognizance of pleas; and that either with-out any words exclusive of other courts, which entities the iord of the franchise, whenever any fuit that belongs to his jurisdiction is commenced in the courts of Westminster, to demand the cognizance thereof; or with fuch exclusive words, which also entitle the defendant to plead to the jurisdiction of the court. Upon this claim of cognizance, if allowed, all proceedings shall cease in the superior court, and the plaintiff is left at liberty to purfue his remedy in the special jurisdiction, As, when a scholar or other privileged person of the univerfities of Oxford or Cambridge is impleaded in the courts at Westininster, for any cause of action whatsoever, unless upon a question of freehold. In these cases, by the charter of those learned bodies, confirmed by act of parhament, the chancellor, or vice chancellor, may put in a claim of cognizance; which, if made in due time and form, and with due proof of the facts alleged, is regularly allowed by the courts. It must be demanded before full desence is made

Imparlance prayed; for these are a submission to the jurisdiction of the superior court, and the delay is the lacker in the lord of the franchise: and it will not be allowed if it occasions a failure · of justice, or if an action be brought against the person himself who claims the franchise, unless he hath also a power in such case of making another Judge. After defence made, the defendant must put in his plea. But before he defends, if the fuit is commenced by capias or latitat, without any special original, he is entitled to demand one imparlance, or licentia loquendi; and may, before he pleads, have more granted by confent of the court, to see if he can end the matter amicably without farther fuit, by talking with the plaintiff: a practice which is supposed to have arisen from a prin--ciple of religion, in obedience to that precept of the gospel, " agree with thine adversary quickly, whilft thou art in the away with him." And it may be observed that this gospel precept has a plain reference to the Roman law of the XII. tables, which expressly directed the plaintiff and defendant to make up the matter while they were in the way, or going to the prætor; in via remuti pacent orato. There are also many other previous steps which may be taken by a defendant before he puts in his plea. He may, in real actions, demand a view of the thing in question, to ascertain its identity and other circumstances. He may crave over of the writ, or of the bond, or other specialty upon which the action is brought; that is, to hear st-read to him; the generality of defendants in the times of ancient simplicity being supposed ineapable to read it themselves: whereupon the whole is entered werbatim upon the record; and the defendant may take advantage of any condition, or other part of it, not stated in the plaintiff's declaration. In real actions also the tenant may pray in aid, or call for the assistance of another, to help him to plead, because of the seebleness or imbecility of his own effate. Thus a tenant for life may pray in aid of him that hath the inheritance in remainder or reveifion; and an incumbent may pray in aid of the patron and ordinary; that is, that they shall be joined in the action, and help to defend the title. Voucher also is the calling in of some person to answer the action, that hath warranted the title to the tenant or defendant. This is made still use of in the form of common recoveries, which are grounded on the writ of entry; a species of action that relies chiefly on the weakness of the tenant's title, who therefore vouches another person to warrant it. the vouchee appears, he is made defendant instead of the voucher; but if he afterwards makes default, recovery shall be had against the original defendant; and he shall recover an equivalent in value against the deficient vouchee. In assizes, indeed, where the principal question is, whether plication may confess and avoid the pleas the the demandant or his ancestors were or were not in possession till the ouster happened, and the title of the tenant is little (if at all) discussed, there no voucher is allowed; but the tenant may bring a writ of warrontia charte against the warrantor, to compel him to affift him with a good plea or defence, or elfe to render damages and the value of the land, if recovered against the tenant. In many real actions and, brought by or against an

infant under the age of 21 years, and also be tions of debt brought against him, as heir to ar deceased ancestor, either party may suggestive nonage of the infant, and pray that the procesings may be deferred till his full age, or, are legal phrase, that the infant may have his age, at that the parol may demur, that is, that the perings may be staid; and then they shall not proeced till his full age, unless it be apparent that: cannot be prejudiced thereby. But by the letutes of Westm. 1. 3. Edw. I. c. 46. and or 1. cefter, 6 Edw. I. c. 2. in writs of entry for high in some particular cases, and in actions an conbrought by an infant, the parol that not dense; otherwise he might be deforced of his white: perty, and even want a maintenance, till le tille of age. So likewise in a writ of dower the: that not have his age; for it is necellary that it: widow's claim be immediately determined to the may want a prefent fublishence. Nor flow a infant patron have it in a quare impedit, face the law holds it necessary and expedient that the church be immediately filled. Whenth k irceedings are over, the defendant multilet page his excuse or plea. See PLEA. No man is a least to plead specially such a plea as amounts out? the general iffue, or a total denial of thethat ; but in such case he must plead the general these terms, whereby the whole question is destile a jury. But if the defendant, in an affect ? tion of trespals, with to refer the validity of !title to the court rather than the jung & Ell flate his title specially; and give color to the plaintiff, or suppose him to have an appearance. colour of title. As if his own true title is the it claims by feoffment with livery from A, by hat of which he entered on the larels in quelien to cannot plead this by itself, as it amounts to so more than the general illue. But he my be this specially, provided he goes farther, of the that the praintiff claiming by colours 1 past deed of feoffment, without livery, ented; upon whom he entered; and may then rein to the judgment of the court which of these two tries the best in point of law. When the place the defendant is thus put in, if it does not amount a total contradiction of the declaration, but us ! evades it, the plaintiff may plead again, and reto the defendant's plea: Either travering it. 1. totally denying it; as if, on an action of debt 124 bond, the defendant pleads folvit ad dien, that a paid the money when due; here the plantif 4 his replication may totally traverse this pica denying that the defendant paid it: Or it me allege new matter in contradiction to the ire dant's plea; as when the defendant pleads \$1.2 ward made, the plaintiff may reply, and fe set an actual award, and affign a breach: Orthe new matter or distinction; as in an admits trespassing upon land whereof the plainting ed, if the defendant shows a title to the led !! defcent, and that therefore he had a nght be ter, and gives colour to the plaintiff, the plant may either traverse and totally deny the tid the defcent; or he may confess and and and the replying, that true it is that fuch descent bas?" ed, but that fince the descent the defendant

f demised the lands to the plaintiff for term of t. To the replication the defendant may rejoin, put in an answer casted a rejoinder. The plainmay answer the rejoinder by a fur-rejoinder; on which the defendant may rebut, and the untiff answer him by a fur-rebutter. Which tas, replications, rejoinders, fur-rejoinders, retters, and fur-rebutters, answer to the exceptio, vicatio, duplicatio, triplicatio, and quadrupkeatio, the Roman laws. The whole of this process is sominated the pleading; in the several stages of ich it must be carcfully observed, not to depart vary from the title or defence which the party sonce infifted on. For this (which is called a arture in pleading) might occasion endless al-Therefore the replication must supit the declaration, and the rejoinder must supit the plea, without departing out of it. As in case of pleading no award made in conseence of a bond of arbitration, to which the piainreplies, fetting forth an actual award; now defendant cannot rejoin that he bath performthis award, for fuch rejoinder would be an endeparture from his original plea, which allegthat no fuch award was made: therefore he snow no other choice, but to traverse the fact the replication, or eife to demur upon the law it. Again, every plea must be simple, entire, meded, and confined to one fingle point: it il never be entangled with a variety of distinct ependent answers to the same matter; which it require as many different replies, and introera multitude of iffues upon one and the fame pute. For this would oft a embarrass the y, and sometimes the court itself, and at all eits would greatly enhance the expence of the ties. Yet it frequently is expedient to plead such a manner as to avoid any implied admisa of a fact which cannot with propriety or fafebe politively affirmed or denied. And this may done by what is called a protestation; whereby party interpoles an oblique allegation or de-I of some fact, protesting that such a matter es or does not exist; and at the same time oiding a direct affirmation or denial. 3ir Edrd Coke hath defined a protestation to be, " an lution of a conclution." For the use of it is, are the party from being concluded with re-It to forme fact or circumstance which cannot directly affirmed or denied without falling into olicity of pleading; and which yet, if he did thus enter his protest, he might be deemed to e tacitly waved or admitted. So if a defento by way of inducement to the point of his ruce, alleges a particular mode of feifin or tee which the plaint if is unwilling to admit, and defires to take itlue on the principal point of defence, he must deny the session or tenure by t of protestation, and then traverse the defenmatter. So, laftly, if an award be fet forth the plaintiff, and he can affign a breach in one t of it, and yet is atraid to admit the performe of the reft of the award, or to aver in genea non-performance of any part of it, left fomeig should appear to have been performed; he y fave to himfelf any advantage he might hereit make of the general non-performance, by al-

OL. XVII. PART IL

leging that by protestation, he can plead only the non-payment of the money. In any stage of the pleadings, when either fide advances or affirms any new matter, he usually avers it to be true; " and this he is ready to verify." On the other hand, when either fide traverses or denies the facts pleaded by his antagonist, he usually tenders an iffue, as it is called; the language of which is different according to the party by whom it is tendered: for if the traverse or denial comes from the defendant, the islue is tendered in this manner, " And of this he puts himself upon the country," thereby fubmitting himself to the judgment of his peers: but if the traverse hes upon the plaintiff, he tenders the issue or prays the judgment of the definition of the ment of the peers against the defendant in another form; thus, " and this he prays may be inquired of by the country." But if either fide pleads a special negative plea, not traversing or denying any thing that was before alleged, but disclosing some new negative matter; as where the fuit is on a band conditioned to perform an award, and the defendant pleads, negatively, that no award was made; he tenders no issue upon this plea, because it does not yet appear whether the fact will be disputed, the plaintiff not having yet afferted the exiftence of any award: but when the plaintiff replies, and fets forth an actual specific award, if then the defendant traveries the replication, and denies the making of any fuch award, he then, and not before, tenders an iffue to the plaintiff. For when in the course of pleading they come to a point which is affirmed on one fide and denied on the other, they are toen faid to be at iffue, all their debates being at last contracted into a single point, which must now be determined either in favour of the plaintiff or of the defendant. See Issue, & r and 2.

(i.) \* PLEASANCE. n. f. [pleasance, French.] Gaiety; pleasantry; merriment. Obsolete .-The lovely pleasance and the losty pride.

Wanting grace in utt'ring of the lame, That turned all her pleasance to a scoffing game.

Spenfer. -Oh that we should with joy, pleasance, revel and applaule, transform ourselves into beasts! Sbak.

(2.) PLEASANCE, in geography, a village adjacent to Edinburgh, being part of its suburbs, leading S. from the foot of the Cowgate and of St Mary's Wynd to Dalkeith, &c.
(1.) PLEASANT. adj. [plaifant, French.] 1.

Delightful; giving delight.

The gods are just, and of our pleasant vices Make inflruments to feourge us. What most he should dislike, seems pleasant to him;

What like, offentive. -How fleafant it is for brethren to dwell in unity! Pjalms. Verdure clad

Her universal face with pleasant green. Miltone 2. Grateful to the fenfes.-

Fruits of palm-tree pleasantest to thirft. Milton.

3. Good-humoured; cheerful.-In all thy humours, whether grave of mellow, Pppp Thou ..

Thou'rt fuch a touchy, testy, pleasant scllow.

Addison. 4. Gay; lively; merry.-Let neither the power nor quality of the great, or the wit of the pleafant, prevail with us to flatter the vices, or applaud the prophaneness of wicked men. Rogers. 5. Trifling; adapted rather to mirth than ule.— They, who would prove their idea of infinite to be politive, feem to do it by a plea ant argument, taken from the negation of an end, which being negative, the negation of it is positive.

(2.) PLEASANT BAY, and a bay and river of (3.) PLEASANT RIVER, the United States, The river runs into the bay, in Lon.

in Maine. The river runs into the bay, in 67. 40. W. Lat. 44. 35. N. \*PLEASANTLY. adv. [from pleasant.] fuch a manner as to give delight. 2. Gayly; merrily; in good humour .- King James was wont pleasantly to say, that the duke of Buckingham had given him a fecretary, who could neither write nor read. Clarendon. 3. Lightly; ludicroufly.-Eustathius is of opinion, that Ulysses speaks pleasantly to Elpenor. Broome.

\* PLEASANTNESS. n. f. [from pleafant.] 1. Delightfulness; state of being pleasant.—Doth not the pleasantness of this place carry in itself sufficient reward? Sidney. 2. Gaiety; cheerfolness; merriment.-It was refreshing, but composed, like the pleasantness of youth tempered with the gravity of age. South.—He would fain put on some

pleasantness. Tillotson.

\*PLEASANTRY. n. f. [plaisantrie, French.]

1. Gaiety; merriment.—The harshness of reasoning is not a little foftened and fmoothed by the infusions of mirth and pleasantry. Addison.—Such kinds of pleasantry are difingenuous in criticism. Addison. 2. Sprightly faying; lively talk.—The grave abound in pleasantries, the dull in repartees. Spectator.

(1.) To PLEASE. v. a. [placeo, Latin; plaire, French.] 1. To delight; to gratify; to humour. -They please themselves in the children of strangers. If. ii. 6. A whistling wind, or a pleasing fall of water running violently. H'ifdom, xvii. 18.

Thou can'it not be so pleas'd at liberty, As I shall be to find thou dar'st be free. Dryd. Leave such to trifle with more grace and ease, Whom foily pleases, and whose follies please.

2. To fatisfy; to content.-Establish him in his true sense again,

And I will please you what you will demand.

What next I bring shail please

Thy with exactly to thy heart's defire. Milton. 3. To obtain favour from; to be pleased with, is to approve; to favour.-This is my beloved fon, in whom I am well pleased. Matt.—I have seen thy face and thou wast pleased with me. Gen .-

Who can please him long? 4. To be Pleased. To like. A word of ceremony.-Many of our most skiiful painters were pleased to recommend this author to me. Dryden.

(2.) \* To PLEASE. v. n. 1. To give pleasure .-What pleasing seem'd, for her now pleases

I found fomething that was more pleafing in them, than my ordinary productions. Dryden. 2. To gain

approbation .- Their wine offerings thall not be pleasing unto him. Hosea. 3. To like; to chuk-

Spirits, freed from mortal laws, with each Assume what sexes and what shapes they mix

4. To condescend; to comply. A word dienmony.-

Please you, lords,

In fight of both our battles we may meet. Stat The first words that I learnt were, to expens my defire that he would please to give me my berty. Savift.

\* PLEASEMAN. n. f. [ please and man.] A

pickthank; an officious fellow.

Some carry-tale, some pleasemen, some light zany,

That knows the trick to make my lady both Told our intents.

\* PLEASER. n. f. [from please.] On the courts favour.

PLEASING, ART OF. See POLITERESS.

\* PLEASINGLY. adv. [from pleafing.] In inch a manner as to give delight .- Pleafingh treeble. fome thought and remembrance have been to be fince I left you. Suckling.

Thus to herfelf the pleafingly begin. Mit. -The end of the artist is pleasingly to decome ix

eye. Dryden.-

He gains all points, who pleafingly commits, Surprises, varies, and conceals the boards

\* PLEASINGNESS. m. f. [from pleafing.] Qui-

lity of giving delight. PI.EASURABLE. adj. [from planfart] Dr. lightful; full of pleasure .- Planting of orchards is very profitable, as well as pleasurable. Ber --It affords a pleasurable habitation in every pur Brown.

Each mutually correcting each, creat A pleasurable medley.

Our ill-judging thought

Hardly enjoys the pleafurable talle. (1.) \* PLEASURE. n. f. [plaifir, French] 1 Delight; gratification of the mind or kild-Pleafure, in general, is the confequent apprehafion of a fuitable object, fuitably applied to 1 rightly disposed faculty. South.-A cauk pr. taking pleasure in the fins of others, is, that porfpiritedness that accompanies guilt. South-

Her name with pleasure once she taught the

Now Daphne's dead, and pleasure is no man

Loofe gratification.—

Convey your pleasures in a spacious pleasures And yet feem cold. -Behold yon dame does shake the head war

of pleasure's name. Shak .-

Not funk in carrial pleasure. 3. Approbation.-The Lord taketh plesin ! them that fear him. Pfalms. 4. What the dictates.-Ule your pleasure; if your love box persuade you to come, let not my letter. He will do his pleasure on Babylon. If 13rm. Choice; arbitrary will .- Arbitrary calculations and fuch as vary at pleafure. Brown-

Upon the rest at pleasure he descends Drd. Dogos Raise tempests at your pleasure. \_11:

Te can at pleasure move several parts of our

ies. Locke.—All the land was disposed by them

rding to their pleasure. Arbuthnot.

.) PLEASURE. See HAPPINESS and MORAL LOSOPHY, Part II. Sect. II. To what is aly faid on this fubject under thefe articles, we only add a fingle reflection or two upon inqual pleasure. " If we compare (says M. Vol-) the pleasures of sense with those which are ly intellectual, we shall find that the latter are itely superior to the former, as they may be yed at all times and in every fituation of life. it are the pleasures of the table, says Cicero, aming, and of women, compared with the hts of fludy? This talle increases with age, no happiness is equal to it. Without knowand study, says Cato, life is almost the i-of death. The pleasures of the soul are such it is frequent to fee men preserve their gaiety ig their whole life, notwithstanding a weak sed and debilitated body. SCARRON was an iple of this."—There are pleasures on which, nind may fecurely reft, which elevate a man e himself, dignify his nature, fix his attention electial objects, and render him fit to enjoy . These are to be found in true religion, h procures for its followers inexpressible hapis in a better world, and in the present state xistence, affords a consolation under every ortune.

To PLEASURE. v. a. [from the noun.] To fe; to gratify. This word, though supporty good authority, is, I think inclegant.

Things, thus fet in order, all further thy harvest, and pleasure thee best.

Tuffer. count it one of my greatest afflictions that I

10t pleasure such an honourable gentleman. If what pleases him, shall pleasure you,

ght closer. Shak. then the way of pleasuring and displeasuring by the favourite, it is impossible any should rergreat. Bacon.-

Nay, the birds rural music too

ias melodious and as free,

s if they fung to pleasure you. Cowley. othing is difficult to love; it will make a man s his own inclinations to pleasure them whom oves. Tillesson.

PLEASUREFUL. adj. [pleasure and full.] Pleas ; delightful. Obsolete.-This country bath reputed a very commodious and pleasureful

ntry. Abbot.

LEAUX, a town of France, in the dep. of tal, 71 miles SW. of Mauriac, and 25 NW. uriliac.

·)\* PLEBEIAN. n. s. [plebeien, Fr. plebius, Lat.]

of the lower people.-

You're plebeians, if they be senators. pon the least intervals of peace, the quarrels ween the nobles and the plebeians would re-. Swift.

1.) \* PLEBEIAN. adj. 1. Popular; confifting of in persons.—As swine are to gardens, so are luits to parliaments, and plebeian concourfes publick counsels. King Charles. 2. Belonging the lower ranks .---

In shew plebeian angel militant

Of lowest order. Milton. 3. Vulgar; low; common.—To apply notions philotophical to plebeian terms; or to fay, where the notions cannot fitly be reconciled, that there wanteth a term or nomenclature for it, as the ancients used, they be but shifts of ignorance. Bacon. The differences of mouldable and not mouldable, feissible and not seissible, are plebeian notions. Bacon.

A queen! and wn a base plebeian mind!

Druden.

(3.) PLEBEIANS. The ancient Romans were divided into patricians, and plebeians. distinction was made by Romulus the founder of the city; who confined all dignities fenatorial, civil, military, and facerdotal, to the rank of patricians. But to prevent the seditions which fuch a diffinction might produce through the pride of the higher order, and the envy of the lower, he endeavoured to engage them to one another by reciprocal ties and obligations. Every plebeian was allowed to choose, out of the body of the patricians, a protector, who should be obliged to affift him with his interest and substance, and to defend him from oppression. These protectors were called patrons; the protected eli-ents. (See Client, § 2, and Patron, § 3.) But though the attachment between the patrons and clients continued inviolate for above 600 years, yet during the greater part of the republic, the struggle between the Patricians and Plebians was frequent and violent. See Rome.

PLECH, a town of Franconia, in Culmbach,

21 miles S. of Pegnitz.

PLECHATEL, a town of France, in the dep. of Ille and Vilaine; 43 miles NW. of Bain, and

13 S. of Rhennes.

PLECTRANTHUS, in botany: a genus of the gymnosperinia order, belonging to the didynamia class of plants; and in the natural method ranking under the 42d order, Verticillate. calyx is monophyllous, short, and bilabiated; the upper lip of which is large, oval, and bent upwards; the inferior lip is quadrifid, and divided into two lacinize: the corolla is monopetalous, ringent, and turned back; the labize look different ways, and from the base of the tube there is a nectarium like a spur: the filaments are in a declining fituation, with fimple antherse: the fly-lus filirorm; the fligma bifid. It has four feeds covered only by the calyx. There are two specics, viz.

1. PLECTRANTHUS FRUTICOSUS, a native of the Cape of Good Hope. It flowers from June

to September.

2. PLECTRANTHUS PUNCTATUS, a native of Africa. It flowers from January to May.

PLECTRONIA, in botany, a genus of the monogynia order, belonging to the pentandria class of plants.

PLEDELIAC, a town of France, in the dep. of the North Coasts, 5 miles E. of Lamballe, and

13 W. of Dinan.

(1.) \* PLEDGE. n. f. [pleige, Fr. pieggio, Ital.] 1. Any thing put to pawn. 2. A gage; any thing given by warrant or fecurity; a pawn.—The great humility, zeal and devotion, which appeared to Pppp2

be in them, was in all men's opinion a pledge of their harmless meaning. Hooker.

There is my pledge, I'll prove it on thy heart. Shak.

That voice their liveliest pleage Milton. Of hope in fears and dangers.

-Money is necessary both for counters and for

pledges. Locker-

Aribert shall be the pledge of peace. Roave. -The deliverance of Ifrael out of Egypt by the ministry of Moles, was intended for a type and pleage of the spiritual deliverance which was to come by Christ. Nelfon. 3. A furcty; a bail; an hostage.-The Guianians offered to leave pledges, fix for one. Raleigh.-

Good sureties will we have for thy return,

And at thy pledges' peril keep thy day. Dryden. (2.) PLEDGE, in Scots Law. See Law, Part

III. Chap. II. Sed. XIII, § 13.
(3.) PLEDGE; [plegius.] in common law, is a furety or gage, either real or personal, which the plaintiff or demandant is to find for his profecuting the fuit.

(4.) PLEDGE, FRANK. See FRANK, No II. 6 7, 8. 5. PLEDGES OF GOODS for money. See PAWN.

(1.) \* To PLEDGE. v. a. [ pleiger, Fr. pieggiare, Italian.] 1. To put in pawn.-

He pledg'd it to the knight; the knight had wit, So kept the diamond, and the rogue was bit.

2. To give as warrant or security. 3. To secure by a pledge.-

Here to pledge my vow, I give my hand.

Sbak. 4. To invite to drink, by accepting the cup or health after another.-

The fellow, that parts bread with him and

pledges

The breath of him in a divided draught, Is the readiest man to kill him.

Shak. To you noble lord of Westmoreland.

Shak. -1 pledge your grace. -That flexanimous orator began the king of Homebia's health; he presently pledg'd it. Howel-

Here's to thee, Dick; this whining love defpife;

Pledge me, my friend. Cowley. (2.) To PLEDGE, v. a. in drinking denotes to warrant, or be furely to one, that he shall receive no harm while he is taking his draught, The phrase is referred by our antiquaries to the practice of the Danes, heretofore in England,

who frequently used to stab or cut the throats of the natives while they were drinking. PLEDGERY, or Pleggery, n. f. in law, furetifhip, or an undertaking or answering for an-

other.

(1.) \* PLEDGET. n. f. [plaggle, Dutch.] A finall mais of lint.-I applied a pledger of bafilicon. Wi'eman.

(2.) PLIDGET, BOLSTER, or COMPRESS, in furgery, 1s'a kind of 'flat tent laid over a wound to

imbibe the superstuous humours, and to keep it PLEDRAN, a town of France, in the dep. of

the North Coufts, 4 miles S. of St Bricux, and 9

W. of Lamballe.

PLEGGERY. See PLEDGERY.

(1.) \* PLEIADS. PLEIADES. n. f. [pleiade; Lt. همنيكين.] A northern conficilation,

The pleiades before him danc'd. E. Then failors quarter'd heav'n, and forst:

For pleiades, hyades, and the northern car. Inc. (2.) Pleiades, in aftronomy, an affembling & feven stars in the neck of the constellation Tarus. They are thus called from the Greek rus, navigare, to fail; as being terrible to mariners by reason of the rains and storms that frequently the with them. The Latins called them wither, from ver, fpring; because of their rising about the time of the vernal equinox. The largel and the third magnitude, and is called lacide pla-

(3. PLEIADES, in the mythology, the feet daughters of Atlas king of Mauritania and Poone, thus called from their mother. They were Maia, Electra, Taygete, Asterope, Merope, lla eyone, and Ceiœno; and were also called Aller-These princelles von tides, from their father, carried off by Busiris king of Egypt; but Herevles having conquered him, delivered them to their father: yet they afterwards fuffered a new priscution from Orion, who purfued them for protill Jove, being prevailed on by their prayer, box them up into the heavens, where they form to constellation which bears their name. Matawatte mother of Mercury by Jupiter.

PLEMET, a town of France, in the dep. the North Coults; 6 miles E. of Loudesc, 26 17 S. of Lamballe.

PLEMMYRIUM, in ancient geography, 2 Pr mentory of Syracuse with a castle: (Fig. Et .: 693) now called Massa Oliveri. PLEMONIA

PLEMONT, a cape of the island of Jersey, 8 miles NW. of Helier.

PLEMY, a town of France, in the dep. of the North Coasts, 10 miles N. of Loudeac, and 10 S.

\* PLENARILY. adv. [from plenary.] Fully; completely.—The cause is made a plenary cause, and ought to be determined plenarily. Ayliffe.

PLENARINESS. n. s. [from plenary.] Fulness; completeness.

(1.) \* PLENARY. adj. [from plenus, Lat.] Full; complete. - I am far from denying that compliance on my part, for plenary confent it was not, to his lestruction. King Charles.—The cause is made a Menary cause. Aglisse.—A treatise on a subject hould be plenary or full. Watts.

(2.) \* PLENARY. n. f. Decifive procedure .aftitution without induction does not make a pleary against the king. Ayliffe.

(3.) PLENARY INDULGENCES. See INDUL-

JENCE, § 2.

PLENEE, a town of France, in the dep. of the Yorth Coasts; 6 miles NW. of Brooms, and 74 E. of Lamballe.

PLENEUF, a town of France, in the dep. of he North Coasts; 7 miles N. of Lamballe, and o WNW. of Dinan.

PLENILUNARY. adj. [from plenilunium, Lain.] Relating to the full moon.—If we add the wo Egyptian days in every month, the interlunany and plenilumary exemptions, there would arise above 100 more. Brown's Vulgar Errours.

PLENIPOTENCE. n. f. [from plenus and

Fulness of power. vientia, Lat.]

PLENIPOTENT. adj. [plenipotens, Lat.] Inthed with full power.-

My substitutes I fend you, and create

Plenipotent on earth. Milton's Par. Loft. (1.) \* PLENIPOTENTIARY. n. f. [ plenipotenare, Fr.] A negotiator invested with full pow-They were only the [plenipotentiary monks of k patriarchal monks. Stilling fleet.

(2.) PLENIPOTENTIARY. See AMBASSADOR.

PLENIST. n. f. [from plenus, Latin.] One at holds all space to be full of matter.—Those aces, which the vacuifts would have empty, beuse devoid of air, the plenists do not prove reenished with subtle matter by any sensible effects.

(1.) PLENITUDE. n. f. [plenitudo, from plevacuity.-If there were every where an absote plenitude and denfity without any pores be-'cen the particles of bodies, all bodies of equal mentions would contain an equal quantity of itter, and confequently be equally ponderous. miles. 2. Repletion; animal fulness; plethory.thaxation from plenitude is cured by spare diet. 3. Exuberance; abundance.—The nitude of the pope's power of dispensing was thain question. Bacon's Henry VII. 5. Comtenels.-

The plenitude of William's fame Can no accumulated stores receive. Prior.(2.) PLENITUDE, in medicine, chiefly denotes

edundancy of blood and humours. • PLENTEOUS. adj. [from plenty.] 1. Copi-3; exuberant; abundant; plentiful.—

Now plenteous these acts of hateful strife. Milt. Lab'ring the fuil and reaping plenteous crop. Milton.

Two plenteous fountains the whole prospect

2. Fruitful; fertile.—Take up the fifth part of the land in the feven plenteous years. Genefis, xli. 35.

\* PLENTEOUSLY. adv. [from plenteous.] Copioully; abundantly; exuberantly; plentifully.-Thy due from me is tears,

Which nature, love and filial tenderness

Shall, O dear father, pay thee plenteoufly. Shak. Each that crept, which plenteoufly

The waters generated. Milt. Par. Loft. God proves us in this life, that he may the more plenteoufly reward us in the next. Wake's Preparation for Death.

\* PLENTEOUSNESS. n. f. [from plenteous.]
Abundance; fertility; plenty.—The feven years of plenteoufness in Egypt were ended. Genesis.

\* PLENTIFUL, adj. [plenty and full.] Copions; abundant; exuberant; fruitful. This is rather used in prose than planteous.-To Amalthea he gave a country, bending like a horn; whence the tale of Amalthea's plentiful horn. Raleigh .--He that is plentiful in expences, will hardly be preserved from decay. Bacon's Essay..-If it be a long winter it is commonly a more plentiful year. Bacon's Nat. Hift .- When they had a plentiful harvest, the farmer had hardly any corn. L'Estrange. -Alcibiades was a young man of noble birth, excellent education, and a plentiful fortune. Swift.

\* PLENTIFULLY. adv. [from plentiful.] Co-

piously; abundantly.—They were at that time plentifully encreased. Brown's Vulgar Errours.— Bern is plentifully furnished with water. Addison on

Haly.

\* PLENTIFULNESS. n. f. [from plentiful.] The state of being plentiful; abundance; sertility. \* PLENTY. n.f. [from plenus, full.] 1. Abundance; fuch a quantity as is more than enough.— Peace,

Dear nurse of arts, plenties and joyful birth.

-What makes land, as well as other things, dear, is plenty of buyers, and but few fellers; and fo plenty of fellers, and few buyers, makes land cheap. Locke. 2. Fruitfulness; exuberance.-

The teeming clouds Descend in gladsome plenty o'er the world.

Thomfon.

3. It is used, I think barbarously, for plentiful.-To grass with thy calves,

Tuffer's Husbandry Where water is plenty. -If reasons were as plenty as black berries, I would give no man a reason on compulsion. Shak. Henry 4. A flate in which enough is had and enjoyed.—Ye shall eat in plenty and be fatisfied. Joel.

Whose grievance is satiety of ease, Preedom their pain, and plenty their disease.

PLENUM, in physics, denotes, according to the Cartefians, that flate of things wherein every part of space is supposed to be full of matter, in opposition to a VACUUM, which is a space suppofed devoid of all matter.

PLENUS FLOS, a full flower; a term expreffive

of the highest degree of luxuriance in flowers. See BOTANY, 9 96, 2; and LUXURIANS FLOS. Such flowers, although the most delightful to the eye, are both vegetable monflers, and, according to the fexualists, vegetable eunuchs; the unnatural increate of the petals constituting the first; the confequent exclution of the stamina or male organs, the last. The following are well known examples of flowers with more petals than one; ranunculus, anemone, marth-marygold, columbine, fennelflower, poppy, prony, pink, gilliflower, campion, viscons campion, lily, crown imperial, tulip, narcissis, rocket, mallow, Syrian mallow, apple, pear, peach, cherry, almond, myrtle, role, and Flowers with one petal are not fo itrawberry. subject to fullness. The following, however, are instances: polyanthes, hyacinth, primrose, crocus, meadow faffron, and thorn-apple, though Kramer has afferted that a full flower with one petal is a contradiction in terms. In flowers with one petal. the mode of luxuriance, or impletion, is by a multiplication of the divisions of the limb or upper part; in flowers with more petals than one, by a multiplication of the petals or nectarium. take a few examples. Columbine is rendered full in three different ways: 1. By the multiplication of its petals, and total exclusion of the nectaria; 2. By the multiplication of the nectaria, and exclusion of the petals; or, 3. By such an increase of the nectaria only as does not exclude the petals, between each of which are interjected three nectaria, placed one within another. Again, fennelflower is rendered full by an increase of the nectaria only; narciffits, either by a multiplication of its cup and petals, or of its cup only; lark-four commonly by an increase of the petals and exclusion of the spur, which is its nectarium. In saponaria concava anglica, the impletion is attended with the fingular effect of incorporating the petals, and reducing their number from five to one; and in gelder-rose, the luxuriance is effected by an increase both in magnitude and number of the circumference or margin of the head of flowers, in the plain, wheel-shaped, barren slorets; and an exclusion of all the bell-shaped hermaphrodite florets of the centre or disk. This last instance seems to connect the different modes of impletion in simple and compound flowers. As a fimple luxuriant flower is frequently, by young botanists, mistaken for a compound flower in a natural state, such flowers may always be diftinguished with certainty by this rule: That in simple flowers, however luxuriant, there is but one pistillum or female organ; whereas in compound flowers, each floret, or partial flower, is furnished with its own proper piltillum. Thus in hawk-weed, a compound flower, each flat or tongue-shaped floret in the aggregate has its five stamina and naked feed, which last is in effect its pistillum; whereas, in a luxuriant lychnis, which is a simple flower, there is found only one pistillum common to the whole. In a compound radiated flower, which generally contifts of plain florets in the margin or radius, and tubular or hollow florets in the centre or dife; plenitude is effected either by an increase of the florets in the margin, and a total exclusion of those in the dife; which mode of luxuriance is termed

impletion by the radius, and refembles what happens in the gelder rose: or by an elongation of the hollow florets in the centre, and a kis profound divition of their brims; which is termed implies by the disc. In the first mode of luxurance, to florets in the centre, which are always herephrodite or male, are entirely excluded; and is their place succeed florets similar in tex to thou of the radius. Now, as the florets in the margin of a radiated compound flower are always either female, furnished with the pistillum only; or neater, furnished with neither stamina nor pistillun; it is evident, that a radiated compound flower, filled by the radius, will either be entirely female, as in feverfew, daify, and African marigold; metirely neuter, as in fun-flower, marygold, and taury: hence it will always be easy to different fuch a lu-uriant flower from a compound flow with plain florets in a natural flate; as thefe Bosers are all hermaphrodite, that is, furnished with both stamina and pistillum. Thus the full sowers of African marigold have each floret furnished with the piftillum or female organ only: the satural flowers of dandelion, which, like the former, is composed of plain florets, are furnished with both stamina and pistillum. In the 2d mode of luxuriance, termed impletion by the diff the ha rets in the margin fometimes remain unchange but most commonly adopt the figure of the the centre, without, however, fuffering any the ation in point of fex; fo that confusion is keto be apprehended from this mode of luxuriance than from the former; befides, the length, to which the florets in the centre run out, is of itself a sufficient distinction, and adapted to excite at once an near of luxuriance. Daily, feverfew, and Aincm marigold, exhibit inftances of this as well as of the In luxuriant conformer mode of impletion. pound flowers with plain florets, the faith of Tournefort, the stigma or summit of the in each floret is lengthened, and the feed by se enlarged and diverge; by which characters in flowers may always be diftinguished from flowers of the fame kind in a natural state. Scorzocoa nipple-wort, and goat's beard, fumile frequent instances of this plenitude. Laftly, the implement of compound flowers with tubular or holow lorets, the Assemble of Tournefort, feems to ohere the same rules as that of radiated flowers jul delivered. In everlafting flower, the wrantement of Linnaus, the impletion is fingular, being effect ted by the enlargement and expansion of the 15 ward chaffy scales of the calyx. Thee kies which become coloured, are greatly augmented length, fo as to overtop the florets, which fearce larger than those of the fame flower si The florets too in the many natural state. which in the natural flower are female, bo by luxuriance, harren; that is, are deprived pistillum; the style, which was very short, fr and is of the length of the chaffy feales; and fummits, formerly two in number, are church into one. Full flowers are more easily referred to their respective genera in methods founded upon the calyx, as the flower-cup generally remains about affected by this highest degree of luxuriance. (1.) PLEONASM. n. f. [pleonafnik, Fr. ]

is nut, Lat.] A figure of thetorick, by which more words are used than are necessary.

(2.) PLEONASY See ORATORY, § 203. (1.) PLES, a twon of Russia, in Kostrom, on he Volga; 16 miles S. of Kostrom. Lon. 59. o. E. Ferro. Lat. 57. 15. N.

(2, 3.) PLES, or PSZCZYNA, a town of Silefia, in latibor, capital of a lordship so named. It has wo churches, with walls and towers; 28 miles ISE, of Ratibor.

PLESCOF. See Pskof, No 1 & 2.

(1.) PLESCOW, a duchy in Russia, between he duchies of Novogorod, Lithuania, Livonia, and

ngria.

(2.) Plescow, the capital of the above duchy, rith an archbishop's see, and a strong castle. It is large place, and divided into four parts, each of rhich is furrounded with walls. It is feated on he Muldaw, where it falls into the lake Plescow, o miles S. of Narva, and 150 S. by W. of Petersurg. Lon. 27. 52. E. Lat. 57. 58. N.

\* PLESH. n. J. [A word used by Spenser instead f plash, for the convenience of rhyme.] A puddle;

boggy marth.-

Out of the wound the red blood flowed fresh, That underneath his feet foon made a purple Spenser.

PLESIIY, a village of Essex, 7 miles N. by W. of Chelmsford. It was the seat of the Lord High lonflable of England from the earlieft times till 1400. Thomas Duke of Gloucester, uncle of K. Richard II. resided in it, till x397, when he was ridiously enticed from it by his nephew, way-laid m Epping Forest, hurried to a ship in the Thames, n which he was sent off to Calais, where he was

rivately murdered. See ENGLAND, § 30. PLESSE, a town of Silefia, on the Viftula; 36 iles E. of Troppaw. Lon. 18. 36. E. Lat. 50. o. N. PLESSEVITŽA, a mountain of Croatia; 12

alles NW. of Bihacs.

(1.) PLESSIS LES Tours, a ci-devant royal paice of France, in the dep. of Indre and Loire, othin half a league of Tours. It was built by ewis XI. who died in it, in 1483. It is fituated 14 plain furrounded by woods, near the Loire. he building is yet handfome, though built of rick, and converted to purpoles of commerce.

(1.) PLESSIS PIQUEL, a town of France, in the

ep. of Paris; 5 miles SSW. of Paris.

PLESTIN, a town of France, in the dep. of the forth Coasts; 75 miles SW. of Lannion, and 19 VSW. of Guingamp.

PLETCHBERG, a mountain of the Helvetic public, in Berne; 22 miles SSE. of Thun.

(t.) \* PLETHORA. n. f. [from The 9with.] The ate in which the veilers are fuller of humours an is agreeable to a natural thate of health; ariseither from a diminution of some natural evarations, or from debauch and feeding higher or ore in quantity than the ordinary powers of the feera can digett: evacuations and exercise are its medies .- The difeates of the fluids are a plethora, too great abundance of landable juices. Arbuth. (2.) PLETHORA, in medicine, (from +2.16;, plentide, may be either fanguine or ferous. In the of there is too much craillimentum in the blood, the latter too little. In the fanguine plethora, here is danger of a fever, inflammation, apoplexy, rupture of the blood vessels, obstructed secretions. &c.: in the ferous, of a dropfy, &c. A rarefaction of the blood produces all the effects of a plethora; it may accompany a plethora, and should be distinguished therefrom. Mr Bromfield obferves, that a fanguine plethora may thus be known to be present by the pulse. An artery overcharged with blood is as incapable of producing a strong full pulse, as one that contains a deficient quantity; in both cases there will be a low and weak pulfe. To diftinguish rightly, the pulfe must not be felt with one or two fingers on the carpal artery; but if three or four fingers cover a confiderable length of the artery, and we press hard for fome time on it, and then fuddenly raife all these fingers except that which is nearest to the patient's hand, the influx of the blood, if there is a plethora, will be so rapid as to raise the other singer. and make us fensible of the fulness. The fanguine plethora is relieved by bleeding: the ferous by purging, diuretics, and fweating. See MEDICINE, Index.

\* PLETHORETICK. | adj. [from plethora.]
\* PLETHORICK. | Having a full habit. The fluids, as they confift of spirit, water, salts, oil, and terrestrial parts, differ according to the redundance of the whole or of any of these; and therefore the pletborick are phlegmatick, oily, fa-

line, earthy, or dry. Arbuthnot.

\* PLETHORY. n. f. [plethore, Fr. from +229 wear.] Fulness of habit.—In too great repletion, the elaftick force of the tube throws the fluid with too great a force, and subjects the animal to the difeafes depending upon a plethors. Arbuthnot.

PLETTENBERG, a town of Germany, in Westphalia, and county of Mark, on the Else and the Oester. The people are governed by their own magistrates; and manufacture cloths, scythes and other iron works. The church is common to Lutherans and Calvinists. It lies 27 miles E. of Lennep, and 28 S. of Hannau.

PLEVEN, a town of European Turkey, in Bulgaria, on the Vid, 28 miles S. of Nicopoli.

\* PLEVIN. n. f. [pl:wvine, Fr. plevina, law Latin.] In law, a warrant or affurance. See RE-PLEVIN. Dist.

PLEUMANGAT, a town of France, in the dep. of the North Coasts; 6 miles SSW. of Dinan, and 16} ESE. of Lamballe.

PLEUMARTIN, a town of France, in the dep. of the Vienne; 10 miles SE. of Chatellerault, and 20 N. of Montmorillon.

PLEUMAUDAN, a town of France, in the dep. of the North Coasts; 6 miles SSW. of Dinan, and 16; ESE, of Lambille,

PLEUMOSII, an ancient people of Belgium, who inhabited the country now called Tournay. C.f. de Bell. Gall. v. c. 38.

PLEURA, in any omy, a thin membrane covering the infide of the thorax. See ANATOMY, Index.

(1.) \* PLEURISY. n. f. [ rhengers; pleurefie, Fr. pleuritis, Lat.] Pleuris, is an inflammation of the pleura, though it is hardly diftinguishable from an inflammation of any other part of the breaft, which are all from the fame cause, a stagnated blood: and are to be remedied by evacuation, suppuration or expectoration, or all together. Quincy.

(2.) PLEURISY.

(2.) PLEURISY. See MEDICINE, Index.

\* PLEURITICAL. | adj. [from pleurify.] 1. Dif\* PLEURITICK. | caled with a pleurify.— The viscous matter, which lies like leather upon. the extravafated blood of pleuritick people, may be dissolved by a due degree of heat. Arbutbnot on Aliments. 2. Denoting a pleurify.—His blood was pleuritical, it had neither colour nor confistence. Wifeman.

PLEURITIS. See MEDICINE, Index.

PLEURON, an ancient city of Ætolia, on the Evenus; founded by Pleuron, the fon of Ætolus, and father of Agenor. Apollod. i. c. 7. Plin. iv. c. 2.

PLEURONECTES, in ichthyology, a genus belonging to the order of thoracici. Both eyes are on the same side of the head; there are from 4 to 5 rays in the gill membrane; the body is comprefled; the one fide relembling the back, the other the belly. These flat fith swim sidewise, for which reason Linnaus called them Pleuroneetes. There are 17 species; the most remarkable are thefe:

1. PLEURONECTES FLESUS, the FLOUNDER, inhabits every part of the British sea, and even frequents our rivers at a great distance from the falt waters; and for this reason some writers call it the paffer fluviatilis. It never grows large in our rivers, but is reckoned fweeter than those that live in the sea. It is inferior in fize to the plaise, seldom or never weighing more than fix pounds. It may very eafily be diflinguished from the plaife, or any other fith of this genus, by a row of tharp small fpines that furround its upper fides, and are placed just at the junction of the fins with the body. Another row marks the fide-line, and runs half

way down the back. The colour of the upper

part of the body is a pale brown, fometimes mark-

ed with a few obscure spots of dirty yellow; the

belly is white.

2. PLEURONECTES HIPPOGLOSSUS, the HOLI-BUT. This is the largest of the genus: some have been taken in our feas weighing from 100 to 300 pounds; but much larger are found in those of Newfoundland, Greenland, and Iceland, where they are taken with a hook and line in very deep water. They are part of the food of the Greenlanders, who cut them into large flips, and dry them in the fun. They are common in the London markets, where they are exposed to fale cut into large pieces. They are very coarse eating, excepting the part which adheres to the fide fins, which is extremely fat and delicious, but furfeiting. They are the most voracious of all flat fish. There have been inflances of their fwallowing the lead weight at the end of a line, with which the feamen were founding the bottom from on board a ship. The holibut, in respect to its length, is the narrowest of any of this genus except the sole. It is perfectly smooth, and free from spines either above or below. The colour of the upper part is dufky; beneath, of a pure white. We do not count the rays of the fins in this genus; not only because they are so numerous, but because nature hath given to each species characters, independent of these rays, sufficient to distinguish them by.

3. PLEURONECTES LIMANDA, the DAB, is found with the other species, but is less common. It is in best season during February, March, and April:

they spawn in May and June, and become fally and watery the rest of summer. They are tiperior in quality to the plaife and flounder, but inferior in fize. It is generally of an union brown colour on the upper fide, though feetimes clouded with a darker. The feeles are fine and rough, which is a character of this species The lateral line is extremely incurvated at the isginuing, then goes quite straight to the tail. Tx lower part of the body is white.

4. PLEURONECTES MAXIMUS, the TULMS, grows to a very large fize: Mr Pennant hasker them of 23 pounds weight, but has heard of heard weighed 30. The turbot is of a remark fquare form: the colour of the upper part of body is cinereous, marked with numbers of b fpots of different fizes: the belly is white; the ikin is without scales, but greatly wrinkled, at mixed with small short spines, dispersed witter

any order. See Fishery, § 19.

5. PLEURONECTES PLATESSA, the PLAISE, at very common on most of our coasts, and some times taken of the weight of 15 pounds; but the feldom reach that fize, one of eight or nine pour being reckoned a large fith. The best and largest are taken off Rye on the coast of Sussex, and all off the Dutch coafts. They fpawn in the bearning of February. They are very flat, and much more square than the holibut. Behind the his eye is a row of fix tubercles, that reachs not commencement of the lateral line. The mil part of the body and fins are of a clear hours. marked with large bright orange-coloured foot: the belly is white.

6. PLEURONECTES SOLEA, the sole, is her! on all our coasts; but those on the western fieres are much superior in fize to those on the nath On the former they are sometimes taken of the weight of fix or feven pounds, but towns 12. borough they rarely exceed one pound; it do reach two, it is extremely uncommon. Item usually taken in the trawl-net; they be see at the bottom, and feed on small shell-side kis of a form much more narrow and oblong that in other of the genus. The irides are yellow; the pupils of a bright fapphirine colour: the fals are fmall, and very rough: the upper part of the body is of a deep brown; the tip of one of the protoral fins black; the under part of the body water the lateral line is straight; the tail rounded at the It is a fish of a very delicate flavour; be the small soles are in this respect much superior h large ones. By the ancient laws of the Cime-Ports, no one was to take foles from the if of November to the 15th of March; neither was at body to fish from fun-setting to sun-rising, the the fish might enjoy their night food. The cas fishery for them is at Brixham in Torbay.

(1.) PLEURS, a town of France, in the depo ment of the Marne, 6 miles SE. of Sezanno

(2.) PLEURS, a town of Switzerland, met the Italian republic, which was buried moot mountain on the 25th Aug. 1618. See Mory TAIN, § 14. Of this fatal event, Bp. Barnet, 2 his Travels, p. 96. gives a particular accept.
Pleurs lay about 4 miles NE. of Chiavenna. Ix town was half the bigness of Chiavenna, bot med more nobly built, having many palaces, beforeth

great palace of Francken. Its population was efimated at 22,000, none of whom escaped but one nan.

PLEUVAULT, a town of France, in the dep. of Cote D'Or: 12 miles SE. of Dijon.

PLEXIPPUS and Toxeus, the fons of Thefins, brothers of Aithæa, and uncles of Meleager, sho killed them, and in confequence lost his own fc. See Meleager, N° 1.

PLEXUS, n. f. among anatomists, a bundle of nall velicls interwoven in the form of net-work; us a congeries of velicls within the brain is calflexus choroid., reticularis, or retifornis. See
ATOMY, Index. A plexus of nerves is an uhof two or more nerves, forming a fort of
aglion or knot.

PLEYBEN, a town of France, in the dept. of it Finisterre, 5 miles N. of Chateaulin, and 25 V. of Carhaix.

PLEYBERG, a town of Cariuthia, in Bamberg; miles E. of Ciagenture, and 6 SW. of Laver-und.

\*PLIABLE. adj. [pliable, from plier, French, bend. 1. Eafy to be bent; flexible.—Though 1 act be never fo finful, they will ftrip it of its 1 lit, and make the very law fo pliable and bendeg, that it shall be impossible to be broke. South. Whether the different motions of the animal way have any effect on the mould of the ce, when the lineaments are pliable and tender, shall leave to the curious. Addison. 2. Flexible idisposition; easy to be persuaded.

\*PLIABLENESS. n. f. [from pliable.] 1. Flexibity; ealiness to be bent. 2. Flexibility of mind. God's preventing graces, which have thus fit the foil for the kindly feed-time, planted plibleness, and humility in the heart. Hamm.—Combre the ingenuous pliableness to virtuous counsels lyouth, as it comes fresh out of the hands of nate, with the most consirred obstinacy in most its of fin, that is to be found in an aged sinner.

PLIANCY. n. f. [from pliant.] Eafiness to be on.—Had not exercise been necessary, nature ould not have given such an activity to the limbs, and such a pliancy to every part. Speciator.

\*PLIANT. adj. [pliant, French.] 1. Bending; 19th; flexile; flexible; lithe; limber.—An anamist promised to dissect a woman's tongue, and amine whether the fibres may not be made up a finer and more pliant thread. Addison. 2. 1sy to take a form.—

Earth but new divided from the sky, And pliant still retain'd th' etherial energy.

As the wax melts that to the flame I hold, Pliant and warm may still her heart remain, Soft to the print, but ne'er turn hard again.

Easily complying.—In languages the tongue is ore pliant to all founds in youth than after- uds. Bacon.—

Those, who bore bulwarks on their backs, Now practise ev'ry pliant gesture,

Op'ning their trunk for ev'ry tester. Scoift. Eastly persuaded.—The will was then ductile d pliant to right reason, met the dictates of a wished understanding halfway. South. Vol. XVII. PART II.

\* PLIANTNESS. n. f. Ifrom pliant.] Flexibility; toughness.—Greatness of weight, closeness of

parts, fixation, pliantness or fotiness. Bacon. PLICA POLONICA, or plaited bair, is a difease frequent in Poland, and occurring also in Hungary, Russia, and Tartary. Many hypotheses have been advanced respecting the causes of this dis-The most probable are those assi, ned by Dr Vicat, viz. 1. The Polish air, which is rendered infalubrious by numerous woods and moraffes, and occasionally derives an uncommon keenness even in the midst of summer from the position of the Carpathian mountains; for the S. and SE. winds, which usually convey warmth in other regions, are in this chilled in their passage over their fllowy fummits. 2. Unwholefome water; for although Poland is not deficient in good fprings, yet the common people usually drink that which is nearest at hand, taken indescriminately from revers, lakes, and stagnant pools. 3. The gross inattention of the natives to cleanliness; for those who are not negligent in their persons and habitations, are less liable to be afflicted with the plica than others who are deficient in that particular. In a word, the plica polonica appears to be a contagious distemper; which, like the leprofy, prevails among people ignorant in medicine, and inattentive to check its progress, but is rarely known in those countries where proper precautions are taken to prevent its fpreading.

\* PLICATION. ? n. f. [plicatura, from plico, \* PLICATURE. ] Lat.] Fold; double. Plica-

tion is used somewhere in Clariffa.

\* PLIERS. n. f. [from pls.] An inftrument by which any thing is laid hold on to bend it.—Pliers are of two forts, flat-nofed and round-nofed; their office is to hold and faften upon a fmail work, and to fit it in its place; the round nofed pliers are used for turning or boring wire or fmall plate into a circular form. Moxon.—I made a detention by a fmail pair of pliers. Wiseman.

\*\* PLIGHT. n. f. [This word Skinner imagines to be derived from the Dutch, plicht, office or employment; but Junius observes, that plibt, Saxon, signifies distress or pressing danger; whence I suppose, plight was derived, it being generally used in a bad sense.] r. Condition; state.—

He no longer would

There dwell in peril of like painful plight.

Spenfer]
—I think myself in better plight for a lender than
you are. Shuk.—

My women may be with me; for, you fee
My plight requires it.

Shak.

They in journed a light reconstant flood. Mile.

They in lowliest plight repentant stood. Milt.

Thou must not here

Lie in this miserable loathsome plight. Miston.

Most perfect hero tried in heaviest plight.

Of labours have and hard.

Miston

Of labours huge and hard.

Milton.

2. Good cafe.—

He that with labour can use them aright, Hath gaine to his comfort, and cattel in plight.

Tiffer.

3. Pledge; gage. [from the verb.]—
That lord, whose hand must take my plight,
shall carry

Half my love with him, half my care and duty.

Qqqq 4. [From

4. [From To plight.] A fold; a pucker; a double; a purfic; a prait.

Purfled up on with many a folded plight. Spenf.

5. A garment of some kind. Obsolete.-He let not lack

My plight, or coate, or cloake. Chapman. \* To PLIGHT v. a. [plichten, Dutch.] 1. To pledge; to give as furety.-

He plighted his right hand Unto another love.

Saint Withold

Spenser.

Met the night mate, and her ninefold,

Bid her alight, and her troth plight. Sbak. I again in Henry's royal name,

Give thee her hand for fign of pl gbted faith. Shak. Here my inviolable faith I plight. Diyden. New vows to plight, and plighted vows to break.

Dryden. I'll never mix my plighted hands with thine. Addi on.

2. To braid to weave. [from plice, Lat. whence to ply or bend, and plight, pleight, or plait, a fold or flexure.]-

About her neck, or rings of rushes plight.

Spenjer.

Some gay creatures of the element, That in the colours of the rainbow live,

And play i' th' plighted clouds. Milton. PLIMLIMMON, a high mountain of S. Wales, Milton.in the N. part of Cardiganshire, on the borders of Montgomeryshire; called also Snowdon. SNOW DON.

PLIMPTON, or PLYMPTON, a town of Devonthire, with a market on Saturdays; feated on a branch of the Pivin. It had once a castie, now in ruins. It fends two members to parliament; is 7 miles E. of Plymouth, and 218 W. by S. of Lon-

don. Lon. 4. o. W. Lat. 50. 22. N.

PLINIA, in botany; a genus of plants of the polyanaria class, in the order monogynia. empal ment is divided into 5 segments; the flower confids of 5 petals; the stamina are numerous filments, flender, and as long as the flower; the antheræ, and the germen of the piftil are fmail; the flyle is fubulated, and of the length of the framina; the fligma is simple; the fruit is a large glob le berry, of a striated or sulcated surface, containing only one cell, in which is a very large, fmooth, and globole feed. There is only one species.

PLINIUS SECUNDUS, Caius Cæcilius, the complete Roman name of both the Plinies. See PLI-

NY, No 1. and 2.

(1.)\* PLINTH. n. f. [ wandos. ! In architecture, is that fquare member which ferves as a foun lation to the base of a pillar; Vitruvius calls the upper part or abacus of the Tuscan pillar, a plinth, because it resembles a square tile: moreover, the fame denomination is fometimes given to a thick wall, wherein there are two or three bricks advanced in form of a platband. Harris.

(2.) PLINTH, ORLE, OI ORLO. See ARCHITEC-TURE, Index. Vitruvius aifo calls the Tufcan a-

bacus plinth.

(3.) PLINTH OF A STATUE, &c. is a base, either flat, round, or fquare, that ferves to support it.

(4.) PLINTH OF A WALL, denotes two or three rows of bricks advancing out from a wall; or, in general, a flat high monlding, that ferre in a front wail to mark the floors, to fullain the conof a wall, or the larmier of a chimney.

PLINTHINE, an ancient town of Egypt, &

the coast of the Mediterranean.

(1.) PLINY, THE ELDER, OF CAIUS CACILITY PLINIUS SECUNDUS, one of the most wantmen of ancient Rome, was descended from no lustrious family, and born at Verona. He less arms in a diffinguished post; was one of the aslege of Augurs; became intendant of Spain; and was employed in feveral important affairs by V. patian and Titus, who honoured him with ther efteem. The eruption of Mount Vesuvius, which happened in the year 79, proved fatal to him. Ils nephew, Pring the Younger, relates the circuiftances of that dreadful eruption, and the det of his uncle, in a letter to Tacitus. Pinytte Elder wrote a Natural History in 37 books, with is still extant, and has he a many editions; theres efteemed of which is that of Father Harders, printed at Paris in 1723, in two volumes talle. He also wrote 160 volumes of observations on the rious authors; for which Lardius Lutiniza offered him an enormous fum, equal to L. 3241 String. but was refused.

(2.) PLINY, THE YOUNGER, nephew and to ted fon of the preceding, was born in the plant of Nero, and the 62d of Christ, at Norocom, now Como, upon the lake Larius, near which te had several beautiful villas. Lucius Caclus sa the name of his father. He showed very early to lents. He wrote a Greek tragedy at 14 fear of age. He lost his father when he was young; and had the famous Virginius for his tutor, whom he has fet in a gorious light. He frequented the schools of the rhetoricians, and heard Quintin; for whom he ever after entertained to high metteem, that he bestowed a considerable portion pen his daughter at her marriage. He wash 18th year when his uncle died; and he has he gan to plead in the forum, which was the trail road to dignities. About a year after, he afford the multary character, and went into Sym strbune; but this did not fuit his tafte, and he icturned after a campaign or two. In his puliet home he was detained by contrary winds at the illand of Icana, where he wrote poetry. Uput his return from Syria, he mairied, and ktied & Rone, in the reign of Domitian. During this most peritous time, he continued to plead in the forum, where he was diftinguithed no less by 15 uncommon abilities and eloquence, than by his great resolution and courage, which enabled hand fpeak boldly, when fearcely any oncelle duri fied at all. He was therefore often appointed by fenate to defend the plundered provinces and their oppressive governors, and to manage that causes of a like important and dangerous and One of these was for the province of Bend? their profecution of Bæbius Massa; in which a acquired fo general an applaute, that the exp ror Nerva, then a private man, and in builbust at Tarentum, wrote to him a letter, in which x congratulated not only Puny, but the age which had produced an example to much in the int of the ancients Puny iciates this affa, maktic to Tacitus, wilom ne increats to record it in 18 hiller

liftory, but with much more modefty than Tully ad intreated Lucceius upon a fimilar occasion. to obtained the offices of question and tribune, and fortunately escaped the tyranny of Domitian. But he tells us himfelf, that his name was afterrands found in Domitian's tablets, in the lift of hole who were deftined to deftruction. He loft is wife in the beginning of Nerva's reign, and bon after married his beloved Calphurnia, of vhon we read to much in his Epifties. He had, lowever, no children by either of his wives: and hence we find him thanking Trajan for the a trium liberorum, which he had granted to his riend Suctionius Tranquillus. He was promoted o the confutate by Trajan in the year 100, when e was 38 years of age; and in this office proounced that famous panegyric, which has ever ace been admired, as well for the copionfuels of he topics as the elegance of address. Then he ras elected augur, and afterwards made proconal of Bithynia; whence he wrote to Trajan, that unous letter concerning the primitive Christians; thich, with Trajan's referret, is happily extant mong his Epifties. (See Christian, § 10.) Pliy's letter, as Mr Melmoth observes in a note uon the passage, is esteemed one of the sew genute monuments of ecclefiaftical antiquity relating the times immediately succeeding the apostles, being written at molt not above 40 years after he death of St Paul. It was preferred by the hillians, as a clear and unfuspicious evidence of be purity of their doctrines, and is often appeal-to by the early writers of the church against be calumnies of their adverfaries. It is not known that became of Pliny after his return from Bithyia. Antiquity is also filent as to the time of his eath: but it is supposed that he died either a ttle before or foon after Trajan; that is, about D. 116. Pliny was one of the greatest wits, id one of the worthieft men, among the ancients. e had fine parts, which he cultivated to the utoft; and he accomplished himself with all the nowledge of the age. He wrote and published great number of books; but nothing has escaped wweck of time except his Letters, and his pakyric upon Trajan. This has ever been confideras a master-piece: and if he has almost exhaufdall the ideas of perfection upon that prince, t no panegyrift ever possessed a subject, on which might better indulge in all the flow of eloquence, thout incurring the suspicion of flattery and Schood. In his letters he may be considered as iting his own memoirs. Every epiftle is a kind historical sketch, wherein we have a view of n in some striking attitude. In them are also elerved anecdotes of many eminent persons, role works are come down to us, as Suctonius, ius Italicus, Martial, Tacitus, and Quintilian; d of curious things, which throw great light un the history of those times. In a word his itings breathe a spirit of transcendent goodness d humanity., There are two elegant Englishwflations of his Epiftles; the one by Mr Meloth, and the other by Lord Orrery. PLISA, a town of Lithuania, in the palatinate Min k; 22 miles E. of Min k. PLISTARCHUS, the son of Leonidas, K. of

arta, succeeded Cleombrotus. Herod. ix. 10.

PLISTHANUS, a philosopher of Eis, who fucceeded PHEDON in his Eliac School. Diog.

PLISTHENES, the fon of ATREUS, king of Argos, and the father of Agamemnon and Me-RELAUS, according to Hefiod and others. He died before his father, and his children were edueated by their grandfather, Atreus, and hence were called ATRIDE, and paffed for his fons.

PLISTONAX, the fon of Paulanias, one of the kings of Sparta, was general of the Lacedzemonians in the Peloponnefian war. He succeeded Plistarchus, and reigned 58 years, but was banithed 19 years, till he was recalled by order of the Delphian oracle. Thursd.

PLISTUS, a river of Phocis, which runs into

the bay of Corinth. Strabo ix.

PLIVA, a river of Bothia, which runs into the Verbas.

PLIUSA, a river of Russia, which runs into the Baitic, between Narva and Ivangored.

PLIVSKINA a town of Russia, in Irkutsk, 20 miles NE. of Old Edinsk.

PLIWISCHEN, a town of Pruffia, in the prov. of Samland, 28 miles E of Konigiberg.

PLOCAMA, in botany, a genus of the monogynia order, belonging to the pentandria class of plants. The calyx is quinquedentate; the fruit is a berry and trilocular, with folitary feeds. There is only one species;

PLOCAMA PENDULA, a native of the Canaries. PLOCE. See ORATORY, § 208.

PLOCKEN ALBEN, a mountain of Germany, in Carinthia; 6 miles SE. of Mauten.

Tue n mble fpirits in the arteries. Sbak.

He plods to turn his am'rous fuit T' a plea in law, and profecute. Hudibrasl She reason'd without pladding long. Swift.

\* PLODDER. n. f. [from plad.] A dull heavy

laborious man-

What have continual plodders ever won, Sive hafe authority from other's books? Shak. PLOEN, a town of Germany, in the circle of Low-r Saxony, and capital of Holstein. It stands on the banks of a lake of the fame name, and gave a title to the duke of Hoistein, till by the death of the last duke Charles without male issue it fell to the king of Denmark in 1761. It has been often The old ducal palace is in the midft of the town; which hes 22 miles NW. of Lubeck, and 10 SE. of Keill. Lon. 10. 30. E. Lat. 54. 11.

(1.) PLOERMEL, a town of France, in the dep. of the Morbihan, and ci-devant province of Bretagne; 4 miles W. of Auray, 12 SE. of Orient,

and 27 NE. of Vannes.

(2.) PLOERMEL, another town of France, also in the Morbihan, described by Mr Cruttwell, as "9 posts E. of Hentebon, (though he no-where defines a pest,) and 54\frac{3}{4} W. of Paris. Lon. 15. 16. E. Ferio. Lat. 47. 57. N."

PLOESTI, a town of Walachia; \$28 miles E.

of Orloya, and 200 E, of Belgrade.

PLOEUC, a town of France, in the dep. of the North Coasts; 10 miles 8. of St Brieux, and 10 N. of Loudeac.

PLOGASTEL, a town of France, in the dep. of Finisterre; 7 miles W. of Quimper, and 9 ESE.

of Pont-croix.

PLOGONNEC, a town of France, in the dep. of Finisterre; 5 miles E. of Douarnenez, and 6

NNW. of Quimper.

PLOMBIERES, two towns of France; 1. in the dep, of the Cote D'Or; 3 miles NW. of Dijon: 2. in that of the Volges; 6 miles SW. of Remirement, and 12 S. of Epinal.

PLOMELIN, a town of France, in the dep. of Finisterre, 4 miles S. of Quimper, and 10 NW. of

Concarneau

PLOMEUR, a town of France, in the dep. of Finisterre, 103 miles SSW. of Quimper, and 14 S. of Douarnenez.

PLOMION, a town of France, in the dep. of

the Aifne; 6 miles ESE. of Vervins.

PLOMO, in metallurgy, is a name given by the Spaniards, who have the care of the filver mines, to the filver ore, when found adhering to the furface of stones, and when it incrusts their cracks and cavities like small grains of gun-powder. Though these grains be few in number, and the rest of the stone has no silver in it, yet they are always very happy when they find it, as it is a certain token that there is a rich vein near it. And if in digging forwards they still meet with these grains, or the plomo in greater quantity, it is a certain fign that they are getting more and more near the good vein.

PLOMODIERN, a town of France, in the dep. of Finisterre; 4 miles W. of Chateaulin, and is N. of Quimper.

PLONCOUR, a town of France, in the dea. of Finisterre; 8 miles SW. of Quimper, and it

SE, of Ponteroix.

PLONDIRY, a town of France, in the depoil the Finisterre; 41 miles E. of Landeman, and 4 SW. of Landivifiau.

PLONGONVERT, a town of France, in the dep. of the North Coasts; 5 miles S. of Belieik en Terre, and 10 WSW. of Guingamp.

PLONSK, a town of Poland, in Pioczko; 11 miles N. of Ploczko.

PLOSAWO, a town of Poland, in Bekz.

(1.) PLOT, Robert, LL.D. a learned another rian and philosopher, born at Sutton barn, it is parish of Borden in Kent, in 1641. He findire Magdalen-hall, afterwards in University-colog-Oxford. In 1682 he was eketed fecretary of the Royal Society, and published the Philes. Transform No 143 to No 166 inclusive. The manyor Elias Ashmole, Esq; appointed him first keper of his museum, and about the same time the norchancellor nominated him first professor of demistry in the university of Oxford. In 1687 to was made secretary to the Earl Marshal, 25d is 1688, Historiographer to King James II. 1890 he refigned his professorthip of chemis, and also his place of keeper of the muleum, walled he prefented a very large collection of natural riofities; which were those he had defended a his histories of Oxfordshire and Staffordhire: the former published at Oxford in 1677, solio; 10printed with additions and corrections in 1701 the latter in the same size in 1686. In justif 1694-5, Henry Howard, Earl Marshal, nominated him Mowbray-herald extraordinary; two days at ter which he was constituted register of the cast of honour; and, on the 30th of April make died of the stone at his house in Borden. Ament feveral MSS, which he left were large manufactured for the "Natural History of Kent, Middlete, and London." He also published De origine fraise tentamen philosophicum, 8vo; and g papers in the Philof. Tranf.

Dryden. . To contrive; to scheme.—The count tells the parquis of a flying noise, that the prince did plot o be feeretly gone; to which the marquis anwer'd, that though love had made his highness ical out of his own country, yet fear would ne-'er make him run out of Spain. Hotton.

PLOTÆ, islands on the coast of Ætolia. PLOTINA POMPEIA, a Roman lady who was

married to the emperor Trajan, when he was in a private flation. She accompanied him and thared his honours when he was elected emperor, and proved berfelf worthy of fuch a confort, by her humanity, affability, and liberality to the poor. She accompanied Trajan in his expedition to the East, and on his death brought back his ashes to Rome; where the was treated with all the honours due to her dignity and virtue, by Adrian. She died, A. D. 122.

PLOTINOPOLIS, r. A town of Thrace, built by Trajan, and named after his wife: 2. A

town in Dacia.

PLOTINUS, a Platonic philosopher of the 3d century, born at Lycopolis, in Egypt, A. D. 204. He attended fome of the most famous professors or philosophy in Alexandria, but was not satisfied with their lectures. But upon hearing Ammonius he because so fond of his system, that he studied under him for in years. He then travelled for farther improvement into Perfia, and India: and followed the Roman army, in 243, when the Emp. G. rdian let out on his unfortunate expedition against the Persians; in which he lost his life, and our philosopher narrowly escaped sharing his fate. In 244, he returned to Rome, where he read philofophical lectures, which were attended by people of all ranks, patricians and plebeians, and rendered him very popular. Among other learned pupils, the celebrate Porphyry attended him 6 years; and his reputation for integrity and virtue, as well as learning, became fo great, that his restration was often applied for, to decide or present, law fints; and many perions of property when dying, left their children to his tutorage, and their estates to his care. The emperor Gailienus and his empress Salonina had so great an effect for \* lm, that they once intended to rebuild the city of Campania, and affign it over with its territory, to Protonus, to be colonized by a fet of Philosophers, upon the plan of Plato's republic; but were diffunded by some courtlers who envied his merit. But, with all his virtues and merits, Plotinus held fome very abfurd opi-He not only entertained the utmost contempt for all terrestrial enjoyments, but despised matter fo philosophically, that he was ashamed that his foul was obliged to be lodged in a body. which he confidered as a prison. From this principal, he lived not only very temperately, but even to abflemiously, that he flept very little and hence there is reason to believe his brain was in fome degree affected. For though a Pagan to the end of his life, he pretended to many of those vifions and illuminations by the Deity, which the Inpertitious devotees in all ages and religions have boafted of. In fhort he boafted, that he not only had a familiar dæmon or angel, like Socrates. but that he had even often been uniten to the Deity himself. Yet of this Deity he appears to have entertained fome very confused notions. wrote two books to prove that " All being is one and the Jame;" which is the very atheistical-doctrine of Spinoza; and he inquires in another tract, "Whether there are many fouls or only one" Full of these remantic metaphysicial ideas and uncertainties, he died, A. D. 570, aged 66, with these words: "I am labouring with all my might

to return the divine part of me to that Divine Whole which fills the universe!" He left 54 treatifes on various subjects; which his disciple Porphyry collected and arranged in 6 Enneades, or volumes of nine tracts each; and published with his life. Marsinus Ficinus, at the desire of Cosmode Medicis, translated this work into Latin, which was published at Balil in 1559; and reprinted along with the Greek in 1580, folio.

(1.) PLOTIUS, Lucius, a Roman poet, who Aourished in the time of Marius, and celebrated

that hero's exploits in his poems.

(2.) PLOTIUS GALLUS, Lucius, a native of Gaul, who first taught Oratory at Rome in Latin. CICERO himself was one of his pupils. Cic.

de Orat. (3.) PLOTIUS TUCCA, a learned Roman, who flourished in the Augustan Age, and was intimate with all the literati of that dignified period. He was particularly the friend of Horaci, Mæcenas and Virgil, who left him his heir. Augustus appointed him along with Varius to review Virgil's

Æneid. Hor. 1. Sat. 5. v. 40.

PLOTUS, or DARTER, in ornithology, a genus of birds belonging to the order paimipedes. The bill is long and sharp-pointed; the nostrils are merely a long flit placed near the base; the face and the chin are bare of feathers; the neck is very long; and the legs are short. They have 4 There are 3 Species, and toes webbed to ether.

3 varieties of the 2d of thefe.

1. PLOTUS ANHINGA, the wbite-bellied darter, is not quite fo big as a mallard; but its length from the point of the bill to the end of the tail is to inches. The bill is 3 inches long, straight and pointed: the colour is greyish, with a yellowish base: the neck long and slender: the upper part of the back and icapulars are of a dufky black colour; the middle of the feathers are dashed with white: the lower part of the back, &c. are of a fine black colour: the under parts from the breaft dare filvery white: the smaller wing coverts, and those in the middle, are dusky black; the larger ones are spotted with white, and the outer ones are plain black: the tail feathers are 12; broad, long, and glossy black: the legs and toes are of a yellowish grey. This species inhabit Brafil, and are exceedingly expert in catching fish. Like the corvorant, they build nests on trees, and rooft in them at night. They are scarcely ever feen on the ground; being always on the highest branches of trees on the water, or fuch as grow in the moift savannas on river sides. When at rest, they fit with the neck drawn in between the shoulders like the heron. The flesh is in general very fat; but has an oily, rank, and disagrecable taste like that of a gull. See Anninga.

2. PLOTUS CAYENNENSIS, the anhinga of Cayen-

ne, black-bellied anbinga, is as large as a comma duck, with a very long neck and a long flappointed straight bill. The upper part of the le is of a pale bine, and the lower is reddiffe; there are very piercing; the head, neck, and nee part of the breaft are light brown: both fideseful head, and the upper part of the neck, are not ed with a broad white line: the back, scapula, and wing coverts, are marked with black and white stripes lengthwise in equal portions: the quill feathers, the belly, thighs, and tail, are if a deep black colour; the tail is very long and flender: the legs and feet are of a paie green colour; and the four toes, like those of the correant, are united by webs. This species is faul in Ceylon and Java. They generally se ca the shrubs that hang over the water; and, when they shoot out their long slender necks are site taken for ferpents at first fight. Mr Lather seferibes three varieties of this species, which are all equal in fize to the common birds of the frecies. The first and the second varieties, whethis Mr Latham calls the black darter, inhabit (2:enne: and the 3d, or rufous darter, inhabits Af. ca, particularly Senegal, where it is called land.

3. PLOTUS SURINENSIS, the Surinam data, is about 13 inches long, being about the fac of 1 teal. The bill is of a pale colour, and about it inches in length: the irides are red; the count the head is black, and the feathers behind into a fort of creft: the neck, as in the other fpeces is long and flender: the cheeks are of a bight bay colour: from the corner of each eye there comes a line of white: the fides and back part of the neck are marked with longitudinal line of black and white: the wings are black, and the tail is dusky brown: it is also tipped we with and shaped like a wedge: the breast and belian white: the legs short, but very strong, and at pale dufky colour: the 4 toes are joined by brane, and barred with black. This species is habits Surinam, frequenting the fides of month creeks, where it feeds on finall fish and ickon especially on slies, which it catches with great When domesticated, which offer dexterity. happens, the inhabitants call it the sun min Authors have differed exceedingly concerning the genus to which this species belongs, asit is found to differ from the others in some pretty escatial characters: it agrees, however, in so many, and those the most essential, as sufficiently to authorise classing it with this penus. See Laber's Synopsis. vol. iii. part 2. p. 627.

PLOTZKAU, a town of Upper Saxony in A halt Bernberg, 5 miles SSW. of Bemberg, 24 WSW. of Deffau.

(1.) PLOVER. n. f. [pluvier, Fr. pluvialis, at.] A lapwing. A bird.—Of wild birds, Cornall hath quail, rail, partridge, pheafant and placer. Carew.—

The bittern knows his time: or from his shore. The plover, when to scatter o'er the heath

Thom 'on's Spring. (1.) PLOVER. See CHARADRIUS, Nº 3, 9, 12, 3. These birds usually fly in exceedingly large icks in the places they frequent; 20,000 or 3000 have been feen in a flock. They generalcome to us in Sept. and leave us about the end March. In cold weather they are found very mmonly on lands lying near the fearin quest of od; but in thaws and open feafons they go ther up in the country. They feed on plowed ids, and are very cleanly. When they rooft, they fquatting on the ground like ducks or geefe, from trees or hedges, when the weather is lm; but when it is stormy, they often get under ther. In wet weather they do not fleep in the tht at all, but run about picking up the worms they crawi out of the ground; during this iding they are continually making a finall cry, it screes to keep them together; and in the mning they take flight. Plovers are very eafily ken at the time of their first coming over, when ey have not got any other birds mixed among em; but when they afterwards pick up the teal d other shy birds among them, it becomes more ficult. The best season for taking them is in r beginning of Oct. After this they grow timous, and are not easily taken again till March, nich is the time of their coupling. The NW. ad is difadvantageous to the taking of them; d in general, great regard is to be paid to the are of the wind in the fetting of the nets. a-lowls fly against the wind when the land lies at way; and the nets for taking them are crefore to be placed in a proper direction, ac-

1.) PLOUGH. n. f. [plog, Saxon; plog, nith; ploegh, Dutch.] 1. The instrument with ich the surrows are cut in the ground to receive seed.—

Proud-lin'd loiterers, that never fow;

Nor put a plant in earth, nor use a plow. Chapm. Look how the purple flower, which the plough 1th shorn in sunder, languishing do die. Peach. tome ploughs differ in the length and shape of ir beams. Mort.—

In ancient times the facred plough employed The kings and awful fathers. Thomson. Tillage; culture of land. 3. A kind of plane. If worth.

(2.) PLOUGH is by others defined, a machine for turning up the foil by the action of cattle, contrived to fave the time, labour, and expence, which, without this instrument, must have been employed in digging the ground, and fitting it for receiving all forts of feed. See RURAL OECONOMY.
(3.) PLOUGH, DRILL. See DRILL SOWING. In the Gentleman's Magazine for July 1793, p. 60:, Mr Wickins of Pondhead Lodge, New Forest, gives an account of a fimplified drill plough, invented by himself. Its importance is increased, he thinks, by the cheapness and easy construction off it, because it can be used upon a small scale by a fingle man, and upon a larger scale by two mer, or a man and boy; fo that the inconvenience futfered by horses trampling the ground, &c. is hereby avoided. To the drill for fowing is occasionally annexed a blade for hoeing between the rows: "the good effects of which (fays Mr Wickins) are no less obvious from its nurturing the growth of the corn, and producing collateral shoots from the application of fresh soil, but also from its affording the means of extirpating the weeds which are fo obnoxious to it." He informs us likewife, that his fingle hand-drill hath been feen and approved by the Bath Society; and they have in confequence voted him an honorary and corresponding member. Since that time he says, he has very materially improved and simplified it.

(4.) PLOUGH, GENERAL FORM OF THE. general form of the body of a plough is that of a wedge, or very blunt chiffel, AFEDBC, (fig. 1. Plate CCLXXVII,) having the lower corner D of its edge confiderably more advanced than the upper corner B; the edge BD and the whole back AFDB is in the same perpendicular plane; the bottom FDB approaches to a triangular form, acute at D, and square at F; the surface BCED is of a complicated shape, generally hollow, because the angle ABC is always greater than FDE: this confequence will be easily feen by the mathematician. The back is usually called the LAND SIDE by the ploughmen, and the base FDE is called the sole, and FE the HEEL, and BCED the mould-board. Lastly, the angle AFE is generally fquare, or a right angle, so that the sole has kvel both as to length and breadth. By comparing this form with attention, the reader will perceive that if this wedge is pulled or pushed along in the direction FD, keeping the edge BD always in the perpendicular cut, which has been previoufly made by the coulter, the point D will both raise the earth and shove it to one side and twist it over; and, when the point has advanced from F to D, the fod, which formerly rested on the triangle DFE, will be forced up along the furface BCED, the line DF, rifing into the position D f, and the line EF into the position E f.—Had the bottom of this furrow beat covered with a bit of cloth, this cloth would be lying on the mould-board, in the position DfE: the slice, thus deranged from its former fituation, will have a fhape fomething like that represented in fig. 2. As the wedge raises the earth, the earth preffes down the wedge; and as the wedge pushes the earth to the right hand, the earth presses the wedge to the left; and thus the plough is strongly pressed, both to the bottom of the furrow by its fole, and also to the firm land

by its back or land fide. In fhort, it is ftrongly squeezed into the angle formed along the line FD (fig. 1.) by the perpendicular plane a b DF and the horizontal plane FDE; and in this manner the furrow becomes a firm groove, directing the motion of the plough, and giving it a refifting fupport, by which it can perform all parts of its talk. We beg our readers to keep this circumstance confrantly in mind. It evidently fuggefts a fundamental maxim in the construction, namely, to make the land-fide of the plough an exact plane, and to make the fole, if not a plane, at least straight from point to heel. Any projection would tear up the supporting planes, destroy the directing groove, and expend force in doing mischief. This wedge is feldom made of one piece. To give it the neceffary width for removing the earth would require a huge block of timber. It is therefore ufually framed of feveral pieces, which we shall men-

tion in the language of the art. (5.) PLOUCH, PARTS OF MR SMALL'S. Fig. 3. represents the land-side of a plough, such as are made by James Small at Rosebank, near Foord, Mid Lothian. The base of it, CM, is a piece of hard wood, pointed before at C to receive a hollow shoeing of iron CO, called the Sock, and tapering a little towards the hinder end, M, called the HEEL. This piece is called the HEAD of the, plough. Into its fore part, just behind the fock, is mortised a sloping post, AL, called the Shfath, the front of which is worked tharp, forming the edge of the wedge. Nearer the heel there is mortifed another piece, PQ, floping far back, called the STILT, serving for a handle to the ploughman. The upper end of the sheath is mortifed into the long BEAM RH, which projects forward, almost horizontally, and is mortifed behind into the stilt. To the fore end of the beam are the cattle attached. The whole of this fide of the wedge is fathioned into one plain furface, and the intervals be-tween the pieces are filled up with boards, and commonly covered with iron plates. The Cour-TER, WFE, is firmly fixed by its shank, W, into the beam, rakes forward at an angle of 45° with the horizon, and has its point E about fix inches before the point of the fock. It is brought into the fame vertical plane with the land fide of the plough, by giving it a knee outward immediately below the beam, and then kneeing it again downward. It is further supported on this side by an iron stay FH, which turns on a pin at F, passes through an eye-bolt I on the fide of the beam, and has a nut screwed on it immediately above. When screwed to its proper slope, it is firmly wedged behind and before the thank .- Fig. 4. reprefents the fame plough viewedfrom above. ST is the right hand or finall fill fixed to the infide of the mould-board LV. Fig. 5. represents the bottom of the wedge. CM is the head, covered at the point by the fock. Just behind the fock there is mortifed into the fide of the head a smaller piece DE, called the wiest, making an angle of 16° with the land-fide of the head, and its outfide edge is in the fame straight line with the fide of the fock. From the point to the heel of the head is about 33 inches, and the extreme

breadth of the heel is about nine. The fide of the

wedge, called the furrow fide, is formed by the mould-board, which is either made of a beet or plank of wood, or of a thick iron plate. The fock drawn in this figure is called a Speak Sci, and is chiefly used in coarse or stony grain, which requires great force to break it up. At ther form of the sock is represented in the nestigure, fig. 6. This is called a Feather Sco, and has a cutting edge CF on its surrow side, and the fourth of the form of the sock about ten inches, and to the rehand or surrow side about six. The use of that to cut the sod below, and detach it from the ground, as the coulter detaches it from the plowed land.

(6.) PLOUGH, THE REV. MR CAMPBELL'S III-PROVED. We thall conclude this article with an account of a plough, recommended by the State Highland Society, as extremely proper for a land The inventor, the Rev. Alex. Comcountry. bell, minister at Kilcalmonell in Argylesian, honoured with the Society's gold medal, viet L 25. A, the fock (fg. 7.); the landfide of which supplies the place of the coulter, and the fole of it ferves for a feather; it is 18 inches and is made of a plate of iron 12 lackes bear when finished, and somewhat under half as all thick .- B, the head; to be made of iron is allangular form, 4 inches broad by 2 inches a thickest part. There are 5 inches of the act is ed in the fock .- C, the beam, 4 inches that [] inches deep, gradually tapered thinner: the 6 feet .- E, the sheath, must be of the interior nefs with the beam above and the head be and is five inches broad. An iron fcrew-boltonnects the beam and head behind the floatthe handles are fo made that the flope of mould-board, which is fixed to one of them, be the longer and more gradual. They and a suches long, and a feet 4 inches aduded a let ends .- G, the mould-board, confits of flicks 2 inches in diameter; the covert of the fi in the plane of the fole, the rest in sucressed to each other above it. This makes the board 14 inches broad. To prevent an one from getting over the mould-board, a thin to or 5 inches broad is fixed above it. The board, land-fide, and fole of the plough. and with iron. - The length is 20 inches: this to 18 inches, the length of the fock, makes " length from point to heel 3 feet 2 inches-T muzzle or bridle OPH is also of a more ent and better construction than those conin use. By means of the screw-pins at L different degrees of land may be given to 1 plough; the iron rod LH being thereby fidewife in the focket LN, and up and date OP. The rod is 30 inches long, one brush half an inch thick. It is hooked into a feet at H. Two inches of the rod project at N form of an eye, before the muzzle, to rest hook of the crofs-tree. The advantages of plough are faid to be: It is not to liable interrupted or turned out of its course by roots, &c. as other ploughs are; nor des # fo deep as to be liable to be broken by lange for or flags. The motion of the muzzle is alfold an improvement. Another advantage it has all

ther ploughs is, its not being so liable to be hoaked up by shibble, &c. This we understand be its chief excellency, and an object much dend in the confiruction of the plough. Upon te whole, we are informed that this plough is ghter, less expensive, and less liable to go out of in than the ordinary plough, and that with it vo horfes can plough land which require four ith any other plough. These ploughs are made Thomas Lindsay, Abbeyhill, Edinburgh, and odels are to be feen in the hall of the Highland cicty.
(i.) \* To Plough. v. a. 1. To turn up with

e plough.-

Let the Volscians

Plough Rome, and harrow Italy. Sbak. No doubt you'd fend the rogue, in fetters bound.

To work in Bridewell, or to plough your ground. Dryden.

A man may plough, in fliff grounds the first time lowed, an acre a day. Mortimer .- You find it ughed into ridges and furrows. Mortimer. 2. bring to view by the plough: with up.-Anoer of a dusky colour, near black; there are of the frequently ploughed up in the fields of Wein. Hoodward. 3. To furrow; to divide .-

When the prince her fun'ral rites had paid, lle plough'd the Tyrrhene feas with fails dif-Addison.

play'd.
With speed we plough the watry way, My power that guard thee. Pope.

To tear; to jurrow.-

Patient Octavia plough thy visage up With her prepared nails. Skak. 2.) \* To PLOUGH. v. n. To practife aran; to turn up the ground in order to fow

Rebellion, infolence, fedition We ourselves have plough'd for, fow'd and scat-

ter'd, By mingling them with us. Doth the ploughman plough all day to fow. If. viii. 24.—They only give the land one plough-· Mortimer.

PLOUGH-BOTE, n. f. in ancient customs, a prige granted to tenants by land-holders, of cuttwood.

PLOUGH-BOY. n. f. [ plough and boy.] A boy t follows the plough; a coarse ignorant boy. L ploughboy, that has never feen any thing but tched houses and his parish church, imagines t thatch belongs to the very nature of a house.

PLOUGHER. n. f. [from plough.] One who ighs or cultivates ground.—The country peothemselves are great ploug bers. Spenser.

To PLOW. v. a. and v. n. See To PLOUGH, N° 1 and 2. This spelling is now most generally used in the verbs and participles; but PLOUGH is still retained for the noun and all its compounds and derivatives except the verbal ones.

PLOWDEN, Edmund, serjeant at law, the for of Humphrey Plowden, of Plowden, in Shropshire, of an ancient and genteel family. He was first a student at the university of Cambridge, where he studied philosophy and medicine, for 3 years. He then removed to Oxford, where, having studied about 4 years more, in 1552 he was admitted to the practice of physic and surgery: but after all gave up both, entered the Middle Temple, and began to read law. Wood fays, that in 1557 he was summer reader to that society, and Lent-reader three years after, being then ferjeant and oracle of the law. He died in 1584, aged 67. He married the daughter of William Sheldon, of Boley, in Worcestershire; by whom he had a fon, who died foon after his father. He wrote, 1. Commentaries or Reports of divers Cases, &c. in the reigns of K. Edw. VI. Q. Mary, and Q. Elizabeth; Lond. 1571, 78, 99, 1613, &c. Written in the old Norman language. 2. Queries, or a Moot-book of cases, &c. translated, methodized, and enlarged, by H. B. of Lincoln's-Inn; Lond. 1662, 8vo.

PLOZEVET, a town of France, in the dep. of the Finisterre; 4 miles SE. of Pont Croix, and 12

W. of Quimper.

PLUCHE, Antony, an elegant writer, born at Rhelms in 1668, who merited, by his engaging manners and proficiency in the belles lettres, the appointment of humanist in the university of that Two years after, he obtained the professor . of rhetoric's chair, and was admitted into holy orders. Clermont, Bp. of Laon, informed of his talents, gave him the direction of the college of his episcopal city. By his industry and superior knowledge, a proper order and subordination soon took place in it; but some particular opinions respecting public affairs, obliged him to re-fign his office. The intendant of Rouen, at the request of the celebrated Rollin, entrusted him with the education of his fon. Abbé Pluche having filled that place with fuccess and honour, left Rouen and went to Paris, where, by the patronage of fome literary friends, and his own excellent writings, he acquired great reputation. He published, s. Le Spellacle de la Nature (Nature Displayed), in 9 vols. in 12mo. a work equally in-itructive and entertaining. 2. Histoire du Ciel, or History of the Heavens, in 2 vols. in 12mo. in two parts: The first contains some learned inquiries into the brigin of the poetic heavens. It is nearly a complete mythology. The 2d is the history of the opinions given by philosophers respecting the formation of the world. The author shows the inutility, the inconfiftency, and uncertainty,

of the most esteemed fystems; and conclude with pointing out the excellence and fublime fiminty of the Mosaic account. 3. De Linguarian. tificio; a work which he translated with thistor, La Mecanique des Langues, in 12mo. 4. Harren of the Pfalms and the Gospel, or a Translation the Pfalms and Hymns of the Church, with Non relative to the Vulgate, the Septuagist, and ikbrew Text; Paris, 1764, 12mo. In 1749, Ale Pluche retired to Varenne St Maure, when h gave himself up entire to devotion and sud; and where he died of an poplexy on the 20th of November 1761, ag. d 73. He possessed qualities which form the scholar, and practice the morals of an honest man, and a Chillin. Some Deifts having been surprised that, in matter of faith, he should think and speak like the regar, his answer was, "I glory in doing to: ha infinitely more rational to believe the world God, than to follow the glimmering lights of a reason which is limited and subject to error.

\*PLUCK. n. f. [from the verb.] I. A poli; a draw; a fingle act of plucking.—Birds kept coming and going all day; but so few at a time, that the man did not think them worth a plait. L'Estrange.—Were the ends of the bones day, they could not, without great difficulty, day the plucks and attractions of the motory muscles. Ly.

2. [Plugbk, Erse. I know not whether doined from the English, rather than the English was the Erse.] The heart, liver, and lights of a zimal.

To PLUCK. v. a. [ploccian, Sar pinks, Dutch.] r. To pull with nimbleness or force; to snatch; to pull; to draw; to sorce on a st; to force up or down; to act upon with violent. It is very generally and licentiously used, pricalarly by Sbakespeare. It has often some prick after it as down; off; on; away; w; interferemed better unto that noble king to plate peaceable government among them, that is placed by the place with the placed by placed them under. Spenfer.

That high royalty was ne'er plack'd his.

Can'st thou not

Pluck from the memory a rooted form? Sad.

When youth with comeliness plucked all gards
way. Sbak.—

I gave my love a ring; He would not pluck it from his finger, for the wealth

That the world masters.
You pluck a thousand dangers on your beat.

Dive into the bottom of the deep. And pluck up drowned honour by the locks

I will pluck them up by the roots out of a land. 2 Chron.—Pluck account his crop with his thers. Lev. i. 16.—A time to pluck up that is planted. Eccluf. iii. 2.—They pluck of their from off them. Mic. iii. 2.—

Dispatch 'em quick, but first pluck at the

tongues,
Lest with their dying breath they for kenter

Beneath this shade the weary pealant lies.

Plucks the broad leaf.

From the back

Of herds and flocks, a thousand tugging bills Pluck hair and wool. 1. To ftrip of feathers. - Since I pluckt geefe, I tnew not what it was to be beaten. Shak.

I come to thee from plume-pluck'd Richard.

. To pluck up a heart or spirit. A proverbial exoreflion for taking up or refuming of courage. de willed them to pluck up their hearts, and make il things ready for a new affault. Knolle's Hift. of be Turks.

PLUCKEMIN, a trading town of New Jersey, n Somerfet county, 28 miles N. of Princeton: fo amed from one of its first inhabitants, an old rithman, who was noted for his address in taking n strangers.

\* PLUCKER. n. s. [from pluck.] One that lucks.-

Thou fetter up and plucker down of kings!

-Let the pluckers tie it up in handfuls. Mortimer. (1.) PLUDENTZ, a county of Germany, in he Tyrolese, purchased, with its capital, in 1376, y Leopold D. of Austria.

(2.) PLUDENTZ, the capital of the above couny, is feated on the III, in a pleasant plain; 65 ailes W. of Innspruck, and 85 NNW. of Trent. n 1533, it was almost destroyed by an earthquake, nd in 1638 it was burnt. Lon. 12. 10. E. Lat. 17. 10. N.

PLUDESCH, a town of Tyrol, in the county

# Paudentz; 6 miles N. of Piudentz.

(1.) PLUE, a lake of North America. Lon. 93. 10. W. Lat. 48. 50. N.

(2.) PLUE, or LA PLUE, a river of N. America, rhich runs from lake La Plue into the Lake of he Woods.

(1.) PLUG. n. f. [plugg, Swedish; pluggbe, Jutch.] A stopple; any thing driven hard into nother body to stop a hole.—Shutting the valve with the plug, draw down the sucker to the botom. Boyle.—The fighting with a man's own shalow, confifts in the brandishing of two sticks trasped in each hand, and loaden with plugs of rad at either end. Addison .- In bottling wine, fill our mouth full of corks, together with a large lug of tobacco. Swift.

(2.) PLUGS, in naval affairs, pieces of timber, ormed like the fruitum of a cone, and used to top the haufe-holes and the breaches made in the ody of a thip by cannon balls; the former are alled baufe plugs, the latter shot plugs, and are ormed of various fizes, in proportion to the holes nade by the different fizes of shot, which may enetrate the ship's sides or bottom in battie. They are always ready for this purpofe.

To PLUG. v. a. [from the noun.] To ftop rith a plug.—A tent plugging up the orifice.

ibarp.

PLUKENET, Leonard, an English physician, forn in x642, one of the most excellent and laboious botanists of any age. He was author of Phytographia Plucenetiana, a work much esteemed, Almagesticum Britannicum, and other works of the. ike kind, on which he spent the greatest part of us life and fortune. He was appointed superin-

tendant of the garden at Hampton Court, by Charles II. with the title of Royal professor of Botany. He died about 1706. His Opera Botanica, with cuts, were printed at London in 6 vols. folio, in 1720.

PLUKENETIA, in botany, a genus of the monadelphia order, belonging to the monoecia class of plants; and in the natural method ranking in

the 38th order, Tricocca.

(1.) \* PLUM. n. s. | plum, plumtreow, Sax. blumme, Danish.] A custom has prevailed of writing plumb, but improperly. 1. A fruit.—The flower contifts of 5 leaves, which are placed in a circular order, and expand in form of a role, from whole flower-cup rifes the pointal, which afterwards becomes an oval or globular fruit, having a foft fleshy . pulp, furrounding an hard oblong stone, for the most part pointed; to which should be added, the footstalks are long and slender, and have but a fingle fruit upon each. The fpecies are; 1. The jeanhative, or white primordian. 2. The early black damask, commonly called the Morrocco plum. 3. The little black damask plum. 4. The great damask violet of Tours. 5. The Orleans plum. 6. The Fotheringham plum. 7. The Perdrigon plum. 8. The violet Perdrigon plum. 9. The white Perdrigon plum. 10. The red imperial plum, fometimes called the red bonum magnum. 11. The white imperial bonum magnum; white Holland or Mogul plum. 12. The Chefton plum. 13. The apricot plum. 14. The maître claude. 15. La roche courbon, or diaper rogue; the red diaper plum. 16. Queen Claudia. Myrobalan plum. 18. The green gage plum. 19. The cloth of gold plum. 20. St Catharine plum. 21. The royal flum. 22. La mirabelle. 23. The Brignole plum. 24. The empress. 25. The monfieur plum: this is sometimes called the Wentworth plum, both refembling the bonum magnum. 26. The cherry plum. 27. The white pear plum. 28. The muscle plum. 29. The St Julian plum. 30. The black bullace-tree plum. 31. The white bullace-tree plum. 32. The black-thorn or floetree plum. Miller,-Philosophers in vain enquired, whether the fummum bonum confifted in riches, bodily delights, virtue or contemplation? they might as reasonably have disputed, whether the best relish were in apples, plums or nuts? Locke. 2... Raisin; grape dried in the sun.-

I will dance and eat plums at your wedding.

3. [In the cant of the city.] The fum of one hundred thousand pounds.—By the present edict, many a man in France will swell into a plum, who fell several thousand pounds short of it the day before. Addison .-

The mifer must make up his plum. Prior. -By fair dealing John had acquired some plums, which he might have kept, had it not been for his law-fuit. Arbutbnot .-

Alas: they fear a man will cost a plum. Pope. 4. A kind of play, called How many plums for a penny? Ainf.

(1.) \* PLUMAGE. r. f. [plumage, Fr.] Feathers; fuit of feathers.—'The plumage of birds exceeds the pilofity of beafts. Bacon.-

Say, will the falcon, Rooping from above, Smit with her varying plumage, spare the dove?

Pope.(2.) PLUMAGE, the covering of birds. See OR-NITHOLOGY. Sed. I, § III.

PLUMAU, a town of Austria, 7 m. NW. of

Hooren.

(1.) PLUMB. n. f. [plomb, Fr. plumbub, Lat.] A plummet; a leaden weight let down at the end of a line. - If the plumb line hang just upon the perpendicular, when the level is fet flat down upon the work, the work is level. Moron's Mec. Exerc.

(1.) PLUMB. adv. [from the noun.] 1. Perpen-

dicularly to the horizon.-

Flutt'ring his pennons vain, plumb down he falls. Milton.

-If all these atoms should descend plumb down with equal velocity, being all perfectly folid and imporous; and the vacuum not relifting their motion, they would never the one overtake the other. Ray on the Creation. 2. It is used for any sudden descent, a plumb or perpendicular being the short passage of a falling body. It is sometimes pronounced ignorantly plump.—Is it not a fad thing to fall thus plumb into the grave? well one minute and dead the next. Collier.

(3.) PLUMB ISLAND, an island near the coast of Massachusetts, abounding with beach plum trees; about 9 miles long, and half a mile broad; extending from the mouth of the Ipswich to that of the Merrimack, on the S. fide; and separated from the main land by a narrow found. It has light-houses on the N. end, and the remains of a fort; belides feveral houses erected by the Marine Society, and provided with fuel and other necessaries, for the relief of those who may be shipwrecked on the

coaft. Lon. 7c. 47. W. Lat. 42. 25. to 43. 4. N. (4.) PLUMB ISLAND, an illand of New York, on the NE. coast of Long Island, about a mile from South-hold, containing feven families, and 800 acres; which are fertile, and produce wheat, com, and pafture; feed theep and black cattle; and thence abound with butter, cheefe and wool.

(5.) PLUMB LINE, among artificers, denotes a perpendicular to the horizon; fo called, as being commonly erected by means of a plummet. See

PLUMMET, § 2.

To PLUMB. v. a. [from the noun.] 1. To found; to fearch by a line with a weight at its end.-The most experienced seamen plumbed the depth of the channel. Swift. 2. To regulate any work by the plummet.

(1.) PLUMBAGO, in botany, LEAD-WORT; a genus of the monogynia order, belonging to the pentandria class of plants. There are 4 species;

the most remarkable are

1. PLUMBAGO EUROPEA. It grows naturally in the S. of Europe, and has a perennial root ftriking deep in the ground. There are many flender channelled stalks, about three feet high, terminated by tufts of small funnel-shaped flowers, of a blue or white colour. It is propagated by freds, and by parting the roots.

2. PLUMBAGO ZEYLONICA grows naturally in both the Indies. The upper part of the fallend empalement are covered with a glutinous juic, which catches the finall files that light upon a It is too tender to thrive in the open air in the country.

(II.) PLUMBAGO, in mineralogy, Black Leader Carburet of Iron, as it is now called by Chemes See CHEMISTRY, Index; LEAD No III; and M. NERALOGY, Part II. Chap. VII. Clas IV. Ord. VI.

Gen. III. Sp. 1.
(1.) PLUMBER. n. f. [plombier, Fr.] Oce who works upon lead. Commonly written and pronounced pummer.

(2.) PLUMBER, in geography, a town of Doicshire, on the Direlish, 21 miles from Liduich.
(1.) PLUMBERY. n. f. [from planter]

Works of lead; the manufactures of a purcha-

Commonly spelt plummers.

(2.) PLUMBERY, is the art of casting and water ing lead, and using it in building. As this metal melts foon and with little heat, it is easy to can into figures of any kind, by running it into mails of brais, clay, plafter, &c. But the chief anck. in plumbery are flicets and pipes of lead; which make the basis of the plumbers work. I la afing sheet-lead, a table or mould is made ut of which confifts of large pieces of wood well joints, and bound with bars of iron at the ends; at fides of which runs a frame confifting of a legt or border of wood, 3 inches thick and 1 mod high from the mould, called the sharps: The indinary width of the mould, within these sharps in from 4 to 5 feet; and its length is 16, 17, or 15 feet. This should be formething longer than in sheets are intended to be, that the end when the metal runs off from the mould may be cutoff, because it is commonly thin or uneven, or regard a the end. It must stand very level in breadth, in something falling from the end in which the is poured in, viz. about an inch or an inch sci half in the length of 16 or 17 feet or more, and ing to the thinness of the sheets wanted; in the thinner the theet, the more declivity the mark should have. At the upper end of the much ftands the pan, which is a concave triangular price. compo ed of two planks nailed together at mil angles, and two triangular pieces fitted in between them at the ends. The length of this pan is the whole breadth of the mould in which the fleri are cast; it stands with its bottom, which by tharp edge, on a form at the end of the mould leaning with one fide against it; and on the oppfite fide is a handle to lift it up by, to pour the melted lead; on that fide of the pan next is mould are two iron hooks to take hold of the mould, and prevent the pan from flipping with the melted lead is pouring out of it into the max This pan is lined on the infide with mother fand, to prevent it from being fired by the built The mould is also spread over, about 197 inches thick, with fand lifted and mointers which is rendered perfectly level by moving our it a piece of wood called a strike, and smooths; it over with a fmoothing plane, which is a part of polithed brass, about one-ath of an inch thick and 9 inches square, turned up on all the e edgeand with a handle fitted on to the upper or a.

e fide. The fand being thus smoothed, it is fit casting sheets of lead: but if they would cast iftern, they measure out the bigness of the four is; and having taken the dimensions of the at or fore-part, make mouldings by pressing g flips of wood, which contain the same moulgs, into the level fand; and form the figures of is, beafts, &c. by preffing in the same manner len figures upon it, and then taking them off, at the same time smoothing the surface where of the fand is raifed up by making these impress upon it. The rest of the operation is the e in catting either cifterns or plain sheets of But before we proceed to mention the manin which that is performed, it will be necessiao give a more particular description of the The strike, then, is a piece of board about iches broad, and fomething longer than the dth of the mould on the infide; and at each is cut a notch about two inches deep, fo that n it is used it rides upon the sharps with those thes. Before they begin to cast, the strike is ie ready by tacking on two pieces of an old on the notches, or by flipping a cafe of leather each end, to raife the under fide about one of an inch or more above the fand, according iey would have the sheet to be in thickness: they tallow the under edge of the strike, and it across the mould. The lead being melted, put into the pan with ladles, in which, when e is a fufficient quantity for the present pur-, the four of the metal is swept off with a t of board to the edge of the pan, letting it e on the fand, which is thus prevented from ng into the mould at the pouring out of the il. When the lead is cool enough, which t be regulated according to the thickness of sheets wanted, and is known by its beginning and with a shell or wall on the fand round the two men take the pan by the handle, or elfe of them lifts it by the bar and chain fixed to a n in the ceiling, and pour it into the mould, e another man stands ready with the strike, as foon as they have done pouring in the meputs on the mould, sweeps the lead forward. draws the overplus into a trough prepared to ive it. The theets being thus caft, nothing reis but to roll them up or cut them into any sure wanted: but if it be a cistern, it is bent tour fides, to that the two ends may join the where they are foldered together; after .h the bottom is foldered up. II. To cast PIPES. out foldering, they have a little mill, with arms evers to turn it withal. The moulds are of s, and confift of two pieces, which open and by hooks and hinges, their inward caliber or leter being according to the fize of the pipe, by two feet and a half. In the middle is ed a core or round piece of brass or iron, twhat longer than the mould, and of the thickof the inward diameter or the pipe. is passed through two copper rundles, one at end of the mould, which they serve to close; to there is joined a little copper tube about inches long, and of the thickness the leaden is intended to be of. By means of these in the core is retained in the middle of the caof the mould. The core being in the mould,

with the rundles at its two ends, and the lead melted in the furnace, they take it up in a ladle, and pour it into the mould by a little aperture at one end, made in the form of a funnel. When the mould is full, they pass a hook into the end of the core, and, turning the mill, draw it out; and then opening the moeld, take out the pipe. If they defire to have the pipe lengthened, they put one end of it in the lower end of the mould and pass the end of the core into it; then shut the mould again and apply its rundle and tube as before, the pipe just cast serving for a rundle, &c. at the other Things being thus replaced, they pour in fresh metal, and repeat the operation till they have got a pipe of the length required. For making pipes of theet-lead, the plumbers have wooden cylinders, of the length and thickness required; and on these they form their pipes by wapping the flieet around them, and foldering up the edges all along them. The lead which lines the Chinese tea-boxes is reduced to a thinness which we are informed European plumbers cannot imitate. The following account of the process by which the plates are formed was communicated to a writer in the Gentieman's Magazine by an intelligent mate of an East Indiaman. The caster sits by a pot containing the melted metal; and has two large stones, the under one fixed, the upper moveable, directly before him. He raifes the upper stone by pressing his foot upon the side of it, and with an iron ladle pours into the opening a proper quantity of the fluid metal. He then immediately lets fall the upper stone, and by that means forms the lead into a thin irregular plate, which is afterwards cut into a proper shape. The which is afterwards cut into a proper shape. furfaces of the stones, where they touch each other, are exactly ground together.

PLUMB-PUDDING. See PLUMPUDDING, No 1. and 2.

(1.) PLUMBUM, [Lat.] LEAD. See LEAD.
(2.) PLUMBUM CORNEUM, a combination of lead with the marine acid. See Chemistry.

\* PLUMCAKE. n. f. [plum and cake.] Cake made with raifins.—

He cramm'd them till their guts did ake
With caudle, custard and plumcake. Hudib.
(1.)\* PLUME. n. j. [plume, Fr. pluma, Lat.] 1.
Feather of birds.—

We'll pull his plumes, and take away his train. Sbak.

Wings he wore of many a coloured plane.

They appear made up of little bladders, like those in the p'ume or stalk of a quill. Grew's Mufaum. 2. Feather worn as an ornament; Chapmas uses it for a crest at large.

Your enemies with nodding of their plumes
Fan you into despair. Shak. Coriolanus.

With this againe, he rusht upon his guest,

And caught him by the horse-haire piume, that dangl'd on his crest. Chapman.

-Offridges feathers are common, and the ordinary plume of Janizaries. Brown.

His high plume that nodded o'er his head.

Dryden.

3. Pride; towering mein .-

Great Duke of Lancaster, I come to thee From plume-pluckt Richard. Shak. Rich. II.

4. Token of honour; prize of contest .-

Ambitious to win from me fome plume. Milt. 3. Plume is a term used by botanists for that part of the seed of a plant, which in its growth becomes the trunk: it is inclosed in two small cavities, formed in the lobes for its reception, and is divided at its loose end into divers pieces, all closely bound together like a bunch of seathers, whence it has this name. Quincy.

(2.) PLUME, in botany, (§ 1, def. 5.) See GEM-

MA.

(3.) PLUME, in geography, a town of France, in the dep. of Lot and Garonne; 7 miles SW. of A-

gen.
To PLUME. v. a. [from the noun.] 1. To pick and adjust feathers.—Swans must be kept in some enclosed pond, where they may have room to come ashore and plume themselves. Mort. 2. [Plumer, Fr.] To strip of seathers.—Such animals, as feed upon sless, because they will not take pains such the plume them. Ray. 3. To strip; to pill.—The king cared not to plume the nobility and people to seather himsels. Bacon. 4. To place as a plume.—

His stature reach'd the sky, and on his crest Sat horror plum'd.

Milton's Par. Lost.

5. To adorn with plumes .-

Farewell the plumed troops. Shak. Othello.

\* PLUMEALLUM. n. f. [alumen plumofum, Bat.] A kind of afbeftus.—Plumeallum, formed into the likeness of a wick, will administer to the flame, and yet not consume. Wilkins.

PLUMELEC, a town of France, in the dep. of Morbihan; 7½ miles SSW. of Josselin, and xx

NE. of Vannes.

PLUMELIAU, a town of France, in the dep. of the Morbihan; 6 miles \$. of Pontivy and 8 NE. of Orient.

PLUMENTAAL, a town of Germany, in Auf-

tria; 4 miles W. of Zifterdorf.

PLUMERIA, in botany, Red Jassinine, a genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method

ranking under the 30th order, Contorta.

PLUMIER, Charles, a learned Minim, born at Marseilles, and one of the most able botanists of the 17th century. He was instructed by the famous Maignan, who taught him mathematics, turnery, the art of making spectacles, burning-glasses, microscopes, &c. He at length went to Rome, and applied himself entirely to botany under a skilful Italian. At his return to Provence, he settled in the convent at Bornes, a maritime place near Hieres, where he made discoveries in the fields with respect to simples. He was sent by the French king to America, to bring from thence fuch plants as might be of service in medicine. He made three different voyages to the Antilles, and stopped at the island of St Domingo. king gave him a pension; and he at last settled at Paris. Preparing to go a 4th time to America, he died at the port of Santa Maria, near Cadiz, in 1706. He wrote feveral excellent works; the chief are, 1. A volume of the Plants in the American Islands. 2. A Treatise on the American Fern. 3. The Art of Turnery; a curious work embellished with plates.

\* PLUMICEROUS. adj. [pluma and gro, Lt]. Having feathers; feathered. Diff.

\* PLUMIPEDE. n. f. [pluma and per, Lt] if fowl that has feathers on the foot. Diff.

(1.) \* PLUMMET. n. f. [from plomb.] 1.1 weight of lead hung at a firing, by which declare founded, and perpendicularity is disconst-

Deeper than did ever plummet found,
I'll drown my book. Shak. Tanjl

Fly, envious time,

Call on the lazy leaden-stepping hours, Whose speed is but the heavy plumme's par-

2. Any weight.—God fees the body of feth what you bear about you, and the planmets which is hangs upon your foul. Duppa's Rules.—The herviness of these bodies must be counterposed a planmet fastened about the pulley on the aim to planmet will descend according as the fand an make the several parts of the wheel lighten hervier. Wilkins.

(2.) PLUMMET, PLUMBRULE, or PLUME LIST, an inftrument used by carpenters, maions, &c. is order to judge whether walls, &c. be unjust planes, horizontal, or the like. It is thus called from a piece of lead, fastened to the end of a chord, which usually constitutes this infused. Sometimes the string descends along a motor ruler, &cc. raised perpendiculary on motor; is

which case it becomes a level. PLUMMING, m. f. among miners, is the stand of using a mine-dial, in order to know the exact place of the work where to fink down as air-fliaft, or to bring an adit to the work or to know which way the load inclines when my liure happens in it. It is thus performed 141 ful person with an assistant, and with pen in and paper, and a long line, and a fundial, at a guess of the place above ground, defeated in a adit or work, and there fastens one coldic line to fome fixed thing in it; then the needle is let to rest, and the exact point wer? refts is marked with a pen: he then gors a bether in the line fiell faftened, and at the next isure of the adit he makes a mark on the lie 172 knot or otherwise: and then letting down the bid again, he there likewise notes down that post & which the needle stands in this second position In this manner he proceeds, from turning to to ing, marking down the points, and marking the line, till he comes to the intended place: done, he ascends and begins to work on the further of the earth what he did in the adit, bringing in first knot in the line to such a place when the mark of the place of the needle will again and its pointing, and continues this till he come to # defired place above ground, which is certain perpendicular over that part of the min which the air fliast is to be funk.

PLUMOSE, adj. formed in the mannod's feather, with a ftem and fibres iffuing from to each fide; fuch are the antenne of certain men butterflies, &c.

\* PLUMOSITY. n. s. [from plants.] The frate of having feathers.

\* PLUMOUS. adj. [plumeux, Fr. plume's, [st]
Feathery; resembling feathers.—This has a la
plumous body in the middle, but finer. Hada-

(1.) \* PLUMP. adj. [Of this word the etymole, Fr. full like a ripe apple; it might be more ily deduced from plum, which yet frems very rih. Junius omits it.] Somewhat fat; not lean; ck; fuil and smooth.-The heifer, that valued :If upon a smooth coat and a plump habit of dy, was taken up for a facrifice. L'Estrange.-Plump gentleman.

Get out as fast as e'er you can. Prior.

The familh'd crow

Grows plump and round, and full of mettle. Swift.

2.) PLUMP. adv. [Probably corrupted from mb, or perhaps formed from the found, of a ne falling in the water.) With a fudden fall .-

Or to fome river take 'em Plump, and fee if that would wake 'em.

Ben Jonson. 3.) Plump. n. f. [from the adjective.] A ot; a tuft; a cluster; a number joined in one is. I believe it is now corrupted to clump.gland, Scotland, Ireland lie all in a plump to-her, not accessible but by sea. Bacon.—Wark having espied certain plumps of Scottish femen ranging the field, returned towards the iere to prevent danger. Hayward .- We refted der a plump of trees. Sandys .-

A plump of fowl behold their foe on high.

Dryden. 1.) \* To PLUMP. v. a. [from the adj.] To fati; to swell; to make large.—The particles of expanding themselves, plump out the sides of : bladder. Boyle.—I'm as lean as carrion; but redding at your house will plump me up with od cheer. L'Estrange.—Let them lie for the w and the rain to plump them. Mortimer.

(2.) \* To PLUMP. v. n. [from the adverb.] To fail like a stone into the water. A word med fro n the found, or rather corrupted from unb. 2. [from the adjective.] To be swollen.

• PLUMPER. n. ). [from plump.] Something orn in the mouth to fweil the cheeks.

She dext'roufly her plumpers draws, That ferve to fill her hollow jawa. Swift. PLUMPNESS. n f. [from plump.] Fuincis; polition towards fulnels .- Those convex glasfupply the defect of plumpness in the eye.

\*PLUMPORRIDGE. n. f. [plum and porridge.] rridge with plums .- A rigid differer, who di-I at his house on Christmas day, eat very plenully of his plumporridge. Addition.

(1.) \* PLUMPUDDING. n. f. (plum and pud-Pudding made with plums.

1.) PLUMPUDDING STONE, in mineralogy. Callander, No 1; and Mineralogy, rt II. Chap. IV. Class I. Order III. Sett. II. Gen.

\* PLUMPY. adj. Plump; fat. A ludicrous

Come, thou monarch of the vine, Plumpy Bacchus, with pink eyne. Sbak. PLUMSTEAD, a post town of Pennsylvania, the W. bank of the Delaware, 36 miles N. of uladelphia.

PLUMULE, n. f. in botany, the diminutive of y is not known. Skinner derives it from pone . PLUME; the small bud, germ, or embryo, in grain, from which vegetation commences; called Acrospire by maitsters. See Acrospire, and PLANT, § 29.

\* PLUMY. adj. [from plume.] Feathered; co-

vered with feathers.-

Satan fell, and straigst a fiery globe Of angels on full fail of wing flew nigh, Who on their plumy vans receiv'd him foft From his unealy station. Milton.

Appear'd his plumy creft, befmear'd with blood.

Addison.

-Like a quill, with the plumy part only upon one fide. Greav.

PLUNATIA. See PIANOSA.

\* PLUNDER. n. f. [from the verb.] Pillage; spoils gotten in war.

Let loofe the murmuring army on their masters. To pay themselves with plunder. \* To PLUNDER. v. a. [plunderen, Dutch.] 1. To pillage; to rob in an hostile way.—Nebuchadnezzar plunders the temple of God. South. 2. To take by pillage.—Being driven away, and his books plundered, one of his neighbours bought them in his behalf. Fell .-

Ships made in peace a treasure richer far-Than what is plunder'd in the rage of war.

Dryden.

3. To rob as a thief .-

Their country's wealth our mightier mifers drain.

Or cross, to plunder provinces, the main. Pope. PLUNDERER. n. f. [from plunder.] 1. Hoftile pillager; spoiler. 2. A thief; a robber.—It was a famous faying of William Rufus, wholoever spares perjured men, robbers, plunderers, and traitors, deprives all good men of their peace and quietness. Addijon -

What one plund'rer left, the next will feize.

PLUNERET, a town of France, in the dep. of the Morbihan; 2 miles E. of Auray, and 74 W. of Vannes.

\* PLUNGE. n. f. 1. Act of putting or finking under water. . Difficulty; ftrait; diftress .- She was weary of life, fince the was brought to that plunge; to conceal her husband's murder, or accuse her son: Sidney .- People, when put to a plunge, cry out to heaven for help. L'Estrange.-

And wilt thou not reach out a friendly arm, To raise me from amidst this plunge of sorrows?

Addison. —He must be a good man; a quality which Ci-'cero and Quintilian are much at a plunge in afferting to the Greek and Roman orators. Baker.

(1.) To Plunge. v. a. plonger, Fr.] 1. To put fuddenly under water, or under any thing supposed liquid.-

Plunge us in the flames. Milton. Headlong from hence to plunge herself she fprings. Dryden.

2. To put into any state suddenly .-

I mean to plunge the boy in pleafing fleep, And ravish'd in Idalian bow'rs to keep. Dryd. 3. To hurry into any distress.

O conscience! into what abyse of sears

And horrors hast thou driv'n me? out of which I find no way; from deep to deeper plung'd.

—Without a prudent determination in matters before us, we shall be plunged into perpetual errors. Watts. 4. To force in suddenly. This word, to what action soever it be applied, commonly expresse either violence and suddenness in the agent, or distress in the patient.—

At this advanc'd, and fudden as the word, In proud Plexippus' bosom plung'd the sword.

Dryden.

Let them not be too hafty to plunge their enquiries at once into the depths of knowledge. Watts.

(2.) \* To Plunge. v. n. 1. To fink fuddenly

into water; to dive.—
Accounted as I was, I plunged in. Shak.

His courter plung'd,

And threw him off; the waves whelm'd over him.

Dryden.

Forc'd to plunge naked in the raging fea.

—When tortoifes have been a long time upon the water, their shell being dried in the sun, they are easily taken; by reason they cannot plunge into the water nimbly enough. Ray. 2. To fall or rush into any lazard or distress.—He could find no other way to conceal his adultery, but to plunge into the guilt of a murther. Tillotion.—

Bid me for honour plunge into a war. Addif. He plung'd into the gulph which heav'n foretoid. Pope.

\* PLUNGEON. n. f. [mergus, Latin.] A fea bird. Ains.

\* PLUNGER. n. f. [from plunge.] One that

plunger; a diver.

\* PLUNKET. n. f. A kind of blue colour.

Ainf.
(1.) PLURAL. adj. [pluralis, Lat.] 1. Implying more than one.—

Better have none

Than plural faith, which is too much by one.

2. [In grammar.]—The Greek and Hebrew have two variations, one to fignify the number two, and another to fignify a number of more than two; under one variation the noun is faid to be of the dual number, and under the other of the plural. Elarke.

(2.) Plural. See Grammar, under English

LANGUAGE, p. 692, 694.

\* PLURALIST. n. f. [pluralifle, Fr. from plural.] One that holds more eccleliastical benchees than one with cure of fouls.—If the pluralifls would do their best to suppress curates, their

number might be retrenched. Collier.

(1.)\* PLURALITY. n. f. [m. ralite, Fr.] 1. The flate of being or having a greater number.—It is not plurality of parts without majority of parts, maketh the total greater. Bacon. 2. A number more than one.—Those hereticks had introduced a plurality of gods. Hummond.—Sometimes it admitteth of distinction and plurality. Pearfon.—They could forego plurality of wives. Bentley.—This impossible to conceive how any language can want this variation of the noun, where the nature of its fignification is such as to admit of plurality. Clarke. 3. More cure of souls than one. 4. The greater

number 1 the majority.—Take the plurality of the world, and they are neither wife nor good. List

(2.) PLURALITY OF BENEFICES, or LIVING is where the same clerk is posselled of two more spiritual preferments, with cure of inc. See BENFFICE, § 2-8. The fmalinels of test benefices first gave rife to piuralities; for an aclebaftie, unable to subtift on a fingle on, wa allowed to hold two; and at length the miniincreased without bounds. A remedy was a tempted for this abuse at the council of latera under Alexander III. and Innocent III. in mis when the holding more than one benefic was forbid by a canon under the penalty of depretion; but the same canon granting the poper power to dispense with it in favour of persons diffinguished merit, the prohibition became at most useless. They were also restrained her 21 Hen. VIII. cap. 13. which enacts, that it my person having one benefice with cure of ford, of the yearly value of 81. or above (in the lars books), accept any other with cure of fools, the first shall be adjudged in law to be roud, acthough the same statute provides for dispension in certain cases. In England, to procure a dipenfation, the presentee must obtain of the bilings in whose diocese the livings are, two ceruscuts of the values in the king's books, and the mar ted values and distance; one for the archive, and the other for the lord chancellor. And the livings he in two dioceses, then two carticals of the same kind are to be obtained from each to thop. He must also show the archbishup to profentation to the 2d living; and bring with im two testimonials from the neighbouring class concerning his behaviour and convertation at for the archbishop and the other for the lod chancellor; and he must also show the artists thop his letters of orders, and a certificated is having taken the degree of M. A. at the ball a one of the univerlities of this realm, werthe hand of the register. And if he be not B.D. m. D. nor LL. B. nor LL. D. he is to proceed quantication of a chaplain, which is to be to registered in the faculty of office, in order to be tendered to the archbishop, according to the tute. And if he hath taken any of the aforded alegrees, which the statute allows as qualification he is to procure a certificate thereof, and to home the same to the archbishop; after which his pensation is made out at the faculty office, when he gives fecurity according to the direction of the canon. He must then repair to the lord thro lor for confirmation under the broad feal; and must apply to the bishop of the diocese where the living lies for his admittion and inftitution. the several stamp acts, for every skin, or proor parchment, &c. on which any difpendix hold two ecclesiastical dignities or benefice. dignity and a benefice, shall be engroffed a ten, there shall be paid a treble 40s, stamp There is also a regulation with regard to plan ties; but it is often dispensed with: for, by faculty of dispensation, a pluralist is required that benefice from which he shall happen to be most absent, to preach 13 fermons every for and to exercise hospitality for two months feet In Germany the pope grants dispensations for po

lefting a plurality of benefices, on pretence that the ecclefialtical princes there need large revenues to bear up against the Protestant princes.

(3.) PLURARITY OF WORLDS. See ASTRONO-MY, \$ 170. 203-105; and PLANET, \$ 2.

PLURALLY. adv. [plural.] In a fense im-

plying more than one.

PLUS, [Litin, more.] in algebra, a character marked thus +, used for the sign of addition. See Algebra, Part I. def. 2. and NEGATIVE, 64.

(r.) PLUSH. n. f. [peluche, French.] A kind of villous or flaggy cloth; flag; a kind of woollen velvet.—The bottom of it was fet against a lining of plush. Bacon.—The colour of plush or velvet will appear varied, if you stroak part of it one way, and part of it another. Boyle.—

I love to wear cloths that are flush,

Not prefacing old rags with plush. Cleavel. (2.) Plush, in commerce, &c. has a fort of vivet knap or shag on one fide, composed regularly of a woof of a fingle wooden thread and a double warp; the one wool, of two threads twished; the other goals or camels hair; though there are some plushes entirely of worsted, and others composed whoily of hair.

\*PLUSHER. n. f. [galea lævis.] A fea fish.— The outchard is devoured by a bigger kind of fish called a plusher, fornewhat like the dog-fish.

Careau.

PLUTARCH, a great philosopher and historian of antiquity, who lived from the reign of Claudius to that of Hadrian, was born at Cherorea, a finall city of Bootia in Greece. Plutarch's fimily was ancient in Cheeronea: his grandfather Limprias was a philosopher, and eminent for his larning; and is often mentioned by Plutarch in is writings, as is also his father. Plutarch was initiated early in study, and was placed under the care of Ammonius, an Egyptian, who, after having taught philosophy with great reputation at Alexandria, fettled at Athens. Under this mafter he made great advances in knowledge; but like a true philosopher, more apt to regard things than words, he neglected the fludy of languages. Though he is supposed to have resided in Rome tear 40 years at different times, yet he never ems to have acquired a competent skill in the Laun language; nor did he even cultivate his mother-tongue the Greek with accuracy, and hence that harshness, inequality, and obscurity in his ftyle, which is so justly complained of. After being groun led by Ammonius, he travelled into Egypt, and was initiated in the Egyptian Mys-TERIES, as appears by his treatife Of Ifis and Ofu: m which he thows himfelf well verted in their nicient theology and philosophy. From Egypt be returned into Greece; and vifiting in his way Ill the academies and schools of the philosophers, rathered from them many of those observations with which he has enriched his works. He does pit feem to have been attached to any particular left, but culled from each whatever he thought excellent. He could not bear the paradoxes of the Stoics, but was still more averte from the impicty of the Epicureans: in many things he followed Ariftotie; but his favourites were Socrates Vel. XVII. PART II.

and Plato, whose memory he revered so highly that he annually celebrated their birth-days with much folemnity. Besides this, he applied him-Telf with extreme diligence to collect not only all books, but also all the fayings and observations of wife men which he had heard in conversation or had received from others by tradition; and likewife to confult the records and public inftruments preferved in cities which he had vifited in his travels. He took a particular journey to Sparta, to fearch the archives of that famous kingdom, to understand their ancient government, with the history of their legislators, kings, and ephoru. He took the fame methods with regard to many or ther commonwealths; and thus was enabled to leave us in his works such a rich cabinet of observation upon men and manners, as, in the opinion of Montaigne and Bayle, have rendered him the most valuable author of antiquity. Few circumfrances of Plutarch's life are known. According to the learned Pabricius, he was born under Claudius, 50 years after the Christian era. He was married to a most amiable woman of his own native town, whose name was Timoxena, and to whosesense and virtue he bears the most affectionate testimony in his moral works. He had severa children, and among them two fons; one called Plutarch after himfelf, the other Lamprias in memory of his grandfather. Lamprias feems to have inherited his father's philosophy; and to him we owe the table or catalogue of Plutarch's writings, and perhaps also his apophthegms. He had a nephew, Sextus Chæroneus, who taught the learned emperor Marcus Aurelius the Greek tongue, and was much honoured by him. Some think, that the critic Longinus was of his family; and A. puleius, in the first book of his Metamorphoses, affirms himfelf to be descended from him. Prutarch upon going to Rome, had a great refort of the Roman nobility: for he tells us himself, that he was fo taken up in giving lectures on philosophy to the great men of Rome, that he had not time to make himfer mafter of the Latin tongue. He was several times at Rome, and contracted an intimacy with Soffius Senecio, a worthy man, who had been four times conful, and to whom Plutarch has dedicated many of his lives. But his chief object in these journeys, was to search the records of the Capitol, and the public libraries. Suidas fays he was intrutted also with the management of public affairs in the empire, during his relidence in the metropolis. "Pintarch (fays he) lived in the time of Trajan, who bestowed on him the confular ornaments, and caused an edict to be pailed, that the magistrates or officers of Hiyria should do nothing in that province without his knowledge and approbation." It is generally supposed that Trajan, a private man when Plutarch first came to Rome, was, among other nobility, one of his auditors; that this wife emperor afterwards made use of him in his councils. Much indeed of the happiness of his reign has been imputed to Pautarch. Pabricius afferts that he was Trajan's preceptor, and that he was raised to the confular dignity by him, and made procurator of Greece in his old age by Adrian. The defire of wifiting his native country prevailed with him at S 3 3 3

length to leave Italy: and at his return he was unanimoully chosen archon of Chæronea, and soon after admitted into the number of the Delphic Apollo's priests. Fabricius says he died in the 5th year of Adrian, aged 70. His works have been divided into Lives and Morals. He has been justly efteemed for his fine fenfe and learning, for his integrity, and for a certain air of goodness which appears in all his works. His aim was to inftruct and charm the mind; and in this none ever went beyond him. Of his moral writings it is to be regretted that we have no elegant English transfation. Even his Lives were chiefly known to the English reader by a misciable version, till a new one executed with fidelity and spirit was presented to the public by the Langhornes in 1770.

PLUTIA, an ancient town of Sicily. Gic. PLUTO, in Pagan worthip, the king of the infernal regions, was the fon of Saturn and Ops, and the brother of Jupiter and Neptune. deity finding himfelf childless and unmarried, mounted his chariot to visit the world; and arriving in Sicily, fell in love with Proferpine, whom the faw gathering flowers with her companions in the valley of Enna, near mount Ætna; when, forcing her into his chariot, he drove her to the river Chemarus, through which he opened himfelf a paffage back to the realms of night. See CERES and PROSERPINE. Pluto is ufually represented in an ebony chariot drawn by four black horses; sometimes holding a scentre, to denote his power; at others, a wand, with which he drives away the ghofts; and at others, fome keys, to fignify that he had the keys of death. Homer observes, that his helmet had the quality of rendering the wearer invisible, and that Minerva borrowed it in order to be concealed from Mars when the fought against the Trojans. Pluto was greatly revered both by the Greeks and Romans. who erected temples and altars to him. To this god facrifices were officied in the night, and it was not lawful to offer them by day.

PLUTUS, in Pagan worship, the god of riches. He was repretented as appearing lame when he approached, and with wings at his departure; to show the difficulty of amassing wealth, and the uncertainty of its enjoyment. He was also frequently represented blind, to show that he often bestowed his favours on the most unworthy, and left in necessity those who had the greatest me-

(1.)\* PLUVIAL. PLUVIOUS. adj. [from pluvia, Latin.] Rainy; relating to rain.—The fungous passes about the wicks of candles only fignifieth a moift and pluvious air about them. Brown.

(2.) \* PLUVIAL. n. f. (pluvial, Fr.) A prieft's cope. Ainf.

PLUVIALIS. See Chanadrius, No 9.

(1.) PLUVIERS, a town of France, in the dep. of Eure and Loire, and ci-devant prov. of Beauce, 20 miles N. of Orleans. Lon. 2. o. E. Lat. 48. 14. N.

(2.) PLUVIERS. See PITHIVIERS.

PLUVIGNER, a town of France, in the dep. of Morbihan; 6 miles N. of Au ay, and 13½ E. of Orient.

PLUVIOSE, [Fr. i.e. Rainy.] the 5th month of the year, and the 2d month of winter, in the

new French Calendar; commencing Jan. 20, 221 ending Feb. 18, See Calendar, 6 3.

PLUVIOUS. See PLUVIAL, 9 1.

PLUVIUS, a furname of Jupiter. He was voked by that name among the Romans when wer the earth was parched up by continued har, and want of rain. He had an altar in the temps on the capitol.

PLY. n. f. [from the verb.] 1. Rent; tent form; cast; base.—The late learners cannot be well take the pla. Bacon. 2. Plait; fold.—The rugae or plies of the inward cost of the source detain the aliment in the stomach. Arbeitses.

(1.) To PLY. v. a. [plin, to wak at my thing, old Dutch. Junior and Skinner, 1. Is work on any thing crofely and importunish.

The wound's great author cioic at handpo-

vokes
<sup>1</sup> His rage, and *plies* him with redoubled finds. *Dyda*.

The hero from afar

Plies him with darts and stones.

Dyer.

To employ with diligence; to keep bus; to fet on work.—

Her gentle wit she plies
To teach them truth.

—He resum'd his pen too, and ply'd it is had.

Rell.—

They their legs ply'd.

He who plies all means and opportunin in feareh of truth, may reft upon the judgment of his conficience so informed, as a warrantible grate.

South.—

The weary Trojans ph their shatterdom.
To nearest land.

Dyla.

-I have plied my needle thefe fifty years but.
3. To practife differently. -

He sternly bad him other business by. Some Keep house, and the his book.

Then commune how they best may by Their growing work.

Their bloody task, unweary'd fill, up face.

4. To folicit importunately. -

He plies her hard, and much rain wear the marble.

He ples the duke at morning and at right. So—Whofoever has any thing of David's picty subbe perpetually plying the throne of grace with fuch like acknowledgments. South.

(2.) \* To PLY. v. n. r. To work, or offer to vice.—He was forced to ply in the streets 25 2 preter. Spellator. 2. To go in haste.—

Thither he plies undaunted. Riese

3. To buly one's felf .-

A bird new made about the banks the part.

Divise
4. [Plier, Fr.] To bend.—The willow plied in

gave way to the gust. L'Estrarge.
(1.) PLYERS. n. f. See PLIERS.

(2.) PLYERS, in fortification, a kind of balant used in raising or letting down a draw-back. They contin of two timber levers, twice as ket as the bridge they lift, joined together by dist timbers formed together in the form of a St. Andrew's cross to countersolate them. They are supported by two upright jumbs, on which they swing; and the bridge is raised or let down by

neans of chains joining the ends of the plyers

PLYING, part. n. f. in the sea language, the ict of making, or endeavouring to make, a proacts against the diffection of the wind. Hence a hip that advances well in her course in this maner of failing, is faid to be a good plyer. See BEATING, PITCHING, and TACKING.

PLYM, a river of England, which rifes in Deouthere; becomes a navigable river at Plymouth, ad falls into Plymouth Sound, a little below

'iymouth.

(1.) PLYMOUTH, a town of Devonshire, aout 215 miles from London, between the rivers lym and Tamar, just before they fail into the right Channel. From a mere filling village, it as become one of the largest towns in the couni; and is one of the chief magazines in the kingom, on account of its port, which is one of the felt in England, and which is so large as to be ale to contain 1000 fail. It is defended by feveil different forts, mounting nearly 300 guns; of hich the chief is the Royal Citadel, erected in e reign of Charles II. opposite to St Nicholas land, which is within the circuit of its walls, id contains a large store-house and five regular In time of war, the outward bound proys generally rendezvous at Plymouth, and meward bound thips generally put in to prode pilots up the Channel. It is also a great ace of refort for men of war that are wind-The mouth of the Tamar is called Hamme, (see HAMOAZE) and that of the Piym, CAT-ATER, which are both commanded by the cafon St Nicholas Island. About two miles up e mouth of the Tamar, there are four docks, to of which were built in the reign of William lone wet, and the other dry, and two which we been built fince. They have every conveency for building or repairing ships, and one of em is hewn out of a mine of slate, and lined th Portland stone. This town has a considera-: PILCHARD fifthery, and carries on an extene trade with Newfoundland and the Straits. zere is a customhouse in it; and though there : two churches, befides feveral meeting houses, teach church has so large a cure of souls, that : parish clerks were till very lately in deacon's ders, to enable them to perform all the offices. he leat rents are given to the poor. The lec-'ers are chosen triennially by the corporation, ich was constituted by Henry VI. and confists a mayor, 12 aldermen, and 24 common counmen. The mayor is elected by a jury of 36 flons, chosen by four others, two of whom are pointed by the mayor and aldermen, and the zer two by the common council. There is ala recorder, and a town clerk, whose place is y profitable. The town confifts of four divins, which were anciently governed by 4 capas, each of whom had 3 constables under him. is well supplied with fresh water, which was sught from the distance of seven miles, by Sir incis Drake, a native of the town. The toll the markets, and of the cotton, yarn, &c. with profit of the mill, which is very confiderable, ongs to the corporation, as do the revenues of thambles, which are farmed out for the mayor's kitchen. There is a charity school in Plymouth, 4 hospitals, and a workhouse, in all which 200 poor children are clothed, fed, and taught; and there are two printing houses. To one of the hospitals Colonel Jory gave a charity for 12 poor widows, and a mace worth 1201, to be carried before the mayor, and fix good bells, valued at 500l. to Charles-Church. In the entrance of the bay lies the famous Edyftone rock. (See En-DYSTONE ROCKS ) In the reign of Edward III. the French landed, and burnt part of the town, but were foon repulled by Hugh Courtenay, carl of Devon. In the reign of Henry IV. the French landed again, and burnt 600 houses. Between this town and the fea is a hill called the Haw, which has a delightful plain on the top, having a pieafant profpect ail round it, and a good landmark for the use of mariners. The lift of parliament men for this borough, formerly divided anto two parts, by the names of Sutton-Valtort and Sutton-Prior, commenced the 26th of Edwar! I. and continued to the 14th of Edward III. after which we find no return made for it till the 20th of Henry VI. when the privilege was renewed. On the Haw is a fort, which at once awes the town, and defends the harbour. Here is a ferry over the Tamar, called Cromwest, or Crim is Paffage, the W. fide of which is called Westone House, and is in Devonshire, though most of the parish wherein it stands is in Cornwall. In April 2759, the parliament granted 25,259!. for the betto fortifying the town and dock of Plymouth; which was visited by George III. with the Queen, &c. in August 1789. Lon. 4. 15. W. Lat. 50. 26. N.

(2.) PLYMOUTH, a maritime county of Massachusetts, bounded on the N. by Norfolk, E. by Cape Cod bay, SE. by Barnstable county, S. by Buzzard's Bay, and SW. and W. by Brittoi. It is 37 miles long. 21 broad, and contained 4240 houses, and 29,535 citizens, in 1795. It is divided in o 15 townships, and abounds with iron one, which has given rife to numerous manufactures. In this and the adjoining county, of Bristol, there are 20 furnaces, so forges, 7 flitting and rolling milie; ocfides an incredible number of shops for the inanufacture of nails and other articles in fmithery. These produce annually about 1800 tons or iron wares; as spades, shovels, saws, scythes, cannon bails, fire arms, bells, cards, nails, &c.

(3.) PLYMOUTH, a fea port town, and capital of the above county. It is remarkable for having been the first settlement in New England, and for having had the first place of worship. It is feated at the fouth end of Plymouth Bay. Its exports, in 1794, amounted to 35,461 dollar. Lon. 70. 10. W. Lat. 41. 58. N.

(4.) PLYMOUTH, a town of Connecticut, in Litchfield county.

(5.) PLYMOUTH, a post town of New Hampflure, in Grafton county, on the W. bank of the Pemigewallet, at the mouth of Baker's river, 45 miles N. of Concord. It has a court-houle and congregational church; and contained 625 citizens in 1795. It is 71 miles NW. of Portimouth, and 463 of Philadeiphia. Lon. 2. 28. E. of that city. Lit. 43. 46. N.

(6.) PLYMOUTH, a past town of N. Carolina. 53382

. or the S. bank of the Roanoke, g miles above its flatue of the goddets, and wathed it. The day mouth; 23 miles S. by W. of Edenton, and 462 SW. of Philadelphia. Lou. 1. 58. W. of that city. Lat. 35. 51. N.

(74) PLYMOUTH, a town of New York, on the W. bank of the Seneca, on a gentle declivity, 12

miles SE. of Geneva.

(8, 9.) PLYMOUTH, two townships of Pennsylvania; the one in Luzerne, and the other in Montgomery counties.

(10.) PLYMOUTH, a town of Hispaniola, near

Jeremie.

(11.) PLYMOUTH, a town of Tobago.

(12.) PLYMOUTH BAY, a bay of Maifachufette, on the coast of Plymouth county, 41 miles SE. of

(13.) PLYMOUTH SOUND, a found on the coaft

. of Devonshire, below Psymouth.

(1.) PLYMPTON. See PLIMPTON. (2.) PLYMPTON, a township of Massachusetts, in Plymouth county, 45 miles SE. of Boston;

containing 956 citizens in 1795. PLYMTREE, a town of Devonshire, E. of

Bradninch.

PLYNLIMMON. See PLIMLIMMON, and

· Snowdon.

PLYNTERIA, a Grecian festival in honour of Aglauros, or rather of Minerva, who received from the daughter of Cecrops the name of Aglauros. The word is derived from show, lavare, because during the solemnity they undressed the on which it was observed was looked upon a unfortunate and inauspicious; and therefore w person was permitted to appear in the temple, a they were purposely furroun - d with ropes liz arrival of Aicibiades in Athens that day, vs thought very unfortunate, but the work in ever after attended him proved it to be otherwise It was cuttomary at this festival to bear in proceffion a clufter of figs; which intimated the progrefs of civilization among the first inhabitants of the earth, as figs ferred them for food after this had begun to diffike acorns.

PNEUMATICAL. | adj. [ suspenses, true PNEUMATICK. | suspenses.] 1. Morted by wind; relative to wind .- I fell upon the many of pneumatical trials. Boyle. - That the airms: furface of the earth will expand itself, who it pressure of the incumbent atmosphere is taken, may be feen in the experiments made by Boyest

bis pneumatick engine. Locke .-They with pneumatick engine cealcichdras.

2. Confisting of spirit or wind .- All sold buter confift of parts pneumatical and tampbe, i's pneumatical substance being in some bales la native spirit of the body, and in others plan at that is gotten in. Bacon.—The race of all thesis here is, to extenuate and turn this gs to kent pneumatical and rare; and not to retrogram, nem pneumatical, to that which is denfer Barn.

#### M K

DEPINITIONS OF THE SCIENCE.

PNEUMATICKS is thus defined and illustrat-

ed by Dr Johnson:

PHEUMATICKS. n. f. [pneumatique, Fr. whum.] 1. A branch of mechanicks, which confiders the doctrine of the air, or laws according to which that fluid is condensed, rarified or gravitates. Harris. 2. In the schools, the doctrine of spiritual fubitances, as God, angels, and the fouls of men. Dia.

The word PNEUMATICS, in its original meaning, expresses a quality of air, or more properly of breath: but is usually extended to the study of the mechanical properties of all elastic or sensibly compressible fluids; as the term Hyprostatics is applied to the fludy of the mechanical properties of such bodies as interest us by their sluidity or liquidity only.

The ad definition, given above by Dr Johnson, is rather refiricted to the science of the intellectual phenomena, and is otherwise expressed

by the term, PNEUMATOLOGY.

The investigation of the nature, principles, and properties of AIR, is therefore the chief object of this science; and the practical application of thefe to the invention and improvement of varicus engines for philosophical experiments, its principal ufe.

SECT. 1. Of the PROBERTIES of Air.

THE properties of Aik; that immense fluid,

upon which not only all animal and regards life, but the principal phænomena of natur depend, have of late very much occupied the street ion of philosophers. And their succession later proportionate to their industry and rathers Numberless properties and phenomenals to discovered in this fluid, of the existence of which the ancients had not the most distant concre-

These properties may in general be divided in to two great classes, Chemical and Mechanical ( these the former are largely treated of, under sciences of Aerology, Chemistry, and M. TEOROLOGY; as well as under the detached at ticles, Air, Atmosphere, Evappeatios, file ED AIR, FLUIDITY, GAS, HYDROGSNE, h. TROGENN, OLYGEN, WIND, &c. &c. T. latter, the mechanical properties of Air, below properly, though not exclusively, to the licent PREUMATICS.

Of all the mechanical properties of and most striking are its Elasticity and Compression See ELASTIC, \$ 51 and ELASTICITY, 140 Many other bodies have fome degree of the properties, but in air they are effectial denter iffics. Water, oil, mercury, and other fich compressible, but the degrees of compressions they possess are not their diftinguishing character In air it is otherwise; for in this fluid enthant and compressibility appear in their most inte form, unaccompanied with any other mechanic affection of matter what forvers except grants Of all the fenfibly compreffible fluids, therebre, air is the most familiar, was the first studid, and the most minutely examined. It has actordingly been generally taken as the example of heir mechanical properties, while those mechanical properties which are peculiar to any of them, and therefore characteristic, have usually been reated as an appendix to the general science of meumatics.

By mechanical properties, we mean such as proluce, or are connected with, sensible changes of notion, and which indicate the presence and ageny of moving or mechanical powers. They are herefore the subject of mathematical discussion; dimitting of measure, number, and direction, no-

ions purely mathematical.

In common language, a veffel is faid to be emp-, when the water, or other fluid which it conained, is poured out of it. Take a cylindrical lais jar, having a small hole in its bottom; and eving stopped this hole, fill the jar with water, nd then pour out the water, leaving the gials mpty, in the common acceptation of the word. yow, throw a bit of cork, or any light body, on he furface of water in a ciftern: cover this with be glass jar held in the hand with its bottom upsards, and move it downwards, keeping it ali the thile in an upright polition. The cork will coninne to float on the furface of the water in the slide of the glass, and will most distinctly show vhereabouts that furface is. It will thus be feen, hat the water within the glass has its surface unfiderably lower than that of the furrounding rater; and however deep we immerge the glafs, re shall find that the water will never rife in the uside of it so as to fill it. If plunged to the lepth of 32 feet, the water will only half fill it; nd yet the acknowledged laws of hydrostatics ill us, that the water would ful the glass if there vere nothing to hinder it. There is therefore omething already within the glass which prevents he water from petting into it; manifesting in this manner the most distinctive property of matter, siz, the hindering other matter from occupying the fame place at the fame time.

In this fituation of matters, pull the stopper au of the hole in the bottom of the jar, and the vater will instantly rise in the inside of the lar, nd stand at an equal beight within and without. This is juftly afcribed to the escape through the whe of the matter which formerly obstructed the ntry of the water: for if the hand be held before he hole, a puff will be diffinely felt, or a feather eld there will be blown afide; indicating in this nanner that what prevented the entry of the waer, and now escapes, possesses another characterftic property of matter, impulfine force. The maeriality is concluded from this appearance, in the ame manner that the materiality of water is conluded from the impulse of a jet from a pipe. We ilso see the mobility of the formerly pent up, and low liberated, substance, in consequence of exterial pressure, wiz. the pressure of the surrounding

Vater.

If we take a finooth cylindrical tube, thut at me end, and fit a plug to its open end, fo as to lide along it, but so tightiy as to prevent all passage by its fides; and if the plug be well soaked

in greafe, we shall find that no-force whatever can pull it to the bottom of the tube. There is therefore fomerbing within the tube preventing by its impenetrability the entry of the plug, and therefore policiling this characteristic of matter. In like manner, if, after having opened a pair of common beliews, we shut up the nozzle and vaive hole, and try to bring the boards together. we find it impossible. There is something included which presents this, in the same manner as if the bellows were filled with wool: but on opening the nozzle, we can eafily flut them, viz. by expelling this fomething; and if the compreffion is forcible, the forething will iffue with confiderable force, and very fanibly impel any thing in its way.

People are apt to think, that we move about without any obstruction; but if we endeavour to move a large fan with rapidity, a very fenfible hinderance is perceived, and that a very fenfible force must be exerted; and a fensible wind is produced, which will agitate the neighbouring bodies. It is therefore juilly concluded that the motion is possible only in consequence of having driven this obstructing substance out of the way ; and that this impenetrable, relicing, moveable, impe ling fubflance, is matter. We perceive the perseverance of this matter in its state of rest when we wave a fan, in the fame manner that we perceive the inertia of water when we move a paddle through it. The effects of wind in impelling our ships and milis, in tearing up trees, and overturning buildings, are equal indications of its perfeverance in a flate of monon.

This matter, when at reft, we call Air; and when in motion, Wind. Air, therefore, is a material fluid; a fluid, because its parts are easily moved, and yield to the smallest inequality of

presiure.

Air possesses several other of the very general. though not effential, properties of matter. It is heavy. This might be proved, 1. from the gravity of the furrounding ATMOSPHERE, which constantly accompanies our globe, in its circuit around the fun: 2. from its power in supporting the clouds and vapours, which constantly float in it: 3. From various familiar experiments; fuch as the following: If we flop the end of a lyringe after its piston has been pressed down to the bottoin, and then attempt to draw up the pifton, we thall find a confiderable force necessary, viz. about 15 or 16 pounds for every square inch of the fection of the fyringe. Exerting this force, we can draw up the pifton to the top, and we can hold it there; but the moment we cease acting, the pifton ruflies down and firites the bottom. It is called a fuction, as we feel formething as it were drawing in the pifton; but it is really the weight of the incumbent air preffing it in. And this obtains in every position of the syringe; because the air is a fluid, and presses in every direction. Nay, it presses on the syringe as well as on the pifton; and if the pifton be hung by its ring on a nail, the fyringe requires force to draw it down, (just as much as to draw the pisson up); and if it be let go, it will fpring up, unless loaded with at least 15 lb. for every square inch of its transverse section.

4. But the most direct proof of the weight of the air is had by weighing a veffel empty of air, and then weighing it again when the air has been admitted; and this, as it is the most obvious consequence of its weight, has been afferted as long ago as the days of Aristotle. (See his work, rise overson, iv. 4.) As a proof, take a round refiel A (fig. 1. Plate CCLXXVIII.) fitted with a stopcock B, and syringe C. Fill the whole with water, and prefs the pifton to the bottom of the fyringe. Then keeping the cock open, and holding the veffel upright, with the fyringe undermost, draw down the piston. The water will follow it by its weight, and leave part of the veftel empty. Now shut the cock, and again push up the piston to the bottom of the fyringe; the water escapes through the piston valve, as will be explained afterwards: then opening the cock, and again drawing down the pifton, more water will come out of the vessel. Repeat this operation till all the water have come out. Shut the cock, unscrew the syringe, and weigh the vessel very accurately. Now open the cock, and admit the air, and weigh the vessel again, it will be found heavier than before, and this additional weight is the weight of the air which fills it; and it will be found to be 523 grains, about an ounce and a fifth avoirdupoife, for every cubic foot that the vessel contains. Now, since a cubic foot of water would weigh 1000 ounces, this experiment would thow that water is about 810 times heavier than air. The most accurate judgment of this kind of which we have met with an account is that recorded by Sir George Shuckbourgh, in the 67th vol. of the Philof Trans. p. 560. Prom this it follows, that when the air is of the temperature 53, and the barometer stands at 294 inches, the air is 836 times lighter than water. But the experiment is not fulceptible of fufficient accuracy for determining the exact weight of a cubic foot of air. Its weight is very small; and the vessel must be strong and heavy, so as to overload any balance that is sufficiently nice for the experiment.

To prevent this, the whole may be weighed in water, first loading the vessel so as to make it preponderate an ounce or two in the water; by which means the balance will be loaded only with this small preponderancy. But even in this case there are considerable sources of error, arising from changes in the specific gravity of the water and other causes. The experiment has often been repeated with this view, and the air has been found at a medium to be about \$40 times as light as water, but with great variations, as may be expected from its very heterogeneous nature.

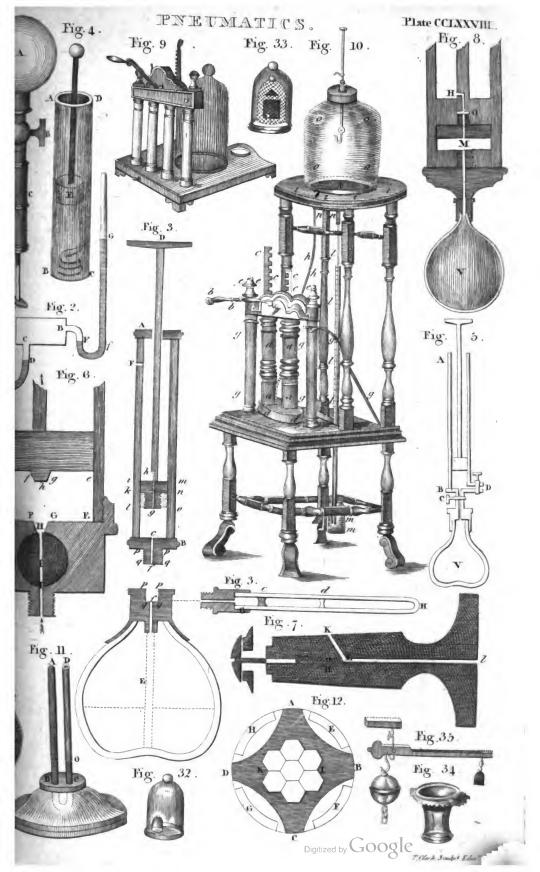

Such is the result of the experiment suggested by Aristotle, evidently proving the weight of the air; and yet the Peripatetics, who profes'd to follow his distates, uniformly resuled it this property. It was a matter long debated among the philosophers of the a7th century. The reason was, that Aristotle, with that indistinctness and inconsistency perceptible in all his writings which relate to matters of fact and experience, assigns a different cause to many phenomena which any man would ascribe to the weight of the air. Of

this kind is the rife of water in pumps and fiphons, which all the Peripatetics had far an afcribed to something which they called natural abborrence of a rooid. Ariftotle had afferted the ail nature was full of being, and that nature had not a void. He adduces many sade, in which it appears, that if not impossible, it is very discult, and requires great force, to produce a spectical, and requires great force, to produce a spection of pumps and syphons came to be known, the philosopher of Europe (who had all embraced the Pempates doctrines) found in this fancial borrer of a specific mind, a ready solution of the phenomen; we under this prejudice were satisfied with very is perficial reasoning on the subject.

GALILEO was the first who ascribed this wife. weight of the air. Many before him had some ed air heavy; and thus explained the different of railing the board of bellows, or the pilimeta fyringe, &c. But he diffinetly applies to the alowed weight of the air all the confequences of hydrostatical laws; for these reasons: These sy air refts on the water in the cifteen, and pulled with its weight. It does the fame with the we ter in the pipe, and therefore both are on a lord: but if the pitton, after being in contact with the furface of the water, be drawn up, thur # 60 longer any pressure on the surface of the min within the pipe; for the air now refts on the ton only, and thus occasions a difficulty is drawing it up. The water in the pipe, therefor, wa the fame fituation as if more water were powed into the ciftern, that is, as much as would can the same pressure on its surface as the air dock In this case the water will be presented me the pipe, and will raise up the water already and follow it till it is equally high with without. The same pressure of the air had valve E during the descent of the piston for Gal. Discourses.)

He paid due attention to the very obimobjection, that if the rife of the water was the felt of the air's preffure, it would also be its admittant would be raifed and supported only than height. He directly said so, and additions as a decrive experiment. If the hororise be the cause, says he, the water must inheight however great; but if it be owing pressure of the aw, it will only rife till the water in the pipe is in equilibriously the pressure of the air, according to the common law of hydrostatics. And he adds, it is a sid, the pumps will not draw water much above 40 pales, although they may be made to proper it, or to sit to any height.

In proof of this, an experiment was mak 2 1642, after Galileo's death, by his zealous at learned disciple Torrice Lil. He filled a tube, close at one end, with mercury; just that if the support of the water was owing he pressure of the air, and was the measure of pressure, mercury would in like manner be ported by it, and this at a height which was the measure of the air's pressure, and therefore times less than water. He had the pleasure of ing his expectation verified in the completes manner. His experiment was often repeated, and four became famous, exciting great controverses a

mong the philosophers about the possibility of a racuum.

This was the era of philosophical ardour; to which Galileo's invention and application of the elefcope gave uncommon vigour. Difcoveries of the most wonderful kind in the heavens, and which required no extent of previous knowledge ounderstand them, were thus put into the hands f every person who could purchase a spy-glass; thile the high degree of credibility which fome f the discoveries, such as the phases of Venus ad the rotation and fatellites of Jupiter, gave to ie Copernican Tystem, immediately set the whole ody of the learned in motion. Galileo joined his ardour a great extent of learning, particurly of mathematical knowledge and found loc, and was even the first who formally united athematics with physics; his treatife on acceleted motion was the first fruit of this union. Aout 1642 and 1644, many gentlemen affociated Oxford and London for the cultivation of owledge by experiment; and before 1655, all e doctrines of hydroftatics and pneumatics were niliar. Mr Boyle procured a coalition and corpondence of these clubs under the name of the visible and Philosophical Society. In May 1658, Hooke finished for Mr Boyle an air-pump, nch had employed him a long time. He foeaks this as a great improvement on Mr Boyle's n pump, which he had been using some time ore. Boyle therefore must have invented his -pump, and was not indebted for it to Schotis account of Otto Gu-rick's, published in his hottus's) Mechanica Hydraulopneumatica, in 7, as he asserts. (Techna Curiosa.) The yal Society of London arose in 1656 from the lition of these clubs, after 15 years co-operaand correspondence. The Montmorine Soy at Paris had subsisted about the same time; Paschal in 1648 speaks of the meetings in the sonne College, from which that fociety origid.-Nuremberg, in Germany, was also a disuished seminary of experimental philosophy. ta'y, indeed, there had long existed institu-3 of this kind. Rome was the centre of church rnment, and the refort of all expectants for The clergy were the majority of earned in all Christian nations, and particuof the systematic philosophers. Thus the riments of Galileo and Torricelli were rapidffused by persons of rank, the dignitaries of hurch, and by the monks.

ALILEO was in fact the author of the experiwhen he proposed it to be made. Valeria-Magnus owns himself indebted to him for the iple and the contrivance of it. It is neither lerful that many ingenious men, of one opiand instructed by Gairleo, should separateon fo obvious a thing; nor that Torricelli, nmediate disciple, his enthusiastic admirer, rho was in the habits of corresponding with ill his death in 1642, should be the first to in practice. All now agree in giving Torthe honour of the first invention; and it rfally passes by the name of the Torricet-EXPERIMENT. The tube is called the ICELLIAN TUBE; and the space left by the try is called the Torricellian Vacuum,

to diffinguish it from the BOYLEAN VACUUM, which is only an extreme rarefaction. The experiment was repeated in various forms, and with apparatus which enabled philosophers to examine feveral effects which the vacuum produced on bodies exposed in it. This was done by making the upper part of the tube terminate in a vessel of some capacity, or communicate with fuch a veffel, in which were included along with the mercury bodies on which the experiments were to be When the mercury had run out, the phenomena of these bodies were carefully observed. An objection was made to the conclusion drawn from Torricelli's experiment, which appears formidable. If the Torricellian tube be suspended on the arm of a balance, it is found that the counterpoise must be equal to the weight both of the tube and of the mercury it contains. This could not be, say the objectors, if the mercury were supported by the air. It is evidently supported by the balance; and this gave rife to another notion of the cause different from the peripatetic fuga vacui: a suspensive force, or rather attraction, was alfigned to the upper part of the tube. But the true explanation of the phenomenon is eafy and fatisfactory. Suppose the mercury in the cistern and tube to freeze, but without adhering to the tube, fo that the tube could be freely drawn up and down. In this case the mercury is supported by the base, without any dependence on the p essure of the air; the tube is in the same condition as before, and the folid mercury performe the office of a pifton to this kind of fyringe. Suppose the tube thrust down till the top of it touches the top of the mercury. It is evident that it must be drawn up in opposition to the pressure of the external air, and it is precisely similar to the syringe mentioned above. The weight sustained therefore by this arm of the balance is the weight of the tube and the downward pressure of the at-mosphere on its top. The curiosity of philosophers being thus excited by this very manageable experiment, it was natural now to try the original experiment proposed by Galileo. According. ly Berti in Italy, Palchal in France, and many others in different places, made the experiment with a tube filled with water, wine, oil, &c. and had all with the fuccefs which might be expected in fo simple a matter: and the doctrine of the weight and pressure of the air was decilively established beyond contradiction of doubt, before 1648.

The doctrine of the gravity and preffure of the air being thus established by the most unexceptionable evidence, we are entitled to assume it as a statical principle, and to assume a priori ail its

legitimate confequences.

Hence we obtain an exact measure of the preffure of the atmosphere. It is precisely equal to the weight of the column of mercury, of water, oil, &c. which it can support; and the Torricellian tube, or others fitted up upon the same principle, are justly termed barofcopes and barometers with respect to the air. Now water is supported at the height of 32 feet nearly: The weight of the column is exactly 2000ib, avoirdupois on every square such. The same conclusion very nearly may be drawn from the columns of mercury, which is nearly 291 inches high when in equilibrium with the pressure of the The measure taken from the height of a column of water, wine, spirits, and the other fluids of confiderable volatility, is not so exact as that taken from mercury, oil, and the like. For the volatile fluids are converted by the ordinary heat of our climates into vapour when the confining pressure of the air is removed; and this vapour, by its elasticity, exerts a small presfure on the furface of the water, &c. in the pipe, and thus counteracts a finall part of the external pressure; and therefore the column supported by the remaining pressure must be lighter, that is, morter. Thus it is found, that reclified spirits will not fland much higher than is competent to a weight of 13 lb. on an inch, the elasticity of its vapour balancing about To of the pressure of the air.

The medium height of the mercury in the barometer being 291 inches, we see that the whole globe fustains a pressure equal to the whole weight of a body of mercury of this height: and that ail bodies on its surface sustain a part of this in proportion to their furfaces. An ordinary fized man fustains a pressure of several thousand pounds. How comes it then that we are not leafible of a pressure which one should think enough to crush us together? This has been confidered as a ftrong objection to the pressure of the air; for when a man is plunged a few feet under water, he is very sensible of the pressure. The autiver is by no means eafy. We feel very distinctly the effects of removing this pr. sure from any part of the body. If any one will apply the open end of a fyringe to his hand, and then draw up the pifton, he will find his hand sucked into the syringe with great force, and it will give pain; and the loft part of the hand will fwell into it, being preffed in by the neighbouring parts, which are subject to the action of the external air. If one lays his hand on the top of a long perpendicular pipe, such as a pump filled to the brim with water, which is at first prevented from running out by the valve below; and if the valve be then opened, fo that the water descends, he will then find his hand so hard prefled to the top of the pipe that he cannot draw it away. But why do we only feel the inequality of pressure? There is a similar instance wherein we do not feel it, although we cannot doubt of its existence. When a man goes slowly to a great depth under water in a diving-bell, we know unquestionably that he is exposed to a new and very great preflure, yet he does not feel it. But those facts are not fufficiently familiar for general argument. The human body is a bundle of fonds, hard or foft, filled or injxed with fluids, and there are few or no parts of it which are empty. All communicate either by veffels or porcs; and the whole furface is a fieve through which the infensible perspiration is personned. The whole exfended furface of the lungs is open to the preffure of the atmosphere; every thing is therefore in equilibrio; and if free or ip edy access be given to every part, the body will not be damaged by the preflure, however great, any more than a wet sponge would be deranged by plunging it a-

ny depth in water. The preffure is inflantaneal. ly diffused by means of the incompressible saids with which the parts are filled; and if any part are filled with air or other compressible fire, these are compressed till their elasticity again is lances the pressure. Besides, all our firth at acquired flowly and gradually mixed with the proportion of air which they can diffolie or contain. The whole animal has grown up in the manner from the first vital atom of the embra For fuch reasons the pressure can occube m change of thape by fqueezing together the fixble parts; nor any obstruction by compressive vessels or pores. We cannot say what would a feet by a man, were it possible that he could have been produced and grown up in vacuo, and then ful jected to the compression. We ever how that any fudden and confiderable change of putral pressure is very severely felt. Persons is to ving-bell have been almost killed by letting them down or drawing them up too fuddenly. Indias. ing up, the elaftic matters within have federal fwelled, and not finding an immediate chare have burft the veffels. Dr Haliv experiences this, the blood gushing out from his carby its expansion of air contained in the internal critical of this organ, from which there are but knills der passages.

Here a very important observation remain pressure of the atmosphere is variable. Trivit observed almost as soon as philosophers beauti attend to the barometer. Paschal ollered : 1-France, and Deseartes in Sweden in 16ce. Me Boyle and others observed it in England in 1619. And before this, observers, who took sever i the concomitancy of these changes of acres per fure with the flate of the atmosphere. Hearth h that it was generally greatest in winter and in #: night; and certainly most variable during weet and in the northern regions. Familiar x7 10 the weight of the air, and confidering # B !!. vehicle of the clouds and vapours, the sec with care the connection between the make and the pretfure of the air, and found that Foll pressure of the air was generally accompany with fair weather, and a diminution of care rain and mitts. Hence the barometer came! confidered as an index not only of the Rate of the air's weight, but also as indicating by its 14" tions changes of weather. It became ? We THER GLASS, and continued to be assistable ferved with this view.

In the next place, we may conclude the preffure of the air will be different in different of the ces, according to their elevation above the law of the oceau; for if air be a heavy fluid, it maked in proportion to its perpendicular height be a homogeneous fluid of equal derive weight in all its parts, the mercury in the of a barometer must be preffet precilely apportion to the depth to which that efferm a merfeel in it; and as this preffure is cased as fured by the height of the mercury in the the height of the mercury in the Torriceasism of the exactly proportional to the cepth of place of observation under the surface of the mosphere.

DESCARTES first entertained this thought (Epist. 1. of Pr. III.), and foon after him Paschal; who ublished an account of this great experiment Grande Exp. fur la Pefantuer de l'Air), and it as quickly repeated in many places of the world. 1 1653 it was repeated in England by Dr Power Power's Exper. Phil.); and in Scotland, in 1661, y Mr Sinclair professor of philosophy in the uversity of Glasgow, who observed the barometer Lanark, on the top of mount Tintock in Clydfile, and on the top of Arthur's Seat at Edinirgh. He found a depression of two inches bereen Glasgow and the top of Tintock, 3 of an ich between the bottom and top of Arthur's Seat, id five gads of an inch at the cathedral of Glafow on a height of 126 feet. See Sinclair's Ars ova et Magna Gravitatis et Levitutis; Sturmii llegium Experimentale, and Schotti Technica Cu-

Hence is derived a method of measuring the ights of mountains. Having afcertained with rat precision the elevation coresponding to a fall one tenth of an inch of mercury, which is near-90 feet, we have only to observe the length of emercurial column at the top and bottom of emountain, and to allow go feet for every tenth an inch. Accordingly this method has been edifed with great fucces; but it requires an atition to many things not yet confidered, fuch as change of denfity of the mercury by heat and d; the changes of denfity of the air, which are wh more remarkable from the fame causes; and we all, the changes of the dentity of sir from compressibility; a change immediately connecwith or dependent on the very elevation we h to meafure.

These observations give us the most accurate aftire of the dentity of the air and its specific vity. This is but vaguely, though directly, assured by weighing air in a bladder or vessel. e weight of a manageable quantity is so small, at a balance fufficiently ticklish to indicate even ry featible fractions of it is overloaded by the ight of the vellel which contains it, and ceafes be exact: and when we take Bernoulli's ingeus method of fuspending it in water, we expose telves to great risk of error by the variation of water's dentity. Also it must negestarily be mid air which we can examine in this way: but proportion of an elevation in the atmosphere he depression of the column of mercury or ofluid, by which we meafure its preflure, gives it once the proportion of this weight, or their afic gravity. Thus fince in fuch a state of prefthe barometer stands at 30 inches, and the mometer at 320, 87 feet of rife produces one of an inch of fall in the barometer, the air the mercury being both of the freezing temiture, we must conclude that mercury is 10,440 is heavier of denser than air. Then, by comng mercury and water, we get one 801 nearly the dentity of air relative to water: but this to retain any thing more than a general notion ; nor is it easy to determine whether this mel or that by actual weighing is preferable. stremely difficult to observe the height of the cury in the barometer nearer than one zooth OL. XVII. PART II.

of an inch; and this will produce a difference of even five feet, or one 26th of the whole. Perhaps this is a greater proportion than the error in weigha

From the fame experiments we also derive some knowledge of the height of the aerial covering which furrounds our globe. When we raise our barometer 87 feet above the furface of the fea, the Increury falls about one tenth of an inch in the barometer: therefore if the barometer shows 30 inches at the fea-shore, we may expect that, by raising it 300 times 87 feet or 5 miles, the mercury in the tube will descend to the level of the cistern, and that this is the height of our atmosphere. But other appearances lead us to sappose a much greater height. Meteors are feen with us much higher than this, and which yet give undoubted indication of being supported by our air. can be little doubt, too, that the vifibility of the expanse above us is owing to the reflection of the fun's light by our air. Were the heavenly spaces perfectly transparent; we should no more see them than the purest water through which we fee other objects; and we see them as we see water tinged with milk or other fæculæ. Now it is eafy to show, that the light which gives us what is called twilight must be restected from the height of at least 50 miles; for we have it when the fun is depreffed 18° below our horizon.

An attention to the constitution of our air may convince us; that the atmosphere must extend to a much greater height than 300 times 87 feets We see from the most familiar facts that it is compreffible; we can fqueeze it in an ox-bladder. It is also heavy; pressing on the air in this bladder with a very great force, not lefs than 1500 lb. We must therefore consider it as in a state of compression, existing in smaller room than it would assume if it were not compressed by the incumbent air. It must be in a condition something resembling that of a quantity of fine carded wool thrown loofely into a deep pit; the lower firsta carrying the weight of the upper strata, and being compressed by them; and so much the more compresfed as they are further down, and only the upper stratum in its unconstrained and most expanded flate. If we shall suppose this wool thrown in by a hundred weight at a time, it will be divided into strata of equal weights, but of unequal thickness # the lowest being the thirmest, and the superior strata gradually increasing in thickness. Now, suppole the pit filled with zir, and reaching to the top of the atmosphere, the weights of all the ftrata above any horizontal plane in it is measured by the height of the mercury in the Torricellian tube placed in that plane; and one tenth of an inch of mercury is just equal to the weight of the lowest stratum 87 feet thick; for on raising the tube 87 feet from the fea, the furface of the mercury will descend one tenth of an inch. Raise the tube till the mercury fall another tenth: This ftratum must be more than 87 feet thick; how much es fo much by heat and moisture, that it is use- more we cannot tell, being ignorant of the law of the air's expansion. In order to make it fall a third tenth, we must raise it through a stratum still thicker; and so on continually. All this is abundantly confirmed by various experiments.

Having thus confidered the leading confequen-Tit

ces of the air's fluidity and gravity, let us confider its comprefibility; and then, combining the agency of both, we shall discover the laws, explain the phenomena of nature, and improve art. All fluids are elastic and compressible as well as air; but in them the compressibility makes no figure, or does not interest us while we are considering their pressures, motions, and impulsions. But in air the compressibility and expansion drawour chief attention, and make it a proper representative of this class of fluids.

Nothing is more familiar than the compressibility of air. It is feen in a bladder filled with it, which we can forcibly squeeze into less room; it is seen in a syringe, of which we can push the plug farther and farther as we increase the pressure. But these appearances bring into view another, and the most interesting, property of air, viz. its FLASTICITY. When we have squeezed the air in the bladder or fyringe into less room, we find that the force with which we compressed it is necessary to keep it in this bulk; and that if we cease to press it together, it will swell out and regain its natural dimensions. This distinguishes it effentially from fuch a body as a mass of flour, salt, or such like, which remain in the compressed state to which we reduce them.

There is therefore fomething which opposes the compression different from the simple impenetrahility of the air: there is fomething that opposes mechanical force: there is something too which produces motion, not only refishing compression, but pushing back the compressing body, and communicating motion to it. As an arrow is gradually accelerated by the bow-ftring pressing it forward, and at the moment of its discharge is brought to a state of rapid motion; so the ball from a pop-gun or wind-gun is gradually accelefated along the barrel by the preflure of the air during its expansion from its compressed state, and finally quits it with an accumulated velocity. These two motions are indications perfectly similar of the elasticity of the bow and of the air.

Thus it is evident that air is heavy and elaftic. It needs little confideration to convince us that it is fluid. The ease with which it is penetrated, and driven about in every direction, and the motion of it in pipes and channels, however crooked and intricate, entitle it to this character. But before we can proceed to deduce confequences from ifs fluidity, and to offer them as a true account of what will happen in these circumstances, it is neceffary to exhibit fome diffinct and fimple cafe, in which the characteristic mechanical property of a fluid is clearly and unequivocally observed in it. That property of fluids from which all the laws of hydroftatics and hydraulics are derived with the firitett evidence is, that any pressure applied to any part of them is propagated through the whole mass in every direction; and that in consequence of this diffusion of preffure, any two external forces can be put in equilibrio by the interpofition of a fluid, in the fame way as they can be put in equilibrio by the intervention of any mechanical encine.

Let a close vessel ABC (Pl. 278, fig. 2-) of any form, have two upright pipes EDC, GFB, inferted into any parts of its top, sides, or bottom, and

let water be poured into them, so as to find in equilibrio with the horizontal furfaces at E, D, G, F, and let D d, F f, be horizontal lines, it will be found that the height of the column Ed is known equal to that of the column Gf. This is a fid univerfally observed in whatever way the piper at interted. Now the furface of the water at Du undoubtedly prefled upwards with a force equi to a column of water, having its surface for to base, and Ed for its height; it is therefore prevented from rifing by fome opposite force. The can be nothing but the elasticity of the confined air pressing it down. The very same thing mot be faid of the furface at F; and thus there are two external preffures at D and F fet in equilibrium the interpolition of air. The force exerted or the furface D, by the pressure of the column 14 s therefore propagated to the furface at F; milia air has this characteristic mark of fluidity.

In this experiment the everybe of the arisintafible when the veffel is of small fize, and has no sensible share in the pressure reaching at Dand f. But if the elevation of the point F above Dis ray great, the column E d will be observed smily to exceed the column Gf. Thus if F be 70 feet higher than D, E d will be an inch longer than the column Gf: for in this case there is reacting # D, not only the preffure propagated from F, but and the weight of a column of air, having the larian at D for its base, and 70 feet high. This is equal to the weight of a column of water one inch inch It is by this propagation of pressure, this ravial-TY, that the pellet is discharged from a child's pop-gun. It flicks fast in the muzzle; and le forces in another pellet at the other end, which he presses forward with the rammer, condering the air between them, and thus propagating to the other pellet the pressure which he exerts, till in friction is overcome, and the pellet is did by the air expanding and following it.

We may now apply to air all the land or-DROSTATICS and HYDRAULICS, perfectly that their legitimate confequences will be obleve in all its fituations. We shall in future substitute, in place of any force acting on a furface of and column of water, mercury, or any other fluid whele weight is equal to this force; and as we know diffinctly from theory what will be the confequences of this hydroftatic preflure, we hall determine à priori the phenomena in air; and il cafes where theory does not enable us to fay will precition what is the effect of this pressure, of rience informs us in the case of water, and me logy enables us to transfer this to air. We la find this of great fervice in some cases, which therwise are almost desperate in the present of our knowledge. From such familiar and inobservations and experiments, the fluidits. heaviness, and elasticity, are discovered of ftance with which we are furrounded, and we call air. But to understand these proposes and completely to explain their numerous and portant consequences, we must call in the more refined observations and experiments with even this feanty knowledge of them enables to be make; we must contrive forme methods of producing with precision any degree of condensas or rarefaction, of employing or excluding the F vitating preffure of air, and of modifying at pleafure the action of all its mechanical properties.

To compress a quantity of air to any degree, Take a cylinder or prismatic tube AB (Pl. 278, fig. 3.) shut at one end, and fit it with a piston or plug C, so nicely that no air can pass by its sides. This will be best done in a cylindric tube by a turned stopper, covered with oiled leather, and fitted with a long handle CD. When this is thrust down, the air which formerly occupied the whole capacity of the tube is condensed into less room. The force necessary to produce any degree of compression may be concluded from the weight secessary for pushing down the plug to any depth. But this instrument leaves us little opportunity of making interesting experiments on or in this condenied air; and the force required to make any legree of compression cannot be measured with much accuracy; because the piston must be very close, and have great friction, in order to be fufficiently tight: And as the compression is increaled, the leather is more squeezed to the side of the tube; and the proportion of the external force, which is employed merely to overcome this variible and uncertain friction, cannot be ascertained with any tolerable precision.

To get rid of these imperfections, the following addition may be made to the instrument, which then becomes what is called the condensing syringe. The end of the fyringe is perforated with a very small hole of; and being externally turned to a imall cylinder, a narrow flip of bladder, or of thin leather, soaked in a mixture of oil and tallow, must be tied over the hole. Suppose the piston pulhed down to the bottom of the barrel to which t applies close; when it is drawn up to the top, t leaves a void behind, and the weight of the external air presses on the slip of bladder, which therefore claps close to the brass, and thus performs the part of a valve, and keeps it close so hat no air can enter. But the piston having eached the top of the barrel, a hole F in the fide If it is just below the piston, and the air rushes brough this hole and fills the barrel. Push the piston down again, it immediately passes the hole f, and no air escapes through it; it therefore prices open the valve at f, and escapes while the pifton moves to the bottom.

Let E be any vessel, such as a glass bottle, haring its mouth furnished with a brass cap firmly emented to it, having a hollow ferew which fits a olid screw pq, turned on the cylindric nozzle of the Screw the fyringe into this cap, and it is vident that the air forced out of the fyringe will x accumulated in this veffel: for upon drawing up the pifton the valve falways fluts by the elaficity or expanding force of the air in E; and on bulhing down again, the valve will open as foon is the pitton has got so far down that the air in be lower part of the barrel is more powerful than he air already in the vetlel. Thus at every stroke a additional barrelful of air will be forced into he veiled E; and it will be found, that after every troke the pifton must be farther pushed down beore the valve will open. It cannot open till the ressure arising from the elasticity of the air conlenfed in the barrel is superior to the elasticity of be air condensed in the vessel; that is, till the

condensation of the first, or its density, is fonewhat greater than that of the last, in order to overcome the straining of the valve on the hole and the sticking occasioned by the clammy matter employed to make it air-tight.

Sometimes the fyringe is constructed with a valve in the pifton. This pifton, instead of being of one piece and folid, confifts of two pieces perforated. The upper part i k n m is connected with the rod or handle, and has its lower part turned down to a fmall cylinder, which is screwed into the lower part klon; and has a perforation g b going up in the axis, and terminating in a hole b in one fide of the rod, a piece of oiled leather is strained across the hole g. When the piston is drawn up and a void left below it, the weight of the external air forces it through the hole bg, opens the valve g, and fills the barrel. Then, on puthing down the pifton, the air being squeezed into less room, prefles on the valve g, shuts it; and none escaping through the piston, it is gradually condensed as the piston descends till it opens the valve f, and is added to that already accumulated in the vessel E.

Having thus forced a quantity of air into the voffel E, we can make many experiments in it in this state of condensation. We are chiefly concerned at present with the effect which this produces on its elasticity. We see this to be greatly increased; for we find more and more force required for introducing every fuccessive barrelful. When the fyringe is unfcrewed, we fee the air rush out with great violence, and every indication of great expanding force. If the fyringe be connected with the veffel E in the same manner as the syringe before described, by interpoling a stop-cock B between them, (see fig. 1.) and if this stop-cock have a pipe at its extremity, reaching near to the bottom of the vessel, which is previously half filled with water, we can observe distinctly when the elasticity of the air in the fyringe exceeds that of the air in the receiver: for the piston must be pushed down a certain length before the air from the fyringe bubbles up through the water, and the piston must be farther down at each successive stroke before this appearance is observed. When the air has thus been accumulated in the receiver, it presses the fides of it outward, and it will burst if not strong enough. It also presses on the surface of the water; and if we now that the cock, unferew the fyringe, and open the cock again, the air will force the water through the pipe with great velocity, causing it to rise in a beautiful jet. When a metal receiver is used, the condensation may be puthed to a great length, and the jet will then rife to a great height; which gradually diminishes as the water is expended and room given to the air to expand itself. See fig. 3.

It is accurately measured by a gage fitted to the inftrument. A glass tube GH of a cylindric bore, and close at the end, is screwed into the side of the cap on the mouth of the vessel E. A small drop of water or mercury is taken into this tube by warming it a little in the hand, which expands the contained air, so that when the open end is dipped into water, and the whole allowed to cool, the water advances a little into the tube. The tube is surished with a scale divided into small T t t t 2 equal

equal parts, numbered from the close end of the tube. Since this tube communicates with the vessel, it is evident that the condentation will force the water along the tube, acting like a pitton on the air beyond it, and the air in the tube and vessel will always be of one density. Suppose the number at which the drop stands before the condensation is made to be c, and that it stands at d when the condensation has attained the degree required, the density of the air in the remote end of the gage, and consequently in the vessel, will be

Sometimes there is used a bit of tube close at one end, having a drop of water in it, simply laid into the vessel E, and furnished or not with a scale; but this can only be used with glass vessels, and these are too weak to resist the pressure arising from great condensation. In such experiments metalline vessels are used, fitted with a variety of apparatus for different experiments. Some of these will be occasionally mentioned afterwards.

Very great condensations require great force, and therefore small fyringes. It is therefore convenient to have them of various fizes, and to begin with those of a larger diameter, which operate more quickly; and when the condensation becomes fatiguing, to change the syringe for a smalk. For this reason, and in general to make the condensing apparatus more convenient, it is proper to have a stop-oock interposed between the syringe and the vessel, or as it is usually called the receiver. This consists of a brass pipe, which has a well-ground cock in its middle, and has a hollow screw at one end, which receives the nozzle screw of the syringe, and a solid screw at the other end, which sits the screw of the receiver. See fig. 1.

By these gages, or similar contrivances, we can afcertain very great degrees of condenfation in the course of some experiments. Dr Hales found, that when dry wood was put into a ftrong veffel, which it almost filled, and the remainder was filled, with water, the swelling of the wood, oceafioned by its imbibition of water, condensed the air of his gage into the thousandth of its original bulk. He found that peafe treated in the fame way generated elastic air, which pressing on the air in the gage condensed it into the 1500th part of its bulk. This is the greatest condensation that has been ascertained with precision, although in other experiments it has certainly been carried much farther; but the precise degree could not be ascertained. The only use to be made of this observation at present is, that since we have been able to exhibit air in a density a thousand times greater than the ordinary denfity of the air we breathe, it cannot, as fome imagine, be only a different form of water; for in this state it is as dense or denier than water, and yet retains its great éxpanfibility.

Another important observation is, that in every fixte of density in which we find it, it retains its perfect fluidity, transmitting all prefiures which are applied to it with undiminished torce, as appears by the equality constantly observed between the opposing columns of water or other fluid by

which it is compressed, and by the facility with which all motions are p-reormed in it in the mode compressed states in which we can make observations of this kind. This fact is totally incompatible with the facility of principle of its particles, touching each other like so many pieces of sponge.

We have feen that air is heavy and compressible, and might now proceed to deduce in order the explanation of the appearances consequent or each of these properties. But the elasticity of ar modifies the effects of its gravity so remarkably, that they would be imperfectly understood it both qualities were not combined in our consideration of either. At any rate, some farther consequences of its elasticity must be considered before we understand the means of varying a passive the effects of its gravity.

Since air is heavy, the lower strata of a mis of air must support the upper; and being compressible, they must be condensed by their weight. It is state of compression the elasticity of the lower strata of air acts in opposition to the weight of the incumbent air, and balances it. There is no reason which should make us suppose that it expanding force belongs to it only when in such a state of compression. It is more probable, thus, if we could free it from this pressure, the would expand into still greater bulk. This is mad distinctly seen in the following experiment.

Into the cylindric jar ABCD (fig. 4.), which has a small hole in its bottom, and is sumified with an air-tight piston E, put a small flacid bladder, having its mouth tied tight with a trag. Having pushed the piston near to the bottom, and noticed the state of the bladder, stop up the hole in the bottom of the jar with the finger, and draw up the pifton, which will require a one derable force. You will observe the biaddried out, as if air had been blown into it; and twill again collapse on allowing the piston to descent. Nothing can be more unexceptionable than the conclusion from this experiment, that ordinary are is in a state of compression, and that its elasticity is not limited to this state. The bladder being flaccid, shows that the included air is in the fame state with the air which surrounds it; and the same must be affirmed of it while it swells but till remains flaccid. We must conclude, that the whole air within the vessel expands, and costnues to fill it, when its capacity has been enlarged. And fince this is observed to go on as long as we give it more room, we conclude, that by fuch esperiments we have not yet given it so much room as it can occupy.

It was a setural object of curiofity to discour the limits of this expansion; to know what we the natural unconstrained bulk of a quantity air, beyond which it would not expand thouse all external compressing force were removed. Accordingly philosophers constructed instruments for rarefying the air. The common water-pump had been long familiar, and appeared very proper for this purpose: The most obvious is the oblowing:—Let the barrel of the stringe AB (25.5.) communicate with the vessel V, with a sequence C between them. Let it communicate with

PNEUMA

the external air by another orifice D, in any conrenient fituation, also furnished with a stopcock. Let this fyringe have a piston very accurately fitted to it, fo as to touch the bottom all over when pushed down, and have no vacancy about the sides. Suppose the piston at the bottom, the cock C open, and the cock D shut, draw the piston to the top. The air which filled the veffel V will expand to as to fill both that veffel and the barrel AB; and as no reason can be given to the contrary, we must suppose that the air will be uniformly diffused hrough both. Calling V and B the capacity of he veffel and barrel, it is plain that the bunk of he air will now be V+B; and fince the quantity of matter remains the same, and the density of a luid is as its quantity of matter directly and its bulk inversely, the density of the expanded air vill be  $\frac{v}{V+B}$ , the density of common air being

 $:: \text{for } V + B : V = i : \overline{V + B}.$ 

The pifton requires force to raife it, and it is aifed in opposition to the pressure of the incumant atmosphere; for this had formerly been palanced by the elafticity of the common air: and ve conclude from the fact, that force is required to aife the pisson, that the elasticity of the expanded ur is less than that of air in its ordinary state; and an accurate observation of the force necessary to raife it would flow how much the elatticity 5 diminished. When therefore the piston is let 10, it well descend as long as the pressure of the tmosphere exceeds the elasticity of the air in the arrel; that is till the air in the barrel is in a state f ordinary density. To put it further down will equire force, because the air must be compressed the barrel; but if we now open the cock D, he air will be expelled through it, and the pillon fill reach the bottom.

Now that the discharging cock D, and open the ock C, and draw up the piston, the air which ccupied the space V, with the density V+B, will ow occupy the space V+B, if it expands so far. have its density D, say, As its present bulk +B is to its former bulk V, so is its former denty V to its new density; which will there-

ty  $\frac{V}{V+B}$  to its new density; which will therewe be  $\frac{V\times V}{V+B\times V+B}$ , or  $\frac{V}{V+B}$ .

It is evident, that if the air continues to exand, the density of the air in the vesses after the sird drawing up of the piston will be  $\frac{V}{V+B}$ , the the fourth it will be  $\frac{V}{V+B}$ , and after any

amber of Rrokes n will be  $\frac{V}{V+B}\Big|^n$ . Thus, if the veffel is four times as large as the barrel, the infity after the fifth Rroke will be  $\frac{1}{1}$  and  $\frac{1}{2}$  decayly  $\frac{1}{2}$ .

I its ordinary dentity. On the other hand, the number n of strokes ecessary for reducing air to the dentity D is

 $\frac{\text{Log D}}{\text{og V.}-\text{Log.}(V+B.)}$ 

Thus we see that this instrument can never abftract the whole air in confequence of its expanfion but only rarefy it continually as long as it continues to expand; nay, there is a limit beyond which the rarefaction cannot go. When the pifton has reached the bottom, there remains a small space between it and the cock C filled with common air. When the pifton is drawn up, this small quantity of air expands, and also a limilar quantity in the neck of the other cock; and no vir will come out of the receiver V till the expanded air in the barrel is of a smaller dentity than the air in the receiver. This circumstance evidently 114 rects us to make these two spaces as small as posfible, or by some contrivance to fill them up altogether. Perhaps this may be done effectually

in the following manner. Let BE (fig. 6.) represent the bottom of the barrel, and let the circle HKI be the section of the key of the cock, of a large diameter, and place it as near to the barrel as can be. Let this communicate with the barrel by means of an hole FG widening upwards, as the frustum of a hollow obtuse cone. Let the bottom of the piston bfbge be shaped so as to fit the bottom of the barrel and this hole exactly. Let the cock be pierced with two holes. One of them, HI, passes perpendicularly through its axis, and forms the communication between the receiver and barrel. The other hole, KL, has one extremity K on the same circumference with H, fo that when the key is turned a fourth part round, K will come into the place of H: but this hole is pierced obliquely into the key, and thus keeps clear of the hole HI. It goes no further than the axis, where it communicates with a hole bored along the axis and terminating at its extremity. This hole forms the communication with the external air, and ferves for discharging the air in the barrel. (A side view of the key is feen in fig. 7.) Fig. 5. shows the pofition of the cock while the pifton is moving upwards, and fig. 6 shows its position while the pi-ston is moving downwards. When the piston has reached the bottom, the conical piece fbg of the piston, which may be of firm leather, fills the hole FHG, and therefore completely expels the air from the barrel. The canal KLI of the cock contains air of the common density; but this is turned alide into the polition KL (fig. 6.), while the pilton is still touching the cock. It cannot expand into the barrel during the ascent of the pilton. In place of it the perforation HLI comes under the piston, filled with air that had been turned aside with it when the pifton was at the top of the barrel, and therefore of the same density with the air of the receiver. It appears therefore that there is no limit to the rarefaction as long as the air will expand,

This inftrument is called an Exhausting Syerynge. It is more generally made in another form, which is much less expensive, and more convenient in its use. Instead of being furnished with cocks for establishing the communications and shutting them, as is necessary, it has valves like those of the condensing syringe, but opening in the opposite direction. It is thus made:

The pipe of communication or conduit MN (fg. 8.) has a male fcrew in its extremity, and o-

ver this is tied a flip of bladder or leather M. The lower half of the pifton has also a male screw on it, covered at the end with a flip of bladder O. This is screwed into the upper half of the pifton, which is pierced with a hole H coming out of the fide of the rod.

Now suppose the syringe screwed to the conducting pipe, and that screwed into the receiver V, and the piston at the bottom of the barrel. When the piston is drawn up, the pressure of the external air shuts the valve O, and a void is left below the piston: there is therefore no pressure on the upper tide of the valve M to balance the elasticity of the air in the receiver, which formerly balanced the weight of the atmosphere. The air therefore in the receiver lifts this valve, and distributes itself between the vessel and the barrel; so that when the piston has reached the top, the density of the air in both receiver and barrel is as be-

fore 
$$\frac{\mathbf{v}}{\mathbf{v} + \mathbf{B}}$$

When the piston is let go, it descends, because the elasticity of the expanded air is not a balance for the pressure of the atmosphere, which therefore presses down the piston with the difference, keeping the piston-valve shut all the while. At the same time the valve M also shuts: for it was opened by the prevailing elasticity of the air in the receiver, and while it is open the two airs have equal density and elasticity; but the moment the piston descends, the capacity of the barrel is diminished, the elasticity of its air increases by collapsing, and now prevailing over that of the air in the receiver shuts the valve M.

When it has arrived at fuch a part of the barrel that the air in it is of the denfity of the external air, there is no force to puth it farther down; the hand must therefore press it. This attempts to condense the air in the barrel, and therefore increases its elasticity; so that it lifts the valve O and escapes, and the piston gets to the bottom. When drawn up again, greater force is required than the last time, because the elasticity of the piston rises further before the valve M is lifted up, and when it has reached the top of the barrel the

density of the included air is  $\frac{V}{V+B}$ . The piston,

when let po, will descend farther than it did before ere the piston-valve open, and the pressure of the hand will again push it to the bottom, all the air escaping through O. The rarefaction will go on at every successive stroke in the same manner as with the other syringe.

This fyringe is evidently more easy in its use, requiring no attendance to the cocks to open and that them at the proper times. On this account this construction of an exhausting syringe is much more generally used.

But it is greatly inferior to the fyringe with cocks with respect to its power of rarefaction. Its operation is greatly limited. It is evident that no air will come out of the receiver unless its elasticity exceed that of the air in the barrel by a difference able to lift up the valve M. A piece of oiled leather tied acrois this hole can hardly be made

tight and certain of clapping to the hole, without some small straining, which must therefore be onecome. It must be very gentle indeed not to sequire a force equal to the weight of two inches of water, and this is equal to about the sooth part of the whole elafticity of the ordinary air; md therefore this fyringe, for this reason alone, casnot rarefy air above 200 times, even though in were capable of an indefinite expansion. In lite manner the valve O cannot be raised without asmilar prevalence of the classicity of the air is the barrel above the weight of the atmosphere. The eauses united, make it difficult to rarefy the ar more than 100 times, and very few such lyings will rarify it more than 50 times; whereas the hringe with cocks, when new and in good order, will rarefy it 1000 times.

But, on the other hand, fyringes with coch as much more expensive, especially when surished with apparatus for opening and shutting the cocks. They are more difficult to make equally tight, and (which is the greatest objection) do not remain long in good order. The cocks, by so sequently opening and shutting, grow loose, and allow the air to escape. No method has been found of preventing this. They must be ground tight by means of emery or other cutting powders. Some of these unavoidably stick in the metal, and coming to wear it down. For this reason phikophes, and the makers of philosophical instruments have turned their chief attention to the improvement of the fyringe with valves. We have been thin assume in our account of the operation of rarefastion, that the reader may better understand the value of these improvements, and in general the operation of the principal pneumatic engines.

### SECT. II. HISTORY of the AIR-PURT.

An Am-Pump is nothing but an exhaust fyringe accommodated to a variety of exponents It was first invented by Otto Guericke, a conteman of Magdeburgh in Germany, about the year 1654. See Air-Pump, and Guericke. instrument, which now makes a principal article in a philosophical apparatus, was at first very rude and imperfect, and therefore a description of it is its original form is unnecessary. But with all its defects, and flowness of operation, which, by the inventor's own account, took feveral hours to perpare it, Guericke exhibited with it many entertaining experiments before his friends upon the rarefaction of air. Being a counfellor and a gentleman of fortune, he made no fecret of his invention, but allowed his friend Gaspar Schottus, professor of Mathematics at Wirtemberg, to publish a particular description of it, in two of his works, a 1657, and 1664. His principal object, in the vention, was the exhauftion of air, and in the secution of this, he discovered, that the of air is unlimited. This was a doctrine quite new, and from his letter to Schottus on the fubject, it appears that his manner of invertigation was as remarkable for ph lofophical ingenerity as for modesty. In another letter to Schottus be deforibes very ingenious contrivances for produces complete rarefaction, after the elafticity of the maining air has been fo far diminished, that a ta not able to open the valves. Their continues

of Guericke's have fince been added to air-pumps, by Haas and Hurter, as new Inventions.

GUERICKE'S doctrine and his machine soon made a norse all over Europe. About this period the soundations of the Royal Society of London were aid. Mr Boyle, Lord Brounker, Dr Wallis, Mr Wren, and other learned men, met at Oxford, and made various experiments on philosophical ubjects. Mr Boyle having seen Schottus's first sublication, began to construct a machine from also own ideas, no description of Guericke's being then published. This instrument, with the various interesting experiments he exhibited with it, soon eclipsed the same of Guericke to such a degree, that the air-pump was called Machina Boylema, and the state of air in the receiver vacuum Boyleman. He soon made farther improvements.

Mi Boyle, having discovered, that to make a reffel air-tight, it was sufficient to put a piece of wet or oiled leather on its brim, and to lay a flat piece of metal on this; and that the pressure of the external air squeezed the two folid bodies so hard ogether, that it was effectually excluded by the oft leather, he foon rendered the whole machine nuch more complete. In this he was affifted by Dr Hooke, the most ingenious and inventive man of the age; who, by applying two fyringes, whose piston rods were worked by the same wheel, as in fg. 9, and putting valves in the pistons, as in those of a common pump, not only doubled the expedition of the operation, but diminished the labour of pumping. This is therefore the form of the air-pump now generally uted, with some trifling

variations, all over Europe. Mr Boyle's air-pump, as finally improved by HAWKESBEE, which, with fome accommodations to particular views, ftill remains the most approved orm, confifts of two brafs barrels a a, a a (fig. to. Pl. 278.) 12 inches high and 2 wide. The pilons are raifed and depressed by turning the winch b. This is fastened to an axis passing through a frong toothed wheel, which lays hold of the teeth of the racks cccc. Then the one is raifed while he other is depressed; by which means the valves, which are made of limber bladder, fixed in the uper part of each pifton, as well as in the openings nto the bottom of the barrels, performing their office of discharging the air from the barrels, and Unitting into them the air from the receiver to x afterwards discharged; and when the receiver comes to be pretty well exhaufted of its air, the reffure of the atmosphere in the descending pison is nearly fo great, that the power acquired to alle the other is little more than is necessary for wercoming the friction of the pifton, which renlers this pump preferable to all others, which rejuire more force to work them as the rarefaction of the air in the receiver advances. The barrels re set in a brass dish about two inches deep, filled with water or oil to prevent the infinuation of air. The barrels are screwed tight down by the nuts 's e, e, which force the frontispiece ff down on them, through which the two pillars gg, gg pals.

From between the barrels rifes a flender brass pipe b b, communicating with each by a perforation in the transverse piece of brass on which they kand. The upper end of this pipe communicates

with another perforated piece of brass, which screws on underneath the plate i i ii, of ten inches diameter, and furrounded with a brafs rim to prevent the shedding of water used in some experiments. This piece of brass has three branches: aft, An horizontal one communicating with the conduit-pipe b b. 2. An upright one screwed into the middle of the pump-plate, and terminating in a fmall pipe A, rifing about an inch above it. 3d, Is a perpendicular one, looking downwards in the continuation of the pipe &, and having a hollow screw in its end receiving the brass cap of the gage-pipe ////, which is of glass, 34 inches long and immersed in a glass cistern mm filled with mercury. This is covered a-top with a cork float. carrying the weight of a light wooden scale divided into inches, which are numbered from the furface of the mercury in the cistern. This scale will therefore rife and fall with the mercury in the cistern, and indicate the true elevation of that in the tube.

There is a stopcock immediately above the infertion of the gage-pipe, by which its communication may be cut off. There is another at n, by which a communication is opened with the external air for allowing its readmission; and there is sometimes another immediately within the insertion of the conduct-pipe for cutting off the communication between the receiver and the pump. This is particularly useful when the rarefaction is to be continued long, as there are by these means fewer chances of the infinuation of air by the many joints.

The receivers are made tight by fimply fetting them on the pump.plate with a piece of wet or oiled leather between; and the receivers, which are open a-top, have a brass cover set on them in the fame manner. In these covers there are various perforations and contrivances for various purpoles. The one in the figure has a flip wire paffing through a collar of oiled leather, having a hook or a screw in its lower end for hanging any thing on or producing a variety of motions. Sometimes the receivers are let on another plate, which has a pipe screwed into its middle, furnished with a flopcock and a ferew, which fits the middle pipe When the rarefaction has been made in it, the cock is thut, and then the whole may be unferewed from the pump, and removed to any conveni-This is called a transporter plate.

The elasticity of the gage, 1/11, in the ordinary state of the air balances the pressure of the incumbent atmosphere. We find this from the force that is necessary to squeeze it into less bulk in opposition to this elasticity. Therefore the elasticity of the air increases with the vicinity of its particles. It is therefore reasonable to expect, that when we allow it to occupy more room, and its particles are farther afunder, its elasticity will be diminished though not annihilated; that is, it will no longer balance the WHOLE pressure of the atmosphere, though it may still balance part of it. If therefore an upright pipe have its lower end immerfed in a veffel of mercury, and communicate by its upper end with a veffel containing rarefied, therefore less elastic, air, we should expect that the pressure of the air will prevail, and force the mercury into the tube, and cause it to rife to such

an height that the weight of the mercury, joined to the classicity of the rarefied air acting on its upper surface, shall be exactly equal to the whole pressure of the atmosphere. The height of the mercury is the exact measure of that part of the whole pressure which is not balanced by the elasticity of the rarefied air, and its desiciency from the height of the mercury in the Torricellian tube is the exact measure of this remaining elasticity.

It is evident, therefore, that the pipe will be a feale of the elasticity of the remaining air, and will indicate in some fort the degree of rarefaction: for there must be some analogy between the dentity of the air and its elasticity. After rarefying till the mercury in the gage has attained haif the height-of that in the Torricellian tube, shut the communication with the barrels and gage, and admit the water into the receiver. It will go in till all is again in equilibrio with the preffure of the atmosphere; that is, till the air in the receiver has collapsed into its natural bulk. This we can accurately measure, and compare with the whole capacity of the receiver; and thus obtain the precise degree of rarefaction corresponding to haif the natural elasticity. We can do the same thing with the elasticity reduced to one third, one fourth, &c. and thus discover the whole law.

This gage must be considered as one of the most ingenious and convenient parts of Hawkeibee's pump; and it is well disposed, being in a situation protected against accidents: but it necessarily increases greatly the fize of the machine, and cannnot be applied to the table pump, represent-ed in fig. 9. When it is wanted here, a small plate is added behind, or between the barrels and receiver; and on this is let a small tubulated receiver, covering a common weather-glass tube.—This receiver being rarefied along with the other, the preffure on the mercury in the ciftern, arifing from the elasticity of the remaining air, is diminished so as to be no longer able to support the mercury at its full height; and it therefore descends till the height at which it stands puts it in equilibrio with the elasticity. In this form, therefore, the height of the mercury is directly a measure of the remaining elasticity; while in the other it measures the remaining unbalanced pressure of the atmosphere. But this gage is extremely cumbersome, and liable to accidents. We are seldom much interested in the rarefaction till it is great: a contracted form of this gage is therefore very useful, and was early nied. A fyphon ABCD (fig. 11.), each branch of which is about 4 inches long, close at A and open at D, is filled with boiling mercucy till it occupies the branch AB and a very small part of CD, having its furface at O. This is fixed to a small stand, and fixed into the receiver, along with the things that are to be exhibited in the rarefied air. When the air has been rarefied till its remaining elasticity is not able to support the column BA, the mercury descends in AB, and rifes in CD, and the remaining elafticity will always be measured by the elevation of the merculy in AB above that in the leg CD.

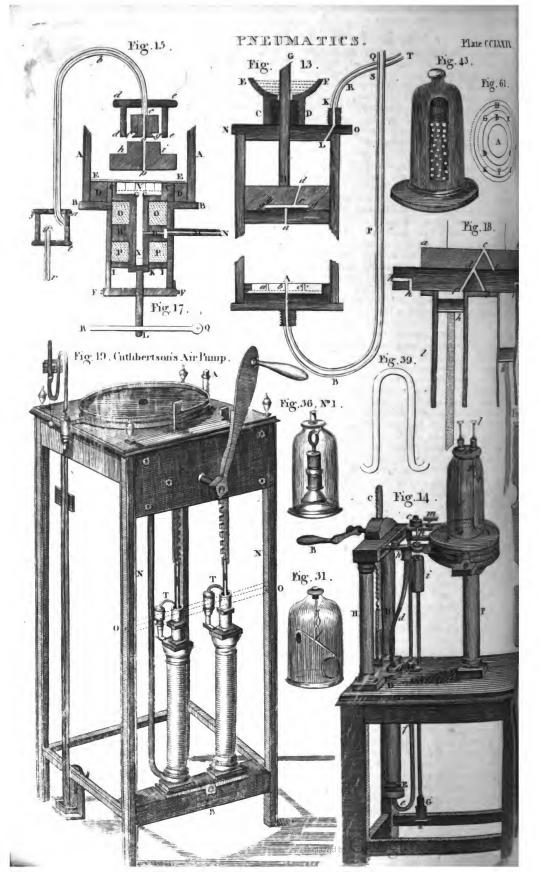

The barometer or syphon gage is a perfect indication and measure of the performance of an airpump, and a pump is (cateris paribus) so much

the more perfect, as it is able to raise the mercary higher in the gage. Thus we discover that none can produce a complete exhaultion, aid that their operation is only a very great rarefaction: for none can raise the mercury to the height at which it stands in the Torricellian tube, well purged of air. Few pumps will bring it within to of an inch. Hawkesbeer's, fitted up according to his instructions, will seldom bring a within 3. Pumps with cocks, when confirmed according to the principles of the exhaulting syringe, (Sed. I.) and new and in fine order, will in favourable circumstances bring it within in. None with valves fitted up with wet leather, or when water or volatile fluids are allowed accels into any part, will bring it nearer than 4. Nay, 2 pump of the best kind, and in the finest orie, will have its rarefying power reduced to the lowest standard, as measured by this gage, if we put into the receiver the tenth part of a square mehot white sheep-skin, fresh from the shops, or of any substance equally damp. This is a discovery made by means of the improved air-pump, and leads to very extensive and important consequences in general physics,

It would require a volume to describe all the changes which have been made on it. But our present purpose is to consider it merely as a machine for rarefying elastic or expansive fluids. All who used it perceived the limit set to the raretion by the resistance of the valves, and the doperfect the construction of the cocks. The Abbe Nollet and Gravesande, two of the most eminent experimental philosophers in Europe, were the

most successful. Mr GRAVESANDE justly preferred Hooke's plan of a double pump, and contrived an apparatus for turning the cocks by the motion of the pump's This is far from either being simple or easy in working; and occasions great jests and concussions in the whole machine. His pilot has no valve, and it has feveral other deficiences, which render a particular description unnecessary. Yet its performance is highly extolled by him, as far exceeding his former pumps with valves. The fame preference was given to it by his successes Muschenbroek. But, while they both prepared the piftons and valves and leathers of the pump. by steeping them in oil, and then in a mixture of water and spirit of wine, no just estimate could be made of its performance. For with this preparation it could not bring the gage within i of an inch of the barometer; from its confirmation, a very confiderable space is left between the pelton and cock, not less than an inch, from which the air is never expelled; it foon loft any advastages it possessed when fresh from the workman's hands, by the cock growing loofe and admitting It is surprising that Gravesande omitted Hawkesbee's security against this, by placing barrels in a dish filled with oil: which would & fectually have prevented this inconvenience.

We must not omit a seemingly paradoxical obfervation of Gravesande, that in a pump confirmeted with valves, and worked with a determined uniform velocity, the required degree of rarefaction is sooner produced by short harrels than by long ones. This will easily be seen by an exam-

ple. Suppose the long barrel to have equal capacity with the receiver, then at the end of the suffitness the air in the receiver will have \(\frac{1}{2}\) its natural dentity. Now, let the short barrels have half this capacity: at the end of the first stroke the density of the air in the receiver is \(\frac{1}{3}\), and at the end of the second stroke it is \(\frac{1}{3}\), which is less than \(\frac{1}{2}\), and the two strokes of the short barrel are supposed to be made in the same time with one of the long-

HAWKESBEE's pump maintained its pre-eminence without rival in Britain, and generally too on the continent, except in France, where every thing took the ton of the Academy, till about 1750, when it engaged the attention of Mr John Smeaton, a person of uncommon knowledge, and cond to none but D: Hooke in mechanical reource. He was then a maker of philosophical infruments, and made many attemps to perfect the jumps with cocks, but foune, that whatever perection he could bring them to, he could not etable them to preferve it; and he never would fell one of this construction. He therefore attached simfelf folely to the valve pumps. The first thing was to diminish the relistance to the entry of the or from the receiver into the barrels: this he renleted almost nothing, by enlarging the furface on which this feebly elaftic air was to prefs. Inflead of making there valves to open by its pressure on circle of To of an inch in diameter, he made he valve-hote one inch in diameter, enlarging the urface 400 times; and, to prevent this piece of hin leather from being burft by the great preffure n it, when the pifton in its descent was approaching the bottom of the barret, he supported by a delicate but strong grating, dividing the alve-hole like the fection of a honey-comb, as rerefented in fig. 12; and the ribs of this grating re feen edgewife in fig. 13. a, b, c.

The valve was a piece of thin membrane or oild filk, gentry firained over the mouth of the aive-hole, and tied on by a fine filk thread 'ound round it in the fame manner that the narow flips had been tied on formerly. This done, e cut with a pointed knife the leather round the lge, nearly four quadrantal arcs, leaving a fmall ingue between each, as in fig. 12. The strained ave immediately thrinks inwards, as represented y the thaded parts; and the strain by which it 18 kept down is now greatly diminished, taking lace only at the corners. The gratings being duced nearly to an edge (but not quite, left ky should cut), there is very little pressure to roduce adhelion by the clammy oil. Thus it aptars, that a very finall clafficity of the air in the ceiver will be fufficient to raife the valve; and Ir Smeaton found, that when it was not able to this at first, when only about of the natui classicity, it would do it after keeping the pilin up 8 or 10 feconds, the air having been ail the hile undermining the vaive, and gradually de-

ching it from the grating.

But he could not follow this method with the fton valve. There was not room round the rod r such an expanded valve; and it would have liged him to have a great space below the valve, om which he could not expel the air by the de-Vol. XVII. PART II.

scent of the piston. His ingenuity hit on a way of increasing the expering force through the common valve: he inclosed the rod of the piston in a collar of leather I, through which it moved freely without allowing any air to get past its sides. For greater fecurity, the coliar of leather was contained in a box terminating in a cup filled with oil. As this makes a material change in the principle of construction of the air-pump (and indee t of pneumatic engines in general), and as it has been adopted in all the subsequent attempts to improve them, it merits a particular consideration.

The pillon itself confists of two pieces of brais. fastened by screws from below. The uppermosi, which is of one fould piece with the rod GH, (fig-13.) is of a diameter somewhat less than the barrel; fo that when they are ferewed together, a piece of leather foaked in a mixture of boiled oil, and tallow, is put between them; and when the piston is thrust into the barrel from above, the leather comes up around the fide of the pifton, and fills the barrel, making the pifton perfectly air-tight. The lower half of the pifton projects upwards into the upper, which has a hollow gbeg to receive it. There is a fmail hole thro? the lower half at a to admit the air; and a hole ed in the upper half to let it through, and there is a flip of oiled lith strained across the hole a by way of valve, and there is room enough left at be for this valve to rife a little when preffed from below. The rod GH paifes through the piece of brass which forms the top of the barrel so as to move freely, but without any fentilize shake: this top is formed into a hollow bex, confifting of two pieces ECDF and CNOD, which screw together at CD. This box is filed with rings of oiled leather exactly fitted to its diameter, each having a hole in it for the rod to pass through. When the piece ECDF is screwed down, it compresses the leathers; iqueezing them to the rod, fo that no air can pass between them; and, to secure us against all ingress of air, the upper part is formed into a cup EF, which is kept filled with oil. The top of the barrel is also pierced with a hole LK, which rifes above the flat furface NO, and has a flip of oiled filk tied over it to act as a valve; opening when prefled from below, but flutting when preffed from above.

The communication between the barrel and receiver is by the pipe ABPQ; and there goes from the hole K in the top of the barrel, a pipe KRST, which either communicates with the open air or with the receiver, by means of the cock at its extr-mity T. The conduit pipe ABPQ has also a cock at Q, by which it is made to communicate either with the receiver or with the open air. These channels of communication are variously conducted and terminated, according to the views of the maker: the sketch in this figure is sufficient for explaining the principle, and is furted to the general form of the pump, as it has been 'requently made by Naithe and other artists in London. Let us now suppose the piston at the top of the barrel, and that it applies to it all over, and that the air in the barrel is very much rarefied: in the common pump the pifton valve is pressed hard down by the atmosphere, and conti-

Uuuu

Bu Ja

nues that till the pitton gets far down, condenses the air below it beyond its natural state, and enables it to force up the valves. But here, as foon as the piston quits the top of the barrel, it leaves . a void behind it; for no air gets in round the pifton rod, and the valve at K is flut by the prefute of the atmosphere. There is nothing now to oppose the elasticity of the air below but the stiffness of the valve be; and thus the expelling (or rather the liberating) force is prodigiously increafed.

The superiority of this construction will be best feen by an example. Suppose the stiffness of the Valve equal to the weight of  $\frac{1}{16}$  of an inch of mercury, when the barometer stands at 30 inches, and that the pump gage flands at 29'9; then, in an ordinary pump, the valve in the pifton will not rife till the pifton has got within the sooth part of the bottom of the barrel, and it will leave the valve hole filled with air of the ordinary denfity. But in this pump the valve will rife as foon as the piston quits the top of the barrel; and when it is quite down, the valve hole a will contain only the 300th part of the air which it would have contained in a pump of the ordinary form. Suppose further, that the barrel is of equal capacity with the receiver, and that both pumps are fo badly conftructed, that the space left below the piston is the 300th part of the barrel. In the common pump the pifton valve will rife no more, and the rarefaction can be carried no farther, however delicate the barrel valve may be; but in this pump the next stroke will raise the gage to 20.05, and the pifton valve will again rife as foon as the piftoir gets half way down the barrel. The Hmit to the rarefaction by this pump depends chiefly on the space contained in the hole LK; and in the space bed of the piston. When the pitton is brought up to the top, and applied close to it, those spaces remain filled with air of the ordinary dentity, which will expand as the pifton descends, and thus will retard the opening of the piston valve. The rarefaction will stop when the elasticity of this small quantity of air, expanded so as to fill the whole barrel (by the descent of the piston to the bottom,) is just equal to the force requilite for opening the pifton valve.

Another advantage attending this confluction is, that in drawing up the piston, we are not refifted by the whole pressure of the air; because the air is rarefied above this pifton as well as below it, and the pifton is in precifely the fame frate of preffure as if connected with another pifton in a double pump. The relistance to the ascent of the piston is the excess of the elasticity of the air above it over the elasticity of the air below: this, toward the end of the rarefaction, is very small, while the pifton is near the bottom of the barrel, but gradually increases as the piston rifes, and reduces the air above it into fmaller dimensions, and becomes equal to the preflure of the atmo-Sphere, when the air above the piston is of the common denfity. If we should raise the piston ftill farther, we must condense the air above it: but Mr Sineaton has here made an iffue for the air by a fmail hole in the top of the barrel, co-vered with a delicate valve. This allows the air vered with a delicate valve. to escape, and thut's again as soon as the piston

begins to descend, leaving almost a neerfect soid behind it as before.

This pump may be changed in a moment from a rarefying to a condensing engine, by simply taming the cocks at Q and T. While T communicates with the open air and Q with the receiver, it is a rarefring engine or air-pump: but when T communicates with the receiver, and O with the

open air, it is a condenfing engine.

Fig. 14. Plate 278. represents Mr SMEATON'S air-pump as made by Nairne. Upon a folid bate or table are set up 3 pillars F, H, H: the pillar F supports the pump-plate A; and the piliars H, H, support the front or head, containing a brass cogwheel, which is turned by the handle B, and works in the rack C faitened to the upper end of the piston rod. The whole is still farther make steady by two pieces of brassed and oa, which connect the pump-plate with the front, and but perforations communicating between the holes in the middle of the plate and the barrel. DE is the barrel of the pump, firmly fixed to the table by screws through its upper board: efdeisa flender brafs tube ferewed to the bottom of the barrel, and to the under hole of the borizontal canal cb. In this canal there is a cock which opens a communication between the barrel and the receiver, when the key is in the politice npresented here: but when the key is at right angles with this position, this communication is cut off. If that fide of the key which is here drawn next to the pump-plate be turned outward, the external air is admitted into the receiver; but if turned inwards, the air is admitted into the barrel. gb is another flender brass proleading from the discharging valve at g to the birizontal canal bk, to the under fide of which it is screwed fast. In this horizontal canal there is a cock n which opens a passage from the band to the receiver when the key is in the position here drawn; but opens a passage from the band to the external air when the key is turned orwards, and from the receiver to the external ar when the key is turned inwards. This communication with the external air is not immediate. but through a fort of box i; the use of this bex is to receive the oil which is discharged through the top valve g. In order to keep the pump tight, and in working order, it is proper fometimes to pour a table spoonful of olive oil into the bee a of the pump plate, and then to work the pemp. The oil goes along the conduit bedfe, gets into the barrel and through the pifton valve, when the piston is pressed to the bottom of the barrel, and is then drawn up, and forced through the 🐠 charging valve g along the pipe g b, the horizer tal passage bn, and finally into the box i. To box has a fmall hole in its fide near the top, which the air escapes.

From the upper fide of the canal co therein a slender pipe which bends outward and be turns downwards, and is joined to a finall box. which cannot be feen in this view. From the bottom of this box proceeds downwards the pipe of glass, which enters the cifters of mesony G fixed below. On the upper fide of the other canal at o is feen a small stud, having a short pipe of glass projecting horizontally from it, close by

SECT. II.

and parallel to the front piece of the pump, and reaching to the other canal. This pipe is close at the farther end, and has a small drop of mercury or oil in it at the end o. This ferves as a gage in condensing, indicating the degree of condensation by the place of the drop: For this drop is forced along the pipe, condensing the air before it in the same degree that it is condensed in the barrel and receiver.

In constructing this pump, Mr Smeaton introduced a method of joining together the different pipes and other pieces, which has great advantages over the usual manner of screwing them together with leather between, and which is nowmuch used in hydraulic and pneumatic engines. The manner in which the exhaufting gage is joined to the horizontal duct cb, is this: The piece hip, in fig. 15, is the fame with the little cylinder observable on the upper side of the horizontal canal ca, in fig. 14. The upper part hi is formed into an outlide screw, to fit the hollow screw of the piece deed. The top of this last piece has a hole in its middle, giving an easy passage to the hent tube cba, fo as to flip along it with freedom. To the end c of this bent tube is soldered a piece of brass efg, perforated in continuation of the tube, and having its end ground flat on the top of the piece bip, and also covered with a slip of thin leather strained across it and pierced with a hole in the middle. It is plain from this form, that if the furface fg be applied to the top of bi, and the cover deed be ferewed down on it, it will draw or press them together, so that no air can escape by the joint, and this without turning the whole tube e ba round, as is necessary in the usual This method is now adopted for joining way. together the conducting pipes of the machines for extinguishing fires, an operation which was extremely troublesome before this improvement.

The conduit pipe Eefc(fg. 14.) is fastened to the bottom of the barrel, and the discharging pipe gb to its top, in the same manner. But to return to the gage, fg. 15; the bent pipe cb a enters the box st near one side, and obliquely, and the gage pipe qc is inserted through its bottom towards the opposite side. The use of this box is to catch any drops of mercury which may sometimes be dashed up through the gage pipe by an accidental oscillation. This, by going through the passes of the pump, would corrode them, and would act particularly on the joints, which are generally soldered with tim. When this happens to an air-pump, it must be cleaned with the most scrupulous attention, otherwise it will be quickly destroyed.

It is reckoned a very fine pump of the ordinary confiruction which will rarefy 200 times, or raile the gage to 20'85, the barometer flanding at 30. But Mr Smeaton's pump, even after long using, raised it to 29'95, which is equivalent to rarefying 600 times. When in fine order, he found no bounds to its rarefaction, frequently raising the gage as high as the barometer; and he thought its performance so perfect, that the arometer-gage was not sufficiently delicate for measuring the rarefaction. He therefore substituted the syphon gage already described, which he gives some reasons for preferring; but even this he sound not sufficiently sensible.

He contrived another, which could be carried to any degree of fenfibility. It confifted of a glass body A (fig. 16,) of a pear shape, and therefore called the pear-gage. This had a small projecting orffice at B, and at the other end a tube CD, whose capacity was the rooth part of the capacity of the whole vessel. This was suspended at the flip-wire of the receiver, and there was let below it a fmall cup with mercury. When the pump was worked, the air in the pear-gage was rarefied along with the rest. When the rarefaction was brought to the degree intended, the gage was let down till B reached the bottom of the mercury. The external air being now let in, the mercury was raised into the pear, and stood at some height E in the tube CD. The length of this tube being divided into 100 parts, and those numbered from

D, it is evident that  $\frac{DE}{DB}$  will express the degree of rarefaction which had been produced when the gage was immerfed into the mercurye or if DC be one rooth of the whole capacity, and be divided into roo parts by a scale annexed to it, each unit of the scale will be one ro-pooth of the whole.

This ingenious contrivance has been the means of making fome very curious and important difcoveries, which engage the attention of philosophers. By this gage Mr Smeaton found, that his pump frequently rarefied 1000, 10,000, nay 100,000 times. But though he in every instance faw the great superiority of his pump above all others, he often found irregularities which he could not explain, and a want of correspondence between the pear and the barometer gages which puzzled him. The pear gage frequently indicated a prodigious rarefaction, when the barometer gage would not show more than 600. These phanumena excited the curiosity of philosophers, who were making much use of the air-pump in their refearches, and were deeply interested in every thing connected with the powers of elastic fluids. Mr Nairne, a most accurate philosophical instrument-maker, made a variety of experiments to examine and compare Mr Smeaton's pump with those of the usual construction. This rigorous comparison discovered several circumstances in the constitution of the atmospheric air, and its relation to other bodies, which are of the utmost importance in the operations of nature. We shall mention such only as relate to the operation of the air-pump in extracting AIR from the receiver.

Mr Nairne discovered, that when a little water, or even a bit of paper damped with water, was exposed under the receiver of Mr Smeaton's air-pump, when in the most perfect condition, raising the mercury in the barometer-gage to \$9.95 he could not make it rife above 29.8 if Fahrenheit's thermometer indicated the temperature 47°, nor above 29'7 if the thermometer flood at 55°; and that to bring the gage to this height and keep it there, the operation of the pump must be continued long after the water had disappeared or the paper become perfectly dry. He found that a drop of spirits, or paper moistened with fpirits, could not in those circumstances allow the mercury in the gage to rife to near that height: U 11 11 11 2

and that fimilar effects followed from admitting any volatile body whatever into the receiver or any part of the apparatus. This showed him at once how improper the directions were which had been given by Gureicke, Boyle, Gravesande, and others, for fitting up the air-pump for experiment, by foaking the leather in water, covering the joints with water, or in short, admitting water or any other volatile body near it.

He therefore took his pumps to pieces, clearedthem of all moisture by heat, and then leathered them anew with leather foaked in a mixture of olive oil and tallow, from which he had expelled all the water it usually contains, by boiling it fill the first frothing was over. When the pumps were fitted up in this manner, he uniformly found that Mr Smeaton's pump rarefied the gare to 29'95, and the best common pump to 29'87, the first of which he computed to indicate a raresaction to 600, and the other to 230. But in this flate be again found that a piece of damp paper, leather, wood, &c. in the receiver, reduced the performance as before. The most remarkable phenomenon was, that when he used the peargage with the pump cleared from all moisture, it indicated the same degree of rarefaction with the barometer-gage; but when he exposed a bit of paper moistened with spirits, and thus reduced he rarefaction of the pump to what he called 50, the harometer-gage standing at 29'4, the pear-gage indicated a rarefaction exceeding 100,000; in fhort, it was not measurable; and this phenomenon was almost constant. Whenever he exposed any substance susceptible of evaporation, he found the rarefaction indicated by the barometer-gage -greatly reduced, while that indicated by the peargage was prodigiously increased; and both these effects were more remarkable as the subject was of easier evaporation, or the temparament of the air of the chamber was warmer.

This uniform refult suggested the true cause. Water boils at the temperature 212, that is, it is then converted into a vapour which is permahently elastic while of that temperature, and its elasticity balances the preflure of the atmosphere. If this preffure be diminished by rarefying the air above it, a lower temperature will now allow it to be converted into elaftic vapour, and keep it in that state. Water will boil in the receiver of an air-pump at the temperament 96, or even ununder it. Philotophers did not think of examin-

g the state of the vapour in temperatures lower than what produced ebullition. But it now appears, that in much lower heats than this the fupenicial water is converted into elastic vapour, which continues to exhale from it as long as the water lasts; and, supplying the place of air in the receiver, exerts the fame elafticity, and hintiers the mercury from riling in the gage, in the time manner as to much air of equal elasticity would have done.

When Mr Nairne was exhibiting these experiments to the Hon. Henry Cavendilli in 1776, this gentleman informed him that it appeared from a feries of experiments made by his father Lord Charles Cavendish, that when water is of the temperature 72°, it is converted into vapour un-

S. der any preffute less than 4 of an inch of meren, and at 41° it becomes vapour when the preffur is less than 4 of an inch. Even mercury evaporates in this manner when all pressure is removed. A dewy appearance is frequently objerved coroing the infide of the tube of a barometer, where we usually suppose a vacuum. This dew, who viewed through a microscope, appears to be a kt of detached globules of mercury, and upon inclining the tube fo that the mercury may alore! along it, these globules will be all ticked up, and the tube become clear. The dew which medit was the vapour of the mercury condensed by the fide of the tube; and it is never observed but when one fide is exposed to a stream of coid in.

As to the vapour in the air-pump receiver, a long as the water continues to yield it, we say continue to work the pump; and it will be continually abstracted by the barrels, and dichard in the form of water, because it coulapses as loss as exposed to the external pressure. All the while the gage will not indicate any more rarefation, because the thing immediately indicated by the barometer-gage is diminified elufticity, which does not happen here. When all the water which the temperature of the room can keep eight his evaporated under a certain preflure, juppok i an inch of mercury, the gage standing at 29%, the vapour with now fills the receiver expands, and by its dimmished elasticity the gage rifes and now some more water which had been attached to bodies by chemical or corpulcular attraction is detached, and a new supply continues to apport the gage at a greater height; and this goes on continually till almost all has been abstracted: but there will remain some which no art can take a way; for as it paffes through the barrels, and go between the pifton and the top, it successively comlaples into water during the afcent of the putes. and again expands into vapour when we put the pifton down again. Whenever this happenstart is an end of the rarefaction.

While this operation is going on, the air comes out along with the vapour; but we cannot fay a what proportion. If it were always uniformly mixed with the vapour, it would diminish rapidly; but this does not appear to be the cafe. There a -a certain period of rarefaction in which a transcat cloudiness is perceived in the receiver. This is watery vapour formed at that degree of rarefaction, mingled with, but not diffolved in, or united with, the air, otherwife it would be transparent. -A fimilar cloud will appear if damp air be admitted fuddenly into an exhaufted receiver. The vapour, which formed an uniform transparent mas with the air, is either fuddenly expanded and the detached from the other ingredient, or is fuddely let go by the air, which expands more than ? does. Different compositions of air exhibit markable differences in this respect. But we ke from this and other phenomena, that the air and vapour are not always intimately united; and therefore will not always be drawn out together by the air-pump. But let them be ever to cosfusedly blended, the air must come out along with the vapour, and its quantity remaining in the seceiver must be prodigiously diminished by this at

lociation, probably, much more than could be,

had the receiver only contained pure air.

t

SECT. II.

As the air and vapour are continually drawn off from the receiver, the air in the pear gage expands ind goes off with it. We that! tuppole that the zenerated vapour hinders the gage from rifing berond 29'5. During the continued working of the nump, the air in the pear, whose elasticity is 0.5, lowly mixes with the vapour at the mouth of the pear, and the mixture even advances into its inide, fo that if the pumping be long enough coninned, what is in the pear is nearly of the same omposition with what is in the receiver, confiltng perhaps of 20 parts of vapour and one part of ir, all of the elafticity of o f. When the pear is lunged into the mercury, and the external air alowed to get into the receiver, the mercury riles

the pear-gage, and leaves not  $\frac{1}{60}$ , but  $\frac{1}{60 \times 20}$  $r = \frac{1}{1200}$ , of it filled with common air, the vapour

aving collapsed into an invisible atom of water. hus the pear gage will indicate a rarefaction of 200, while the barometer-gage only showed 60, nat is, showed the elasticity of the included sub-ance diminished 60 times. The concussion to e drawn from thefe two meafures (the one of the actaction of air, and the other of the diminution (enflicity) is, that the matter with which the reewer was filled, immediately before the readmifon of the air, confifted of one part or inconden-

bic air, and  $\frac{1200}{60}$ , or 20 parts of watery vapour.

he only obscure part of this account is what reites to the composition of the matter which fild the pear-gage, before the admill m of the merary. It is not eafy to see how the vapour of the ceiver comes in by a narrow mouth while the r is coming out by the fame pallage. Accordgry it requires a very long time to produce this treme rarefaction in the pear-gage; and there t great irregularities in any two forceeding exriments, as may be feen by looking at Mr arne's account of them in Philof. Tranf. Vol. XVII. Some vapours appear to have mixed uch more readily with the air than others; and ere are forme unaccountable cafes where vitriolic id and fulphurcous bodies were included, in uch the diminution of density indicated by the ar-gage was uniformly lefs than the diminution eladicity indicated by the barometer-gage. It is ough for us to have established, by ququestionic facts, this production of elaftic vapour, and : necessity of attending to it, both in the conaction of the air-pump and in drawing refults m experiments exhibited in it.

Mr Smeaton's pump, when in good order, and fective free from all moisture, will in dry wear rarely air about 600 times, railing the baroter-gage to within a'o of an inch of a fine baroter. This was a performance to much superr to that of all others, and by means of Mr irne's experiments opened to new a field of obvation, that the air-pump once more became a of al infirmment among the experimental philohere. The causes of its superiority were also nistinct, that artists were immediately excited

to a farther improvement of the machine; so that this becomes a new emen in its history.

There is, however, one imperfection which Mr Smeaton has not attempted to remove. The difcharging valve is fill of ened against the pressure of the atmosphere. Mr Smeaton, in his ingenious construction, has greatly diminished, but has not annihilated, the obstructions to the passage of the air from the receiver into the barrel. His fuccess encouraged farther attempts. One the first and most ingenious was that of Prof. Ruffel of the univerfity of Edinburgh, who about 1770 conftructed a pump in which both cocks and valves were avoided. But the death of the ingenious author put a stop to the improvements by which he expected to have brought it to perfection; and we have heard of none who has fince attempted to complete it.

In the 73d volume of the Philof. Trans. Mr Ti-BERIUS CAVALLO has given the description of an air-pump contrived and executed by Messrs. Haas and Hurter, inftrument-makers in London, where thefe artifts have revived Guericke's method of opening the barrel-vaive during the last strokes of the pump by a force acting from without. thali only infert to much of this defeription as relates to this diftinguishing circumstance : Fig. 27 reprefents a fection of the bottom of the barren where AA is the barrel and BB the bottom, which has in its middle a hollow cylinder CCFR, projecting about half an inch into the barrel at CC, and extending a good way downwards to FF. The space between this projection and the fides of the barrel is filled up by a brafs ring DIA over the top of which is strained a piece of oiled firk EE, which performs the office of a valve, covering the hole CC. But this hole is filled up by a piece of brafs, or rather an affemblage of pieces screwed together GGHIIII. It confids of three projecting filicts or fliouiders GG, HII, II, which form two hollows between them, and which are filled with rings of oiled leather OO, PP, firmly forewed together. The extreme fillets GG, II, are of equal diameter with the infide of the cylinder, to as to fill it exactly, and the whole stuffed with oiled leather, flide up and down without allowing any air to pass. The middle fillet HII is not fo broad, but thicker. In the upper fillet GG there is formed a shallow dish about 1 of an inch deep and 1 wide. This dish is covered with a thin plate, pierced with a grating like Mr Smeaton's valve-plate. There is a perforation VX along the axis of this piece, which has a passage out at one fide H, through the middle finet. Opposite to this pullage, and in the fide of the cylinder CCFF, is a hole M, communicating with the conduit pipe MN, which leads to the receiver. Into the lower end of the perforation is screwed the pin KI, whose tail L patter through the cap FE. The tail L is connected with a lever RQ, moveable round the joint Q. This lever is pushed upards by a spring, and thus the whole piece is kept in contact with the flip of olied filk or valve EE.

Now suppose a void formed in the barrel by drawing up the pifton; the elafficity of the air in the receiver, in the pipe NM, and in the paflage XV, will prefs on the great furface of the valve exposed through the grating, will raise it, and the pump will perform precifely as Mr Smeaton's does. But suppose the rarefaction to have been fo long continued, that the air is no longer able to raite the valve; this will be feen by the mercury ring no more in the pump-gage. When this is perceived, the operator mult prefs with his foot on the end R of the lever RQ. This draws down the pin KL, and with it the whole hollow plug with its grated top. And thus, inflead of railing the valve from its plate, the plate is here drawn down from the valve. The air now gets in without obstruction, and the rarefaction proceeds as long as the pifton rifes. When it is at the top of the barrel, the operator takes his foot from the lever, and the fpring preffes up the plug again and shuts the valve. The pifton rod pattes through a collar of leather, as in Mr Smeaton's pump, and the air is finally discharged through an outward valve in the top of the birrel. This is an ingenious contrivance, fimilar to what was adapted by GUERICKE hinfelf; and we have no doubt of these pumps performing extremely well if carefully made; and it feems not difficult to keep the plug perfectly air-tight by supplying plenty of oil to the leathers. Mr Cavallo, in the Philof. Trans. 1783, says, that when it had been long used it had, in fome experiments, rarefied 600 times.

Aiming full at the removing the obstructions to the entry of the air from the receiver into the barrels, Mr Prince, an American, has conftructed a pump in which there is no valve or cock whatever between them. In this pump the pifton rod paties through a collar of leathers, and the air is finally discharged through a valve, as in the two Lift. But great inconveniences were experienced from the ofcillations of the mercury in the gage. As foon as the pifton comes into the ciftern, the air from the receiver immediately rufhes into the barrel, and the mercury thoot up in the gage, and gets into a flate of ofcillation. The fublequent rife of the pillon will frequently keep time with the 2d ofcillation, and increase it. The defeent of the pifton produces a downward ofcillation, by allowing the air below it to collapse; and, by improperly timing the strokes, this ofcilation becomes for creat as to make the mercury enter the pump. To prevent this, and a greater irregularity of working as a condenfer, valves were put in the pillon: but as there require force to open them, the addition feemed rather to increase the evil, by rendering the of illations more fimultaneous with the ordinary rate of working. Befides all this it appears, likewife of very difficult execution. It has many long, flender, and crooked passages, which must be drilled through broad plates of brafs, fome of them appearing feareely practicable: fo that it appears rather a fuggestion of theory than a thing warranted by its actual performance.

Mr Lavoisier and the naturalits, who were occupied with him in the investigation of the different species of gas disengaged from bodies in chemical operations, contrived an air-pump which has great appearence of simplicity, and, being very different from all others, merits a description. It consists of two barrels l, m, fig. 18, with folid piftons kk. The pump plate ab is pieceed at its entre c with a hole which branches towards each

of the barrels, as represented by ed, ee. Berno the plate and the barrels flides another place, pierced in the middle with a branched has it. and near the ends with two holes bb, 15, what is from its under fide to the ends. The holes may two plates are fo adjutted, that when the parbi is drawn for far towards b that the hole recorwithin the barrel m, the branch df of the tole n the middle plate coincides with the brack it is the upper plate, and the holes e, g are list. The a communication is established between the both I and the receiver on the pump-plate, and tesm the barrel m and the external air. In this figures the barrel I will exhauft, and m will district When the pifton of I is at its mouth, and und m touches its bottom, the fliding plate is first over to the other fide, fo that m communate with the receiver through the pallage galence communicates with the air by the publication This finding plate performs the office of 4 cm.: a very beautiful and fumple manner, and they's tons apply close to the ends of the banda for to expel the whole air, the pump will be pend It works, indeed, against the whole prelimed in external air. But this may be avoided by pura; valves on the holes h, i; and there can do to him because the air remaining in them never gets as into the barrel till the pilton be at the futtor 4 and the exaustion of that stroke completed by the best workmen of London thick that a will is incomparably more difficult to execute the car (for it is a cock of unufual form), in suchamum: that it shall be air tight and yet more with time ble eafe, and that it is much more liable to was ing loofe than common cocks. It must be some be acknowledged to be ingenious, and knowle geft to an intelligent artiff a method of content common conical cocks upon one axis first # fwer the fame purpofes much more effect?

TI

C

The laft improvement which we 的是定立 is that published by Mr Cuthbertson, phit (2) instrument-maker in Amsterdam. His parts given fuch evidences of its perfectior, the star hardly expect or with for any thing more course. But the fame conftruction was invented, and part, executed, before the end of 1179 by [b DANIEL RUTHERFORD, professor of box; " university of Edinburgh, who was then counted experiments on the production of air during combustion of bodies in contact with nitro re who was vallly delirous of procuring a money plete abstraction of pure aerial matter than of be effected by Mr Smeaton's pump. The No tor's differtation on this fullied, was rad a "" period in the Philosophical Society of Fundament In it the Doctor appeared fully applied of the iftence of pure vital air in the nirrous and no chief ingredient, and as the cause of its man markable phenomena, and to want but a 200 the discoveries which have eternized the next LAVOISIER. He was particularly anxious to detain apare this diftinguishing ingredient is toposition, and, for this purpose, to abstract of pletely from the veffel in which he subjected? examination, every particle of elaftic matter. Robifon proposed to him to cover the hours is Mr Smeaton's pifton with fome claume with which frould take hold of the bottom rates in

lart it when the pifton was drawn up. A few lays after, Dr Rutherford thowed him a drawing f a pump, having a conical metal valve in the ottom, furnished with a long slender with, slidng in the infide of the pifton-rod with a gentle riction, fufficient for lifting the valve, and fecured gainst all chance of failure by a spring a-top, which took hold of a notch in the infide of the oifton-rod about a quarter of an inch from the ower end, so as certainly to lift the valve during he last quarter of an inch of the piston's motion. king an excellent mechanic, he had executed a alve on this principle, and was fully fatisfied with ts performance. But having already confirmed iis doctrines respecting the nitrous acid by inconrevertible experiments, his wifnes to improve the ir-pump loft their incitement, and he thought no nore of it; and not long after this, the ardour of he philosophers of the Teylerian Society at Haerem and Amsterdam excited the efforts of Mr luthbertson, their instrument-maker, to the same urpose, and produced the most persect air-pump bat has yet appeared. The following description f it, and its performance is given in the invenor's own words:

## SECT. III. Of Mr Cuthbertson's Air-Pump.

Fig. 19, plate CCLXXIX, gives a perspective iew of this pump, with its two principal gages trewed into their places. These need not be used ogether, except in cases where the utmost exactels is required. In common experiments one of hem is removed, and a stop-screw put in its place. When the pear gage is used, a small round plate, n which the receiver may stand, must be first rewed into the hole at A; but this hole is stoped on other occasions with a screw. When all he three gages are used, and the receiver is exaufted, the stop-screw B, at the bottom of the ump, must be unscrewed, to admit the air into he receiver; but when they are not all used, ither of the other stop-screws will answer this surpole. Fig. 20 represents a cross-bar for preenting the barrels from being shaken by working he pump or by any accident. Its place in fig. 19 represented by the dotted lines. It is confined its place, and kept close down on the barrels by wo flips of wood NN, which must be drawn out, s well as the screws OO, when the pump is to c taken afunder. The other figures exhibit a :ction of all the working parts of the pump, exept the wheel and rack, in which there is nothing

Fig. 21. is a section of one of the barrels, with it internal parts; and fig. 22, 23, 24, and 25, are ifferent parts of the piston, proportioned to the ze of the barrel and to one another. The piston nd barrel are 1.65 inches in diameter. In fig. 21. D represents the barrel, F the collar of leathers, a hollow cylindrical vessel to contain oil. R is sho an oil-vessel to receive the oil which is drawn, long with the air, through the hole a a, when the iston is drawn upwards; and, when this is full, he oil is carried over with the air, along the tube into the oil-vessel. G. ec is a wire which is riven upwards from the hole a a by the passage of the air; and as soon as this has escaped, it falls own again by its own weight, shuts up the hole,

and prevents all return of the air into the barrel. At dd are fixed two pieces of brass, to keep the wire ce in a vertical direction, that it may accurately shut the hole. H is a cylindrical wire or rod which carries the piston I, and is made hollow to receive a long wire g g, which opens and shuts the hole L; and on the other end of the wire O is screwed a nut, which, by Ropping in the narrowest part of the hole, prevents the wire from being driven up too far. This wire and screw are more clearly seen in fig. 22 and 26; they slide in a collar of leather r r, hg. 22 and 25 in the middle piece of the pifton. Fig. 24 and 25 are the two mean parts which compose the piston, and, when the pieces 3 and 6 are added to it, the whole is represented by fig. 22. Fig. 25 is a piece of brass of a conical form, with a fhoulder at the bottom. A long hollow screw is cut in it, about † of its length, and the remainder of the hole, in which there is no screw, is of about the same diameter with the ferewed part, except a thin plate at the end, which is of a width exactly equal to the thickness of g.g. That part of the inside of the conical brass in which no thread is cut, is filled with oiled leathers with holes through which gg can flide stiffly. There is also a male screw with a hole in it, fitted to g g ferving to compress the leathers r r. In fig. 24. a a a a is the outlide of the pifton, the infide of which is turned to as exactly to fit the outside of fig. 25. b b are round leathers about 60 in number; cc is a circular piece of brass of the fize of the leathers, and dd is a screw ferring to compress them. The screw at the end of fig. 23. is made to fit the screw in fig. 25. Now if fig. 26 be pushed into fig. 25, this into fig. 24, and fig. 23, be screwed into the end of fig 25, these will compose the whole of the piston, as represented in fig. 22. H in fig. 21 represents the same part as H in fig. 22, and is that to which the rack is fixed. If, therefore, this be drawn upwards, it will cause fig. 25 to shut close into fig. 24, and drive out the air above it; and when it is pushed downward, it will open as far as the shoulder a a will permit, and fuffer air to pass through. A A fig. 27, is the receiver plate, BB is a long square piece of brass, screwed into the under tide of the plate, through which a hole is drilled corresponding to that in the centre of the receiver-plates and with three female ferews b, b, c.

The RAREFACTION of the AIR in the receiver is effected thus:—Suppose the piston at the bottom of the barrel. The inside of the barrel, from the top of the pifton to a, fig. 21, contains common air. When the rod is drawn up, the upper part of the piston sticks fast in the barrel till the conical part connected with the rod shuts the conical hole, and its shoulder applies close to its bottom. The piston is now shut, and therefore the whole is drawn up by the rack-work, driving the air before it through the hole a a, into the oil-vessel at R, and out into the room by the tube T. The pifton will then be at the top of the barrel at a, and the wire gg will stand nearly as represented in the sigure just raised from the hole L, and prevented from rifing higher by t e nut O. During this motion the air will expand in the receiver, and come along the bent tube m into the barrel. the barrel will be filled with air, which, as the pifton rifes, will be rarefied in proportion as the capacity of the receiver, pipes, and barrel is to the harrel alone. When the pifton is moved down again by the rack-work, it will force the conical part, fig 25, out of the hollow part fig. 24 as far as the shoulders a a; fig. 22 will rest on a a fig. 24, which will then be so far open as to permit the air to pass freely through it, while at the same time the end of g g is forced against the top of the hole, and shuts it, in order to prevent any air from returning into the receiver. Thus the piston, moving downwards, suffers the air to pass out between the fides of fig. 24 and 25; and, when it is at the bottom of the barrel, will have the column of air above it; and, confequently, when drawn upwards it will thut, and drive out this air, and, by opening the hole L at the same time, will give a free passage to more air from the receiver. process being continued, the air of the receiver will be rarefied as far as its expansive power will permit. For in this machine there are no valves to be forced open by the elafticity of the air in the receiver, which at last it is unable to effect. There is therefore nothing to prevent the air from expanding to its utmost degree.

As the air must escape thro' the discharging pasfage ac, fig 21, against the pressure of a column of oil and the weight of the wire, it may be supposed, that there will remain in this passage a quantity of air of confiderable denfity, which will expand again into the barrel during the descent of the pifton, and thus put a ftop to the progress of rarefaction. This is the case in Mr Smeaton's pump, and all which have valves in the pifton. But it is. the peculiar excellency of this pump, that whatever be the denfity of the air remaining in a c, the rarefaction will still go on. In proof of this, suppose that the air contained in a c, is + to part of the common air which would fill the barrel, and that the capacity of the barrel is equal to that of the receiver and passages, and that the air in the receiver and barrel is of the same density, the piston being at the bottom of the barrel: The barrel will therefore contain  $\tau_0^{\frac{1}{2}}$  parts of its natural quantity, and the receiver  $\tau_0^{\frac{1}{2}}$ . Now let the pillon be drawn up. No air will be discharged at a c, because it will contain the whole air which was in the barrel, and which has now collapfed into its ordinary bulk. But this does not in the lead hinder the air of the receiver from expanding into the barrel, and diffuting itself equally between both. Each will now contain Took of their ordinary quantity when the pilton is at the top, and a e will contain 100 as before, or 1003. Now puth down the pitton. The hole L is instantly thut, and the air in ar, expands into the barrel, and the barrel now contains Tolo. When the piston has reached the bottom, set it be again There will be Too discharge1 through c, and the air in the receiver will again be equally distributed between it and the barrel. Therefore the receiver will now contain 21/2-When the piston reaches the bottom, there will -

When the pifton reaches the bottom, there will be  $\frac{12\frac{1}{2}}{1000}$  in the barrel. When again drawn up to

the top, there will be  $\frac{2\frac{1}{2}}{1000}$  discharged, and the re-

ceiver will contain  $\frac{1}{1000}$ ; and when the pillon

C

reaches the bottom, there will be  $\frac{11\frac{1}{4}}{1000}$  At the

next stroke the receiver will contain only  $\frac{\sigma_1^2}{1000}$ 

&c. &c.

Thus it appears, that notwithstanding the 1000 which always expands back again out of the hole a c into the barrel, the rarity of the air is the receiver will be doubled at every stroke. There is therefore no need of a subsidiary airpump at c, as in the American air-pump, and is the Swedish attempt to improve Smeaton's."

In using this air-pump no particular direction are necessary, nor is any peculiar care necessary for keeping it in order, except that the oil-ter. A be always kept about half full of cil. Was the pump has frood long without being used, it will be proper to draw a table-spoonful of officoil through it, by pouring it into the hole in the middle of the receiver-plate, when the pifter is a the bottom of the barrel. Then by working the piston, the oil will be drawn through all the parof the pump, and the furplus will be driven through the tube T into the oil-veffel G. Near the top of the pifton-rod at H there is a hole which let for: oil into the infide of the rod, which gets at the collar of leathers r r, and keeps the wire grantight.

When the pump is used for condensation at the fame time that it rarefies, or separately, the pice containing the bent tube T must be removed, z.! fig 28. put in its place, and fixed by its feren-Fig. 28. as drawn in the plate, is intended for a double barrelled pump. But for a single bent only one piece is used, represented by Bas, the double piece being cut off at the dotted line and In this piece is a female ferew to receive the disof a long brass tube, to which a bladder a fifcient for the experiment of condenfation, as glass, properly secured for this purpose, near he lerewed. Then the air which is abstracted free the receiver on the pump-plate will be forced into the bladder or glats. But it the pump be doubte the apparatus fig. 8. is used, and the long beat tube ferewed on at c. Fig. 29, and 30 regreters the two gages, which will be fufficiently explained afterwards. Fig. 29. is forewed into a last into the forew at the other end of c fig. 27. 48. fig. 30, into the ferew a b fig. 27. If it be ukdaa lingle pump, either to railefy or condenic, the forew K, which fallens the rack to the pitton-red H, must be taken out. Then turning the wres till H is depretted as low as possible, the machine will be fitted to exhauft as a fingle pump; and a it be required to condense, the direction in pargraph 7th SECT I, must be observed with regat to the tube T, and fig. 28.

"I took (lays Mr Euthbertson) two baroment tubes of an equal bore with that fixed to to pump. These were filled with mercury four times boiled. They were then compared, and stood eachly at the same height. The mercury in one of them was boiled in it four times more, without making any change in their height; they were therefore judged very perfect. One of these was immersed.

ramericd in the ciftern of the pump-gage, and aftened in a position parallel to it, and a fliding cale of one inch was attached to it. This feale, when the gage is ufed, must have its upper edge et equal with the furface of the mercury in the poiled tube after exhauftion, and the difference between the height of the mercury in this and in the other barometer tube may be observed to the one roodth of an inch; and being ciole together, no error arifes from their not being exactly vertical, if they are only parallel. (Scefig. 30. Pl. 280.) I used a ed gage, which I shall call a double fyphon. (See ig. 29. 16.) This was also prepared with the utmost are. I had a feale for measuring the difference between the height of the columns in the two legs. It was an inch long, and divided as the former, and kept in a truly vertical position by suspending t from a point with a weight hung to it, as repreented in the figure. Upon comparing these two gages, I always found them to indicate the fame degree of rarefaction. I also used a pear goge, fiz. 16) though the most imperfect of all, to repeat

the curious experiments of Mr Nairne and others.

When experiments require the utmost rarefying power of the pump, the receiver must not be placed on leather, either offed or foaked in water, as is ufually done. The pump-plate and the edge of the receiver must be ground very flat and true, and this with very fine emery, that no roughness may remain. The plate of the pump must then be twiped very clean and very dry, and the receiver ubbed with a warm cloth till it become electrical. The receiver being now fet on the plate, heg's ard, either alone or mixed with a little oil, which his been cleared of water by boiling, must be meared round its outfide edge. In this condition he pump will rarefy its utmost, and what fill renains in the receiver will be permanent air. Or a ittle of this composition may be thinly fineared on the pump-plate; this will prevent all risk of cratching it with the edge of the receiver. Leaher of very uniform thickness, long dried before tire, and well foaked in this composition, which nust be cleared of all water by the first boiling, till answer very well, and is expeditious, when receivers are to be frequently flifted. Other leahers foould be at hand, foaked in a composition containing a little rotin. This gives it a clammiiefs which renders it importmeable to air, and is ery proper at all joints of the pump, and all apparatus for pneumatic experiments. As it is immillible to render the pear-gage as dry as other parts of the apparatus, there will be generally ome vari tion between this and the other gages. When it is only intended to show the atmost

when it is only intended to how the intmote ower of the pump, without afcertaining the quality of the refliction, the receiver may be fet on vet leaffier. It in this condition, the air be rareled as far as possible, the syphon and buremeterage will indicate a less degree of rarefaction than in the former experiments. But when the air is et in again, the pear-gage will point out a rarelaction some thousands of times greater than it did sefore. If the true quality of permanent air after exhaustion be required, the pear-gage will be near-sit the truth; for when the air is rarefued to a cerain degree, the moistened leather emits an expansible sluid, which, filling the receiver, forces out

YOL. XVII. PAFT II.

the permanent air; and the two first gages indicate a degree of exhansion which relates to the whole classic matter remaining in the receiver, viz. to the expansible sluid together with the permanent air; whereas the pear gage points out the degree of exhansion, with relation to the permanent air alone, which remains in the receiver; for by the pressure of the air admitted into the receiver, the classic vapour is reduced to its former bulk, which is imperceptible.

IC

Many bodies emit this elaftic fluid when the prefure of the air is much diminished; a piece of leather, in its ordinary damp flate, about in inch fquare, or a bit of green or dry wood, will supply this for a great while. When such fluids have been generated in any experiments, the pump must be carefully cleared of them, for they remain not only in the receiver, but in the barrels and passages, and will again expand when the exhaustion has been carried far. The best method of clearing the pump is to take a very large receiver, and, to use every precaution to exhauit it as far as possible. Then the expansible matter lurking in the barrels and paffes will be diffused through the receiver alfo, or will be carried off along with its air. It will be as much farer than it was before, as the aggregate capacity of the receiver barrels and paties is larger than that of the two laft.

The performance of the pump may be estimated by the 4 following experiments. The two gages being ferewed into their places, and the hole in the receiver-plate that up, the pump was made to exhault as far as it could. The mercury in the legs of the lyphon was only one 40th of an inch out of the level, and that in the boiled harometertube one 40th of an inch higher than in the one ferewed to the pump. A standard barometer then stood at 30 inches, and therefore the pump rarefied the permanent air 1200 times. This is twice as much as Mr Nairne found Mr Smeaton's do in its best state.' Mr Cavallo seems disposed to give a favourable account of Hazs and Hurter's pump, and it appears never to have exceeded 600 times. Mr Cathbertson has often found the mercury within one recitth of an inch of the level in the fyphon-gage, indicating a rarefaction of 3000

· To one cud of a glass tube, a inches diameter and 30 inches long, was fitted a brafs cap and collar of leather, through which a wire was inferted, reaching about two inches within the tube. This was connected with the conductor of an elestric machine. The other end was ground flat and let on the pump plate. When the gages indicated a randaction of 300, the light became fleady and uniform, of a pale colour, though a little tinged with purple; at 600 the light was of a spale daily white; at fixed it disappeared in the middle of the tube, and the tube conducted to well that the prime conductor only gave sparks for faint and thort as to be ferreely perceptible. Atter taking off the tube, and making it as dry as possible, it was again connected with the conductor, which was giving sparks two inches long. When the air in it was received to times, the foarks were of the fame length. Semetimes a pencil of light darted along the tube. When the rarefaction was 20, the spark did not exceed an in h, and light streamed the whole length of the  $Z \times Z X$ ¹ube

tube. When the rarefaction was 30, the sparks were half an inch, and the light ruffled along the tube in great streams. When the rarefaction was 100, the sparks were about 1 long, and the light filled the tube in an uninterrupted body. When 300, the appearances were as before. When 600, the sparks were one 10th, and the light was of a faint white colour in the middle, but tinged with purple toward the ends. When 1200, the light was hardly perceptible in the middle, and was much fainter at the ends than before, but still ruddy. When 1400, which was the most the pump could produce, fix inches of the middle of the tube were quite dark, and the ends free of any tinge of red, and the fparks did not exceed one ⊿oth of an inch.

Although this noble instrument originated in Germany, all its improvements were made in this kingdom. Both the mechanical and pneumatical principles of Mr BOYLE's pump were extremely different from the German, and in respect of expedition and conveniency, much superior. double barrel and gage by HAWKESBEE were capital improvements, and on principle; and Mr SMEATON's method of making the pifton work in rarefied air, made a complete change in the whole

By this machine, we can make experiments eftablishing and illustrating the gravity and elasticity of the air in a much more perspicuous manner, than could be done by the spontaneous phenomena of nature. It enables us in the first place to show the materiality of air in a very distinct manner. Bodies cannot move about in the atmosphere without displacing it. This requires force; and the relistance of the air always diminishes the velocity of bodies moving in it. A heavy body therefore has the velocity of its fall diminished; and if the quantity of air displaced be very great, the diminution will be very confiderable. This is the reason why light bodies, such as scathers, fall very flowly. Their moving force is very finall, and can therefore displace a great quantity of air only with a very finall velocity. But if the fame body be dropped in vacuo, when there is no air to be displaced, it falls with the whole velocity competent to its gravity. A guinea and a downy feather, dropped at the fame inftant, by opening the forceps which holds them by means of the flipwire in the top of the receiver, will both reach the bottom at the same instant.

We can now abstract the air almost completely from a dry veffel, fo as to know the precise weight of the nir which filled it. The first experiment we have of this kind, done with accuracy, is that of Dr Hooke, Feb. 10, 1664, when he found 114 pints of air to weigh 945 grains. One pint of water was 87 r oz. This gives for the specific gra-

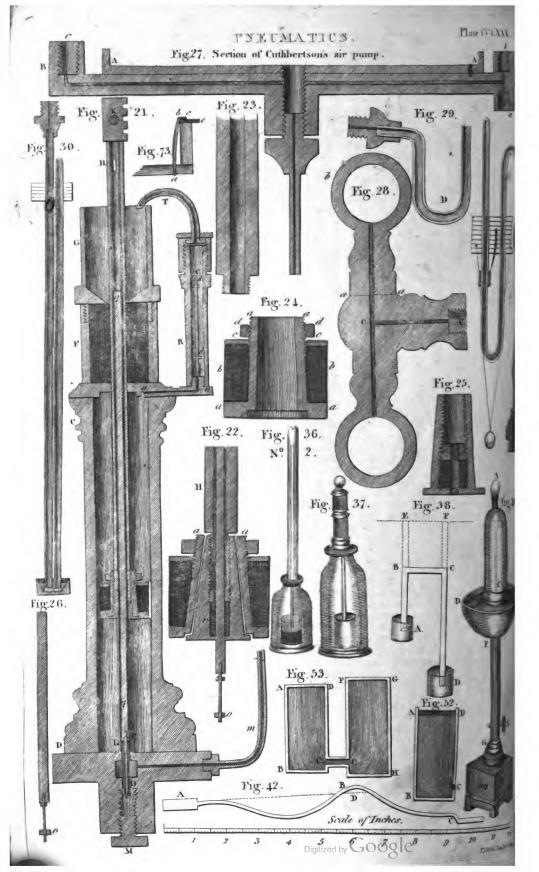

vity of air one 8 coth very nearly.

As we are thus immerfed in a gravitating fluid, it follows, that every body preponderates only with the excels of its own weight above that of the air which it displaces; for every boay lofes by this immersion the weight of the displaced air. A cubic foot loses about 521 grains in frosty weather. We see balloons even rate in the air, as a piece of cork rises in water. A mass of water which really contains 850 lb. will

SECT. III. load the scale of a balance with 849 only, and will be balanced by about 8494 lb. of brass. This is evinced by a very pretty experiment, represented in fig. 31. Pl. 279. A small beam is suspended within a receiver. To one end of the beam is appended a thin glass or copper ball, close in every part. This is balanced by a fmall piece of lead hung on the other arm. As the air is pumped out of the receiver, the ball will gradually preporderate, and will regain its equilibrium when the air is re-admitted.

Some philosophers propose, and actually use, a large globe of light make, suspended at a beam, for a barometer. If its capacity is a cubic foot, IT grains will indicate the same change that is indicated by one roth of an inch of an ordinary But a veffel of this fize will load a barometer. balance too much to leave it fufficiently fealible to fmall changes of denfity. Belides, it is affected by heat and cold, and would require a very troublesome equation to correct their effects. It may be worth while to attend to this in buying and felling precious commodities; fuch as peris, diamonds, filk, and fome drugs. As they mostnerally fold by brafs or leaden weights, the buyer will have fome advantage when the air is heavy and the barometer high. On the other hard he will have the advantage in buying gold and mo-The mealure of cury when the air is light. time by pendulums is also dependent on this pure. matical principle. As the accelerating force on ! pendulum is not its whole weight, but the excess of its weight over that of the displaced air, it fillows that a pendulum will vibrate more flowly in the air than in vacuo. A pendulum composed d lead, iron, and brafs, may be about 8400 times heavier than the air which it displaces, when the barometer is at 30 inches and the thermometra 32°, and the accelerating force will be diminifed about one 1680oth. This will cause a id perculum to make about five vibrations kis sady than it would do in vacuo. Therefore to deduce the accelerative power of gravity from the length of a pendulum vibrating in the air, we must make an allowance of o"17, or feventeen 100dthi of i fecond, per day, for every inch that the barometer flands lower than 30 inches. But we must also note the temperature of the air; because when the air is warm it is less dense when supporting by as elasticity the same weight of atmosphere, and " must know how much its density is diminished by an increase of temperature. The correction is more complicated; for the change of dentity if fects the relistance of the air, and this affects the time of the vibration, by a law that is not yet well As far as we can determine free afcertained. any experiments yet made, the change ariting min the altered relistance takes off about two 5ths? the change produced by the altered density, as a fecond pendulum makes but three vibrations? day more in vacuo than in the open air. This a very unexpected refult; but the expenses have neither been numerous nor very correctly

The air-pump also allows us to show the effects of the pressure of the air in a great number x2 musing and instructive phenomena. When the is abstracted from the receiver, it is strongly protect

to the plump-plate by the incumbent atmosphere, and it supports this great pressure in consequence of its circular form. Being equally compressed on all sides, there is no place where it should give way sooner than another; but if it be thin, and not very round, which is sometimes the case, it will be crushed to pieces. If we take a square thin phia!, and apply an exhausting syringe to its mouth, it will not fail being crushed.

As the operation of pumping is something like sucking, many of these phenomena are in common discourse ascribed to sudion, a word much abused; and this abuse misseads the mind exceedingly in its contemplation of natural phenomena. Nothing is more usual than to speak of the suction of a syringe, the suction and draught of a chimney, &c. The following experiment puts the true cause of the strong adhesion of the receiver beyond a doubt.

Place a small receiver or cupping-glass on the pump-plate without covering the central hole, as in fg. 32, Pl. 278, and cover it with a larger receiver. Exhaust the air from it; then admit it as suddenly as possible. The outer receiver, which after the rarefaction adhered strongly to the plate, is now loose, and the cupping-glass will be found sticking sast to it. While the rarefaction was going on, the air in the small receiver also expanded, escaped from it, and was abstracted by the pump. When the external air was suddenly admitted, it pressed on the small receiver, and forced it down to the plate, and thus shut up all entry. The small receiver must now adhere; and there can be no suction, for the pipe of the pump was on the outside of the cupping-glass.

To make this experiment succeed, the cuppingglass should be pressed down by the hand on the greafy leather or plate, the glass will be so little. raised by the expansion of its air during the pumping, that it will instantly clap close when the air re-admitted. In like manner, if a thin square phial be furnished with a valve, opening from within, but shutting when pressed from without, and if this phial be put under a receiver, and the iir be abstracted from the receiver, the air in the shial will expand during the rarefaction, will ecape through the valve, and be at last in a very arefied state within the phial. If the air be now dmitted into the receiver, it will press on the flat ides of the included phial and crush it to pieces. ice fig. 33, Plate 278.

If a piece of wet ox-bladder be laid over the top f a receiver whose orifice is about 4 inches wide, and the air be exhausted from within it, the inmbent atmosphere will press down the bladder to a hollow form, and then burst it inward with prodigious noise. See fig. 34. Or if a piece of hin stat glass be laid over the receiver, with an iled leather between them to make the junctive air-tight, the glass will be broken downwards. This routs be done with caution, because the pieces of glass sometimes sly about with great force.

It there be formed two hemispherical cups of rais, with very flat thick brims, and one of them in fitted with a neck and stopcock, as representably fig. 35. the air may be abstracted from them in forewing the neck into the hole in the pumplate. To prevent the infinuation of air, a ring oiled leather may be put between the rims.

Now unferew the sphere from the pump, and fix hooks to each, and suspend them from a strong nail, and hang a scale to the lowest. It will require a considerable weight to separate them; namely, about 15 lb. for every square inch of the great circle of the sphere. If this be four inches diameter, it will require near 190 lb. This pietty experiment was first made by Otto Guericke, and on a very great scale. His sphere was of a large size, and, when exhausted, the hemispheres could not be drawn asunder by 20 horses. It was exhibited, along with many others equally curious and magniscent, to the Emperor of Germany and his court, at the breaking up of the diet of Ratisbon in 1654.

It a loaded fyringe be fuspended by its piston from the hook in the top of the receiver, as in fig. 36, No 1, Plate 279, and the air be abstracted by the pump, the syringe will gradually descend, and will at last drop off; as the elasticity of the air, which previously balanced the pressure of the atmosphere, is now diminished by its expansion, and is therefore no longer able to press the syringe to the piston. On admitting the air before this happens, the syringe will instantly rise again.

If a Torricellian tube be put under a tall receiver, as in fig. 36, N° 2, Pl. 280, and the air be exhausted, the mercury in the tube will descend while that in the gage will rise; and the sum of their heights will always be the same, that is, equal to the height in an ordinary barometer. The height of the mercury in the receiver is the effect and measure of the remaining elasticity of the included air, and the height in the pump-gage is the unbalanced pressure of the atmosphere. This is a very instructive experiment, perfectly similar to Mr Auzour's, mentioned above, and completely establishes and illustrates the whole doctrine of atmospheric pressure.

We get a limilar illustration and confirmation of the cause of the rise of water in pumps, by screwing a syringe into the top plate of a receiver, which syringe has a short glass pipe plunging into a small cup of water. See fg. 37. When the piston-rod is drawn up, the water rises in the glass pipe, as in any other pump. But if the air has been previously exhausted from the receiver, there is nothing to press on the water in the little jar; and it will not rise in the glass pipe though the piston of the syringe be drawn to the top.

#### SECT. IV. Of SYPHONS.

The rife of water in pumps is analogous to its rife and motion in typhons. Suppose a pipe ABCD, fig. 38. bent at right angles at B and C, and having its two ends immersed in the cifterns of water A and D. Let the leg CD be longer than the leg BA, and let the whole be full of water. The water is pressed upwards at A with a force equal to the weight of the column of air EA reaching to the top of the atmosphere; but it is pressed downwards by the weight of the column of water BA. The water at F is pressed downwards by the weight of the column CD, and upwards by the weight of the column of air FD reaching to the top of the atmosphere. The two columns of air may without any sensible error be considered as caula. Therefore there is a superiority of pressure

downwards at P, and the water will flow out there. The preflure of the air will raife the water in the leg AB, and thus the firean will be kept up till the veffel A is emptied as low as the orifice of the keg BA, provided the neight of AB is not greater than the preflure of the atmosphere can balance, that is, does not exceed 32 or 33 feet for

water, 30 inches for mercury, &c.

A lyghon then will always run from that veffel whose surface is highest; the form of the pipe is indifferent, because the hydrostalizal presures depend on the vertical height only. It must be filled with water by some other contrivance, such as a sunnel, or a pump applied a-top; and the funnel must be stopped up, otherwise the air would get in, and the water would fall in both legs. If the lyphon have equal-legs, as in sig. 39, and be tunned up at the ends, it will remain full of water, and be ready for use. It need only be dipped into any vessel of water, and the water will then show out at the other end of the lyphon. This is called the Wirtemberg supplies, and is represented in fg. 39, Plate 279. See Sec. XII.

What is called the SYPHON FOURTAIN, confiructed on this principle, is flown in fig. 40, Plate 280, where AB is a tall receiver, flanding in a wide bafon DE, which is supported on the pedefial H by the hollow pillar FG. In the centre of the receiver is a jet pipe C, and in the top a ground stopper A. Near the base of the pillar is a cock N,

and in the pedefial is another cock O.

Fill the bason DE with water within half an inch of the brim. Then pour in water at the top of the receiver (the cock N being shut) till it is about half sull, and then put in the stopper. A little water will run out into the vessel DE. But before it runs over, open the cock N, and the water will run into the eistern H; and by the time that the pipe C appears above water, a jet will rise from it, and continue as long as water is supplied from the bason DE. The passage into the base eistern may be so tempered by the cock N that the water within the receiver still keep at the same height, and what runs into the base may be received from the cock O into another vessel, and returned into DE,

to keep up the stream.

This philosophical amusement may be constructed in the following manner. BB, fig. 41, Pl. 281, is the ferril or capitato which the receiver is cemented. From its centre descends the jet pipe C a, sloping outwards to give room for the discharging pipe b d of larger diameter, whose lower extremity d fits tightly into the top of the hollow pillar FG. The operation is easily understood. Suppose the difance from C to H fig. 40, Pl. 280, 3 feet, which is about one xith of the height at which the atmosphere would support a column of water. The witer poured into AB would descend through FG (the hole A being that) till the air has expanded one 10th, and then it would flop. If the pipe Ca be now opened, the preduce of the air on the furf ce of the water in the eithern DE will cause it to fout through C to the height of three feet nearly, and the water will continue to defeend through t e pipe FG. By tempering the cock N fo as to a low the water to pass through it as sait as it is supplied by the jet, the amusement may be contimed a long time. It will flop at laft, however;

for, as the jet is made into rarefied air, a little air will be extricated from the water, which will gradually accumulate in the receiver, and diminish its rarefaction, which is the moving cause of the jet. This indeed is an inconvenience selt in every employment of syphons, so much the more remarkably as their top is higher than the surface of the water in the ciftein of supply.

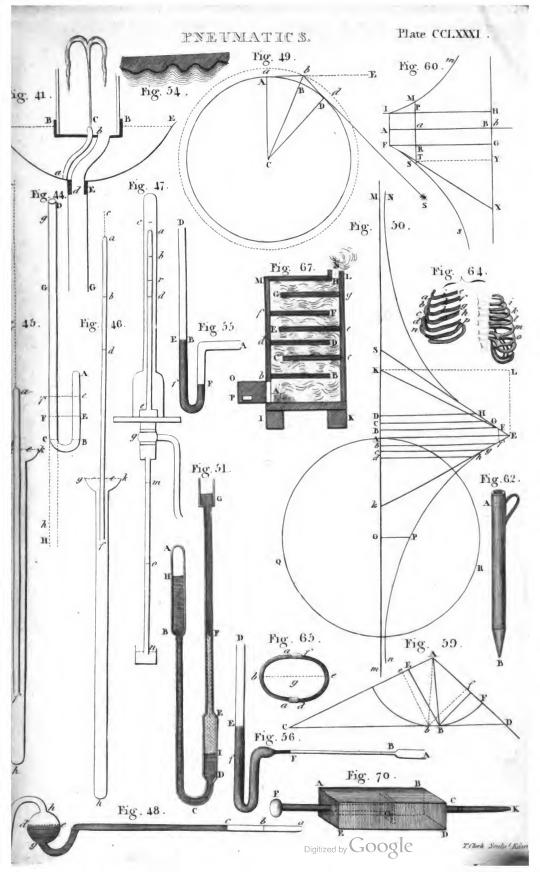

Cases of this employment of a syphon are not unfrequent. When water collected at A (fg. 4:.) is to be conducted in a pipe to C, fituated in a lower part of the country, it founctimes happens as between Lochend and Leith, that the interesing ground is higher than the fountain-head as at A forcing pump is erected at A, and the water forced along the pipe. Once it runs out at C, the pump may be removed, and the water will continue to run on the Typhon principle, provided BL do not exceed 33 feet. But the water in that part of the conduit which is above the horizont! plane AD, is in the fame flate as in a recent of rarefied air, and gives out some of the air which u chemically united with it. This gradually accemulates in the elevated part of the conduct, and at last chooks it entirely. When this happens the forcing pump must again be worked Athough the elevation in the Leith conduit is all about 8 or 10 feet, it will feldom run for :: hours This air cannot be discharged by the well :cocks; for if there were an opening at B, the in would rush in, and immediately stop the mobile.

This combination of air with water is very ditinctly feen by the air-pump. If a small class cataining cold water, fresh from the spring, be appeared, as in sig. 43, Pl. 279, under the receiver, and the air rarefied, small bubbles will be observed to form on the inner surface of the gials, or or the surface of any body immersed in it, which will recreate in size, and then detach themselves smaller class and reach the top; as the rarefaction during slass and reach the top; as the rarefaction during the whole water begins to show very make air-bubbles rising to the top; and this appearance will continue for a very long time, till it be con-

pletely disengaged.

Water purged of air by boiling (or even without boiling) in wacua, will again abforb in what exposed to the atmosphere. The best democsation of this is to fill with this water a phink leaving about the fize of a pea not filled. Immerication in a vessel of water, with the mouth matrix most, by which means the air-bubble will mean up to the bottom of the phial. After some days standing in this condition, the air-bubble will be completely absorbed, and the vessel quite fairly with water.

The air in this state of chemical solution had lost its elasticity, for the air is not more compressible than common water. It is also some if it water brought up from a great depth under ground contains much more air than water at the surface. Indeed fountain waters differ executively in this resolution. The water which comes into the city of Edinburgh by pipes contains so which as to throw it into a considerable ebullines is the contained of elastic study of elastic study in this loosely combined from A glats, of beer treated in the same way will a almost wholly converted into froth by the casts.

of its fixed air, and will have loft entirely the prickling fmartness which is so agreeable, and it become quite vapid.

SECT. V.

# SECT. V. Of the ELASTICITY, DENSITY, and COMPRESSIBILITY of the AIR.

The air-pump affords a great variety of experiments illustrative of the air's ellisticity and expansibility. The very operation of exhaustion is an instance of its great, and hitherto unlimited expansibility. The following experiments show it clearly:

Ist, Put a flaccid bladder, of which the neck is firmly tied with a thread, under a receiver, and work the pump. The bladder will gradually fwell, and will even be fully diftended. Upon readmitting the air into the receiver, the bladder gradually collapses again into its former dimenfrom: white the bladder is flaccid, the air within it is of the fame denfity and elafficity with the furrounding air, and its elasticity balances the pressure of the atmosphere. When part of the air of the receiver is abstracted, the remainder expands fo as still to fill the receiver: but by expanding, its elafticity is plainly diminished; for we see by the fact, that the elasticity of the air of the receiver no longer balances the elafficity of that in the bladder, as it no longer keeps it in its dimensions. The air in the bladder expands also: It expands till its diminished elasticity is again in equilibrio with the diminished elasticity of the air in the receiver; that is, till its denfity is the fame. When all the wrinkles of the bladder have difappeared, its air can expand no more, although we continue to diminish the elasticity of the air of the receiver by further rarefaction. The bladder now tends to burst; and if it be pierced by a point or knife fastened to the sip-wire, the air will rush Out, and the mercury descend rapidly in the gage.

Every one must have observed a cavity at the big end of an egg between the shell and the white. The white and yolk are contained in a thin meme brane or bladder which adheres loofely to the fliell, but is detached from it at that part; and this cavity increases by keeping the egg in a dry place. One may form a judgment of its fize, and therefore of the freshness of the egg, by touching it with the tongue; for the shell, where it is not in contact with the contents, will prefently feel warm, being quickly heated by the tongue, while the rest of the egg will feel cold. If a hote be made in the oppolite end of the egg, and if it be fet on a little tripod, and put under a receiver. the expansion of the air in the cavity of the egg will force the contents through the hole till the egg be quite emptied: or, if nearly one half of the egg be taken away at the other end, the white and yolk taken out, the shell put under a receiver, and the air abstracted, the air in the cavity of the egg will expand, gradually detaching the membrane from the shell, till it causes it to swell out, and gives the whole the appearance of an entire egg.—In like manner shrivelled apples and other fruits will iwell in vacuo by the expansion of the air confined in their cavities.

The AIR-BLADDER of a fifth is furrounded by circular and longitudinal muscles, by which the fifth can compress the air fill further; and, by cea-

t

fing to act with them, allow it to fwell out again-It is in this manner that the fifth can fult its specific gravity to its lituation in the water, fo as to have no tendency either to rife or fink : but if the fish be put into the receiver of the air-pump, the rarefaction of the air obliges the fifth to act more ftrongly with these contracting muscles, in order to adjust its specific grayity; and if too much air has been abstracted from the receiver, the fish is no longer able to keep its air-bladder in the proper degree of compression. It becomes therefore too buoyant, and comes to the top of the water, and is obliged to flruggle with its tail and fins to get down; often in vain. The air-bladder fometimes burfts, and the fifth goes to the bottom, as it can no longer keep above without the continual action of its tail and fins.

The play-things called Cartesian devils are similar to this: they are hollow grais figures, having a smal aperture in the lower part of the figures, as at the point of the foot; their weight is adjusted so that they swim upright in water. When put into a tall jar silled to the top, and having a piece of leather tied over it, they will sink in the water, by pressing on the leather with the ball of the hand: this, by compressing the water, forces some of it to enter into the sigure and makes it heavier than the water, for which reason it sinks, but rises again on removing the pressure of the hand.

If a half-blown ox bladder be put into a box, and great weights laid on it, and the whole put under a receiver, and the air abstracted; the air will, by expanding, lift up the weights, though above 100 lb. By such experiments the great expansibinty was by the condensing syringe. The two fets of experiments form an uninterrupted chain: and that there is no particular state of the air's dentity where the compressibility and expansibility is remarkably diffimilar. Air in its ordinary state expands; because its ordinary state is a state of compression by the weight of the atmosphere. It has been supposed that if there were a pit 33 miles deep, the air at the bottom will be as denfe as water; if it were 50 miles deep, it would be as denfe as gold, if it did not become a liquid before this depth; nay, that if a bottle with its mouth undermost were immersed six miles under water, it would be as denfe as water. But the truth of these suppositions depends on the nature of its compressibility.

This is the circumstance of its constitution. which is evidently of the utmost importance. The great COMPRESSIBILITY and permanent FLIUDI-TY of air, observed in a vast variety of phenomena, is totally inexplicable, on the supposition that the particles of air are like fo many balls of iponge or fo many foot-balls. Give to thefe what compreffibility you please, common air could no more be fluid than a male of clay; it could no more be fluid than a mais of fuch bails preffed into a box. It can be demonstrated that before a parcel of fuch balls, juit touching each other, can be iqueezed into half their prefent dimensions, their glos bular thape will be entirely gone, and each will have become a perfect cube, touching fix other cubes with its whole furface; and thefe cubes will be strongly compressed together, so that motion could never be performed through among them by

20 4

any folid body without a very great force: Whereas we know that air in its most compressed state is just as permeable to any body as the common air that we breathe. There is no way in which we can represent this fluidity to our imagination but by conceiving air to confilt of particles, not only discrete, but distant from each other, and actuated by repulsive forces, or fomething analogous to them. It is an idle fubterfuge, to which fome naturalists have recourse, faying, that they are kept afunder by an intervening ether. (See OFTICS, § 153, 154.) We must, according to the rules of just reasoning, begin the inquiry here; determine from the phenomena what is the analogy between the distances of the particles and the repullive forces exerted at these distances, proceeding in the fame way as in the examination of planetary gravitation. We thail learn the analogy by attending to the analogy between the compressing force and the density. The density depends on the distance between the particles; the nearer they are to each other, the denser is the air. Suppole a square pipe one inch wide and 8 iong, thut at one end, and filled with common air; then suppose a plug so nicely fitted to this pipe that no air can pais by its fides; suppose this pifton thrust down to within an inch of the bottom: it is evident that the air which formerly filled the whole pipe now occupies the space of one cubic inch, which contains the fame number of particles as were formerly diffused over 8 cubic inches.

The condensation would have been the same, if the air which fills a cube whose fide is two inches had been squeezed into a cube of one inch, for the cube of two inches also contains 8 inches. In this case it is evident, that the distance between the particles would be reduced to its half in eyery direction. If a cube whose side is 3 inches, and which therefore contains 27 inches, be squeezed into one inch, the distance of the particles will be one 3d of what it was: in general the diftance of the particles will be as the cube-root of the space into which they are compressed. If the fpace be  $\frac{1}{4}$ ,  $\frac{1}{37}$ ,  $\frac{1}{64}$ ,  $\frac{1}{127}$ , &c. of its former dimensions, the distance of the particles will be  $\frac{1}{3}$ , 1, 4, 4, &c. Now the term denfity, in its frict fense, expresses the vicinity of the particles. The measure of this vicinity therefore is the true meafure of the density; and when 27 inches of air are compressed into one, we should say that it is three times as dense; but we say, that it is 27 times denfer.

DENSITY is therefore used in a sense different from its common acceptation: it expresses the comparative number of equidistant particles contained in the same bulk. This is also sufficiently precise, when we compare bodies of the same kind differing in density only; but we also say, that gold is 19 times denser than water, because the same bulk of it is 19 times heavier. This assertion proceeds on the assumption, that every ultimate atom of terrestrial matter is equally heavy. In such a case, the term density has little or no reference to the vicinity of the particles; and is only a term of comparison of other qualities. But when we ipeak of the respective densities of the same substance in its different states of compressions.

fion, the word denfity is strictly connected with vicinity of particles, and we may safely take either of the measures. We shall abide by the common acceptation, and call that air 8 times as dense which has 8 times as many particles in the same buik, although the particles are only twice as near to each other.

Thus by observing the analogy between the compressing force and the density, we shall discover the analogy between the compressing force and the distance of the particles. The force which is necessary for compressing two particles of air to a certain vicinity is a proper measure of the elasticity of the particles corresponding to that vicinity or distance; for it balances it, and forces which balance must be esteemed equal. ELAS-TICITY is a distinctive name for that corpuscular force which keeps the particles at that diffauce: therefore observations made on the analogy between the compressing force and the density of air will give us the law of its corpufcular force, as observations on the simultaneous deflections of the planets towards the fun give us the law of celeftial gravitation.

But the fensible compressing forces which we are able to apply is at once exerted on unknown thoufands of particles, while it is the law of action of a fingle particle that we want to discover. We make therefore know the proportion of the numbers of particles on which the compressing force is exerted. As the diffance of the particles is as the cube root of the denfity inverfely, the number of particles in phyfical contact with the compressing surface must be as the square of this root. Thus when a cube of 8 inches is compressed into one inch, and the particles are twice as near each other as they were before, there must be 4 times the number of particles in contact with each of the fides of this cubical inch; or, when we have pushed down the fquare pifton of the pipe spoken of above to within an inch of the bottom, there will be 4 times the number of particles immediately contiguous to the pifton, and refifting the compression; and to obtain the force really exerted on one particle, and the elasticity of that particle, we must divide the whole compressing force by 4. In like manner, if we have compressed air into 17 of its former bulk, and brought the particles to 3 of their former distance, we must divide the compressing force by o. In general if d express the density,

 $\sqrt[3]{d}$ , or  $d^{\frac{1}{3}}$ , will express the vicinity or real density; and  $d^{\frac{3}{3}}$ , will express the number of particles acting on the compressing surface; and if f express the accumulated external compressing

will express the distance x of the particles;

force,  $\frac{f}{d^{\frac{3}{4}}}$  will express the force acting on one par-

ticle; and therefore the elafticity of that particle corresponding to the distance x.

The first experiments made to establish the law of compression were published by Mr Boyle, in 1661, in his Desirifu Dostrine de Aris Elsacre contra Linum, and exhibited before the Royal Society the year before. Mariotte made experiments of the same kind, published in his Essayis

La Nature de l' Air, and Traité des Mouvemens des Eaux. The most copious experiments are those by Sulzer, (Mem. Berlin. ix.) by Fontana, Opusc. Physico-Math.) and by Sir George Shuck-Bourgh and Gen. Roy.

To examine the compressibility of the air that is not rarer than the atmosphere at the surface of the earth, we employ a bent tube or fyphon ABCD, pl. 281. fig. 44., hermetically fealed at A and open at D. The thort leg AB must be very accurately divided in the proportion of its folid contents, and fitted with a scale whose units denote equal increments, not of length, but of capacity. There are various ways of doing this; but it requires the most scrupulous attention, and without this the experiments are of no value. In particuar the arched form at A must be noticed. A imall quantity of mercury must then be poured nto the tube, and passed backwards and forwards iil it flands (the tube being held in a vertical position) on a level at B and C. Then we are certain, that the included air is of the fame denity with that of the contiguous atmosphere. Mertury is now poured into the leg DC, which will ill it, suppose to G, and will compress the air nto a smaller space AE. Draw the horizontal ine EF: the new bulk of the compressed air is evidently AE, measured by the adjacent scale, and the addition made to the compressing force of the atmosphere is the weight of the column Produce GF downwards to H, till FH is equal to the height shown by a Torricellian ube filled with the fame mercury; then the whole compressing force is HG. This is eviwhole compressing force is HG lently the measure of the elasticity of the com-

and make fb equal to FH; then Ac will be the tow bulk of the compressed air,  $\frac{AB}{Ac}$  will be its

n more mercury, and let it rife to g, compressing the air into A.e. Draw the horizontal line ef, and

new denfity, and bg will be the measure of the new elasticity. This operation may be extended in far as we please, by lengthening the tube CD, and taking care that it be strong enough to resist the great pressure. Great care must be taken to keep the whole in a constant temperature, because the elasticity of air is greatly affected by heat, and the change by any increase of temperature is different according to its density or compression.

The experiments of Boyle, Mariotte, Amontons, and others, were not extended to very great compressions, the density of the air not having been quadrupled in any of them; nor do they seem to have been made with very great nicety. It may be collected from them in general, that the elasticity of the air is very nearly proportioned to its density; and accordingly this law was almost immediately acquiesced in, and was called the Boylean law: it is accordingly assumed by almost all writers on the subject as exact. Of late years, however, there occurred questions in which it was of importance that this point should be more scrupulously settled, and the former experiments were repeated and extended. Sulzer and Fontana have carried them sarther than any other.

Suizer compressed air into a of its former dimenfions.

In these experiments, it is extremely difficult to preferve the temperature of the apparatus, particularly of the leg AB, which is most handled. A great quantity of mercury must be employed; and it does not appear that philosophers have been careful to have it precifely fimilar to that in the barometer, which gives the unit of compressing force and of elasticity. The mercury in the barometer should be pure and boiled. If the mercury in the fyphon is adulterated with bifmuth and tin, which it commonly is to a confiderable degree, the compressing force, and consequently the elasticity, will appear greater than the truth. If the barometer has not been nicely fitted, it will be lower than it should be, and the compressing force will appear too great, because the unit is too fmail; and this error will be most remarkable in the fmaller compressions.

The greatest source of error and irregularity in the experiments is the very heterogeneous nature of the air itself. Air is a solvent of all stuids, all vapours, and perhaps of many folid bodies. It is highly improbable that the different compounds shall have the same elasticity, or even the same law of elafticity: and it is well known, that air, loaded with water or other volatile bodies, is much more expansible by heat than pure air; nay, it would appear from many experiments, that certain determinate changes both of dentity and of temperature, cause air to let go the vapours which it holds in folution. Cold causes it to precipitate water, as appears in dew; so does rarefaction, as is feen in the receiver of an air-pump. In general, the elasticity of air does not increase quite so fast as its density. This will be best seen by the following tables, calculated from the experiments of Mr Sulzer. The column E, in each fet of experiments, expresses the length of the column GH, the unit being FH, while the column D ex-

presses  $\frac{A B}{A E}$ .

There appears in these experiments sufficient grounds for calling in question the BOYLEAN LAW. Prof. Robifon repeated them with fome precautions, which probably had not been attended to by Mr Sulzer. He was particularly anxious to have the air as free as posible from moisture. For this purpole, having detached the short leg of the fyphon, which was 34 inches long, he boiled mercury in it, and filled it with mercury boiling hot. He took a tin-plate veffel of sufficient capacity, and put into it a quantity of powdered quicktime just taken from the kiln; and having closed the mouth, he agitated the lime through the air in the veffel, and allowed it to remain there all night. He then emptied the mercury out of the fyphon into the veffel, keeping the open end far within it. The short leg of the syphon was thus filled with very dry air. The other part was now joined, and boiled mercury put into the bend of the fyphon; and the experiment was then profecuted with mercury which had been recently boiled, and was the same with which the barometer had been carefully filled. The refults of the experiments are expressed in the following table:

Dry Air.		Moist Air.		Camp. Air.	
D	E	D	E	D	E
1,000	1,000	1,000	1,000	1,000	1,000
2,000	1,957	2,000	1,920	2,000	1,909
3,000	2,848	3,000	2 839	3,000	2,845
4,000	3,737	4,000	3,726	4,000	3,718
5,500	4.930	5,500	5,000	15,500	5,104
6,000	5,342	6,000	5.452	6,000	5,463
17,620	5,490	7,020	0,775	7,620	6,812

Here it appears again in the clearest manner that the elasticities do not increase as fast as the denfities, and the differences are even greater than in Mr Sulzer's experiments.

The 2d table contains the refults of experiments made on very damp air in a warm fummer's morning. In these it appears that the elasticities are almost precisely proportional to the + a small constant quantity, nearly o're deviating from this alle chiefly between the densities r and 1'5, within which limits we have very nearly  $D=E^{r,1007}$ . As this air is nearer to the constitution of atmospheric air than the somer, this rule may be safely followed in cases where atmospheric air is concerned, as in measuring the depths of pits by the

The 3 table shows the compressions and elasticity of air strongly impregnated with the vapours of camphire. Here the Boylean law appears pretty exact, or rather the elasticity seems to increase a little faster than the density. Dr Hooke examined the compression of air by immersing a bottle to great depths in the sea, and weighing the water which got into it without any escape of air. But this method was liable to great uncertainty, on account of the unknown temperature of the sea at great depths.

Hitherto we have confidered only such air as is not rarer than what we breathe; we must take a very different method for examining the elasticity of rarefied air. Let g h(fig. 45.) be a long tube,

formed a top into a cup, and of fufficient dameter to receive another finaller tube a f, open at first at both ends. Let the outer tube and cup le filled with mercury, which will rife in the inter tube to the same level. Let a f now be stopped at a. It contains air of the same density and e-Inflicity with the adjoining atmosphere. Notects actly the space a b which it occupies. Drawing into the position of fig. 46, and let the mercer stand in it at the height de, while ce is the height the mercury in the barometer. It is evident that the column de is in equilibrio between the preffire of the atmosphere and the elasticity of the air included in the space a d. And since the weight of c e would be in equilibrio with the whole preffere of the atmosphere, the weight of ed is equivalant to the elafticity of the included air. While therefore ce is the measure of the elasticity of the furrounding atmosphere, ed will be the meafor of the elafticity of the included air; and facethe air originally occupied the space a b, and has now

expanded into a d, we have  $\frac{ab}{ad}$  for the measure d its density. N. B. c e and e d are measured by the perpendicular beights of the columns, but ab and ab must be measured by their folid capacities. By raising the inner tube fill higher, the mercury will also rise higher, and the included air wile expand still farther, and we obtain another e d and

another  $\frac{a}{a}\frac{b}{d}$ ; and in this manner the relation between the denfity and elasticity of rarefied in may be discovered.

This examination may be managed more easily by the air-pump. Suppose a tube  $a \in (\mathcal{R}, \mathcal{L})$  containing, a small quantity of air  $a \in \mathcal{L}$ , let up a a cistern of mercury, which is supported at two tube at the height  $e \circ a$ , and let  $e \circ a$  be the height the mercury in the barometer. Let this apparatus be set under a tubulated receiver on the pump-plate, and let  $g \circ a$  be the pump-gage, and  $g \circ a$  be

made equal to c e. Then cb is the measure of the elasticity of the air in ab, corresponding to the bulk ab. Now let some air be abstracted from the receiver. To elafticity of the remainder will be diminified by its expansion; and therefore the mercury in the tube a e will descend to some point d. For tx fame reason the mercury in the gage will rife to fome point o, and mo will express the eiasticity of the air in the receiver. This would support mercury in the tube a e at the height er, if the space ar were entirely void of air. Therefore ra is the effect and measure of the elasticity of the included air when it has expanded to the book ad; and thus its elasticity, under a variety of " ther bulks, may be compared with its elafacty when of the bulk a b. When the air has been in far abstracted from the receiver that the mercen in a e defeends to e, then mo will be the precis measure of its elasticity. In all these cases at necessary to compare its bulk ab with its natural bulk, in which its elasticity balances the presu: of the atmosphere. This may be done by lave. the tube ae horizontally, and then the air wal collaple into its ordinary bulk.

Concluded in Vol. Eighteenth.

END OF THE SEVENTEENTH VOLUME.
